Third edition 1949-50
Fourth edition 1958

PREFACE

THE fourth edition of *Everyman's Encyclopaedia* is more fortunate than the second and third, each of which had to take into account the aftermath of a world war—so largely in fact did the Second World War loom when the late Athelstan Ridgway was editing the third edition that some 10 per cent of the total wordage was devoted to it. To counterbalance this, the effects of the cold war, while not so materially disruptive as those of the great wars, have already proved to be politically and culturally far-reaching, especially in the Middle and Far East, and every attempt has been made to obtain the latest information from these areas right up to the time of going to press.

Advantage has been taken of the comparatively peaceful 1950's to carry out a much more drastic revision of the basic material than has been possible hitherto. To this end the entire work was divided up into sections of knowledge, each of which was reorganised and re-balanced within itself before being redistributed under its alphabetical headings in the body of the work as a whole. The effect of this method has been to ensure a uniformity of treatment and approach which was absent from the enlarged second and third editions, and which readers will be able to test for themselves with the aid of the interlocking cross-references that have been provided. For the convenience of the reader, too, it has been a matter of policy to break up the very long articles as far as possible and distribute them under appropriate sub-headings in their alphabetical order. Short articles for quick reference are again an outstanding feature. Thousands of articles, both long and short, have been entirely rewritten so as to cover the latest advances in human knowledge, especially in the field of Science, and the number of illustrations has been increased. The method of revision adopted for this edition has the further advantage that in reviewing their sections as a whole the contributors have been able to preserve a just balance between the topical event, which is given such prominence by press and radio, and the findings of centuries of civilisation, the summary of which is an encyclopaedia's primary concern.

The articles themselves, which are the composite work of numerous experts within their own fields, are, as in the previous editions, unsigned. To the many learned contributors I should like to express my sincere gratitude for their willing and constructive co-operation, without which the difficulties of my task would have been immeasurably increased.

1958

A

A: 1. First letter of the Eng. alphabet, as of all the European alphabets. It is derived through the Lat. and Etruscan from the Gk *alpha*, and we still retain in our cap. A the Gk and Rom. lapidary form. The Greeks, who learned the art of writing from the Phoenicians, borrowed this letter from the Semites. Indeed, whereas the Gk name is meaningless, the Semitic name, *aleph*, is a word in the Semitic languages meaning ox. The modern name of the letter A is of Etruscan origin. Our small a, in both its forms, italic *a* and roman *a*, derives from the Caroline form (employed in the Frankish empire at the end of the 8th cent.), which in its turn descended from the semi-uncial book-hand. The Venetian minuscule, nowadays known as *italica* (introduced in Florence in the 15th cent.), and the Rom. type of letter (perfected in N. Italy, chiefly at Venice, where it was used in the printing presses about the end of the 15th cent.), were adopted here, from Italy, in the 16th cent. The black letter or Gothic, also developed from the Caroline (at the end of the 12th cent.), and employed in NW. Europe, including England, until the 16th cent., is still used in Germany as the 'national' hand. The Semitic *aleph* was (and still is, for instance, in Heb.) a consonant, not a vowel. Its sound was that of a guttural breathing, and, strange to say, this sound is perhaps the most commonly represented by our own A, as in *aboard*, *aground*, etc. The Greeks adopted the symbol to represent what is now the general continental pronunciation of A, which is rare in Eng.: this is the purest and simplest vowel sound, and is uttered by opening the air passage to its fullest extent, as in *father*. It is regarded as the primitive vowel sound.

A is readily interchanged with O, as in the Ger. and Eng. *kalt*, *cold*. It is interchanged also with E. Thus the Romans generally substituted an A where we now find E in Ger. names, as *Albis* for *Elbe*; *Amisia* for *Emis*. A is interchanged with I, as in the Gk *α*, *an-* and the Lat. *in-*, and in the Lat. *sine* and the Fr. *sans*. The numerical value of *a* is 1 in most alphabetical scripts. See ALPHABET.

2. In music, the sixth note of the diatonic scale of C major. The key of A major contains F♯, C♯, and G♯, and its relative minor is F♯. The key of A minor has no key signature, though it requires G♯ for its leading note. It is relative to the major key of C.

3. Or *An*, the indefinite article, *a* being used before a consonant, *an* before a vowel; as *a king*, *an emperor*. Sometimes a virtual consonant exists at the beginning of a word without being written, as in *union* and *once*; before these words it is customary to drop the final letter of the article in conversation and writing. When an *h* is mute, however, we may at

the risk of ~~being misunderstood~~ take the *n* in writing and speaking; thus *a history*, *an historical work*. That *an* and not *a* was the original form is proved by the A.-S. *an* and the Ger. *en*; indeed our numeral one is nothing but a form of it. The *a* in 'three shillings a pound,' however, is not an indefinite article but a deteriorated form of an O.E. preposition. The double form of our article has caused certain words to be wrongly written, as *a newt* for *an ewt* (*eft*). The letter *a* often appears prefixed to a word, as in *aside*, *afoot*, *aboard*, *nowadays*, etc.; these are derived from *on syde*, *on fote*, *on borde*, *now-on-daies*, all of which forms are found in our early Eng. poets; this *on* is an A.-S. preposition meaning *in*. In many places a *now* takes the place of *on*, as 'he fell asleep,' which in an old version of the N.T. was 'he fell on sleep.'

A Becket, Thomas, see BECKET, THOMAS.
A Beckett, Gilbert Abbott (1811-56), humorous writer, b. London. Educ. at Westminster School, he was called to the Bar and became a magistrate. He was one of the first contributors to *Punch*, and also wrote for *The Times*, *Morning Herald*, and *Illustrated London News*. He wrote over 50 plays, and helped to dramatise some of Dickens's novels, but is best remembered as the author of comic hist. of England and Rome, and *Comic Blackstone*, 1846.

A Cappella (It., 'in church style'), musical term used in reference to compositions in which the vocal parts have no instrumental accompaniment. Formerly it was also used for vocal compositions in the accompaniment of which octaves and unison only were employed, and as an equivalent for the tempo direction *alla breve*.

A Capriccio (It., 'capriciously'), musical term which indicates that the composition may be played in time and expression according to the will of the instrumentalist.

A Priori and A Posteriori. The contrast between these 2 methods of reasoning does not now imply exactly what it did in earlier times. By an *a priori* argument was originally meant one from law or cause to effect; by a *posteriori*, one from effect to cause. Kant (q.v.) introduced a new distinction. Reasoning on the fundamental laws of the mind, he asserts that there are certain 'transcendental ideas' (called by him *categories*), which exist independently of experience, and arguments from these are *a priori*. Such ideas are those of space, time, reality, negation, and others, which, he says, we do not derive from experience, but through the application of which we acquire experience. In morality also he declares that the ideas implied in the words good and bad are innate and imperative in every mind, independently of actual observation. A *posteriori*

arguments, on the other hand, are deduced from experience founded on observation. That school of philosophy which sets the highest value on the Kantian *a priori* reasoning is called Institutional or Transcendental; the opposing section are called Empiricists.

A tempo (It., 'in time'), musical term used to indicate a reversion to the time at the beginning of a movement, when that time has been altered, e.g. *ad libitum*, *a piacere*, or for a longer time, e.g. *piu lento*, *piu allegro*, etc.

Aa (from Old Ger. *aha*, water), name of

the Dutch and Belgian borders. It was known as a spa in Rom. times, and it became the N. cap. of the empire of the Carolingians (q.v.). Twenty-eight of the Holy Rom. emperors were crowned in the city, the last being Ferdinand I (q.v.). A treaty signed at A. in 1668 ended the War of Devolution (q.v.), and a treaty of 1748 ended the War of the Austrian Succession (see AUSTRIA, History). The city was in Fr. hands in 1792 and again from 1794 to 1815. In 1815 it went to Prussia, and in 1818 a great congress was held in the city for settling the

AACHEN:
KAISERDOM

Paul Popper

sev. small rivs.—3 in Germany, 3 in Switzerland, 2 in Holland, 2 in Latvia, and 1 in France. The Fr. riv. rises near Desvres, and flows through St-Omer to the N. Sea at Gravelines.

Aabenraa (Ger. *Apenrade*): 1. Amt in S. Jutland, Denmark. From 1864 until 1920 the prov. was part of the plebiscite of Germany. Area 305 sq. m.; pop. 49,000.

2. Cap. of the above, seaport on an inlet of the Little Belt; it has a good harbour and considerable transport trade, besides fishing, shipbuilding, and other industries. Pop. 13,800.

Aach, Ger. tn in the *Land* of Baden-Württemberg (q.v.), near the Swiss border, 65 m. S. by W. of Stuttgart (q.v.). It has a pilgrims' chapel, and its mineral spring is the strongest in Germany. Pop. 1100.

Aachen (Fr. *Aix-la-Chapelle*), Ger. city in the *Land* of N.-Rhine-Westphalia (q.v.), 45 m. SW. of Düsseldorf (q.v.), near

affairs of Europe after the Napoleonic wars. During the First World War it was for a time the Kaiser's H.Q. During the Second World War it was very severely damaged. The cathedral, in which Charlemagne (q.v.) is buried, has a wonderful Gothic choir; the Palatine chapel (whence the Fr. name) dates from the 9th cent. Among the other notable buildings of the city is the 14th-cent. tn hall, built on the site of Charlemagne's palace. A. is in a rich coal-mining dist., and has iron, chemical, textile, and glass industries. The mineral springs are the hottest in central Europe. Pop. 148,900.

Aalborg: 1. Amt in N. Jutland, Denmark. The N. part is low, and much of the region is covered by forests and moors. Area 1130 sq. m.; pop. 233,000.

2. Cap. of the above, on the S. side of the Lim Fjord. It has a Gothic cathedral and is the seat of a Lutheran bishopric. A modern festival and concert hall was built in 1949-53. There are cement

works, textile and tobacco factories, and shipbuilding yards. The tn was used as an air base by the Germans in 1940 and was bombed by the R.A.F. Pop. 83,210.

Aalen, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Kocher, 42 m. E. of Stuttgart (q.v.). It was once a free city of the empire, and has fine old houses and the oldest baroque church in Germany. There are Rom. remains in the dist. Textiles and iron and leather goods are manuf. Pop. 26,000.

Aalesund (*Alesund*), tn in Romsdal, Norway; a great port for herring-fishing;

Aar, largest riv. entirely within Switzerland, trib. of the Rhine; rises W. of the Grimsel pass (q.v.) and flows through Lakes Brienz and Thun, joining the Rhine near Waldshut. On its banks are Meiringen, Interlaken, Thun, Bern, Solothurn, Aarburg, Olten, Aarau, and Brugg. It has sev. tribs., including the Reuss and Limmat. It is 180 m. long.

Aarau, cap. of the canton of Aargau, Switzerland, on the R. Aar, 40 m. N.E. of Bern; manufs. silk, leather, cotton goods, mathematical instruments. At A. the assembly of the diet of the cantons met

Aalborg Turistforening

AALBORG: OLD TOWN HALL AND THE STONE HOUSE OF THE AALBORG MERCHANT, JENS BANG

burnt down in 1904, but rebuilt since; bp. of Hollo. Has broadcasting station. Pop. 19,000.

Aali Pasha (1815-71), Turkish statesman. At the Congress of Paris (1856) he represented Turkey, and maintained her rights with great skill. He helped to put down the Cretan rebellion (1867-8) and subdued the Khedive of Egypt (1869).

Aalst, see **ALOST**.

Aalter, see **AELTRE**.

Aalto, (*Hugo*) **Alvar** (1898-), Finnish architect, tn-planner, and furniture designer, awarded R.I.B.A. royal gold medal for architecture, 1957. Prin. buildings: library, Viipuri (1927-35); sanatorium, Paimio (1929-33); Finnish pavilions at the Paris exhibition (1937) and New York (1939); students' hostel at Cambridge, Massachusetts (1947); Pensions Office, Helsinki (1956); flats in the Tiergarten, Berlin (1957).

Aaltonen, **Wäinö** (1894-), Finnish sculptor and academician. His sculptures in granite are famous.

(1798), and proclaimed the Helvetic Republic (q.v.), of which A. became the cap. for a short time. Pop. 14,900.

Aardvark, the (Cape ant-bear), *Oryzomys*, is not closely related to the edentate ant-eaters, but on account of various peculiarities of structure is placed in a separate order, *Tubulidentata*. It has large pointed ears, tapering snout and tail, stumpy legs, a long slimy tongue, and little hair on its body. Its name (*aardvark*) is the Dutch for earth-pig, and is very appropriate, as it resembles the pig in its burrowing and grubbing, for which its sharp snout is of great use. Its hams are esteemed as good as those of a pig. When fully grown it is about 5 ft long. During the heat of the day it lies in its burrow. It is the only ant-eater possessing teeth, having 7 molars on each side above and 6 below. It is very timid, and if pursued burrows very rapidly: it can be killed by a smart blow on the snout. There are sev. species found in different parts of Africa S. of the Sahara. See **ANT-EATER**.

Aardwolf, the (*Proteles cristatus*), is an African animal 3 ft 6 in. in length, of yellowish-grey colour, with heavy dark stripes and a long bushy tail. It resembles a young hyaena. The molar teeth are very small and placed some distance apart. There are a total of 30 or 32 teeth. As its name indicates, it is a burrowing animal, of nocturnal habits and timid disposition; it is like the hyaena in its taste for carrion and termites, which it digs up with its sharp claws.

Aarestrup, Carl Ludwig Emil (1800-56), Dan. poet, b. Copenhagen. He was a doctor by profession, and did not gain great popularity as a poet during his lifetime. The pub. of *Digte*, 1838, went unnoticed, although his strongly erotic *Efterladte Digte*, 1863, caused some stir. But it was not till after his death, when Brandes ed. his *Samlede Digte*, 1877, that he became known as one of the greatest Dan. lyric poets. See G. Nygaard, *E. Aarestrup*, 1918.

Aargau (Fr. Argovie), canton of N. Switzerland, taking its name from the Aar, which flows through it. It is bounded on the N. by the Rhine; on the S. by the canton of Luzern. Area 548 sq. m. Previously the centre of the Hapsburgs and taken from them by the Swiss Confederates in 1415, A. was admitted to the Swiss Confederation in 1803. In the fertile parts the people are engaged in agriculture, dairy-farming, and cattle-breeding. Prin. tns: Aarau (cap.), Baden, Brugg, Laufenburg, Lenzburg. Pop. (1955) 320,600; the majority are Protestants.

Aarhus: 1. Amt in E. Jutland, Denmark. The soil is fertile and agriculture is carried on. Area 310 sq. m.; pop. 210,400.

2. Cap. of the above, and second port in Denmark, on the E. coast of Jutland. It is an important industrial centre, has motor, locomotive, and electrical works, and shipbuilding yards. The tn has been the seat of a (now Lutheran) bishop since the 10th cent., and has a large cathedral. There is a new univ. which was opened in 1933. Pop. 119,000.

Aaron (Heb. *Aharón*), brother of Moses, 3 years his senior and a man of influence with his tribe, the Levites. A. became the associate and spokesman of his brother in their interviews with Pharaoh (Exod. iv-v). The priesthood was fixed in his line (Exod. xxviii). While Moses was on Sinai A. was intimidated into making the golden calf (Exod. xxxii); yet he was not deprived of the priesthood. His consecration (Lev. viii) was ratified by the budding of his rod (Num. xvii). He married Elisheba and had 4 sons.

Aaron's Beard, name given to (1) *Hypericum calycinum* (q.v.); (2) *Saxifraga sarmenlosa*; and (3) *Verbascum thapsus* (q.v.).

Aaron's Rod, see MULLEIN.

Aarschot, tn in the prov. of Brabant, Belgium, on the R. Demer. It was a fortified crossing place in Rom. times. In Aug. 1914 the Gers. shot more than 150 of its inhab. on various pretexts; the tn

suffered severe war damage, until the Belgians retook it in Sept. During the Second World War A. was a target for air-raids. It is an important agric. centre. Pop. 11,600.

Aartsen, Pieter, see AERTSEN, PIETER. **Aasen**, Ivar (1813-96), b. Sunnmøre, Norway; self-educ.; studied the Norwegian country dialects, and constructed from them (connecting them with Old Norwegian) a standard dialect, now known as *nynorsk* (or modern Norwegian). This developed into the *landsmål*, which is one of the two literary languages of Norway, the other being the *riksmål* or *bokmål*, which is a development of Dan. (at one time the official and literary language of Norway); pub. a grammar (1848) and a dictionary (1850) of the 'Norwegian Popular Language'. In the *landsmål* A. wrote plays and poems.

Aavasssa, hill in Finland, near Tornio, forming an excellent vantage ground for witnessing the phenomenon of the midnight sun.

Ab, eleventh month of the Jewish civil year, corresponding to a part of July and a part of Aug.; it does not occur in the A.V. of the Bible, but is often found in the Talmud.

Ababde, vil. of Middle Egypt, on the Nile, near which are found ruins of Antinöe, a city built by Hadrian and named after Antinous, and also ruins of Besa.

Abaca, Philippine name for *Musa textilis*, yielding fibre for ropes and cordage; cultivated in the Philippines, whence exported; resembles banana in growth. See BANANA; FIBRE; HEMP; MANILA HEMP.

Abaco, see BAHAMAS.

Abacus: 1. Instrument used for aiding calculation; the name may be given to any machine for counting with beads, etc., in which one row stands for units, another for tens, etc. In England it is only used nowadays in infant schools to teach children to count. Used by Romans and still used in parts of Russia, China, and Persia. The early A. was a board strewn with sand on which rows of pebbles were laid.

2. In architecture a flat padstone between the capital and the supporting column, designed to concentrate the load.

3. A sideboard.

Abadan, ls. of Persia, at head of Persian Gulf, has important oil refinery and port. Pop. 65,000.

Abaddan, Heb. for 'destruction,' occurs in the O.T. as a synonym for Sheol (Hades) and Death. In Rev. ix it is the name of the angel (devil) of the bottomless pit—perhaps Hell personified. The Gk trans. Apollyon (destroying) is given with perhaps a punning reference to Apollo, whose symbol was the locust.

Abadeh, dist. and tn, Persia, half way between Isfahan and Shiraz, noted for wood-carving. Pop. of tn 8000.

Abaka, see ABACA.

Abakan, tn on the Yenisey in S. Siberia, cap. of the Khakas (q.v.) Autonomous Oblast and cultural centre of the Minusinsk basin (q.v.). It was founded in 1929. Pop. (1956) 48,000, largely Russian.

Aballo, see **AVALLON**.

Abalone, or ear-shell, a shell-fish of the family *Haliotidae*, found chiefly on Californian coasts, and largely used for food.

Abana (riv.), see **AMANA**.

Abancay, cap. of Apurimac, Peru, near Cuzco, noted for sugar. Pop. 15,000.

Abandonment, see **DERELICT**; **DOMICILE**; **HUSBAND** and **WIFE**; **INSURANCE**, **MARINE**; **NOLLE PROSEQUI**; **PARENT** and **CHILD**; **SALVAGE**.

Abanilla, Sp. morkt tn in the prov. of Murcia. Pop. 8800.

Abano, Pietro di, see **PETER OF ABANO**.

Abano Terme (anc't Aponi Fons, or Aquae Patavinae), It. spa, in Veneto (q.v.), 5 m. SW. of Padua (q.v.). It was the bp. of Pietro di Abano (q.v.). Pop. (tn) 2900; (com.) 8700.

Abantes, anc't inhab. of Euboea; said to have been of Thracian origin, and to have first settled in Phocia, where they built Abae, and afterwards crossed to Euboea; they assisted in colonising sev. of the Ionic cities of Asia Minor.

Abanus, Petrus, see **PETER OF ABANO**.

Abarbanel, **Abraham**, or **Abarbenel**, **Isaac Ben Jehudah** (1437-1508), Jewish statesman and author; b. Lisbon of an anc't Jewish family. Distinguished for his learning and wealth; minister of state to King Alfonso V. of Portugal. Suspected of treason by John II and had to escape. Served Ferdinand, King of Aragon, until the expulsion of Jews from Spain, 1492. Lived thenceforward in Naples and Venice, where he d., 1508. Wrote commentaries on the O.T. and the expected Messiah. His first son, *Leo Hebraeus* (Juda Leon), doctor and philosopher, wrote *Dialoghi di amore*, 1535; his second son, *Joseph*, was a doctor at Venice and Ferrara, and the third son, *Samuel*, a statesman.

Abaris, legendary Hyperborean priest of Apollo; came from near Caucasus to Greece during a plague; said to have taken no earthly food, and to have ridden through the air on an arrow, the gift of Apollo. See Herodotus, iv. 36.

Abas: 1. Son of Metanira; changed by Demeter into a lizard for mocking the goddess; when quenching her thirst in his mother's house, where she had wandered. See Ovid, *Metam.* v. 451-61.

2. 12th King of Argos; grandson of Danaus and father of Acrisius and Proetus; received the shield of Danaus, which had the power of subduing rebels.

Abasia, see **ABKHAZIA**.

Abate Ciccio, P., see **SOLIMENA**.

Abatement, derived from O.F. word *abatre*, to prostrate or destroy.

In a literal sense to destroy, as to abate or discontinue a nuisance. See **NUISANCE**.

In heraldry, a mark of dishonour on a coat of arms for some stain on the character of the wearer. The only A. now used is the *baston*, to indicate bastardy.

Abati, **Abatti**, or **Abbate**, **Niccolò dell'** (1512-71), painter, b. Modena. He worked in fresco under Primaticcio (q.v.). 'The Adventures of Ulysses,' in the palace at Fontainebleau, was destroyed, but prints were pub. by Van Thulden in Paris, 1630. His best-known easel work, 'The

Martyrdom of St Peter and St Paul,' painted on wood for the church of the Benedictines at Modena (1546), is now in the gallery at Dresden. He accompanied Primaticcio to France, where he d. at Paris (1571). His brother Pietro Paolo was a clever horse and battle painter. His son Giulio Camillo, his grandson Erocole, and his great-grandson Pietro Paolo were all painters; Erocole, b. Modena 1563, d. 1613, executed with B. Schidoni frescoes of the council hall of Modena.

Abatis, or **Abattis**, in military art a number of felled trees with the smaller branches cut off, placed side by side with their butt ends towards the defenders, and secured to the ground by forked pickets; serves as an obstacle to the advance of an enemy.

Abattoir, name given to the public slaughter-house established in Paris by a decree of Napoleon, and finished in 1818. An A. was first estab. in Great Britain at Edinburgh in 1851; another was estab. at Islington in 1855, and now many tns have them. The largest cattle- and hog-killing centre in the world is Chicago (q.v.). See also **ADULTERATION** and **SLAUGHTER-HOUSES**.

Abaza, Caucasian-speaking people in the Circassian Autonomous Oblast of N. Caucasus; they numbered (1926) 14,000. They are bilingual, and speak and write Kabarda (q.v.) as well as A.

Abba, Aramaic for father (Mark xiv. 36, Rom. viii. 15, Gal. iv. 6; always with its trans. subjoined). In the Syriac, Coptic, and Ethiopic Churches the title came to be applied to the bishops.

Abba-Comites, **Abbi-Comites**, see **ABBOT**.

Abbadie, **Antoine Thomas**, see **ABBOT**. **Abbadie**, astronomer, b. Dublin H. was educ. in France, and in 1835 was sent on a mission to Brazil by the Académie des Sciences. In 1837-48 he explored Abyssinia. He was made a member of the above academy in 1867, and in 1882 went to San Domingo to see the transit of Venus across the sun. His prin. work is *Géodésie de la haute Éthiopie* (Paris, 1873). His brother, Arnaud Michel (1815-93), b. Dublin, travelled with him. His prin. work is *Douze ans dans la haute Éthiopie* (Paris, 1868) a record of the travels and observations of both.

Abbadie, **Jacques** (1654-1727), b. Nay, educ. at Sedan, Saumur, and Puy-laurens, where he became D.D. In 1680 he was made pastor of a Fr. Protestant church in Berlin by Frederick William, elector of Brandenburg. In 1688 and 1689 he accompanied Marshal Schomberg to Holland, England, and Ireland, afterwards becoming pastor of the Fr. Church in the Savoy. In 1699 he was made dean of Killaloe by William III. He died in London. His chief works are *Traité de la vérité de la religion chrétienne*, 1684; *Traité de la divinité de Notre Seigneur Jésus-Christ*, 1689; *L'Art de se connaître soi-même*, 1692; *Défense de la nation britannique*, 1692 (in support of the 1688 revolution); *La Grande Conspiration d'Angleterre*, 1696 (written by order of William III).

Abbas (566-652), uncle of Mohammed and founder of the dynasty of the Abbasids (q.v.), who ruled as caliphs of Bagdad from 750 to 1258.

Abbas I, Shah of Persia 1587-1629, known as Shah A. the Great. He was b. 1571 or 1572, the son of Muhammad Mirza and the grandson of Tahmasp. At the time of his accession Persia was threatened by internal revolt and external attack by the Ottomans and the Uzbeks. Peace was made with Turkey in 1590, by the terms of which Persia lost various dists. in Azerbaijan and Georgia. A. then reduced rebels in the S., and in 1597 recovered Khorasan from the Uzbeks. He honourably received Sir Anthony and Sir Robert Shirley in 1598; and the following year Sir Anthony was sent to the Christian princes of Europe to offer them the shah's friendship with a view to some combination against the Turks. In 1601 the Turkish war was renewed and Persia regained the provs. which had been lost under A.'s predecessors. Kandahar was recovered in 1609. In 1622 a joint Persian and Brit. force evicted the Portuguese from Hormuz. During his reign A. encouraged commerce, granted immunities and privileges to European merchants, and promoted the prosperity of Persia. He made Isfahan the cap. of his kingdom. A. d. in 1629 and was succeeded by his grandson, Shah Safi.

Abbas II, Shah of Persia 1642-67. He was b. 1620. He received various embassies from Europe and treated Christians favourably. He recaptured Kandahar, which had been lost by his predecessor to the Great Moguls.

Abbas III, Shah of Persia 1732-6. He was b. 1732, and crowned shah when he was only 8 months old, Tahmasp Quli Khan (later Nadir Shah) becoming regent. He was the last of the Safavid dynasty.

Abbas Hilmy (1874-1923), last Khedive of Egypt, which, as A. II, he ruled before the First World War. Succeeded his father Tewfik on the throne of Egypt, 1892. He at first tried to overthrow Brit. rule; he abolished and reduced taxes, and disagreed with Lord Cromer and Lord Kitchener. He threw in his lot with Turkey in 1914; was deposed 18 Dec. 1914, and the khedivate passed, with the title of sultan, to Hussein Kemal Pasha, his uncle. He died at Vienna.

Abbas Mirza (1783-1833), second son of Fath Ali Shah, ruler of Persia. He was made governor-general of Azerbaijan at the age of 17. He commanded the Persian Army in the Russian wars of 1812-13 and 1825-8 (see *PERSIA, History*). He also commanded the Persian forces in the war with Turkey, concluded by the Peace of Erzerum (1823). In 1828 he made an expedition to Khorasan to restore Persian supremacy and d. besieging Herat in 1833. A. was an enlightened prince and sought to reorganise his army on European lines with the help of various European officers.

Abbas Pasha, Abbas I (1813-54), grandson of Mehemet Ali (Mohammed Ali). Became Viceroy of Egypt on the death of

his uncle, Ibrahim Pasha, 1848; and was found dead, probably murdered, 1854. He promoted the estab. of the railway from Alexandria to Cairo, 1851.

Abbasids, family of sovereigns who occupied the throne of the Arabian empire from AD 750 to AD 1258. The name is derived from their ancestor Abbas ben Abd-al-Motaleb, a paternal uncle of Mohammed. They made war on the Omayyad caliphs, who had occupied the throne of the Arabian empire from 661, and completely defeated them in a battle on the banks of the R. Zab, near Mosul, 750. Under Harun al-Rashid (786-808) the prosperity of the Abbasid empire was very great, flourishing tns were estab., and literature and the arts were encouraged; the splendour and luxury of the court of Bagdad are exhibited in many of the *Arabian Nights* tales. Under Mamun (813-33) colleges and libraries were founded, and works on astronomy, mathematics, metaphysics, natural philosophy, and medicine were trans. from the Sanskrit and Gk into Arabic. Later in the century the prosperity was broken by invasions by the Saracens and Turks, and by internal disturbances. From the time of Rhadi (939-40) almost all power had passed from the caliphs to the emirs al-Omara, and the caliphate then became a mere nominal dignity, with the possession of the tn of Bagdad. The last caliph, Mostasem, was defeated and killed by the Mongol chieftain Hulagu, 1258, and thus ended the gov. of the A.

Abbate, Niccolò dell', see *ABATI*.

Abbatas Milites, see *ABBOT*.

Abbaye, prison in Paris, close to the church of St-Germain-des-Prés, built between 1631 and 1635 as the manorial prison of the great abbey of St-Germain. Made into a military prison in the revolution, it was the scene of a terrible massacre on 2 and 3 Sept. 1792. It was demolished in 1854. See *Carlyle, The French Revolution* (Pt III, Bk 1, Ch. IV).

Abbe, Cleveland (1838-1916), Amer. meteorologist, b. New York. Studied astronomy at Ann Arbor and Cambridge (Massachusetts), and spent 2 years in Russia at the Pulkovo observatory. He became director of the Cincinnati observatory in 1868, and meteorologist of the weather bureau in 1891. Among his publications are *Report on Standard Time*, 1879; *Preliminary Studies for Storm and Weather Predictions*, 1889; *The Mechanics of the Earth's Atmosphere*, vol. 1, 1891; vol. 2, 1909; *Physical Basis of Long-range Forecastings*, 1902.

Abbe, Ernst (1840-1905), Ger. physicist, b. Eisenach. Studied at Göttingen, and joined the firm of Zeiss in 1866, of which he became sole owner in 1888. He made important contributions to the theory and practice of the design of optical instruments, and introduced many new optical glasses.

Abbé, originally the Fr. term for abbot. Before the Fr. Revolution it was applied to many persons who had little or no connection with the Church, but who acted

as tutors, profs., and men of letters. 'Abbes commendataires' were persons who received revenues from their monasteries, but who were not necessarily monks. The title A. is now applied to any Fr. priest who is not a member of a religious order, as well as to abbots.

Abbess, superior of a nunnery (usually Benedictine) which has canonical status as an abbey, usually elected by the sisters subject to the approval of the bishop. In the Rom. Catholic Church an A. possesses the same dignity and exercises the same functions as an abbot, except those of his priestly order. According to a decree of the Council of Trent, an A. at the time of her election should be at least 40 years of age, and should have made profession for 8 years; and it is forbidden that any person be elected to the dignity who has not been professed for 5 years, or is under 30 years of age.

Abbeville, Fr. tn in the dept of Somme, near the mouth of the R. Somme. Historically it is noted for two treaties which have borne its name—one between Henry III of England and Louis IX of France in 1259, and the other between Henry VIII of England and Francis I of France in 1527. The church of St Wolfram has a remarkable flamboyant facade; the church was seriously damaged during the Second World War, and many other fine old buildings in the tn were destroyed. Manufs. are sugar, textiles, carpets, and there is an agric. market. Pop. 15,300.

Abbey, Edwin Austin (1852-1911), Amer. painter and illustrator, b. Philadelphia. In 1878 he was sent by Harper Brothers of New York to England to gather material to illustrate Herriek's poems. His delightful illustrations to Herriek, Goldsmith, and Shakespeare secured his fame. From 1891 to 1902 he was engaged on a series of panels, 'The Quest of the Holy Grail,' for the Boston Public Library, and in 1901 he was commissioned by Edward VII to paint his coronation. Among his pictures may be mentioned 'A May-Day Morning,' 'Flammetta's Song,' 'Crusaders Sighting Jerusalem,' 'Pot-pourri,' and 'A Measure.' In 1896 he was elected A.R.A., and in 1898 he became an R.A.

Abbey (from the O.F. *abaie*), religious community presided over by an abbot or abbess; a building occupied by the community; the church of a monastery, or a private dwelling-house built on or converted from the remains of an A. dissolved at the Reformation and granted to lay owners. See MONASTERY.

Abbey Theatre, Dublin, the most famous of all modern Irish theatres. Ireland, and in particular Dublin, has always been a great centre of theatrical art, and many famous players were of Irish birth. At one time Dublin stood second only to London as the centre of the drama in the Brit. Isles, as they then were.

The Irish dramatic movement, founded by W. B. Yeats and Lady Gregory (q.v.), saw the necessity of having a theatre largely devoted to Irish plays and Irish players. When in 1901 their amalgama-

tion with the company led by W. G. Fay (q.v.) took place, they set about founding a theatre, and with the aid of the celebrated Miss Horniman of Manchester the A. T. arose. Lady Gregory did much to finance its early days but it became self-supporting in 1910, although now there is also a small gov. subsidy. It became world famous as a specialised repertory theatre and from it came well-acted plays of fine quality. It is not too much to say that in its heyday it had on its stage some of the finest acting in the world. It had its own methods of production, staging, and acting which suited it admirably, and many distinguished players graduated there. It was burned down in 1951 and is now in process of being rebuilt.

Abbeyleale, mkt tn of Limerick co., Rep. of Ireland, on the R. Feale. Pop. 1200.

Abbeyleix, tn of Laois co., near Portlaoise, Rep. of Ireland. Pop. 800.

Abbiatograsso, It. tn in Lombardy (q.v.), 13 m. WSW. of Milan (q.v.) on the Naviglio Grand Canal. Near here Bayard (q.v.) was killed in 1524. Pop. 16,000.

Abbot, Charles, see COLCHESTER, BARON.

National Portrait Gallery

GEORGE ABBOT
Artist unknown.

Abbot, George (1562-1633), Archbishop of Canterbury, b. Guildford, Surrey, son of a cloth-worker; educ. at the grammar school, Guildford, and Balliol College, Oxford. He became private chaplain to Thomas Sackville, Lord Buckhurst, chancellor of the univ., 1592; master of Univ. College, 1597; dean of

Winchester, 1600; 3 times vice-chancellor of Oxford Univ., 1600-5. He was deprived of his authority, 1627, for opposing the doctrine of passive obedience preached by Dr Manwaring and Dr Sibthorp; but was summoned as usual to Parliament, 1628. His works include *Exposition on the Prophet Jonah*; *A Brief Description of the Whole World*, 1599.

Abbot, John (d. 1623), Brit. poet, educ. at Sidney Sussex College, Cambridge, taking the degree of B.D. in 1617. A Rom. Catholic, he wrote a poem entitled *Jesus Praefigured: or, a Poeme of the Holy Name*, 1623.

order, and when monastic institutions were first founded to the head monk of the institution (not necessarily a priest). In the Gk Church the corresponding title to A. was archimandrite (chief monk), or hegumenos (leader). In orders founded after the 10th or 11th cent. the title A. was discontinued, and superiors were known as priors, guardians, and rectors.

In dignity an A. is considered to stand next to a bishop. In England 26 A.s and 2 priors (wearing the mitre and carrying the crozier) used to sit in the House of Lords. Cardinal A.s were

The British Travel and Holidays Association

ABBOTSFORD, ROXBURGHSHIRE, ONE-TIME HOME OF SIR WALTER SCOTT

Abbot, Robert (1560-1617), elder brother of George A., Archbishop of Canterbury, educ. at the grammar school, Guildford, and Balliol College, Oxford. He became one of the chaplains in ordinary to James I, 1603; master of Balliol College, 1609-15; fellow of Chelsea College, 1610; Regius Prof. of Divinity at Oxford, 1612; and Bishop of Salisbury, 1615. He was a great preacher, and wrote theological works, including: *A Mirrour of Popish Subtilties*, 1594; *The Exaltation of the Kingdom and Priesthood of Christ*, 1601; *A Defence of the Reformed Catholicke of Mr W. Perkins*, 1606; *Antilogia adversus Apologiam Andreae Eudaemon Joannis*, 1613.

Abbot, title of the head of a monastery or abbey (usually Benedictine). The word 'abbot' or 'abbat' is derived through Aramaic *abba* from the Heb. *ab*, father. Originally the title was given as a mark of respect to any member of the clerical

those who presided over an estab. with sev. branches; and in Germany there were prince A.s as well as prince bishops. In the 10th cent. there were field A.s (in Lat. 'Abbates Milites') and A.-counts ('Abba-Comites' or 'Abbi-Comites'), secular persons who rendered military service in return for certain abbeys bestowed upon them by the prince, and this practice continued in Great Britain after it had been discontinued on the Continent.

An A. is usually elected by the monks, subject to the approval of the pope or of the bishop, according as the monastery is independent or under episcopal jurisdiction. There was at times friction between the A.s and the Church owing to an attempt by the A.s to free themselves from the authority of the diocesans. Some became independent and possessed great power and wealth. Long before the Reformation, however, their power was

reduced to narrow limits, and subjected in all material points to the civil authority.

Abbot of Unreason, Lord, or Abbot of Misrule, title of the master of Christmas revels, used respectively in Scotland and in England, while *L'abbé de Liesse* (i.e. Jollity) is the Fr. equivalent. In Walter Scott's *The Abbot*, the falconer Adam Woodcock masquerades as A. of U. under the name of Father Howleglass.

Abbotts Langley, tn and par. of Herts, England, 5 m. from Watford, said to be the bp. of Nicholas Breakspear (later Pope Adrian IV (q.v.)). The par. church was built in 1154. Pop. 7500.

Abbotsford, mansion in baronial style on the r. b. of the Tweed, 2½ m. W. of Melrose, Roxburghshire, Scotland, the home of Sir Walter Scott from 1812 until his death in 1832. It was formerly a small farm, which Scott bought in 1811. He built a villa, calling it A., and between 1817 and 1825 added further buildings, making it a picturesque and irregular estate. There are many Scott relics. See Lockhart's *Life of Scott*.

Abbotshall, see KIRKCALDY.

Abbott, Charles, see TENTERDEN, BARON.

Abbott, Edwin Abbott (1838-1926), teacher and scholar, b. London. He was educ. at the City of London School, of which he became headmaster 1865-89, and at St John's College, Cambridge, where he was Hulsean Lecturer in 1876. His most notable pub. was his *Shakespearean Grammar*, 1870, and he also wrote many theological works.

Abbott, Eleanor Hallowell (1872-), Amer. novelist, grand-daughter of Jacob A. (q.v.), b. Cambridge, Massachusetts. She was a teacher of Eng. for a time, and in 1908 married Dr Fordyce Coburn. Her novels, which were very popular, include *Molly Make-Believe*, 1912, *White Linen Nurse*, 1913, and *Little Eve Edgerton*, 1914.

Abbott, Emma (1849-91), Amer. singer, b. Chicago. She studied music in Europe, appeared in opera at Covent Garden, and later, having formed a company of her own, toured the U.S.A.

Abbott, Evelyn (1803-1901), scholar, b. Notts. He had a brilliant career at Oxford, but became permanently paralysed as a result of a hurdlng accident. Fellow of Balliol from 1874, he collaborated with L. Campbell in an ed. of Sophocles and in the *Life and Letters of B. Jowett*, 1897. He ed. *Hellenica* and the *Heroes of the Nations* series, for which he wrote *Pericles*, 1891, and pub. other classical works, including a *History of Greece*, 1888-99.

Abbott, Jacob (1803-79), Amer. author, b. Hallowell, Maine. He was educ. at Bowdoin College, where he graduated 1820, and at Andover. He entered the ministry of the Congregational Church, but he is best known by his writings—educational and religious. His first book, *The Young Christian*, 1832, was followed by about 200 others, the best among which were in the 28-vol. series of Rollo Books, instructive tales for the young in the manner of Day's *Sandford and Merton*.

Abbott, John Stevens Cabot (1805-77),

Amer. clergyman and historian, brother of Jacob A. (q.v.), b. Brunswick, Maine. He was educ. at Bowdoin College and the Theological Seminary, Andover, and became a Congregationalist minister, but from 1844 devoted himself to writing. Among his prin. works, which were very popular, are his *History of Napoleon Bonaparte*, 1852-5, hist. of the *Civil War in America*, 1863-6, and of *Frederick the Great*, 1871, and a number of biographies of Amer. presidents.

Abbott, Lyman (1835-1922), Amer. clergyman and author, b. Roxbury, Massachusetts, son of Jacob A. (q.v.). He succeeded Henry Ward Beecher in 1888 as minister of Brooklyn Congregational church, and in 1893 as editor of the *Outlook*. His works include *The Theology of an Evolutionist*, 1897, *Henry Ward Beecher*, 1903, *Reminiscences*, 1915, *What Christianity Means to Me*, 1921, and *Silhouettes of my Contemporaries*, 1922.

Abbottabad, tn in the NW. frontier area of W. Pakistan, once a military cantonment. Situated well up in the hills, it is a hot-weather resort.

Abbreviation, in music, consists of signs or terms used to facilitate the work of the composer and copyist. In organ music,

ABBREVIATION IN MUSIC

G.O. or Gr. = Great Organ, F.O. = Full Organ, etc. In pianoforte music, L.H. or M.S. (It. *mano sinistra*) or M.G. (Fr. *main gauche*) = left hand; R.H. or M.D. (It. *mano destra*, Fr. *main droite*) = right hand; ped. = depress pedal; * = release pedal. General A.s are ^ = pause; < or cres. = *crescendo*, get gradually louder; > or dim. = *diminuendo*, get gradually softer; f = loud; ff = very loud; mf = fairly loud; p = soft; pp = very soft; mp = fairly soft; D.C. (*da capo*) = repeat from the beginning of the movement; D.S. (*dal segno*) or § = repeat from previous sign §; ten. or *tenuto* = hold, or sustain; sf. or sfs. = *sforzando*, or *sforzato*, accentuate; rit. = *ritenuto*, slacken immediately in speed; rall. = *rallentando*, slacken gradually in speed; accel. = *accelerando*, quicken gradually; and so on. In full scores the instruments are named in abbreviation, e.g. Fl. = *flauto* or flute, Fag. = *fagotto*, Viol. or Vo. = violin, Va. = Viola, etc. Another kind of A. is shown in the

For Classical A., see Graevius's *The-saurus Antiquitatum* (1694), Mommsen's *Corpus Inscriptionum Latinarum* (1863); Alph. Chassant's *Paléographie* (1854), and Campelli's *Dizionario di Abbreviature*

(1899). See also DIPLOMATICS and PALAEOGRAPHY.

Abbreviator is more particularly used for an officer of the Court of Rome, appointed as assistant to the vice-chancellor for drawing up the pope's briefs and reducing petitions, when granted by the pontiff, into proper form for being converted into bulls. The A.s are supposed by Ciampini to be the successors either of the *cellarii* of the imperial household or of the 7 *notarii* said to have been placed by Pope Clement I in the 7 quarters of Rome, to write down the acts of the martyrs within their sev. dists. They are said to have taken their name either from their writing the *brevia* or shorter epistles of the pope, or from making use of notes or abbreviations in writing. A. is also a name given by some authors to an auct. literary academy supposed to have existed at Rome in the 15th cent. and composed of the chief men of letters of the age, as Pomponius Laetus, Platinus, Pontanus, Sannazarius, Sabellicus, etc., who, by the rule of the society, latinised their names as a condition of their admission. The existence of such an academy is doubtful.

Abbt, Thomas (1738-66), Ger. writer, b. Ulm. In 1760 he became prof. of philosophy at Frankfurt. He was the friend of Lessing and Moses Mendelssohn, and contributed to the *Literaturbriefe*. In 1761 he wrote *Vom Tod fürs Vaterland*, a fine expression of his patriotism; in 1763 followed *Vom Verdienst*, a treatise in favour of the education of the people.

Abd-el-Kader (1807-83), Algerian patriot and hero of the long struggle against the French. This he commenced at Oran in 1833, and with varying fortune sustained till he surrendered to Gen. de Lamoricière in 1847. He displayed great skill and perseverance in his conduct of the campaign, and in 1834 he compelled the Fr. Gen. Desmichels to recognise his authority in a treaty. On a resumption of hostilities he inflicted a serious defeat on a large Fr. army at Makta, but he was driven to seek refuge in Morocco in 1843. He became Amir of Mascara in 1832. After his final capture he was released by Louis Napoleon in 1852, and received a pension of 100,000 francs. In retirement at Damascus he wrote a book on the consolations of philosophy under the title *Rappel à l'intelligent: avis à l'indifférent*, 1858, and supplied commentaries to N. J. E. Dumas's *Cherchez du Sahara*, 1858. See A. Bellemare, *Abd-el-Kader*, 1863, and C. H. Churchill, *Life of Abd-el-Kader*, 1867.

Abd-el-Krim (1881-), leader of Rifs in the Moroccan campaigns, 1921 and 1925. The son of a tribal chieftain, and a man with some pretensions to culture, he was, in the heyday of his brief career of military adventure, an able leader and an adept in the arts of intrigue. During the First World War he was in the Sp. service and engaged in helping the Sp. authorities to consolidate their hold on their treaty zone. Later, however, he turned against his Sp. masters and strove to incite the Rifs against the invader.

So successful was he in the field, notably near Melilla, where he almost exterminated an army of some 20,000, that he produced an upheaval in Spain, with the result that a military dictatorship was estab. to cope with the situation. In 1925 he launched an offensive against the Spaniards, this really being his only course when the French had joined the latter. Previously Gen. Primo de Rivera, the Sp. dictator, had offered to make peace on terms very favourable to the Rifs, but the offer was refused by A.-el-K., who wanted nothing less than complete independence. Ultimately he was forced to abandon the struggle through the defections of the tribesmen, who, though unbeaten in their inaccessible fastnesses, had grown tired of fighting, and in May 1926 he surrendered unconditionally to the Fr. Moroccan commander at Fez and was exiled to the Mascarene Is. When being brought to France in 1947 he escaped to Egypt, and in May 1957 was living in Cairo.

Abd-el-Rahman, or **Abd-ur-Rahman** (fl. 732), Moorish chief, invaded Gaul in 731 at the head of the largest Mohammedan army which had yet menaced Christendom. He was defeated and slain by Charles Martel at Tours in 732. **Abd-el-Rahman I** founded in 755 at Cordova the Omayyad dynasty of Sp. caliphs. The second caliph of this name, 822-52, was a great patron of learning; under the third, 912-61, the Cordova caliphate attained its most brilliant period.

Abd-ur-Rahman (1778-1859), Sultan of Morocco, reigned from 1823 to 1859. Much of his time was occupied in putting down internal insurrection. It was during his reign that the practice was abandoned of European states paying a tribute for protection against the piracy of the Moors.

Abd-ur-Rahman Khan (either 1830 or 1844-1901), Amir of Afghanistan from 1880. Supported successfully for a while the claim of his father, Afzal, against his uncle, Sher Ali, but in 1868 had to take refuge in Russian Turkestan. Finally he overcame the son of Sher Ali, Yaqub Khan, and firmly estab. himself as amir. He was eminently friendly to Great Britain, and did much to consolidate his power and to promote the social welfare of his country.

Abdalatif (**Abdu'l Latif**) (1162-1231), Arabian physician and writer, b. Bagdad. Held professorships at Mosul, Damascus, and Cairo, and at the latter place wrote in 1203 a *Compendium of the History of Egypt*. The titles of 166 works by A. have been recorded, about one-fourth of which are on medical subjects.

Abdallah III, see AL-MAMUN.

Abdel-Khalek Pasha Sarwat, see EGYPT.

Abdera, see ADRA.

Abdera, tn in Thrace, the bp. of the philosopher Democritus and the sophist Protagoras; nevertheless its inhab. had a reputation for stupidity, and 'Abderite' became a term for a simpleton.

Abdication, voluntary renunciation of an office by a ruler or sovereign. In a

few striking instances office has been relinquished owing to a desire for the freedom of private life, as was the case with the Rom. dictators Cincinnatus, 438 BC, Sulla, 80 BC, and the Rom. emperor Diocletian, AD 305. Philip V of Spain, who abdicated (1724) in favour of his son, resumed the regal functions after his son's death. Other notable A.s in more modern times are Isabella II of Spain, 1870; Amadeus I of Spain, 1873; Prince Alexander of Bulgaria, 1886; Milan of Serbia, 1889; Oscar of Norway, 1905; Abdul Hamid II of Turkey, 1909; Manoel of Portugal, 1910. The emperor Pu-yi of China not only abdicated (1912), but by a final decree converted China from an absolute autocracy into the largest rep. in the world. According to Blackstone, no Eng. sovereign may abdicate without the consent of parliament. This was done in the case of James II (1688), who was declared by a joint sitting of both houses to have abdicated.

The most important A.s during or after the two world wars were Nicholas II of Russia, 1917 (*see RUSSIA, History*); Constantine of Greece, 1917 (restored 1920), abdicated finally 1922; Ferdinand of Bulgaria, 1918; William II of Germany, 1918; Nicholas of Montenegro left his country in 1916 and was dethroned in 1918; Karl of Austria, 1918; Mohammed VI of Turkey, 1922; George II of Greece, 1924 (restored 1936); Hussein, King of the Hejaz, 1924; Ali, King of the Hejaz, 1925; Amanullah of Afghanistan, 1929; Michael of Rumania, 1930 (restored 1940) and 1948; Alfonso XIII of Spain, 1931; Prajadhipok of Siam, 1935; Edward VIII of Great Britain, 1936; Zog I of Albania, 1939; Charles II (Carol) of Rumania, 1940; Peter II of Yugoslavia, 1945; Simeon of Bulgaria, 1946; Victor Emmanuel III of Italy, 1946; Umberto II of Italy, 1946; Wilhelmina of the Netherlands, 1948; Leopold III of Belgium, 1951; Talal I of Jordan, 1951; Farouk of Egypt, 1952; Ahmed Fouad II of Egypt, 1953.

Abdomen, that part of the body separated from the thorax by the diaphragm, enclosed by the lower ribs and the muscles of the belly, and supported by the pelvis. The diaphragm is a partition of membrane and muscle with a movement determining the action of the lungs in breathing. The whole abdominal cavity is lined by a membrane called the peritoneum (q.v.). The term abdominal cavity lends itself to a possible misunderstanding, as it is most economically packed with a number of organs which are concerned in the nutrition of the body, and which are kept in their relative positions by the muscles of the abdominal wall and the bands of the visceral peritoneum. When for any reason there is a gap in the muscles of the abdominal wall part of the contents of the A. are liable to protrude, giving rise to a hernia, or rupture (q.v.).

The stomach (q.v.) is situated in the upper part of the A., with the liver in front and the kidneys, pancreas, and spleen behind. From the stomach the intestines (q.v.), with a total length of

about 30 ft., lead to the anus. The organs occupying the pelvic cavity, the lower part of the A., are the rectum and bladder in the male and the rectum, bladder, uterus, ovaries and their appendages in the female. *See also under* the appropriate headings for the individual abdominal organs.

REGIONS OF THE ABDOMEN

A, stomach; B, spleen; C, pancreas; D, kidney; E, small intestine; F, descending colon; G, liver; H, large intestine; I, appendix; J, rectum; K, bladder.

Abduction. In ancient legal codes the word implied the unlawful taking away of a free person, or a slave of another person. Under the Rom. criminal law the word *plagium* stood for the buying of a free person, and the term is still used in Scotland for the theft of a child. In Eng. law, A. technically means the taking away by force, fraud, or persuasion of a woman (or child) against her own will, or, if the woman be under 21, against the will of her parents or guardians. The term is also applied under the Corrupt and Illegal Practices Act, 1883, to the action of preventing the free exercise of the franchise of any elector. The common forms of the crime are defined by the Criminal Law Consolidation Act, 1861, and the crime is also dealt with in the Criminal Law Amendment Act, 1885. The more serious forms of the offence, the A. of women, are held to be a felony, and the heavy penalty of 14 years' imprisonment may be inflicted. It is also a misdemeanour punishable by a term of 2 years' imprisonment to take a girl under 18 for the purpose of seduction, provided there were no reasonable grounds for supposing the girl to be above 18. The A. of children under 14 is technically called 'child-stealing', and is an offence punishable by a maximum term of 14 years' imprisonment, but the mother of a child or the father of an illegitimate child cannot be

indicted. A. must not be confused with *kidnapping* (q.v.). The latter includes the theft of any person, but is more properly applied to taking away beyond the seas—so that the person loses the protection of his country's laws. Throughout the U.S.A., A. is a felony, and in some states is punishable by a fine, not exceeding \$10,000, in others by solitary confinement at labour for a term not exceeding 25 years.

Abdul-ahi-el-Taachi, or **Abdullahi ibn sayid Mohammed** (c. 1850–99), 'Khalifa,' follower of the Mahdi, Mohammed Ahmed, succeeded him in 1885. He was defeated by Kitchener at Omdurman in 1898, and killed at the battle of Om Debrikat in 1899.

Abdul Aziz (III of Nejd) **ibn Sa'ud**, see SA'UD.

Abdul-Aziz (1830–76), Sultan of Turkey, succeeded his brother, **Abdul-Medjid**, in 1861. His reign was one long struggle against rebellion in Turkey's European provs., and he is remembered chiefly for his extravagance and bad gov. He was deposed on 30 May 1876, and found dead 4 days later.

Abdul-Hamid I (1725–89), Sultan of Turkey, came to the throne in 1773. His reign was signalised by Turkey's struggle with Russia and Austria. The former wrested from him suzerainty over the Crimea in 1774, and the latter inflicted a crushing defeat on him at the battle of Ochakov (1788).

Abdul-Hamid II (1842–1918), Sultan of Turkey, succeeded in 1876, on the deposition of his brother, Murad V, and was himself deposed in 1909. His reign included wars with Serbia (1876), Russia (1877–8), Greece (1897). The Armenian atrocities (1894–6) earned him the titles 'Great Assassin' (Gladstone) and 'Abdul the Damned' (poem by Sir Wm Watson). The revolution of the 'Young Turks' under Enver Bey which deposed him estab. the beginnings of parl. gov. in Turkey.

Abdul Latif, see ABDALATTIF.

Abdul-Medjid (1823–61), Sultan of Turkey, succeeded to the throne (1839) 8 days after the disastrous defeat of his father's (Mahmud II) army at Nisib by Mehmet Ali, the rebellious viceroy of Egypt. The intervention of the Christian powers checked the advance of the victorious Egyptians on Constantinople, and thus saved A.-M.'s dynasty. The treaty of 1841, imposed on both parties by the European powers, settled the relationship of Egypt and Turkey. This sultan instituted many reforms, the status of Christians being considerably improved. The Crimean War took place during A.'s reign.

Abdullah el Hussein (1882–1951), 1st King of Jordan (formerly Transjordan), b. Mecca, second son of the sherif Hussein ibn Ali (later King of the Hejaz) and brother of Faisal, King of Iraq (q.v.). After fighting against the Turks during the First World War, he arrived in Transjordan in 1921 and was allowed by the Brit. Gov. to estab. himself there as emir. In 1928 his position was formally

recognised as independent ruler of Transjordan under Brit. mandatory rule. He received an ann. subsidy from the Brit. Gov. On 22 Mar. 1946 the mandate was abrogated, and by a new treaty of alliance with Britain Transjordan became an independent kingdom with A. as its first king. A. now had under his control the Arab Legion (raised in 1922 by Peake Pasha), which, under Brit. training and leadership, was the best Arab military force in the Middle E. As a result of the Palestine war of 1947–8, A. was able to annex Arab Jerusalem and most of that part of Palestine assigned to the Arab State by the U.N.'s resolution of 1947. He thus aroused the hostility of the Arab League (q.v.). In 1949 he assumed the title of King of Jordan. On 20 July 1951 he was assassinated by a member of the Jihad faction. His memoirs were pub. in English in 1950, ed. by P. P. Graves. See also JORDAN; TRANSJORDAN; PALESTINE.

Abdullahi ibn Seyid Mohammed, see ABDUL-AHL-EL-TAACHI.

Abecedarians, name (derived from A B C) of small sect consisting of followers of Storch (1522), the Ger. Anabaptist. Holding that only a knowledge of the Scriptures communicated by the Holy Spirit direct was necessary, they refused to learn to read.

Abel ('breath' or 'vapour'), second son of Adam (Gen. iv), was a shepherd. Because he offered to God a more acceptable sacrifice than that of his brother Cain, the latter slew him in a fit of jealousy. This was the first death, the first murder, and the first martyrdom.

Abel (d. 764), Archbishop of Rheims; a native of England or Ireland, he aided St Boniface in missionary work in Germany. He was never able to take possession of his see and died abbot of Lobbes.

Abel, **Sir Frederick Augustus** (1827–1902), authority on explosives, sharing with Sir James Dewar (q.v.) the credit for inventing cordite. He also invented a close-test apparatus for ascertaining the flash-point of petroleum. He began his career as prof. of chem. at the Royal Military Academy (1851–5), and was afterwards appointed chemist to the war dept (1854–8). He was the first director of the Imperial Institute, being appointed in 1887, and pub. many important works on gunpowder and other explosives. His introduction of pulping was an important step towards making the manu. of gun-cotton safe. He developed the heat test for explosives.

Abel, **Karl Friedrich** (1723–87), Ger. musician and composer, b. Cöthen. He played on the viola da gamba. Originally in the court band at Dresden, he came to England in 1759 and became one of the queen's chamber musicians. He joined Johann Christian Bach in giving concerts in London, where he died.

Abel, **Niels Henrik** (1802–29), Norwegian mathematician, b. Findö, son of a clergyman. Entered univ., Christiania, 1821, and later became a lecturer there. Is chiefly known for his develop-

ment of the theory of elliptical functions and algebraic equations, and he proved that an algebraic solution of the quintic was impossible. The name of Abelian functions has been given to the higher transcendents of multiple periodicity which he was the first to discuss. In 1825 the gov. gave him an allowance to enable him to travel, and after his premature death from consumption they pub. his works.

Abélard, Pierre (1079–1142), Fr. scholastic philosopher and theologian, b. Pallet, near Nantes; studied under Roscelin and Wm of Champeaux (q.v.) in Paris. Having scored some success over the latter in debate, he was obliged to leave Paris and subsequently opened a school of his own, first at Melun, then at Corbeil, and finally became head of the school at St Geneviève. A. next went to Laon where he attended the theological lectures of St Anselm and again gave proof of exceptional ability. He returned to Paris, was made a canon of Notre-Dame (1115), and set up another school in which there were trained a future pope, 19 future cardinals, and more than 50 future bishops. A. now had the misfortune to fall in love with Héloïse, the niece of Canon Fulbert; a son was born, and the pair were secretly married soon afterwards. When this fact became known, Héloïse retired to a convent at Argenteuil. Fulbert revenged himself by having A. castrated by a band of ruffians. The victim recovered and became a monk at St Denis, while Héloïse took the veil at Argenteuil. In 1120 A. was persuaded to open a theological school at Maisoncelle, but it was not long before his *Introduction to Theology* raised suspicions of unorthodoxy. A provincial synod held at Soissons (1121) condemned his teaching, ordered the work to be burned, and confined him in the Abbey of St Médard. On his release A. returned to St Denis and infuriated the community by denying the tradition that their monastery had been founded by Denis the Areopagite. He withdrew to the countryside near Nogent-sur-Seine and built a little oratory of wicker; but students flocked to him in thousands and rebuilt the chapel in stone. This was the famous Paraclete, so named in gratitude for the comfort given by his friends. Driven from here by relentless enemies, A. spent ten years as superior of the monastery of St Gildas de Rhuys in Brittany, establishing Héloïse as head of a new convent at the now deserted Paraclete. After leaving St Gildas, he wrote a number of works, including *Historia Calamitatum*, which drew from Héloïse three famous letters. His theological writings, however, were denounced by St Bernard of Clairvaux at the Council of Sens (1141). A. appealed to Rome; but the council condemned his works notwithstanding, and the Holy See confirmed their judgment. A. set out to plead his cause before the Pope in person. Sickness, however, obliged him to abandon his journey at Cluny where he was received by the abbot, Peter the Venerable. When his suffering increased he

was moved to the priory of St Marcel near Châlon-sur-Saône, where he d. Héloïse lived until 1164, and was buried at A.'s side. In 1497 their ashes were moved into the priory church; in 1800 to the garden of the Musée Française at Paris; and in 1817 to the cemetery of Père Lachaise.

The philosophy of A. was opposed to both Realism and Nominalism (q.v.). He maintained that universals obtain reality by being predicated of things; but this view, known as Conceptualism (q.v.), tended too much towards Nominalist materialism and hence incurred the censure of the Church. The physical sufferings of A., and the aura of romance which hangs about his love for Héloïse, have tended to obscure his intellectual no less than his moral weakness. His ability is not called in question; but it lacked the virtues of humility and self-discipline which are the prerequisites of philosophical approach to revealed truth.

A.'s works have been ed. by V. Cousin (2 vols.), 1849–59. See C. de Rémusat, *Abélard* (2 vols.), 1845; J. G. Sikes, *Peter Abélard*, 1932; E. Gilson, *Héloïse et Abélard*, 1938; M. H. Carré, *Realists and Nominalists*, 1946.

Abele, Eng. name of the *Populus alba*, or white poplar. See **POPLAR**.

Abelia, genus of evergreen and deciduous shrubs, family Caprifoliaceae, hardy in S. England; the Chinese *A. chinensis*, *A. schumannii*, and the Mexican *A. floribunda* being esteemed for their summer and autumn flowers.

Abelin, Johann Philipp (c. 1600–c. 1634), Ger. historian, better known under his pseudonym of Johann Ludwig Gottfried, b. Strasburg. His writings, all pub. at Frankfurt, include vols. i and ii of *Theatrum Europaeum* (21 vols.), 1633–1738, *Historia Orientalis Indiae*, 1628, and *Inventarium Sueciae*, 1632.

Abell, John (1653–1724), singer, lutenist, and composer, b. Aberdeenshire. He settled early in London, worked at various places in Germany, and returned c. 1700. He d. at Cambridge.

Abellinum, see **AYELLINO**.

Abencerrages, name of a noble family in the Moorish kingdom of Granada, the story of whose long struggle with the rival family of the Zegriss has been the theme of many Sp. chroniclers and romance writers. According to tradition the leading members of the A. were eventually massacred in the Alhambra by Boabdil in the 15th cent.

Abenezra (c. 1093–1167), a celebrated Jewish scholar, b. Toledo, who lectured and pub. works on philosophy, grammar, medicine, mathematics, and astronomy, and in connection with the last-named science gave his name to a star. He is chiefly known for his great commentary on the O.T.

Abensberg, Ger. tn in the *Land* of Bavaria (q.v.), 47 m. N. by E. of Munich (q.v.), on the A. riv., a trib. of the Danube (q.v.). It has anct fortifications and an abbey-church. Pop. 4000.

Abeokuta, tn in S. Nigeria, cap. of the

area of the same name, 50 m. from Lagos. Constituted in 1914, it was previously the centre of a semi-independent native state. It was founded in 1825 by the inhab. of many neighbouring vills. to protect themselves from slave-hunters. The Yorubas who belong to A. are very politically conscious and can be intractable. They are keen traders and a highly intelligent people. Area of the prov. 4266 sq. m.; pop. 84,000.

Aber, Celtic word meaning 'mouth of river,' which forms the prefix of many names of places in Great Britain.

Aber, small vil. in Caernarvonshire, N. Wales, with noted waterfalls. Pop. 400. **Aberavon**, see PORT TALBOT.

Aberayron, small watering-place in Cardigan, Wales. Pop. 1100.

Aberbrothook, see ARBROATH.

Abercarn, urb. dist. in Monmouthshire, England, with collieries and tinplate works. Pop. 18,800.

Aberconwy, see CONWAY.

Abercorn, Duke of, Irish title held by the family of Hamilton (q.v.). James Hamilton, a Scottish nobleman, was made baron, 1603, an earl in 1606, and in 1790 his descendant became a marquess. In 1868 the 2nd marquess was made a duke and became Lord-Lieutenant of Ireland. His family is portrayed in Disraeli's *Lothair*. James, the 2nd duke (1838-1913), was chairman of the Brit. S. Africa Co.; James, the 3rd duke (b. 1869), was Governor of N. Ireland, 1922-1945.

Abercorn, N. Rhodesia, is near the S. end of Lake Tanganyika. On 25 Nov. 1918 the Ger. troops surrendered to the British here. Broken Hill, 595 m., is the nearest railway station. A. is beautifully situated in a healthy climate and fertile country.

Abercrombie, John (1726-1806), a writer on horticult. subjects, employed at Kew Gardens. In 1767 he pub. *Every Man his own Gardener*, which is said to have been submitted to Goldsmith for purposes of literary revision and returned without any alteration.

Abercrombie, John (1780 - 1844), physician, b. Aberdeen. He graduated M.A. Aberdeen, 1803, and M.D. Edinburgh, where, at a later date, he was appointed surgeon to the Royal Public Dispensary. He rapidly developed a large practice among rich and poor and worked this with a number of apprentices. A. became famous as a teacher and was responsible especially for the introduction of the systematic teaching of pathological anatomy, a subject in which he particularly distinguished himself. A. was appointed physician to the king in Scotland (1828) and was lord rector of Marischal College, Aberdeen (1835). In addition to treatises on the pathology of the nervous system and on other medical subjects he was the author of 2 works that had considerable vogue at the time. These were *Inquiries Concerning the Intellectual Powers*, 1830, and *Philosophy of the Moral Feeling*, 1833, in which he sought to harmonise the facts of science with the revelations of religion.

Abercrombie, Lascelles (1881-1938), poet and scholar, b. Ashton-upon-Mersey. He was educ. at Malvern and Owens College, Manchester. His first vol. of verse, *Interludes and Poems*, appeared in 1908 and was followed by *Mary and the Bramble*, 1910, and *Emblems of Love*, 1912, as well as sev. plays which included *The Sale of St Thomas*, 1911, and *Deborah*, 1913. After the First World War he was appointed lecturer in Eng. at Liverpool, then held the Chairs of Eng. at Leeds, 1922-9, and London, 1929-35, finally becoming Goldsmith's Reader in Eng. at Oxford and a fellow of Merton College. His later pubes. include *Four Short Plays*, 1922, *Phoenix*, 1923, and *Twelve Idylls*, 1928; *Collected Poems* appeared in 1930. His poetry is complex and generally dramatic in form. Among his critical works are a study of *Thomas Hardy*, 1912, *The Epic*, 1914, *Principles of English Prosody*, 1924, *The Idea of Great Poetry*, 1925, *Romanticism*, 1926, and *Poetry: Its Music and Meaning*, 1932.

Abercrombie, Sir (Leslie) Patrick (1879-1957), architect and town planner, b. Ashton-upon-Mersey. Prof. of Civic Design, Liverpool Univ., 1915-35; Prof. of Town Planning, London Univ., 1935-46. Author of *Town and Country Planning*, 1933, and other books. Won the competition for replanning Dublin in 1913. With J. H. Forshaw, prepared for the L.C.C. *The County of London Plan*, 1943. This was followed by *The Greater London Plan*, 1944, in which many other persons collaborated under his direction. The purpose of both reports was to improve means of transport, distribution of pop. and industry, conditions of housing, and provision of open spaces, etc., with regard for the welfare of the people and the preservation or creation of amenities. Both reports were very comprehensive and detailed, illustrated on a scale never attempted previously. Other tns and areas for which he prepared plans include Edinburgh, Plymouth, Hull, the W. Midlands, Clydeside, and Bournemouth.

Abercromby, David (d. 1702), Scottish physician and metaphysician of the 17th cent., of whose life little is known save what he himself has told in his book, *Protestancy to be Embraced*, 1682. He was educ. as a Rom. Catholic, and lived for 18 years with a Fr. Jesuit order, but he finally embraced the Protestant faith.

Abercromby, Patrick (1656-1716), antiquary and historian, b. Forfar. Educ. at St Andrews, he was physician to James II. He wrote pamphlets against the Union of 1707 and a hist., *Martial Achievements of the Scots Nation*, 1711-1716.

Abercromby, Sir Ralph (1734-1801), general, b. Menstry, Clackmannanshire. He was educ. at Rugby, and studied law at Edinburgh and Leipzig. He joined the army, accompanied the Duke of York on the two disastrous campaigns against the Fr. in Holland (1793 and 1799), and by his skilful administration and humanity gained the affection of the whole army.

On 18 Feb. 1787 Chacon, Sp. governor, surrendered Trinidad to A. without a fight, and the cession was confirmed by the treaty of Amiens, 1802. He was wounded

National Portrait Gallery
SIR RALPH ABERCROMBY
Painting after John Hoppner.

during an engagement with the Fr. at Alexandria, Egypt, and, though victorious, *d.* from his wounds a week later.

Aberdare, Henry Austin Bruce, 1st Baron (1815-95), statesman, *b.* Dufryn, Glamorganshire. He was Liberal M.P. for Merthyr from 1852, and held sev. political appointments, including the home secretaryship, 1868-73, and the Presidency of the Council, 1873-4. A. was made a baron in 1873 and was the first chancellor of the univ. of Wales, 1894.

Aberdare, tn and urb. dist. of Glamorganshire, S. Wales, 20 m. N. of Cardiff at the confluence of the Dare and the Cynon. Once an important coal-mining tn, it is now largely concerned with light industries estab. on the Hirwaun Trading Estate (NW. of A.). Electric cables and metal products are also manuf. Pop. 40,916.

Aberdeen, George Hamilton Gordon, 4th Earl of (1784-1860), statesman, *b.* Edinburgh and educ. at Harrow and Cambridge. He succeeded to the earldom in 1801. A. was ambas. at Vienna (1813), and signed the treaty of Teplitz. He then entered political life as a Tory, and became successively chancellor of the duchy and foreign secretary in Wellington's Cabinet (1828-30), but although he held office (colonies and war) under Peel (1834-5) and was again foreign secretary (1841-6) he resigned with Peel in 1846. In 1852 he succeeded Lord Derby as Prime Minister, forming a popular coalition ministry. His ministry soon met with disfavour owing to the

mismanagement of the Crimean War, and he resigned after a motion of censure against his gov. had been carried in the House of Commons. *See* life by Lady Frances Balfour, 1923.

Aberdeen, Sir John Campbell Gordon, 1st Marquess and 7th Earl of (1847-1934), grandson of 4th earl, educ. at St Andrew's and Oxford. He succeeded his brother to the earldom in 1870. He was twice Lord-Lieutenant of Ireland (1896 and 1905-15), and was Governor-General of Canada, 1893-8. He was created marquess, 1916.

Aberdeen, N. co. of Scotland, bounded N. and E. by the N. Sea, S. by the cos. of Kincardine, Angus, and Perth, and SW. and W. by Inverness and Banff. The ruins of sev. old feudal castles still exist, among which may be noted Dundargue, Ken-Edgar, Craigston, Fedderssett, Slains, and Fyvie. Balmoral Castle is the favourite royal residence in the highlands. The coastline of A. is fairly regular, but there are points and headlands towards the NE. (Buchan Ness is the most easterly point of Scotland). Farther N. there are high rocks and caves. In the SW. the co. is bounded by the Grampians (q.v.), which in their highest peaks rise to over 4000 ft. Ben Macdui, Cairntoul, Braeriach, and Lochnagar are the prin. heights. The surface of the co. is generally hilly, and A. is watered by the R.s. Dee, Don, Uthan, Ugie, and Deveron. The soil on the whole is not fertile except in that portion of the co. between the R.s. Don and Uthan, but by the exertion of the farmers crops of barley, oats, and turnips are produced. Much of the land is covered with fr. ash, birch, and poplar trees. Sheep and cattle are reared and A. is noted for the breeding of pedigree cattle. Herring and salmon fishing is an important industry, particularly at Peterhead and Aberdeen. The co. is divided

LORD ABERDEEN, FOURTH EARL

into 5 parts: Mar, Formartine, Strathbogie, Buchan, and Garioch. The most important tns are Aberdeen, one of the prin. Scottish ports, Peterhead, Fraserburgh, Inverurie, and Huntly, and there are many small vils. The co. returns 2 members to Parliament. Area 1927 sq. m.; pop. 323,000.

Aberdeen: 1. Important city, royal burgh, port, and holiday resort of N. Scotland, situated between the mouths of the R.s Dee and Don, cap. of Aberdeen co. and a co. of itself. In 1179 William the Lion

College, founded 1593 by George Keith, Earl Marshal of Scotland, in New A. Famous Aberdonians include John Barbour, the poet (c. 1320-95), who was archdeacon of A. from about 1356 until his death; Hector Boece (c. 1465-1536) the Scottish historian and principal of King's College; and George Campbell, the Scottish theologian (1719-96), a principal of Marischal College. Byron received his early education at the grammar-school. A. carries on an extensive trade of which the ann. value runs into millions of

Corporation of the City of Aberdeen

THE MUNICIPAL BUILDINGS, ABERDEEN

granted A. a charter and it became a royal burgh, but was burned in 1336 by Edward III. Rebuilt as New A., it became a flourishing tn. The buildings of this beautiful city are largely of granite; among the more imposing are the municipal buildings, the market hall, the art gallery, the grammar-school, the Royal Infirmary, the trades hall, and Marischal and Gordon's Colleges (the former a college of the univ. of A., the latter a boys' public school). Among the places of worship are the church of St Nicholas, the Rom. Catholic cathedral, St Andrew's Cathedral, and St Machar's Cathedral in Old A. (this dist. is now incorporated in the municipality). The univ. of A. comprises 2 constituent colleges: King's College, founded in 1494 by Bishop Elphinstone in Old A., and Marischal

pounds; and ships ply between A. and other Brit. ports, America, the E. and W. Indies, and Baltic and Mediterranean ports. There are extensive docks and a large fish market; the chief industries are white and salmon fishing, shipbuilding, paper-making, engineering, granite-working, comb-making, quarrying, and the manuf. of linen and woollen goods. In recent years the ann. value of fish landed has exceeded £2,000,000, while A. trawlers did good service as mine-sweepers and patrols in both world wars. A. is governed by a council of 37 members, and as a parl. bor. returns 2 members to the House of Commons. Pop. 182,714.

2. Cap. of Brown co., S. Dakota, U.S.A. It is a rail and wholesale distribution centre, and produces farm machinery, wood products, dairy produce, flour,

wheat, barley, oats, and corn. It has a state teachers' college, a hospital, and an airport. Pop. 21,050.

3. Tn in Chehalis co., Washington, U.S.A.; it has saw-mills and machine shops, and there are fishing and fish-canning industries. Pop. 19,653.

Aberdeen Angus Breed, see CATTLE.

Aberdeen Terrier, see SCOTTISH TERRIER.

Aberdevine, see SISKIN.

Aberdovey, seaside resort of Merioneth, Wales, on the estuary of the R. Dovey, in Cardigan Bay, part of Towyn (q.v.) urb. dist. Pop. 1500.

Aberfeldy, burgh on the r. b. of the R. Tay in Perthshire, Scotland. The scenery around, referred to by Burns in *The Birk of Aberfeldy*, is very beautiful, the falls of Moness being a great attraction. Pop. 1560.

Aberfoyle, vil. of Perthshire, Scotland, on the R. Forth, nearest vil. to the Trossachs (q.v.). Pop. 1200.

Abergavenny, tn in Monmouthshire, at the confluence of the Usk and Gavenny. It is an old Rom. settlement (Gobannium); there are remains of an old castle and of a Benedictine priory, and it has an old church and sev. other places of worship. Coal and iron are found in the vicinity, but it is chiefly noted as a wool market. Pop. 8844.

Abergeldie Castle, royal seat in Aberdeen co., situated on the R. Dee near Balmoral.

Abergele, tn and coastal resort of Denbighshire, N. Wales, formerly the township of the lordship of Denbigh (estab. 1282). The narrow defile of Tan-y-Ogo (2 m. W.) is the site of the battle between Harold and Gruffydd ap Llewellyn. A Brit. vil. (3rd cent. AD) has been excavated above modern St George (1½ m. E.). Pop. 7500.

Aberhart, William (1878-1943), Canadian politician, b. Ontario and educ. at Queen's Univ. Principal at high school in Calgary, Alberta. Organised a social credit movement, which won the prov. election in 1935. A. becoming Prime Minister of Alberta on 3 Sept. of that year. He then tried to establish a currency system on social credit principles, his proposals involving the grant of a 'basic dividend' of £25 a month to every citizen, payable in non-negotiable certificates deposited with a special bank. These proposals also involved price control and taxation to recover expenditure on the dividends. The Alberta legislature passed the necessary legislation, including the Bank Taxation Bill, the Credit Regulation Bill, and a Press Control Bill, but all these measures were declared *ultra vires* by the Supreme Court of Canada, and their decision was upheld by the Judicial Committee of the Privy Council. Other unorthodox measures having failed A. reverted to orthodox finance, but in 1937 the Alberta budget showed a deficit of 1½ million dollars. By 1940 his majority had become considerably reduced. A.'s Social Credit Gov. was defeated for the first time in Feb. 1937 on a motion to adjourn the debate on the budget; after which A. introduced

a Social Credit Bill providing for a commission to administer the social credit plan. But in 1940, on his own advice, the legislature was dissolved, though the Social Credit Gov. was returned to power in the prov. election with A. at its head.

Abernethy, John (1680-1740), Irish Protestant divine. By his refusal to accept the synod's decision that he should go to Dublin (1717) he caused a div. in the Irish Presbyterian Church, the 2 parties becoming known as 'subscribers' and 'non-subscribers.' Ultimately he went to Dublin (1730), where he engaged in many theological controversies, and strongly opposed the Test Act.

Abernethy, John (1764-1831), surgeon, b. London, grandson of Irish Presbyterian minister (*supra*). Educ. at Wolverhampton Grammar School, he was appointed assistant surgeon at St Bartholomew's Hospital, 1787. Full surgeon from 1815 to 1827, during which period he gained a wide reputation for his daring and skilful conduct of operations for the cure of aneurysm. He pub. many surgical works and laid down two important principles which greatly influenced subsequent surgical practice: (1) that local diseases had a constitutional origin, and (2) that this origin could generally be traced to disorders of the digestive system. His reputation, however, rests mainly on his brilliance as a lecturer, and he was easily the most popular medical teacher of his day. His *Surgical and Physiological Works* were pub. in 1830. See G. Macilwain, *Memoirs of J. Abernethy*, 1856, and biography by J. L. Thornton, 1953.

Abernethy, burgh on the Tay, Perthshire, Scotland. It was the ant. cap. of the Picts, and possesses a round tower. Pop. 1150.

Aberration, a deviation: 1. In biology an abnormal structure, or departure from the type.

2. In optics, *A. of Light* is the apparent deviation of a star from its path, a phenomenon depending upon the relation between the velocity of light and the velocity of the earth in its orbit. A man walking with an umbrella provides what is perhaps the best illustration. If he wishes to shelter himself from vertically descending rain, he has to hold the umbrella before him at an angle which varies with his own pace and also with the downward speed of the rain. If his own rate is slow and the rain is descending swiftly the umbrella is held fairly upright; but a brisk walk through slowly falling rain necessitates inclining the umbrella well to the front. Now consider the case of an observer looking at a star through a telescope. The rays of light come from the star with a velocity of 186,283 m. a sec. whilst the observer himself with his telescope is travelling along the earth's orbit. In order to catch the rays proceeding from the star in the telescope tube, the instrument has to be tilted away from the direction of the light, just as the umbrella has to be inclined away from the true direction of the rain. The slope of the telescope therefore indicates

as the position of the star a point which is somewhat in advance of its true position. During a year the apparent position of a star describes a curve around its true position; this curve is an ellipse except when the star lies on the ecliptic, when it is a line along which the star appears to move backward and forward, and when it is in the pole of the ecliptic, the curve being then a circle. The semi-major axis of the ellipse is $20.47''$ and the semi-minor axis $20.47'' \sin(\text{star's latitude})$. As A. depends upon the ratio between the velocity of light and the velocity of the earth, the determination of this 'constant of A.' provides a method of calculating an approximate value of one of these velocities if the other be known.

Chromatic A. When ordinary white light passes through a convex lens, the violet rays are refracted most, and tend to come to a focus nearer to the lens than do the red rays. If a screen be placed near the focus of the violet rays the image will be found to have a red border, owing to the red rays not yet having converged. When the screen is moved a little further from the lens the border becomes violet, because the violet rays are now diverging again. A. of this kind, called chromatic, is often a nuisance in optical instruments. It may be remedied by coupling 2 carefully designed lenses made of different glasses, so that the differences in refracting powers bring the colours more nearly to the same focus. The arrangement is known as an achromatic doublet.

Spherical A. Even when the light passing through a spherical lens is monochromatic, the focusing is never quite exact. The image of a point is shown as a small circle, so that objects perceived are blurred in outline. Rays passing through the centre of the lens come to a focus farther away from the lens than those passing through the periphery. Spherical A. can therefore be avoided to some extent by the use of diaphragms limiting the used area of the lens. This A. is also corrected by a suitable combination of 2 lenses, or by using a lens with an aspherical surface.

Spherical A. is also occasioned by mirrors of spherical form. A parabolic mirror, however, gives an exact focus, which is the reason why such mirrors are used when a parallel beam of light is required, the source of light in this case being placed at the focus.

Abershaw, Louis Jeremiah, or 'Jerry' (1773?-85), Brit. highwayman mentioned by Borrow in his *Lavengro* as Jimmy Abershaw.

Aberillery, tn in Monmouthshire, England, noted for its collieries and tin-plate works. Pop. 27,800.

Aberystwyth, mkt tn of Cardiganshire, Wales, at the mouths of the R.s Ystwyth and Rheidol, in Cardigan Bay. A. is the seat of the University (Founder) College and National Library of Wales. There is evidence near by of stone and iron age occupation, and the remains of Edward I's castle and Owen Glendower's dwelling still exist. It is the administrative centre for a wide area, and has become

the seat of government for W. central Wales and a cultural centre for the Principality. A.'s industries include agriculture, the servicing and distribution of agric. equipment, boat building, and sea and river fishing. Pop. 10,200.

Abeshir, cap. of central Sudan, on the caravan route from Khartoum to Kuka. Pop. about 25,000.

Abettor, term used both in a legal and general sense, indicates a person who instigates or encourages an offence, without taking any active part in it. See also ACCESSORY and ACCOMPLICE.

Abeyance, legal term derived from the O.F. *beer*, to gape after. The term is used to imply the state of suspense of the rights in a freehold or a title of honour. It is a maxim of Eng. law that freehold cannot be put in A. by any action of the owner, the underlying idea being that some person should be in existence for the discharge of feudal duties. Where, however, a life interest only exists in lands, such for example as in the case of a bishop, that interest is said to be in A. until the appointment of his successor. In the same way, where a title can be held only by male heirs that title may be in A. if the persons next in inheritance to the last possessor are females. The title is not extinct, for the birth of a son to any of the female heirs can revive it.

Abgar, name of a line of rulers of Edessa in Mesopotamia during 1st cent. BC-3rd cent. AD. They were 29 in number, the best known being Abgar V. He it was who is said to have written to Jesus asking Him to come and cure him of a disease. Eusebius (*Ecll. Hist.* i. 13) trans. this letter, and the reply of Christ promising to send a disciple after His ascension, from the Syriac to Gk, but their authenticity was discredited by Pope Gelasius in 494.

Abhorrens, court party in the reign of Charles II who 'abhorred' the views of the rival party, led by Shaftesbury, who opposed the royal prerogative. The former evolved into the Tories and the latter into the Whigs. See TORRY.

Abiathar, son of Ahimelech (q.v.) and high priest under David and Solomon. He alone escaped from the massacre carried out by Saul. He joined David at the cave of Adullam, and remained faithful to him during the latter's life. He was deposed by King Solomon for his participation in the rebellion of Adonijah and banished.

Abib, or **Nisan**, formerly the first month in the Jewish calendar, but according to present-day reckoning the seventh. It corresponds to part of Mar. and part of April. In it is celebrated the feast of the Passover.

Abies, See FIR.

Abies, in fossil botany, the name given by Brongniart to the *A. laricinae*, a single incomplete specimen of a fruit resembling the spruce fir (*A. excelsa*). Its locality is unknown.

Abietineae, tribe of the family Pinaceae, belonging to the class Coniferae, consisting of the genera *Abies*, *Keleleria*, *Picea*, *Pinus*, *Larix*, and *Pseudolarix* (q.v.).

Abigail, wife of Nabal, the rich man who refused hospitality to King David when fleeing his kingdom. A. intercepted David when later he returned, and so won his heart that not only did he forgo his chastisement of Nabal, but after the latter's death took A. to wife. Another A. was the sister of David. The name is sometimes applied to a female servant because A. so described herself.

Abijah, name of more than one biblical character, of whom the chief was the son of King Rehoboam. He was engaged in war with and defeated Jeroboam, the other king of the divided kingdom of Palestine.

Abila, see **ABYLA**.

Abilene, co. seat of Taylor co., Texas, U.S.A., 150 m. W. of Fort Worth; has flour and planing mills, and deals in cotton. Pop. 45,600.

Abimelech: 1. Name of two Philistine kings, father and son, who, thinking the wives of Abraham and Isaac to be their sisters, married them. Both were restored to their husbands when their true relationship was revealed. (Gen. xx and xxv.)

2. Natural son of Gideon, who (Judges ix) murdered his 70 brothers (except the youngest, Jotham, who escaped) and became King of Shechem. Jotham protested in the parable of the bramble-king, the first biblical parable.

Abingdon, historic tn. of Berks, England, on the Thames, 6 m. S. of Oxford, formerly the co. tn and now a flourishing residential and mkt tn, with some light industries, including motor-cars, leather, pre-stressed concrete, and scientific instruments. Interesting buildings include the remains of the Benedictine abbey (founded in the 7th cent.); the Guildhall (c. 1440); the former Co. Hall (1677); a fine par. church (c. 1450); and the Elizabethan schoolroom of what is now a boys' public school. There are facilities for boating and fishing. Pop. 12,000.

Abinger, Sir James Scarlett, 1st Baron (1789-1844), Eng. politician and judge, b. Jamaica, educ. at Cambridge, studied at the Inner Temple, and was called to the Bar in 1791. In 1819 he entered parliament as Whig member for Peterborough; was knighted and appointed attorney-general in Canning's ministry (1827), and in Wellington's (1829-30). A. successfully carried through a Bill to amend the administration of justice (1830), but opposed the Reform Bill of 1831. He was raised to the bench by Peel (1834) as lord chief baron of the Court of Exchequer and created Baron A. in 1835.

Abinger, vil. near Dorking, Surrey. It has an observatory to which, in 1925, was transferred from the Royal Observatory, Greenwich, the work of recording earth magnetism.

Abington, Mrs Fanny (1737-1815), celebrated actress, b. London. Debut at Haymarket, 1755, as Miranda in *The Tempest*. Created 30 original characters, including Lady Teazle (1777), and impersonated many of Shakespeare's heroines.

Abiogenesis, the supposed production

of living from non-living matter. The more popular term is spontaneous generation, and under this name the possibility of the phenomenon was generally believed in until recent times. The ancients supposed that bees and flies were generated in putrefying carcasses, and that mud and filth brought forth such creatures as eels, frogs, and mice. The growing knowledge of the life history of those animals gradually dispelled the belief, but at a later period it was held that the bacteria of fermentation and putrefaction owed their origin wholly to the substances in which they were found. Pasteur was to a great extent responsible for the conclusion that if a substance has been sterilised only infection from outside sources can reintroduce bacteria. Complete sterilisation, however, is difficult to obtain, for some bacteria survive the temperature of boiling; and the presence of germs, too, is so widespread and their multiplication so rapid that workers before the time of Pasteur had found it difficult to establish a direct refutation of the theory. The mere fact that the earth must have been at one time a molten mass of inorganic matter is sufficient to encourage many in the belief that it may yet be possible to produce life from non-living matter. On Pasteur's work are based all the modern methods of food preservation by canning, bottling, etc., including the pasteurisation of milk, named after him. See **ANTI-SEPTICS**.

Abipones, formerly a fine race of S. Amer. Indians inhabiting Paraguay, who by their courage proved very formidable opponents to the Spaniards. Now incorporated with other tribes. See M. Dobrizhoffer, *An Account of the Abipones* (3 vols., trans.), 1822.

Abishai, King David's nephew, a great warrior who accompanied David on the night expedition to the camp of Saul (1 Sam. xxvi. 6-9). With 2 others he broke through the Philistine ranks, and once he slew 300 men. He was faithful to David during Absalom's revolt.

Abjuration, Oath of, oath taken by holders of public office, such as members of parliament, clerics, and lawyers, originally imposed in the reign of William III, and requiring the taker of the oath (juror) to abjure the claims of the Stuart pretender or his heirs to the throne. It also rejected the opinion that the Pope had any jurisdiction in England, or that princes excommunicated by him could be deposed or murdered. After many modifications with a view to relieving Jews, Catholics, etc., the various statutes were consolidated in the Promissory Oaths Act, 1868. The famous Bradlaugh (q.v.) case arose from Bradlaugh's objection to the final wording of the oath, 'so help me God.'

Abjuration of the Realm. By the old common law of England, if a person accused of any crime other than treason or sacrilege took sanctuary in a par. church or churchyard, and within 40 days went in sackcloth to the coroner and confessed his guilt, he was allowed to take the

oath of A. of the R., i.e. he would leave the country forthwith and never return without licence from the king. All his property was forfeited, and the penalty for returning without leave was hanging. By a statute of Elizabeth (35 Eliz. c. 2) Rom. Catholics and Dissenters might be required to abjure the realm. The privilege of sanctuary was abolished in the reign of James I.

Abkhazia, autonomous rep. in NW. Georgia, situated between the main Caucasian range and the Black Sea, with a subtropical climate on the shore. It has coal deposits. Area 3300 sq. m.; pop. over 300,000, mainly Georgians and Abkhazians (a Caucasian-speaking people related to the Circassians, and numbering 58,000 in 1939). Tobacco, citrus and other fruits, and tea are cultivated; viticulture, cattle-raising, and bee-keeping are practised, and there are tobacco, food, saw-milling, and coal-mining industries. There are many health resorts. The cap. is Sukhumi. A. belonged to Colchis (q.v.), later to Pontus, Rome, and Byzantium, became independent in 756, and was merged in the all-Georgian state in 985. It became a separate principality in the 16th cent., fell under Turkish rule in 1578, under Russian in 1810, and was abolished in 1864. There were uprisings against Russian rule, and many Abkhazians emigrated to Turkey. The autonomous rep. was formed in 1921. In 1938-53 Abkhazians were subject to a policy of assimilation by the Georgian authorities. See W. Kolarz, *Russia and her Colonies*, 1952.

Abblancourt, Nicolas Perrot d' (1606-1664), Fr. translator of Gk and Rom. writers. He trans. the whole of Tacitus and 4 of Cicero's orations, but his versions, being somewhat paraphrastic, have long been superseded.

Ablaut, Ger. term used by philologists to signify a relation existing between the vowels of certain series of related words in Indo-European languages, caused by the Indo-European system of accentuation. It is most clearly shown in the strong verbs, where it is still to be found in modern Eng. The relation of *e, a, u* in the verb *drink, drank, drunk* is an A. relation, the vowels themselves forming an A. series.

Able-bodied Seaman (A.B.). In the R.N. a youth about 18 signs on for 12 years, and after attaining proficiency in gunnery, or any other specified branch or trade, becomes an A.B. In the merchant service the term is used for any man who has had 2 years' experience before the mast.

Abner, cousin of Saul and captain of his army. After Saul's death A. proclaimed Ishbosheth king. To reconcile the rival claims of Ishbosheth and David he visited the latter at Hebron, where, to David's great sorrow, he was treacherously slain by Joab, whose youngest brother Asahel A. had killed in battle (2 Sam. ii and iii).

Abney, Sir Thomas (1640-1722), one of the original promoters and directors of the Bank of England. Benefactor of St Thomas's Hospital; lord mayor of London, 1700-1.

Abney, Sir William de Wivelsale (1844-1921), physicist and astronomer, b. Derby. He was educ. at the Royal Military Academy, Woolwich. He pub. important works on stellar photography and wrote valuable treatises on spectroscopy; he was President of the Royal Astronomical Society, 1893-5. Pubs. include *Treatise on Photography*, 1875, *Colour Vision, Colour Measurement and Mixture*, 1893, *Researches in Colour Vision*, 1913, and *Trichromatic Theory of Colour*, 1914.

Abney Park, dist. in N. London, in the bor. of Stoke Newington; has a large cemetery, dedicated in May 1840 and notable for its old trees and arboretum. The dist. is named after Sir Thomas Abney (q.v.), who lived here.

Abo, see TURAKU.

Abo, in S. Nigeria at head of Niger delta. Palm oil largely exported. In 1930 A. (and also Opobo) was the scene of rioting, in which native women took a leading part, the cause of the unrest being the uneconomic prices obtained for palm kernels. In the restoration of order, more than a score of women were killed by the rifle fire of native police. Pop. 8000.

Abode, see DOMICILE.

Abolitionists, name of party in the U.S.A. who demanded the abolition of slavery. Although many individuals had held opinions hostile to slavery, especially among the Quakers, it was not until 1774 that Benjamin Franklin presided over their first congress in Philadelphia. Towards the end of the third decade of the 19th cent. the movement against slavery began to make great headway, and in 1831 one of its chief leaders, Wm Lloyd Garrison (q.v.), began to publish its organ, the *Liberator*, in Boston. The New England Anti-Slavery Society, formed in 1832, became the nucleus of a great political party which influenced and finally (1856) merged with the Republican party. The feeling against the A. was naturally very strong in the S. or slave-owning states, the legislature of Georgia even going the length of offering a reward of \$5000 to anyone who could secure the conviction of Garrison. Even in his own city of Boston Garrison was severely handled by the mob. No doubt much of the unpopularity incurred by the A. was due to the practical assistance rendered to runaway slaves by an organisation called the 'Underground Railway.' The Abolitionist ideals finally triumphed when President Lincoln proclaimed the freedom of the slaves on 1 Jan. 1863.

Abomey, walled city, formerly the cap. of Dahomey, the Negro kingdom of W. Africa, about 70 m. from Porto Novo. It was occupied by the French when they conquered Dahomey in 1892. A. is connected by road with Ketou, 75 m. Pop. 11,300.

Aborigines, formerly the name given by Gk and Rom. writers who treated of the earliest period of Rom. hist. to a tribe who occupied, with their allies, the Pelasgi, the dist. of Latium. Now used to denote the original inhab. of any

country, and more particularly the natives found in a country conquered or colonised by Europeans. The Aborigines' Protection Society, founded in 1833, has formulated regulations designed to secure the natives of Brit. and other colonies from ill usage by white officials or colonists. In 1872 and 1875 Acts were passed for the protection of the Pacific islanders, especially in relation to their importation as labourers into Australia. The dominion of Canada has exclusive control over its aboriginal tribes, but for other

repetition. It is probably due to some endocrine disturbance, but this theory is not supported by the poor results of treatment with hormones.

The symptoms comprise pains in the loins and a sense of bearing down, accompanied by a discharge of blood. The discharge, if continued, results in the expulsion of the foetus, and it is advisable that the matter discharged should be kept for examination by a medical man, as the treatment depends upon the possibility of preventing the miscarriage altogether. The patient should be kept quiet in a recumbent position. If it be impossible to prevent the occurrence, the treatment then aims at bringing about the expulsion as quickly as possible, and with a minimum amount of derangement. The mechanism of A. is the same as in a full-time birth, but in miniature. The main complications of A. are haemorrhage and septic infection. Infection following A. is far more common than in normal labour owing to the fact that many A.s are self- or criminally induced, without regard for asepsis and without medical attention. Sepsis is the commonest cause of death after A.

The procuring of A. by a pregnant woman, by taking drugs or using instruments, is a felony, and any person who endeavours to procure the miscarriage of any woman by administering drugs, or using any instrument or other means with the same object, is guilty of a felony. The penalty is penal servitude for life or not less than 3 years, or imprisonment not exceeding 2 years with or without hard labour. To supply or procure drugs or instruments, knowing that they are to be used with the object of procuring a miscarriage, is a misdemeanour. The penalty in this case is penal servitude not exceeding 5 or less than 3 years, or imprisonment not exceeding 2 years with or without hard labour. Persons tried under the Offences Against the Persons Act, 1861, for administering drugs or using instruments to procure A. may be convicted of the felony of child destruction under the Infant Life (Preservation) Act, 1919. An A. brought about artificially to save the mother's life or health is not a crime; but the burden of proof is on the person bringing about the A. A doctor will not carry out a therapeutic A. without first consulting one or more colleagues who are specialists in the particular disease for which A. is contemplated.

Abou-hannes (*Ibis religiosa*, Cuvier; *Tantalus aethiopicus*, Latham), an Egyptian word meaning Father John, is a bird which in ant times was regarded with great veneration by the Egyptians. It is no doubt the white or sacred ibis mentioned by Herodotus (ii. 76).

Abou-harb, Arabic name of the Leucoryx antelope.

Aboukir, vil. on Aboukir Bay, 13 m. NE. of Alexandria, Egypt. The battle of the Nile was fought in Aboukir Bay, 1798, when the Fr. were completely defeated by Nelson. In 1799 Napoleon defeated the Turks with an army of

E.N.I.

AUSTRALIAN ABORIGINE

colonies special protection is afforded the natives by the imperial gov. In 1890, by the General Act of the Brussels Conference, the adhering powers agreed to certain restrictive measures concerning the sale of drink to natives, etc.

Abortion (Lat. *aboriri*, to miscarry), premature expulsion of the foetus from the womb before the seventh month. Later such an occurrence is called premature birth. Cases of A. due to accidental or pathological causes are frequently known simply as miscarriages.

The expulsion of the foetus is by no means rare, and may be the result of a salutary effort of nature to get rid of diseased matter within the womb; or it may be deliberately induced; or it may be due to preventable causes. The malformed or diseased condition of the womb may lead to the death of the foetus. Some women habitually abort within the first few months of each pregnancy, and no obvious reason can be found for this

18,000 men there, and in 1801 Sir Ralph Abercrombie defeated the French.

Abousambul, see **ABUSMABEL**.

About, **Edmond François Valentin** (1825-85), Fr. author, b. Dieuze, Lorraine. He was educ. at the École Normale, Paris, and at Athens. In 1854 he wrote *La Grèce contemporaine*, which was a great success, and *Tolla*, a novel, 1855. Other novels are *Le Roi des montagnes*, 1856; *Le Nez d'un notaire*, 1862; *L'Homme à l'oreille cassée*, 1862; *Le Cas de M. Guérin*, 1862, 3 fantastic tales; *Trente et quarante*, 1865; and *Le Roman d'un brave homme*, 1880. He contributed to the journals and founded *Le XIX^e Siècle* in 1871, and wrote *Le Progrès*, a study of social reforms, 1864. As a dramatist, however, he was not successful, although he wrote *Gaétana*, 1862, and *Guilleri*, 1856, a comedy. He was elected a member of the Fr. Academy, 1884. See life by M. Thiébaud, 1936.

Abrahanel, see **ABARBANEL**.

Abacadabra, magical word, written in the form of a triangle, and used by anct as a spell to overthrow evil spirits, and to cure fever and other maladies.

According to Sammonicus Serenus, a doctor and poet, at the commencement of the 3rd cent., the letters of the word must be written in the form of a triangle so that it can be read in different ways. It was often written on a piece of paper, folded, and worn round the neck.

Abraham, great patriarch of the Heb. race. He was b. in Ur of the Chaldees, the son of Terah, an idolater (Joshua xxiv. 2); he set out with his father, his wife, Sarai, who was also his half-sister (Gen. xx. 12), and Lot, his nephew, and settled for a time in Haran, where Terah d. (Gen. xi. 31). Thence, at the call of God, he went into Canaan, taking his wife and nephew, with his household and property (Gen. xii. 1). At Shechem A. first received the promise of the land, and he built an altar to the Lord; a second he built at Bethel, as he journeyed S. (Gen. xii. 7-9). Famine in Canaan drove A. to Egypt, where, calling Sarai his sister, he brought her into grave danger. God protected her, and A. returned to Canaan (Gen. xii. 10; xiii. 1). A. and Lot separated at Bethel, and A. moved to Hebron (Gen. xiii). He defeated Chedorlaomer, and both booty and captives were rescued, including Lot. Melchizedek, King of Salem, met A. and blessed him. A., now an old man and childless, doubted the promise to his seed, but God renewed it (Gen. xv). His first son, Ishmael, was b. of Hagar, the Egyptian maid (Gen. xvi. 1). In his hundredth year, God

changed the name of Abram, 'exalted father,' to Abraham, 'father of many' (Gen. xvii. 5), and in her ninetieth year Sarai's name was changed to Sarah, and she was promised a son, whereat A., incredulous, laughed; hence the son's name, Isaac, from the Heb. verb 'to laugh.' Told by the Lord of the impending destruction of Sodom, A. interceded (Gen. xviii). At the birth of Isaac (Gen. xxi. 1), Ishmael and his mother were driven away (Gen. xxi. 8). At Beersheba an alliance was arranged between A. and Abimelech, the Philistine king (Gen. xxi. 22). While in the Philistine country, A.'s faith was tested when he was told to sacrifice his son Isaac (Gen. xxii), a command withdrawn at the last minute. Sarah d., and A. bought the cave of Machpelah as a burying-place; and, feeling his end near, sent for Rebekah as a wife for Isaac (Gen. xxiv). A.'s second wife was Keturah, by whom he had 6 sons (Gen. xxv. 1). At the age of 175 he d., and was buried by Isaac and Ishmael in the cave of Machpelah (Gen. xxv). A. is known as 'The Friend of God,' and not only as the spiritual ancestor of many (Christian as well as Hebrew), but as the 'prophet' (Gen. xx. 7) through whom the revelation was begun. A. (Arabic Ibrahim) is also an important figure in Islam. Some Mohammedans say that the intended victim of his sacrifice was Isaac; but the accepted view is that it was Ismail (Ishmael), and that the place was near Mecca, the site of some of the ceremonies of the pilgrimage. A. and his son rebuilt the Kaaba, and the horns of the ram of sacrifice were fixed to it. See C. L. Woolley, *Abraham*, 1936.

Abraham, Plains of, or Heights of, in Quebec city, Quebec, Canada. Here was fought the battle of the Heights of Abraham, 1759, between the Fr. under Montcalm and the Eng. under Wolfe. The Fr. were defeated and Canada became a Brit. possession.

Abraham a Sancta Clara (1644-1709), whose real name was Ulrich Megerle, b. near Möskirch, Swabia, Germany, and d. Vienna. He was a very popular Ger. preacher, joined the Augustinians, became court preacher at Vienna, went to Graz, but afterwards returned to Vienna. His sermons are full of imagination, but nevertheless contain sound doctrine. Schiller's *Wallensteins Lager* was inspired by his sermon, 'Up, up, ye Christians!'

Abraham-man, wandering beggar of Elizabethan times, who was either demented or shammed lunacy in order to excite pity. The term is derived from the parable in Luke xvi, where Lazarus the beggar is received into Abraham's bosom. Another name for these vagabonds was Tom o' Bedlam; in Shakespeare's *King Lear* the disinherited Edgar takes the guise of one of these.

Abrahamites: 1. Sect of Syrian heretics, said to be allied to the Paulicians, who denied the divinity of Christ. Their founder was Ibrahim, or Abraham, of Antioch.

2. Sect of Bohemian deists, who claimed the original religion of Abraham.

They denied the Trinity, and accepted from the Bible only the Ten Commandments and the Lord's Prayer, declaring themselves followers of John Huss (q.v.). Joseph II transported them to Transylvania in 1783.

Abraham's Bosom, metaphorical name for the abode of righteous souls after death, used by Christ in the parable of the Rich Man and Lazarus. The ancients reclined on couches at table for meals, so that necessarily the head of each guest lay towards the breast of his neighbour. The expression denotes honour, refreshment, and absolute repose.

Abrantes (anct *Aurantes*), tn of Portugal, in Santarém dist., on the Tagus (q.v.), 32 m. N.E. of Santarém. In 1807 it was captured by Junot (q.v.), who was created Duc d'A. There is a trade in cereals, fruit, and olive oil. Pop. 4200.

Abrasives (from Lat. *ab*, away; *radere*, to scratch), mineral substances used for polishing and grinding, e.g. emery, sand, pumice, grindstone, millstones, corundum, rouge, and garnet.

Abraxas, name devised by the heretic Basilides, containing those Gk letters which, according to the numeral system then in use, stood for 365, and expressing the all-pervading spirits of the universe. The word was engraved on gems among the ancients and the term is also used for a stone or gem thus engraved.

Abrazite, see PHILLIPSITE.

Abrogation: 1. In canon law the annulling of any previous law either by decree or disuse.

2. In Eng. law the reversion or repeal by a higher legislative authority of the order of a subordinate court.

Abrus, genus of shrubs of sub-order Papilionateae of order Leguminosae, growing in E. Indies. *A. precatorius*, wild liquorice, Crab's Eye Vine. Weather Plant, is a W. Indian plant, the seeds of which are scarlet tipped with black. They are used as weights, and are strung together into necklaces and rosaries, whence they obtain the name of 'prayer-beads.'

Abruzzi, Luigi Amadeo Giuseppe Maria Ferdinando Francesco di Savoia-Aosta, Duca di (1873-1933), son of Amadeo, Duke of Aosta, b. Madrid. He ascended Mt St Elias, in Alaska, in 1897; beat Nansen's record in his polar expedition of 1900; ascended highest peaks of the Ruwenzori Mts in central Africa in 1906; Mt Kenya in Brit. E. Africa in 1909; and climbed to 24,600 ft in the Karakoram. He commanded an It. squadron during the Tripolitan war of 1912. In 1913 he was made commander of the It. Navy, and assumed active command in 1915 when Italy intervened in the First World War. He retired in 1917 through disagreement with his staff. His writings include *The Ascent of Mount St Elias*, 1900; *Farther North than Nansen*, 1901; *On the 'Polar Star' in the Arctic Sea*, 1903; *Ruvenzori*, 1908.

Abruzzi e Molise, region (*compartimento*) of central Italy, comprising the provs. of L'Aquila, Chieti, Pescara, Teramo, and Campobasso (qq.v.). It is

bounded N. by the Marches, W. by Lazio, S. by Campania, S.E. by Apulia, and E. by the Adriatic (qq.v.). The region contains some of the highest peaks of the central Apennines (q.v.). The riv. valleys are fertile, cereals, rice, vines, olives, and almonds are grown, sheep are raised in the hills, and there are large herds of swine in the woods. The chief tn is L'Aquila. Area 5930 sq. m.; pop. 1,699,000.

Absalom, third son of David and Maacah, daughter of the King of Geshur, killed his brother Amnon for assaulting his sister, Tamar, but was, after a long exile, pardoned by his father. Able, ambitious, and handsome, he prepared the way for a revolt by cunningly cultivating the goodwill of the people. After 4 years he raised his standard at Hebron, and had such success that David fled to Mahanaim beyond Jordan. A. was aided by Ahithophel; but Hushai, David's friend, joined A. to defeat the plan of Ahithophel; who, seeing his counsel ignored, hanged himself. A. was routed in the Forest of Ephraim, caught by the hair in the branches of a terebinth, and was slain by Joab, in spite of the king's order to 'deal gently' with him. David's lament for his son is famous. See 2 Sam. iii and xiii-xviii.

Absalon, or **Axel** (c. 1128-1201), Dan. statesman, b. in the is. of Seeland, Denmark, became Archbishop of Lund (1178), and minister to Valdemar I and Canute VI of Denmark. He took an active part in helping with the legislation of Valdemar, and drove the Wendish pirates from the country. Under Canute he helped to overthrow Bogislaw of Pomerania. Besides being a great statesman and general, he was a lover of art and learning, assisting Saxo Grammaticus with his great hist. of Denmark. He built a castle which was the nucleus of the city of Copenhagen.

Abscess, a collection of pus as the result of bacterial inflammation. When pathogenic organisms gain access to any part of the human body, the white blood corpuscles engage in a struggle with the invaders. If the hostile germs are not quickly destroyed the contest proceeds until there is formed a creamy mass of dead corpuscles and bacteria known as pus. This may be absorbed into the bloodstream by other corpuscles, but is more frequently discharged by the disintegration of the covering tissue.

Abscissa, see CO-ORDINATES.

Absecone (from Lat. *abscondere*, to hide), small lantern, of anct origin, used in the Catholic Church during the performance of the night offices.

Absentee, term applied to one who receives from an estate rent which he spends in another country, or to one who draws a salary from an office without performing its duties, or to workmen who stay away from work for reasons other than illness (i.e. because they prefer leisure to more income). The effect of absenteeism is twofold, moral and economic. The introduction of middlemen, or agents, tends to lessen the sense that property owners have obligations as

well as privileges. Also the property owner by absence loses that personal touch between owner and tenant which tends to promote community of interest. The economic result of absenteeism has been the subject of much debate among economists, but there is no general opinion among them, as there is in the popular mind, that the A. by spending his money abroad is depriving the industries of his own country of support. On the other hand, it is argued that the A. still indirectly supports the industries of the homeland, for there must be an export of goods from his native country equivalent to the amount of goods he consumes, otherwise his remittances could not be made to him. Much of Irish poverty has been attributed to absenteeism, and Acts were passed in the reigns of Richard II and Henry VIII to check it.

Absinthe, aperitif banned in France on the outbreak of the First World War and since then in most other countries. Of very high alcoholic degree, it owed its taste to aniseed, and its popularity to its reputation for wickedness, studiously maintained by the Fr. decadents at the turn of the cent., and its attractive way of curdling when water was dripped into it through sugar and a perforated silver spoon. Its deleterious effects were ascribed to the presence of wormwood (*Artemisia absinthium*) among the herbs compounding it; but there is no wormwood in the various substitutes now sold in France, though as 'vermouth' means 'wormwood' it is presumably present in the aperitifs sold under this name. Taken in moderation A. was quite innocuous, but it was deadly when taken almost undiluted early in the morning instead of the *petit déjeuner*, as it often was in the manufacturing dists. of Paris. See M. I. Fisher, *Liqueurs*, 1951, and H. Warner Allen, *Through the Wine-glass*, 1954.

Absolute. Its adjectival signification is opposed to relative, contingent, or conditioned; the result of the highest abstraction. Thus it has come about that in its substantial sense it has been regarded by some as the fundamental principle and cause of all being (Gk to *on*), while others (notably Hamilton and Renouvier) regard it as a fantastic conception—a pseudo-idea. These differences of opinion arise from the fact that our minds can only regard anything relatively which is opposed to the principle of the A. That the A. is the all-pervading, unconditioned, and necessary principle of all things is the basis of the philosophy of Descartes, Spinoza, Schelling, and Hegel, while Kant holds that the mind cannot form an idea of the A. Perhaps it is best to regard it as what is constant, invariable, and necessary in the relation between one idea and another—as that which could not be other than what it is whether regarded subjectively or objectively.

In physics A. velocity was once considered to be the rate of motion through space as opposed to relative velocity, which is the rate with which 2 objects

approach or recede from each other. The Michelson-Morley experiment (q.v.) showed, however, that absolute motion does not exist. A. weight is the weight of a body viewed apart from all modifying influences, as, for instance, of the atmosphere; and, to ascertain its amount, the body must, therefore, be weighed *in vacuo* or allowance must be made for buoyancy (q.v.). A. numbers are those which stand in an equation without having any letters combined with them; thus in the following equation

$$5x \times 11 = 31$$

11 and 31 are A. numbers, but 5 is not so. See also RELATIVITY.

Absolute Alcohol, see ALCOHOL.

Absolute Magnitude, in astronomy, term applied in contradistinction to the 'apparent' magnitude of stars viewed from the earth. In other words it implies the luminosity of the star irrespective of its distance, and, mathematically, it is the number expressing, in accordance with the usual system of stellar magnitude, the brightness of the star as it would be if it were at the distance of 10 parsecs—parallax 0.1". If the distance of any given star be known, its A. M. can be calculated from its apparent magnitude; or, again, if the A. M. and apparent magnitude be known, the actual distance of the star can be determined; the numerical relation between the absolute (M) and the apparent (P) being $M = P + 5 + 5 \log \pi$, where π is the decimal fraction of a second of arc that indicates the parallax. The nearer stars are not necessarily the brighter, nor are the apparently bright stars necessarily very bright intrinsically. A star of A. M. 4.85 emits as much light as the sun; one of A. M. 0, 87 times as much, and one of -5, over 8000 times as much. For the various magnitudes of Ptolemy and the cataloguing of stars according to magnitude, see MAGNITUDE.

Absolute Monarchy, see ABSOLUTISM.

Absolute Temperature is given by an absolute scale of temp. which is chosen to be independent of the properties of the thermometric substance. *Absolute thermo-dynamic temp.*, proposed by Kelvin, is defined according to the principles of thermodynamics alone and closely approximates to the temp. on the Gas Scale. It is usually expressed in units of degrees Celsius (or Centigrade) from absolute zero, and the ice-point is then about 273° K. *Absolute zero* is the zero of the absolute scale of temp. and has been approached in experiments to within one thousandth of a degree. See HEAT; TEMPERATURE; THERMODYNAMICS.

Absolute Zero, see GAS AND GASES; METROLOGY; TEMPERATURE.

Absolution, religious ceremony by which the Christian priest declares an individual, on repentance and submission to the requisite penance, to be absolved either from his sin or from the eccles. punishment to which it rendered him liable. Since the 12th cent. the formula used in the Rom. Catholic Church has been: 'Ego te absolvo a peccatis tuis' (I absolve thee

from thy sins), accompanied by the sign of the cross. The Council of Trent expressly condemned (Session xiv, Canon 4) the doctrine that the priest has not power of himself to absolve from the guilt of sin. The Church of England also holds (cf. the introduction to Morning and Evening Prayer, and the form for the ordaining of priests) that power has been left with the Church to absolve repentant sinners, and the words prescribed in the Office for the Visitation of the Sick are, as in the Roman rite, 'I absolve thee from thy sins.' In the Protestant Church of Scotland, the term A. is commonly used to denote simply the declaration of the Kirk session, or other indicatory, expressed by the mouth of its president, that the party is released from the eccles. interdict to which his delinquency had subjected him; this approaches the original use of the word with the early Christians. The word is used also in a minor sense to describe a prayer for God's forgiveness uttered by a priest, or even by a layman, after a general confession of sinfulness by others, e.g. in the Latin Preparation for Mass, and Compline, or in the Anglican Communion Office; and it is even applied in the Book of Common Prayer to the general reminder given, after the General Confession at Morning and Evening Prayer that priestly A. is obtainable if people are truly penitent, which they are exhorted to pray to be in the words of the Lord's Prayer.

Absolutism, form of gov. as opposed to constitutionalism, in which the king or ruler is the supreme head, responsible to no parliament or constitutional check. A. did not exist in modern times until its reappearance with the dictatorial or 'leader' states of Russia, Germany, and Italy. In the Middle Ages A. was a necessity to centralise the strength of a nation for self-defence, and to remove the power of the feudal lords by changing them from autocrats into courtiers. Continental A. of the 18th cent. had not the anti-democratic character of Communism and Fascism; it buttressed the central power at the expense of the nobility. Indeed, it styled itself 'benevolent' or 'enlightened'. A. See GOVERNMENT and INDIVIDUALISM.

Absolutists, Sp. political party opposed to the constitution of 1812. They wished to restore to the Crown its former absolute powers. Subsequently the A. supported the pretensions of Don Carlos against Queen Isabel.

Absorption, the process by which one substance is taken up by another. When a liquid is absorbed by such a substance as blotting-paper, the action depends on capillarity (q.v.). Plants are enabled by their root fibres to absorb liquid matter into their tissues by osmosis (q.v.). In the process of digestion, the intestines absorb compounds necessary for the nutrition of the body. The term A. has also some special applications in physics.

Absorption of gases by liquids. Gases may be absorbed or dissolved by liquids.

The solubility of different gases in water varies considerably. One vol. of water at 0° C. and atmospheric pressure absorbs only .02 vol. of nitrogen, whilst ammonia at the same temp. and pressure dissolves to the extent of 1050 vols. to 1 vol. of water. The mass absorbed increases in proportion to the pressure (Henry's Law), but decreases as the temp. increases, though not in exact proportion.

Absorption of gases by solids. Some solids also have the property of absorbing gases, the best-known example being charcoal, which can absorb large quantities of ammonia, chlorine, phosgene, and other gases. To this power of absorbing gases charcoal owes its efficacy as a deodorant. After being heated in superheated steam charcoal becomes even more efficient an absorbent, and is said to be 'activated.' Active charcoal is used in gas masks. Platinum black, if surrounded by a mixture of hydrogen and oxygen, absorbs so much of the gases, and therefore brings them into such intimate molecular contact, that sufficient heat is given out to ignite the rest of the gas. Scientifically A. is distinguished from adsorption, the two together being known as sorption. Adsorption implies the taking up of a gas by the surface layers of a solid, while A. implies the taking up of the gas by the interior of the solid. Hence adsorption always precedes A.

A. of light and heat. Electromagnetic waves, e.g. light and heat, are liable to be interrupted by intervening substances. Some rays may be transmitted with more or less disturbance of direction, some may be reflected, and some may be absorbed; that is, energy is given to the particles of the intervening substance, and its temp. rises. A particular substance may absorb rays of certain frequencies, allowing the others to be transmitted or reflected. The long waves produced by electrical methods can pass through thick, opaque obstacles without being absorbed. The shorter heat-waves are absorbed readily by dark substances such as lamp black, whilst the various wave-lengths which correspond to the different colour sensations are variously affected by different substances, the result determining the colour as seen by transmitted light. In green glass, for example, only green rays are allowed to pass through, the other components of the white light which enters the substance being absorbed and converted into heat. What light is reflected is white, so that if green glass be ground up it reduces to a white powder; similarly, the foam of a transparent green liquid is white. Even reflected light penetrates the surface to some extent, and the amount of penetration has an effect on the character of the A., and consequently on the colour of the reflected light. Gold, for instance, reflects white light at the surface, and also light which by A. before it returns to the surface is orange. In the interior of a gold vessel we get repeated reflection, which means repeated A., and the resultant colour is a deep orange.

A. bands are dark lines in the spectrum of light transmitted through substances. They indicate the absence of the particular wave-lengths which have been absorbed, and vary with the temp. and thickness of the substance. See ADSORPTION and FRAUNHOFER LINES.

Abstinence, see BAND OF HOPE MOVEMENT and TEMPERANCE.

Abstract, in law, the brief statement of the prin. fact in a document—used now generally with relation to the purchase of land—the A. being furnished by the vendor to the purchaser; in time, it now extends back 30 years, and traces the devolution of title, legal and equitable, of the land in question. If not satisfactory, the purchaser must object within a certain period. See also VENDORS and PURCHASERS.

An A. thought or term has regard only for qualities or essences without reference to individual or particular things, e.g. wisdom.

Abstract Art, painting or sculpture which does not represent the appearance of objects in nature but concentrates on harmonious or effective combinations of colour and form 'in themselves.' In eliminating imitation and description it may be said to 'aspire to the condition of music' (and, in a popular form, Walt Disney's *Fantasia* illustrates this point with the accompaniment of abstract shapes and colours by a musical composition). A. A. is, however, to be distinguished from decoration or pattern, and a subconscious element is allowed, or considered, to play a part in the final result. All great art has this abstract element, even when it is otherwise realistic or 'true to nature,' but uncompromising abstraction is modern; perhaps to be dated from Cézanne's dictum that 'everything is geometry,' certainly from the advent of cubism between c. 1907 and 1914. Picasso, Braque, Juan Gris, Léger, Marcel Duchamp, give examples of abstract 'still life' and experiment; though the Russian Kandinsky (1866–1944) (q.v.) is often regarded as the main pioneer of complete abstraction. In England Wyndham Lewis, Ben Nicholson, Barbara Hepworth, and Henry Moore are among those variously influenced by abstract theory. It is the longest-lived of the modern tendencies, and recent years have seen fresh developments, e.g. 'Tachismo' (q.v.). See G. Duthuit, *Abstract and Cubist Art*, 1937.

Abstraction is an act of the mind by which it directs its attention to particular attributes of an object or objects without regard for the other attributes which the object may possess. Thus in the objects coal, pitch, Negro, we see the quality of blackness, and this we may abstract from among the other qualities or attributes in the objects and consider it independently. All names of classes, inasmuch as the individual members cannot be identical, are formed by a process of abstraction—thus the word *ship* connotes a certain number of attributes, and all objects possessing these attributes fall under the heading ship. The

higher the abstraction the greater number of objects embraced. Abstraction, then, is formation into classes and species. The highest abstractions are *time*, *space*, and *being*. Abstraction involves such generality that abstract reasoning may be fallacious if attention is not held continually to concrete objects. See GENERALISATION.

Abstrudum, Reductio ad, method of proof in which it is initially assumed that the proposition which it is desired to prove is not true. If it can then be shown that this assumption leads logically to a self-evident contradiction or 'absurdity,' it will have been proved that the original proposition must be true.

Abstyrtus, Apsyrtus, son of Aëtes, see ARGONAUTS.

Ahu Abdullah Mohammed, see IBN BATUTA.

Abu Bekr, father of Mohammed's favourite wife and his first successor; a well-to-do citizen of Mecca, he was one of the early believers in the new prophet, a pillar of strength to the young community, and was chosen to accompany him when he fled to Medina. When Mohammed d. rivalry between the Emigrants, the men of Mecca, and the Helpers, those of Medina, threatened the new state, but Umar (who was to be the second caliph) did homage to A. B., and all present did likewise. Most of the Arab tribes felt that the death of Mohammed released them from any obligations to Medina, especially the payment of the religious tax, and danger threatened. Mohammed had prepared an expedition against Syria, and A. B., against the advice of all, insisted on sending it. His reign lasted only 2 years, but he saw the supremacy of Islam restored in Arabia and the beginning of the conquest of Syria and Persia. He d. in 634.

Abu Klea, Sudan, vil. on the route from Korti to Metemma, where an Eng. army under Sir H. Stewart defeated the forces of the Mahdi, 17 Jan. 1885.

Abu-Maaschar, see ALBUMAZAR.

Abu Mansur, see DAQIQI.

Abu Nuwas (c. 760–810), lyric and erotic Arabic poet of partly Persian descent. He was educ. at Basra, spent a year in the desert among the Arabs, and later lived under the protection of Caliph Harun al-Rashid in Baghdad. The *Divan des Abu Nuwas*, trans. by A. von Kremer, was pub. in Vienna in 1855; in the original in Cairo in 1860; and in Beirut in 1884.

Abu Shahrain, see ERIDU.

Abu-Simbel, in Lower Nubia, site of two famous rock-cut Egyptian temples dating from Rameses II.

Abu'l-Ala al-Ma'arri (973–1057), Arabic poet, letter-writer, and lecturer. Though blinded in his youth, he attended the lectures of the best contemporary teachers at Aleppo, Antioch, and Tripoli. The last of a school of Syrian writers in Arabic, he was a great humanist, distinguished by his hatred of injustice, hypocrisy, and superstition. Works include poems under the title *Saqt us-Zand*; later poems, the *Luzumiyyat*; and a collection of letters.

Abulcasis, **Albuacasis**, or **Abu'l Qasim** (936-1013), Sp. physician and surgeon, b. at El Zahra, near Cordova. He wrote a great encyclopaedia of medicine and surgery in 30 books or sections, entitled *Alusuri*, the surgical section being the first independent work on the subject and the first to contain illustrations of surgical instruments; it had a great influence on medieval medicine.

Abulfaraj, or **Abulpharagius**, **Gregory Bar Hebraeus** (1226-86), the last of the great Syriac writers. He was b. in Malatya, the son of a doctor of Jewish descent. Like so many scholars in the Middle Ages he took all learning for his prov. and wrote both in Syriac and Arabic. In 1246 he was made bishop of the little tn of Gubos and he d. as maphrian (the highest rank under the patriarch) of the Eastern Jacobites. His books of most general interest are the *Ecclesiastical Chronicle* and the hist. of the world, important for his own time, in two forms, one Syriac and one Arabic for Muslim readers.

Abulfeda (1273-1331), Arabian historian and geographer, b. Damascus, and while a youth distinguished himself in the campaigns against the crusaders and the Tartars. The Mameluke sultan Nasir raised him to royal rank in 1310, making him governor of the kingdom of Hamah, which he ruled as an independent ally of Nasir. Of his numerous works the 2 best known are a universal hist. and a treatise on geography. The hist. is of special value, and one of the chief sources of information concerning the Saracens.

Abumeron, see **AVENZOAR**.

Abuse, legal term. *A. of Distress*, i.e. in an irregular manner to make use of goods distrained on, as, for example, by working a horse, is an offence which makes the offender liable to an action for damages. *A. of Process*, i.e. the bringing of vexatious actions, is guarded against by certain rules of the Supreme Court, notably Order XXV, Rule 4, and by the Vexatious Actions Act, 1896. By the former rule a court can dismiss an action which appears to be of a frivolous nature, and by the latter Act, on an application made by the attorney-general, any person who habitually institutes legal proceedings without reasonable cause may be restrained from so doing by an order of the court. By the common law of England any sufferer from a malicious action either in the criminal or bankruptcy court has the right to bring an action to recover damages.

Abushehr, or **Abushire**, see **BUSHIRE**.

Abutilon (Arabian *aubutilun*), or Indian mallow, a genus of plants belonging to the Malvaceae of which 80 species are known. They are tropical or semitropical, but during the warmest part of the year may be grown in the open air in England. *A. avicennae*, or velvet-leaf, is grown largely in China for jute.

Abutment, technical term used in architecture to denote that part of an arch which receives the lateral pressure, and in machinery to indicate that point at

which resistance is obtained. Thus the breech of a gun, the end of a steam cylinder, are the *A.s* to the explosive or expanding force.

Abuttals, buttings or boundaries of land or of a par. The ceremony of 'beating the bounds' sometimes performed consists in a priest making a tour of his par. and striking each abuttal with a wand.

Abydenus, Gk historian whose hist. of Chaldaea, or Assyria, has been lost except for some fragments quoted by Eusebius and others of the early Fathers of the Church. His date is uncertain, but cannot be placed earlier than 250 bc.

Abydos: 1. Anct tn on the Asian shore of the Hellespont, or Dardanelles. Facing it on the European side was Sestos. Here it was that in 480 bc the Persian monarch Xerxes built his famous bridge of boats to enable his immense army to cross. The bridge, which is described by Herodotus, was nearly a mile long. *A.* will always be remembered for its association with the legend of Hero and Leander. Byron, in his poem *The Bride of Abydos*, recalls this story. See Herodotus, vii. 34-9.

2. Sacred city in Upper Egypt, where the kings of the 1st and 2nd dynasties were buried. Later one of their tombs was thought to be the tomb of Osiris, so all Egyptians wished to be buried there. There were temples of all periods, the best known being that of Seti I, in which is the 'Table of *A.*', a list of all the kings preceding Seti, which is of great historical importance.

Abyla, or **Abila**, one of the Pillars of Hercules (q.v.) on the African shore of the Straits of Gibraltar.

Abyssal (from Gk *a-*, without, *bussos*, bottom) **Fauna** is one of the 3 divs. of marine fauna, the others being littoral or shallow-water, and pelagic or surface fauna. They exist in the greatest depths of the ocean, from about 1000 to 5000 fathoms.

The uniform coldness of temp., total absence of light, and the enormous pressure of water naturally cause great modifications among them. Many are blind, while others see by means of the phosphorescent glow emitted from their own bodies and those of other fish. Their organs of touch are frequently highly developed. As no plants can grow in the abyssal depths because of want of light, the fauna are carnivorous, catching in their wide jaws the falling debris of the organisms which exist above them. In colour they are very vivid, scarlet, violet, orange, and purple being the predominant colours, but not blue. W. European coastal *A. F.* include various sponges, certain coelenterates (including sea-pens, gorgonians, madreporian corals, and sea anemones).

In their discovery the researches of H.M.S. *Challenger*, sent out 1872-6 by the Brit. Gov., are invaluable. See H. N. Moseley, *Notes by a Naturalist on the 'Challenger'*, 1879; Sir Chas. Wyville Thomson and Sir John Murray, *Reports*

on the *Scientific Results of the Voyage of H.M.S. 'Challenger'*, 1880-96; F. B. Sumner, *Intensive Study of Fauna and Flora of Sea Bottom*, 1908; J. Murray and J. Hjort, *The Depths of the Ocean*, 1912; J. A. Thomson, *Haunts of Life*, 1921.

Abyssinia, see **ETHIOPIA**.

Abyssinian (Ethiopian) Church, The, founded in the time of St Athanasius, who sent them their first bishop. Their Metropolitan, called *Abuna*, 'our Father,' has always been appointed by Alexandria, which, to prevent the election of an independent Patriarch, has limited their episcopate to seven. This has prevented them from evangelising Africa. They became Uniats (q.v.) for a few years in 1626 under Jesuit influence; but in 1632 the Jesuits were expelled, and the Church reverted to its Coptic allegiance and monophysitism (q.v.). The It. occupation of Ethiopia hardened their antagonism to Rome. See B. J. Kidd, *The Churches of Eastern Christendom*, 1927.

Acacia, genus of trees and shrubs, usually thorny, belonging to the subfamily Mimosoidae of the order Leguminosae. The hardy tree commonly known as *A. is false A. or robinia* (q.v.). The true genus comprises over 500 species, found chiefly in the equatorial zone and in subtropical regions of Australia and Africa. The *A. julibrissin*, however, is grown in the open air in some parts of France and the warmer European countries, and is remarkable for its clusters of beautiful pink flowers. The leaves of the genus are normally bipinnate, but are subject to modification, and the flowers grow in a head. The Australian 'wattles' are *A.s* in which the leaf blade is absent, but the leaf-stalk has flattened into a phyllode with the edge presented to the light, and a thick epidermis which prevents transpiration. In America the fruits of the edible *A.* are used as food; in the Is. of Mauritius and Réunion the leaves of *A. lebbek* serve as soap. *A. arabica* is used in tanning and gives gum arabic, while gum senegal comes from *A. senegal*. The drug catechu is prepared from *A. catechu*.

Acacia, False, see **ROBINIA**.

Acacia, Three-horned, see **HONEY-LOCUST TREE**.

Acacius (340-65), Bishop of Caesarea, surnamed Monophthalmus (Gk. 'one-eyed'), founded an Arian sect known as the Acacians. His doctrine was that Christ is not of the same substance as God, but merely resembles Him.

Academic Legion, armed troop of Viennese students who joined in the revolution of 1848.

Académie Française, see **INSTITUT DE FRANCE**.

Academus, mythical Attic hero, who revealed to Castor and Pollux the hiding-place of their sister Helen. The *academia* where Plato taught was named after him.

Academy (Gk *Akademeia*), park in the Ceramicus, a W. suburb of Athens; so called after the hero Academus. A gymnastic school was held there; purchased by Cimon, son of Miltiades, who

adorned it with statues and olive plantations and left it to the public. A favourite walk of Socrates and his disciples, it was afterwards famous because Plato, whose home was in the neighbourhood, taught there; his followers soon came to be called *Academici*, and academic philosophy was synonymous with that of Plato. There was after Plato's death some variation in the system, causing the following distinctions to be made: the Platonic A. under Plato, 398-347 BC; the Ancient A. under Speusippus, Xenocrates, and Polemo (qq.v.); the Middle A. under Arcesilaus (q.v.); and the New A. under Carneades (q.v.). Two more *A.s* were founded after these: the Fourth A. by Philo of Larissa, and the Fifth A. by Antiochus of Ascalon, which terminated 79 BC. Ptolemy Soter (q.v.) had endowed a museum, which was essentially an A., at Alexandria, 314 BC. Charlemagne, at the suggestion of Alcuin, estab. a school or institute resembling an A. in AD 796 at St Martin's, Tours. Until the time of the Renaissance most of the learning was to be found in the monasteries, some of which might be regarded as *A.s*. After that period most learned bodies were called *A.s*. The following is a list of *A.s* arranged alphabetically, with the dates of their estab.: *Ancona*, Caliginosi, 1642. *Berlin*, Akademie der Wissenschaften, 1700, founded by Frederick I; *Architecture*, 1799. *Bologna*, Eccles., 1687; *Mathematics*, 1690; *Sciences and Arts*, 1712. *Boston, U.S.A.*, A. of Arts and Sciences, 1780. *Brescia*, Erranti, 1626; A., 1801. *Brest and Toulon*, Military, 1682. *Brussels*, Académie Royale, 1773. *Bucharest*, Rumanian A., 1866. *Caen*, Belles Lettres, 1705. *Chicago, U.S.A.*, Sciences, 1865. *Copenhagen*, Sciences, 1742; *Beaux Arts*, 1754. *Cortona*, Antiquities, 1726. *Dublin*, Royal Irish A., 1782; Royal Hibernian A., 1803. *Edinburgh*, Royal Scottish A., 1826. *Erfurt*, Saxony, Sciences, 1754. *Faenza*, Philoponi, 1612. *Florence*, Fine Arts, founded by Brunetto Latini, 1270; *Platonica*, founded by Lor. de' Medici, 1474 (dissolved 1521); *Della Crusca* or *Furfuratum*, 1582; *Del Cimento*, 1657; *Georgofili*, 1752 (agric.); *Antiquities*, 1807. *Geneva*, Medical, 1715. *Genoa*, Painting, etc., 1751; *Sciences*, 1783. *Göttingen*, Gesellschaft der Wissenschaften, 1752. *Haarlem*, Sciences, 1760. *Helsinki*, Societas Scientiarum. *Istanbul*, A., 1851. *Leipzig*, A., 1768. *Leningrad*, A. of the U.S.S.R., formerly known as the Imperial, 1728. *Lisbon*, Portuguese A., 1779. *London*, Royal Soc., 1662; Royal A. of Arts, 1768; Royal A. of Music, 1823; Brit., 1902. *Lyons*, Sciences, 1700. *Madrid*, Royal Sp., 1713; Hist., 1730; Painting and the Arts, 1753. *Mannheim*, Sculpture, 1775. *Mantua*, Vigilanti (Sciences), 1704. *Marseilles*, Belles Lettres, 1726. *Massachusetts*, Arts and Sciences, 1780. *Milan*, Sciences, 1719; A., 1838: *Architecture*, 1880. *Modena*, Società Italiana delle Scienze. *Munich*, Arts and Sciences, 1759. *Naples*, Rossana, 1540; *Secretorum Naturae*, 1560; Sciences, 1695; *Herculaneum*, 1755;

Nuova Società Reale, 1808. *New York*, Literature and Philosophy, 1814; *Amer. Geographical Society*, 1852; *National A.*, 1863; *Sciences*, 1876 (founded as *Lycæum of Natural Hist.*, 1818). *Newhaven, U.S.A.*, Connecticut A. of Arts and Sciences, 1799. *Nîmes*, Royal A., 1683. *Oslo, A.*, 1837. *Padua*, Poetry, 1610; *A.*, 1779; *Sciences*, 1792. *Palermo*, Fine Arts, 1300; *Medical*, 1645. *Paris*, Académie Française, 1635; Académie Royale de Peinture et de Sculpture, 1648; Académie de Peinture, by Le Brun, 1648; Académie des Inscriptions, 1663; Académie Royale des Sciences, by Colbert, 1666; Académie Royale d'Architecture, 1671; all suppressed in 1793; in 1795 Institut National was founded. This was divided into 4 parts in 1803, and in 1816 some of the original names were restored to these 4 parts by Louis XVIII: (a) Académie Française; (b) Académie des Inscriptions et Belles Lettres; (c) Académie des Sciences; (d) Académie des Beaux Arts; and in 1832 Académie des Sciences Morales et Politiques. *Parma*, Innominati, 1550. *Pennsylvania*, A. of Fine Arts, 1805. *Perugia*, Incensati, 1561. *Philadelphia, U.S.A.*, Philosophical Society for Promotion of Useful Knowledge, 1743; *Natural Sciences*, 1812. *Rome*, Lincei, 1609; Uomini, 1611; Fantastici, 1625; Infecondi, 1633; *Painting*, 1656; *Arcadi*, 1656; *Eng.*, 1752; *Nuovi Lincei*, 1847. *St Louis, Miss.*, A. of Science, 1857. *Stockholm*, Sciences, 1741; *Belles Lettres*, 1753; *Agric.*, 1781. *Toulon*, Military, 1682. *Trondhjem*, A., 1760. *Turin*, A. of Sciences, 1757; *Fine Arts*, 1778; *Royal Institute*, 1783. *Uppsala*, Royal Society, 1720. *Venice*, *Medical*, 1701; *A.*, 1831. *Verona*, *Music*, 1543; *Sciences*, 1780. *Vienna*, Kaiserliche A., 1487; *Sculpture and Arts*, 1705; *Surgery*, 1783; *Oriental*, 1810. *Warsaw*, *Language and Hist.*, 1753. *Washington, D.C.*, Smithsonian Institution, 1846; *National Geographical Society*, 1888; *International A. of Sciences, Arts, and Letters*, 1910.

See J. L. Myres, *Learned Societies. A Lecture*, 1922.

'Academy, The,' former well-known literary and artistic monthly jour., founded by C. E. C. B. Appleton, 1869. Among the many famous men who contributed to its early pages were Matthew Arnold, W. M. and D. G. Rossetti, F. T. Palgrave, Wm Morris, and W. W. Skeat. It became a fortnightly (1871) and finally a weekly periodical (1874). It ceased pub. in 1909.

Academy of Arts, Royal, London. Attempts had been made by the prin. artists in Britain prior to the accession of George III to form a permanent A. for the cultivation of painting, sculpture, and architecture, but they had failed. In 1760, however, with the assistance of 'The Royal Society for the Encouragement of Arts, Manufs., and Commerce in Great Britain' (see ROYAL SOCIETY OF ARTS), the artists opened the first public exhibition which attracted public attention. In 1765 a charter was obtained from the king, and the society became

'The Incorporated Society of Artists.' This, however, was not entirely successful, and a memorial signed by 22 artists was presented to the king asking for his sanction and encouragement for a gratuitous national school of art. The king approved, and 'The Royal Academy of Arts in London, for the purpose of Cultivating and Improving the Arts of Painting, Sculpture, and Architecture' was founded, 10 Dec. 1768. Sir Joshua Reynolds was appointed president; G. M. Moser, keeper; F. M. Newton, secretary; E. Penny, prof. of painting; T. Sandby, prof. of architecture; J. Wall, prof. of perspective; Dr William Hunter, prof. of anatomy. Its first quarters were in Somerset House, but when old Somerset House was purchased by the nation a part of the new building was given to the society. It took possession of its new quarters in 1780, and the first exhibition was held in 1781. In 1836 it was removed to Trafalgar Square, and it was afterwards removed to Burlington House, Piccadilly, its present quarters. It consists of 40 academicians, painters, sculptors, engravers, and architects; 30 associates; and sev. honorary members. An exhibition of works by living artists is held every summer from the first Monday in May to the first Monday in Aug., and an exhibition of works by old masters every winter from the first Monday in Jan. for ten weeks. There are schools which give instruction in art, and all persons who have passed the required examination are admissible as students of the A. An exhibition of 'The First Hundred Years of the Royal Academy' held at the Academy, 1951-2, gave an impressive survey of works originally shown between 1769 and 1868. See Blackburn, *Academy Notes*, 1875-1900; Laidlaw, *Royal Academy*, 1898; Hodgson and Eaton, *Royal Academy and Members, 1768-1830*, 1905; Graves, *Royal Academy Dictionary, 1769-1904*, 1905-6; Lamb, *The Royal Academy*, 1935. In France, the Académie Royale de Peinture et de Sculpture, founded by Louis XIV in 1648, perished with the old regime. The Amer. A. is the National A. of Design, founded 1826; it admits 125 painters, 25 sculptors, and 25 architects and engravers.

Academy of Arts and Letters (America) is a select body of men distinguished in the realms of literature, painting, and music. It had its origin in the National Institute of Arts and Letters, and its object was the furtherance of all 3 of these arts. The first 7 members of the A. elected in 1904 were William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John Le Farge, Samuel Langhorne Clemens (Mark Twain), John Hay, and Edward A. MacDowell. The hon. offices are in 633 West 155th Street, New York.

Acadia, or Acadie, see NOVA SCOTIA.

Acadia National Park, gift to the U.S. Gov. This park consists of 44 sq. m. on Mt Desert Is. off the coast of Maine, with part on the Schoodic Peninsula and part on Isle au Haut. The name was

changed from Lafayette National Park in 1929. It contains many lakes, and was restored as far as possible to its pristine condition by reforestation by the U.S. Forest Service. The forests were heavily damaged by fire in 1947.

Acajutla, port serving W. and central areas of El Salvador, central America, on the Pacific Ocean. Pop. 2500.

Acalephae (from Gk *akalēphē*, a sea-nettle), name given by Aristotle to the jelly-fish tribe because of their stinging properties. Cuvier covered with the term the Acraspeda, Lucernarida, and Ctenophora, but the nomenclature has since been altered.

Acampichtli (Aztec, 'handful of reeds') (d. probably in 1403), the first king of the Aztecs of Mexico. He constructed canals and built stone edifices, and generally improved the conditions of his kingdom.

Acanthaceae, family of dicotyledonous plants, mostly tropical herbs and shrubs with 5- or 4-parted flowers often in racemes or clustered in leaf-axils, showy and sometimes enclosed in large bracteoles, and capsular fruits, often explosive. Genera include *Acanthus*, *Aphelandra*, *Beloperone*, *Dianthera*, *Fitonias*, *Hygrophila*, *Jacobinia*, *Odontonema*, *Ruellia*, *Schaueria*, *Thunbergia*, and *Whitfieldia*.

Acanthocephala (Gk *akantha*, a thorn, *cephalē*, a head), class of parasitic worms of which the *Echinorhynchus* is the chief genus. The largest species, *gigantorhynchus*, is found in the pig, and may attain a length of more than a yard, but most species are less than 1 cm. in length. It has a cylindrical body with a proboscis furnished with many hooks by which it attaches itself to the intestine of its host. When the embryo is born it is ejected from the body of the host and depends for its further development on being swallowed by an intermediate host, which in the case of *E. gigas* of the pig is the larva of a particular beetle. It continues in these surroundings for a time, but only reaches adult proportions if the intermediate host is eaten by a pig, its permanent host, when the cycle begins again.

Acanthodians, primitive Palaeozoic placoderms (q.v.) which looked like small 'spiny sharks.' The head was covered by dermal bones, and the body with bony scales; the fins were stiffened anteriorly by spines, and there were frequently additional pairs of fins. The tail was heterocercal. *A.* lived from Silurian to Permian times.

Acanthopterygii (from Gk *akantha*, a thorn; *pteryx*, a wing), one of Cuvier's 3 primary divs. of fish, those in this section having spinous rays in the dorsal, anal, and pelvic fins.

Acanthurus (from Gk *akantha*, a thorn; *oura*, a tail), genus of percomorph fishes found in tropical seas. They are known as surgeon-fishes, having on each side of the tail a movable, lancet-like spine.

Acanthus, in architecture, is the sculptured leaf which is the distinguishing characteristic of a Corinthian capital. The *A. mollis* growing on a tomb probably

suggested this ornamentation to Callimachus in the 5th cent. BC.

Greek ACANTHUS Roman

Acanthus (Brankursine or Bear's Breech), genus of Mediterranean perennials, family Acanthaceae, of which *A. mollis* has naturalised as a garden escape in Cornwall, and *A. caroli-alexandri* is a fine rock garden plant from Greece.

Acapulco, seaport of most important state of Guerrero, SW. Mexico, on the Pacific coast, 282 m. from the cap. Exports consist of hides, timber, and fruit. Pop. 10,000.

Acarides (from Gk *akarēs*, small; *eidos*, form), or *Acarina*, are a low order of the Arachnida, vulgarly known as mites. The body is usually globular and presents no exact div. between the abdomen and cephalo-thorax. The organs are simple, and the mouth is adapted for biting or sucking. The *Sarcoptes scabiei* produces gall. *Tyroglyphus siro* is the cheese-mite. See also MITES.

Aacarnan, son of Alcmaeon and Callirhoe, daughter of river-god Achelous. He avenged his father's death by slaying the sons of Phegeus, and became the eponymous hero of the Acarnanians.

Acarnania, dist. of ant. Greece, bounded on the N. by the Ambracian Gulf, now the Gulf of Arta, and Aetolia, and on the W. and SW. by the Ionian Sea. It was inhabited by a piratical race, which formed a league and had for its cap. Stratus, a tn situated on the R. Achelous. It was subdued by the Macedonians in 225 BC. In 146 it became part of the Rom. prov. of Achaia, and to-day it forms with Aetolia a prov. of modern Greece.

Aoastus, King of Iolcus, an Argonaut, who on his return from Colchis instituted funeral games in honour of Pelias, his father, whom his sisters had killed on the advice of Medea, who had promised to restore him to life as a young man. *A.* was dethroned and killed by Peleus. See Ovid, *Metam.* vii. 297-349.

Acatalectic, term in prosody meaning 'not catalectic,' i.e. a normal line of the full number of syllables, without shortening. See CATALECTIC.

Acatalepsy (Gk alpha-privative and *katalambanein*, to seize), name of the doctrine of Arcesilaus (3rd cent. BC), a Gk philosopher, who maintained, in opposition to the Stoics, that there can be no criterion of truth. The Sceptics apply the term to incomprehensibility.

Acatus (dimin. *acatium*), small boat, swift and light, propelled by wind or oars, used by the anct Gks, particularly by pirates. It bore a spike in the front and was curved at the prow.

Acca Larentia, or **Laurentia**, a Rom. deity, wife of Faustulus, shepherd of Numitor, and foster-mother of Romulus and Remus. Another legend made her a courtesan who married a rich Etruscan named Tarutius, and left her wealth to the Rom. people.

Accad, see **AKKAD**.

Accademia, Venice, the central gallery of Venice, on the Campo di Carità. In it may be studied the whole sequence of Venetian art from the 14th cent. onwards, from Lorenzo Veneziano to the Bellinis (Giovanni and Gentile) to Carpaccio and Cima and so to the great period of Titian, Giorgione, Tintoretto, Palma Vecchio, Lotto, Paris Bordone, and down to Tiepolo. One of the outstanding possessions of the Accademia is the splendid series of paintings by Carpaccio on the legend of St Ursula. Next to these may be seen the series of Giovanni Bellini's Madonnas, one of them, 'Madonna with the Magdalen and St Catherine' being equal to his work in the National Gallery. The finest of Titian's paintings here is his 'Presentation of the Virgin.' Two other great treasures are the dramatic 'Miracle of St Mark' of Tintoretto and the splendid composition, 'The Feast in the House of Levi,' by Paul Veronese. With Tiepolo the greater days were past, but much excellent work is to be seen in the Venetian views of Canaletto and Guardi.

Accalia, Larentalia, or **Larentinalia**, Rom. funeral festival on 23 Dec. in honour of Acca Larentia (q.v.).

Accelerando (It.), musical term to indicate the quickened movement of a passage.

Acceleration, rate of change of velocity. Like velocity it is a vector (q.v.), and to be fully specified must be assigned a direction and sense as well as a magnitude. A force acting on a body produces a change of velocity in the direction of the force, if the body is free to move, i.e. the body suffers an A. in the given direction. If the speed is reduced the effect is known as retardation. A common example of A. arises from the action of gravity on a body. The force acting between the earth and the body causes an A. of about 32 ft. per sec. per sec. (c. 981 cm. per sec. per sec.). From the equation of motion $v = u + gt$, where u is the initial velocity and v the velocity after an A. g has acted for a time t , it is seen that a body falling freely from rest has a velocity of 32 ft. per sec. at the end of the first sec., 64 ft. per sec. after two sec., and so on. See **MECHANICS**.

Accent is the stress with which a certain syllable of a given word is pronounced, in comparison with the other syllables of the same word. In a long word, however, there are frequently two A.s, but they need not be equally emphasised; as in the words *manufacture* and *independent* and in the phrase 'On the top of the hill' the first A. is comparatively faint.

For anct A., especially the Gk, see **METRE**. The A. of some words is variable and has undergone changes. Thus we say *triumph*, while Milton said *triumph*, the noun and the verb being distinguished by him as we distinguish nowadays *produce* the noun and *produce* the verb. Comparatively recently *advertisement* has become *advertisment*. The tendency, due to a desire for rapid speaking, is to throw the A. back. The symbols used in Gk to denote A. are three: the acute (´), the grave (`), and the circumflex (˘). Originally these A. marks indicated a distinct difference of musical pitch in pronouncing the syllables of a word, those having the grave A. being pronounced at a comparatively 'low pitch,' those having the acute A. being a 'musical fifth higher.' Those having the circumflex started in the high pitch and descended 'a fifth' during the pronunciation of the same syllable. In later times, however, the A.s represented mere stress. The A. has different meaning in language, prosody, poetry, music, and script. Some scripts such as It., Fr., Sp., Polish, Czech, and so on have numerous A. signs, which are employed as diacritical marks for letters (ä, é, ö, ê, ü, ê, etc.).

Accent, in mathematics: 1. A mark placed at the right hand of a letter and above it to signify different magnitudes of the same kind, e.g. $a, a', a''; x, x', x''$.

2. In trigonometry to express the minutes and seconds of a degree, e.g. $8^{\circ} 10' = 8 \text{ min. } 10 \text{ sec.}$

3. To express feet and inches, e.g. $2' 6'' = 2 \text{ ft } 6 \text{ in.}$

Accent, in music, is the regular emphasis occurring in a series of notes. It is usually placed on the first beat after the bar-line, and in any music divided into bars of more than 3 beats there is usually a secondary A. less strongly stressed.

Accentor (Prunellidae) (Lat. *ad*, to; *cantor*, singer), family of small passerine birds, probably related to the thrushes. Usually found in thickets in hilly districts. Represented in Great Britain by the hedge-sparrow.

Acceptance, Acceptor, see **BILL OF EXCHANGE**. For acceptance in the law of sale of goods see **SALE**.

Acceptation in Rom. and Scots law meant the remission of a debt by a creditor giving a receipt for money never actually paid. The word was used in theological controversy by the Arminians for the doctrine that the sufferings of Christ were not sufficient atonement for man's sins, albeit graciously accepted by God.

Accession, Deed of. In Scots law, the creditors of a bankrupt or other insolvent person can by a deed approve of, and bind themselves to concur in, the administration of his estate in trust for the general good.

Accession of Property. In the law of England and Scotland, derived from the Roms., property added to either naturally or artificially is said to be acquired by A. All accretions to property naturally added belong to the owner of the nuclear property; thus the offspring of animals,

the produce of the soil, the increase of land due to alluvial deposits, belong to the owner whose land has been added to or whose fields or cattle have been fruitful. Property, acquired artificially, as, for example, when a man builds a house on another's land or embellishes or works on another's material, was generally under the Rom. law held to be the property of the owner of the prin. thing, provided compensation was made for improvement. An exception was made in cases where as the result of labour (which, of course, is a form of property) a totally new thing was produced. Thus the man who made wine from another's grapes, or painted a picture on another's canvas, retained the wine and the picture and compensated the owners of the grapes and the canvas, thereby reversing the usual rule. In the U.S.A. all A. or accretion is, in the absence of any agreement to the contrary, the property of the owner of the prin. materials.

Accessory. In Eng. law, an A. is one who, though not the principal in a felony, and even absent at the time of commission, has nevertheless been concerned with the crime, either *before* or *after* the fact. An A. *before* the fact has been defined by a dictum of Lord Hale as one who, 'being absent at the time of the crime committed doth yet procure, counsel, or command another to commit a felony.' An A. *after* the fact is one who, knowing that a felony has been committed, assists, relieves, or protects the felon. The mere knowledge that a felony is about to be committed or the omission to apprehend or report the felon does not constitute accessory, and a distinction must be made between A.s and principals in the second degree who are present aiding and abetting. There are no A.s in a case of misdemeanour or of treason; all persons concerned are held as principals and generally receive the same punishment. In Scots law, except for treason, A. after the crime is not recognised, and in the United States the distinction of the Eng. common law between principal and accessory has by statute been abolished, every person concerned being liable to punishment as a principal. See CRIMINAL LAW.

Acciacatura (It. *acciaccare*, to crush), in music, an auxiliary note played as grace-note, played simultaneously with the prin. note and immediately released. In modern music it has been entirely superseded by the appoggiatura (q.v.).

Acciajuoli, Donato (1428-78), It. scholar, b. Florence, who wrote lives of Hannibal, Scipio, and Charlemagne, and commentaries on Aristotle's *Ethics* and *Politics*.

Accidence, corruption of accidents, signifying the properties and qualities of the parts of speech, as gender, number, and case; originally a small book containing these, but now used to express that part of grammar which deals with inflections (q.v.).

Accident means any extraordinary or unforeseen event. In the law of torts 'inevitable A.' is the antithesis of negligence, and, generally speaking, involves

no liability in damages. The word, however, varies in its legal connotation according to the context: thus, in the criminal law, it means an act done unintentionally and in such circumstances that no person of common prudence could very well have avoided it.

In insurance practice, however, the word A. includes occurrences brought about by the negligence of the insured or assured and of other or third parties. (See INSURANCE, *Casualty and Contingency Insurance*.) In the law of employers' liability the word is also loosely used to include not only events accidental in a popular sense but, for the purposes of statutory compensation, others which are in no sense fortuitous. See also ACCIDENTS, MOTORING, and WORKMEN'S COMPENSATION.

Accident, metaphysical term defined by Aristotle (1) as 'that which belongs to a thing and is truly stated of it, but not necessarily nor even usually', and (2) as 'that which belongs to a thing *per se*, though no part of its essence'. The word is used of all qualities as distinct from substance (q.v.).

Accidentals, in music, are signs occurring before a particular note, not in the signature, which change the pitch during the course of a bar. These signs are the flat, double-flat, sharp, double-sharp, and the natural.

Accidents, Motoring. In the case of an accident causing damage to any person, vehicle, or animal, the driver of the motor vehicle must stop, and on request of any person having reasonable grounds for so requiring, give his name and address and identification of his vehicle. If this is not done on the spot, then the accident must be reported at a police station or to a constable as soon as possible, and in any case within 24 hours. Hospitals now have a right to claim the reasonable expenses of hospital treatment from the insurance company which is meeting claims under a third party insurance policy. See INSURANCE and ROAD SAFETY.

Accipiter (Lat. *accipiter*, hawk), Raptores, or Rapaces, the common name for all birds of prey, now generally put in the order Falconiformes. They appear by day and by night, and are recognisable by their crooked and powerful beaks and talons.

Accius, Lucius (170-c. 85 BC), Rom. tragic poet. He wrote more than 40 tragedies on Gk. but only 2 on Rom. themes. Only fragments survive. See text and trans. in E. H. Warmington's *Remains of Old Latin*, II (Loeb Library), 1936, and W. Beare, *The Roman Stage*, 1950.

Acclimatisation, the adaptation of plants, animals, and mankind to the difference in climate experienced in some place other than the native country. It differs from *domestication*, which implies protection, and from *naturalisation*, which implies mere residence in another country, in the fact that it requires adaptation. It is made difficult of study in that many other factors are present which would

bring about or prevent any change in the original nature of the plant or animal under observation, e.g. changed conditions in food, increase of enemies, and in man intermixture of races. One of the common products of A. in all kinds of organic life seems to be fertility, which can be noted in many cases; in others, however, the reproductive element is limited, as in some plants which lose all power of sexual reproduction when transferred to varying climates, and propagate only vegetatively. The fertility of adapted animals has sometimes proved a great disadvantage to the adopted country, the introduction of rabbits into Australia and their subsequent degeneration into a pest being a case in point.

It has been maintained by some scientists that man is incapable of adaptation, but there are many evidences to the contrary among peoples who have spread successfully over many parts of the world from a single source (e.g. the Jews, Indians in the W. Indies, E. Africa, and Fiji, Brit. and Dutch colonists, Negroes in the New World). However, such adaptation is not always successful, and diseases which are comparatively harmless to natives of a country frequently prove fatal to strangers, e.g. malaria and liver complaints affect Europeans in the tropics, while lung troubles are common in Africans transferred to colder climates.

In France a society was founded in 1854 by Isidore Geoffroy Saint-Hilaire for the practical and theoretical study of this subject, and the Société Nationale d'Acclimatation has adapted species and receives assistance from the Jardin Zoologique d'Acclimatation. London has the Zoological Gardens and Kew Gardens, in which A. can be seen in animals and plants respectively. See I. G. Saint-Hilaire, *Acclimatation et domestication des animaux utiles*, 1861; Chas. Darwin, *The Variation of Animals and Plants under Domestication*, 1868; J. Hann, *Handbuch der Klimatologie*, 1897; B. E. Livingston, *Climatic Areas of the U.S. related to Plant Growth*, 1913.

Acco, see ACRE.

Accolade (Fr. from It. *accollare*, to embrace; from Lat. *ad*, to, and *collum*, neck): 1. A knight ceremony, used in conferring knighthood. It was supposed that it consisted of an embrace, but is now believed to have been a slight blow with the flat of a sword on the shoulder.

2. In music, a brace used to join several staves.

Accolti, Benedetto (1415-66), It. jurist and writer, b. Arezzo. He became chancellor of the Florentine Rep. in 1459, and held this office until his death. His poem of Godfrey of Bouillon's conquest of Palestine, the *De Bello a Christianis contra Barbaros gesto pro Christi Sepulchro*, 1432, was the basis of Tasso's *Gerusalemme liberata*, 1575.

Accolti, Bernardo (c. 1465-c. 1535), It. poet, son of the jurist Benedetto Accolti, b. Arezzo. He was known as *l'Unico Aretino*. He owed his fame to his powers of poetical improvisation, and when he announced that he would recite his poems

tradesmen closed their shops and flocked to hear him; unfortunately the poems have hardly survived him.

Accolti, Pietro (1455-1549), It. cardinal, brother of Bernardo A., b. and d. Florence. As cardinal of Ancona he had a large share in drawing up the bull against Luther in 1520.

Accommodation, Housing. Apart from an attempt made under the Labouring Classes Lodging Houses Act, 1851, until the Housing of the Working Classes Act, 1890, the provision of housing A. was no one's legal responsibility. Since the passing of the 1890 Act the legislature has placed some responsibility upon local authorities for providing houses for the working classes and dealing with slums. Gradually this power has grown until in the Housing Act, 1949, the responsibility for the housing of all sections of the community was placed upon local housing authorities. The ability of housing authorities to provide such A., however, has tended to depend more and more upon Exchequer subsidies.

GENERAL POWERS AND DUTIES OF LOCAL AUTHORITIES. Housing authorities must periodically review the housing conditions in their areas, and the need of further housing A., and submit to the Minister proposals for meeting the need.

Prior to 1919 houses were principally provided by private enterprise supplemented by: (1) Building Societies; (2) Friendly Societies; (3) Trade Unions; (4) Industrial Co-operative Societies; (5) Philanthropic Bodies; (6) Employers of Labour; (7) Housing Associations; (8) Public Utility Societies; and (9) Local Authorities. Between the two wars approximately four million houses were erected, of which about three million were constructed by private enterprise.

Local authorities may provide A. by: (a) erecting houses on any land acquired or appropriated by them; (b) converting any buildings into houses; (c) acquiring houses suitable for the purpose; (d) altering, enlarging, repairing, or improving any houses or buildings which have, or any estate or interest in which has, been acquired by them. Any house so erected or acquired may be altered, enlarged, repaired, or improved, and supplied with all requisite furniture, fittings, and conveniences.

Local authorities are empowered to acquire for the provision of A.: (a) *any land*, including any houses or other buildings thereon, as a site for the erection of houses; (b) (i) *houses*; (ii) *buildings*, other than houses, being buildings which may be made suitable as houses; together with any land, or any estate or interest in any houses, or in any such buildings; (c) *land* for the purpose of: (i) lease or sale to *other persons* to erect houses thereon; (ii) *lease* or sale for purposes necessary or desirable for, or incidental to, the development of the land as a building estate, including: (1) the provision, maintenance, and improvement of houses and gardens, factories, workshops, places of worship and recreation; and (2) other works or buildings. Acquisition may be by

agreement or compulsorily with the consent of the Minister, and even if not immediately required, provided it is likely to be so required within ten years. The authority may also with the consent of the Minister appropriate land already vested in them to these purposes.

The general management, inspection, regulation, and control of houses provided by a local authority under the Housing Act, 1936, as amended, are vested in and exercised by the authority. It may make such reasonable charges in this connection

Management Commission and transfer to them: (a) the management, regulation, and control; and (b) the repair and maintenance of houses, etc. The Minister must approve the scheme setting up the Commission. The chairman may be remunerated and the Commission may employ their own staff.

It is the duty of the co. council to have constant regard to housing conditions in rural dists., and the rural dist. council may agree to the co. council exercising all or any of their duties.

London County Council

TERRACE HOUSES, ALTON ESTATE, WANDSWORTH

for the tenancy or occupation of the houses as it may determine. It may grant such rebates from rents as it thinks fit. It must review the rents from time to time and make such changes as circumstances require. A differential rent scheme based on the income of a tenant has been held appropriate, but the reasonableness of charges is open to review by the Court. In selecting tenants, preference must be given to persons occupying insanitary or overcrowded A.; to those with large families; and to persons living under unsatisfactory housing conditions. It must further be a term of occupation that the tenant shall not assign or underlet without consent of the authority.

If a local housing authority consider it expedient it may set up a Housing

Although the Housing (Rural Workers) Acts, 1926, 1931, and 1933, were allowed to lapse in 1945, their financial provisions may operate until 1965 and should be considered.

There was a danger that in concentrating on the problems of urb. housing needs, slums, and overcrowding, the needs of the agric. pop. might be overlooked, and these Acts were passed with a view to providing houses for the agric. workers and those whose economic conditions were substantially the same as those workers'. The local authorities were the councils of cos. and co. bors., but the Minister could make the council of a co. dist. the local authority, or the co. council could agree to the co. dist. council exercising the functions. The local authorities could, and had to if required by the Minister, submit

schemes to the Minister for the reconstruction and improvement of houses or buildings for dwellings. Owners could be assisted by loans or grants. There was a limit on the value of the property receiving assistance. The cost of the work had not to be less than £100 or two-thirds of the cost of the improvements, whichever was less, increased to £150 if for the abatement of overcrowding. Grants could be in lump sums or periodical payments spread over 20 years at the most. Loans were secured by mortgage and could not exceed 90 per cent of the security. Exchequer grants to local authorities were 50 per cent of the loan charges on a 20-year basis for reconditioning houses of which they were or became the owners.

POWER OF LOCAL AUTHORITIES TO MAKE ADVANCES, ETC., FOR THE PURPOSE OF INCREASING HOUSING ACCOMMODATION. It is confusing to the uninitiated to understand the two codes under which advances may be made to facilitate the purchase of houses or the construction of houses. The provisions are to be found in the Small Dwellings Acquisition Acts, 1899 to 1923, and the Housing Act, 1949, Section 4:

The Small Dwellings Acquisition Acts, 1899 to 1923. The Act of 1899 contained the original provisions. This code now includes: the Small Dwellings Acquisition Act, 1899; the Housing and Town Planning, etc., Act, 1919, Part III; and the Housing, etc., Act, 1923, as amended by the Housing Act, 1936, Section 92.

The provisions of the code are: (1) A formal adoption of the Acts is required. (2) An advance must not exceed 90 per cent of the valuation. (3) The applicant must undertake to reside in the house constructed or purchased for a period of at least three years, but this condition may be dispensed with at any time by the local authority. (4) The market value of the house must not exceed £5000. (5) The market value must be ascertained by a valuation made on behalf of the local authority. (6) In respect of an advance made for a house in course of construction, it may be made by instalments from time to time as the building progresses, but so that the amount advanced at any time before the completion of the house does not exceed 80 per cent of the value of the work done, including the value of the site. (7) The advances must be repaid with interest over a period of not more than 30 years, although arrangements may be made for repayment before the agreement expires. (8) The interest to be acquired must be the freehold or a lease of not more than 60 years unexpired at the date of purchase. (9) The rate of interest on advances is fixed at 1 per cent above the rate at which the local authority can borrow from the Public Works Loan Board—a rate fixed from time to time by order of the Minister and approved by the Treasury. (10) The property must first be vested in the local authority by mortgage subject to redemption which, under the Act of 1919, Section 49 (d), may be by receipt under seal in the form of the

Fourth Schedule to that Act and having the legal effect specified in Part II of that schedule (Act, 1899, Section 2 (c)). (11) The statutory receipt does not require a stamp (Act, 1919, Section 49, proviso (1)). This apparently has the same effect as that of the Law of Property Act, 1925. (12) An advance can be made in respect of one house only. (13) There is no disqualification from being elected as, or being a member of, the local authority by reason only that an advance has been made under the Act. A member must, however, disclose his interest in this respect to the meeting and must not take part in the consideration of, or voting upon, the subject (Local Government Act, 1933, Section 76). (14) The house must be insured by the mortgagor against fire, kept in good sanitary condition, and not used for the sale of intoxicating liquor. The local authority has adequate powers to enter into possession, and in certain circumstances to sell the house, for breach of conditions. (15) If the cost of administration to the local authority exceeds a rate of one penny and one-third in the pound on the rateable value (co. councils two-thirds of a penny), no further advances must be made for five years or until such cost falls below one penny and one-third (co. councils three-farthings).

The Housing Act, 1949. The Housing Code is now contained in Section 4 of the Act, 1949. The local authorities for Part V of the Act, 1936, including co. councils, may make advances under the Act, 1949, Section 4, as under the Small Dwellings Acquisition Acts with the following modifications. The applicant need not undertake to reside in the house. The leasehold interest need only be such as exceeds the term of the loan by ten years. There is no restriction regarding the sale of intoxicating liquors or the insurance of the premises, but of course such conditions may be incorporated in the mortgage deed. There is no limit to the amount which can be advanced during construction, or to the rate limit on the expenditure of the local authority. Further, advances may be made not only for the acquisition or construction of houses but for: (1) converting into houses buildings which have been acquired, or acquiring buildings and converting them into houses; or (2) altering, enlarging, repairing, or improving houses, whether the houses or buildings are within or outside the area of the authority.

HOUSING ASSOCIATIONS. The power of local authorities and co. councils to promote and assist housing associations includes making grants or loans to them; subscribing towards any share or loan capital; and guaranteeing to join in the payment of principal or interest for them. With the approval of the Minister, arrangements can be made with such associations under the provisions of the Housing Act, 1936, as amended by the Housing Act, 1949, (1) to provide any housing A. which the authority could provide; (2) to alter, enlarge, repair, or improve houses or buildings; (3) to provide dwellings by means of conversion

of houses or other buildings. Arrangements may include terms as to types of houses, rents, and other matters considered expedient by the authority. Exchequer contributions in respect of this housing provision are considered in HOUSING FINANCE (q.v.).

The Minister may recognise any central association or other body estab. to promote the work of housing associations. (The Minister has recognised for this purpose The National Federation of Housing Societies, 12 Suffolk Street, London, SW.1.) Housing associations are incorporated under the provisions of the Industrial and Provident Societies Acts. They are given tax concessions and other advantages. For instance, the Housing Repairs and Rents Act, 1954, Section 33, removes houses of such associations, like those of local authorities, from the control of the Rents Acts.

BUILDING SOCIETIES. Under the Housing Act, 1949, a local authority may, in accordance with proposals approved by the Minister, guarantee the repayment of advances made by building societies to members for the purpose of building or acquiring houses. Where the guarantee extends only to the amount by which the loan exceeds the normal society advance, and the liability of the local authority cannot be greater than two-thirds of that excess, the ministry may undertake reimbursement to the authority of not more than one-half of any loss sustained. In other words, under the scheme any loss is borne in equal shares by the building society, the local authority, and the ministry. The properties to which this facility is applicable must not exceed £5000 in market value.

REQUISITIONED HOUSES. To meet the emergency in the provision of houses arising from the Second World War, the powers of the Minister under the Defence (General) Regulations, 1939, to requisition property were used extensively for housing purposes. The power was delegated during the war by circular to clerks of local authorities, and the delegation continued until 1948. A process of de-requisitioning has since been pursued, but substantial units of A. are still held and managed by local authorities as agents for the Minister.

The Requisitioned Houses and Housing (Amendment) Act, 1955, repealed the power to requisition premises for general housing purposes. Possession of houses already requisitioned is transferred from the Minister to the local authorities, who may continue so to use them until 31 March 1960, but no longer. Meanwhile premises must be released: (a) when falling vacant, unless the Minister authorises retention; (b) when the owner accepts the licensee (existing occupier) as his statutory tenant; (c) on order of the co. court for occupation by the owner or his family; (d) on direction of the Minister in case of hardship unless the local authority purchase; (e) when the owner undertakes modernisation or conversion into flats with a rent-restricted tenancy to persons nominated by the local authority.

Expenditure in respect of requisitioned premises is transferred to the local authority, who will be assisted by grants from the Exchequer. The local authorities must have divested themselves of requisitioned premises by 1960, either by release, as previously described, or by purchase or lease of the premises.

See also HOUSING; HOUSING ACT, 1936; HOUSING FINANCE; OVERCROWDING, ABATEMENT OF; TOWN AND COUNTRY PLANNING.

Accommodation Bill, bill of exchange to which a party has put his name without consideration (q.v.), and for the accommodation of another; the latter should find the funds for payment when the bill becomes due, but the holder for value (*see* BILL OF EXCHANGE) is entitled to sue the accommodating party, though he knows of the want of consideration. The fact that an acceptor is an 'accommodation party,' though no defence to an action by another party, entitles the acceptor to what he would not usually have, a recourse to the drawer he accommodated. The defence of an 'accommodation bill' or 'accommodation party,' therefore, is very rarely one which gets beyond the solicitor or counsel when they are first consulted, because it is seldom any use to bring such a defence into court.

Accommodation of Scripture, application of Scripture to a subject with which it has no strict connection in the mind of the human or of the divine author. It is a favourite device of preachers, and is quite legitimate, provided it is remembered that the meaning given to the passage in an accommodated sense is not the genuine use of Scripture, and no proof of a doctrine can be drawn from it. A. of S. is often found in the Liturgy of the Church, in the choice of a lecture to suit a particular occasion (*see Catholic Commentary on Holy Scripture*, 1953).

Accompaniment, in music, is the assistance given to a solo part by subordinate parts either vocal or instrumental. Thus a song or a violin solo may have a pianoforte A. to support the solo with harmony and texture. A. is also the harmony of a figured bass.

Accomplice, person associated with another in committing or attempting to commit a crime. An A. may give evidence in court, i.e. turn queen's evidence, but, although there is no exact rule to this effect, the general practice is to discount its value unless supported by independent testimony.

Accoramboni, Vittoria (d. 1585), Duchess of Bracciano, famous for her beauty and tragic hist. Married to Francesco Peretti, nephew of Pope Sixtus V, she instigated his murder, then married his murderer, the Duke of Bracciano. On his death she was involved in a lawsuit with Luigi Orsini regarding the inheritance, and was murdered by him at Padua.

Accord and Satisfaction may be pleaded by a defendant in a civil action in an Eng. court, viz. that he has agreed with the plaintiff, and has acted upon the agreement, to pay money or perform

some action in satisfaction of the plaintiff's demand.

Accordion, musical instrument invented by Damian of Vienna, 1829. It is in the form of a small oblong box, consisting of a row of very small elastic metallic springs, fixed at one end in a plate of metal, so that they may vibrate freely, and a bellows to put the springs into vibration. The instruments vary in size and in capabilities, and 2 or more notes can be played at once.

Accorso, Francesco (Latinised *Accursius*) (c. 1180-c. 1260), lt. jurist, b. Florence. He wrote glosses on Rom. law, and his chief work, the *Great Gloss*, was long a standard authority.

Accorso, Mariangelo (c. 1490-c. 1550), lt. writer and critic, b. Aquila. A great favourite of Charles V, he pub. in 1524 the *Diatribae in Ausonium, Solinum, et Ovidium*.

Accoucheur, see MIDWIFERY.

Account, general term for a statement of pecuniary transactions between two parties. According to Eng. law, an *A. stated* is one in which both debtor and creditor have agreed to the balance. The debtor is not, however, precluded from showing, if he can, the existence of error, but if the *A.* has been actually settled by payment it can only be re-opened upon proof of fraud. A *settled A.* is a written statement, agreed to by both parties as correct, of the final position of 2 *A.s.*

All modern commerce is conducted by keeping records of *A.s* (see BOOK-KEEPING), and public bodies and companies, such as tn councils, limited liability companies, friendly societies, executors and trustees, or administrators of estates and similar officers of the court, are all bound by statute to keep *A.s.*, and provision is made for audit and inspection. It is also a criminal offence under the bankruptcy laws for the bankrupt to have failed to keep such books as the usage or importance of his business would seem to warrant.

Account, or **Accompt**, Writ of, form of legal action now rarely resorted to, but which was much used in early times, for the recovery of money wrongfully retained.

Account Current, **Account Sales**, see BOOK-KEEPING.

Accountant, person skilled in the practice of keeping books of accounts and generally with a knowledge of bankruptcy and mercantile law. The name is applied to officials, such as are employed by banks, insurance companies, railways, and other large businesses, whose duty it is to supervise the keeping of accounts and to prepare balance sheets, etc. An *A. of Court* is an officer of the Scottish court of session, whose duties are defined by the Judicial Factors (Scotland) Act, 1889, part of which include bankruptcy affairs. The profession of accountancy is generally more of a consultative nature, and an *A.* one who is called in from outside to audit and investigate books, to give advice as to how they should be kept, and to make

reports as to solvency. Their status has been regularised and their standard of efficiency maintained by societies of *A.s.*, some incorporated under royal charter, and a member of one of these societies is called a *Chartered A.* The Institute of Chartered *A.s* in England and Wales (q.v.) was founded in 1880 and the Society of Incorporated *A.s* (q.v.) in 1885. In the U.S.A. there is an Association of Public *A.s.*

Accountant-General, title applied today to a civil servant, usually the head of an accounts branch in certain gov. depts, such as the Ministry of Supply, Commonwealth Relations Office. *Accountant and Comptroller General* is the title of the head of the accounts dept in Inland Revenue, and also in Customs and Excise.

Accra, seaport in and cap. of Ghana, formerly the Gold Coast. It has all the public buildings usually associated with gov. administration as well as modern shops, schools, and hospitals; 5 m. N. is Achimota College, the chief educational estab. in Ghana. Cocoa is the chief export, and the prosperity of *A.* is largely dependent on the crop and its world price. Other exports are gold, palm oil, and timber. It is the terminus of a railway to Kumasi. *A.* is lighted by electricity and has pipe-borne water supplies. Wireless communications are maintained with other parts of the country. Considerable damage was done by an earthquake which occurred not long before the Second World War. Pop. 135,926.

Accrington, manufacturing tn and municipal bor. in Lancs, England, about 22 m. N. of Manchester. It is noted for cotton manuf., calico-printing, textile machinery, weaving, and brickmaking; it possesses a tn hall and mrkt hall. Coal is worked in the neighbourhood. Pop. 41,000.

Accum, Friedrich (1769-1838), Ger. chemist, b. Bückeburg, Lower Saxony, crossed to England in 1793, and became prof. of chem. in London in 1802. He introduced illumination by gas into England by his *Practical Treatise of Gas-light*, 1815. He was appointed prof. in Berlin in 1822, and d. in that city. His other chief works are *An Essay on Chemical Reagents*, 1816, and *A Treatise on the Adulteration of Food*, 1820.

Accumulation (Capitalism), see CAPITAL. **Accumulation**, legal term implying the *A.* of income from an estate that has been bequeathed by will or deed, during such time as the legatee might not enjoy the estate. Thellusson's Act, 1800 (40 Geo. III, c. 98), which imposed certain restrictions on *A.*, provided that it could only continue during the life of the settler plus 21 years, or during the period of legal minority of the legatee. Where *A.* has been directed contrary to the provisions of this Act, the direction as to *A.* is null and void, but not the settlement, and the property passes to such person or persons as would have been entitled to it had *A.* not been directed. Certain exceptions, such as the provision for payment of debts and for raising portions for children, etc., are made in Section 2

of the Act. The Act at first applied only to England, but it was extended to Scotland in 1848 (12 Vict. c. 36).

Accumulation of Power, see ACCUMULATOR, HYDRAULIC.

Accumulator, Electric, or storage cell, an electrolytic cell in which a current passed through ('charging') effects chemical change in the 'active material,' involving increase in chemical energy, recoverable as electric energy when the electrode plates are connected through an external circuit ('discharge'), the chemical reaction being then reversed. The cell usually

forming lead sulphate, the electrolyte becoming more dilute. During charge the water in the electrolyte is decomposed; the sulphate on the negative is reduced to spongy lead, with formation of sulphuric acid; and the sulphate on the positive is ultimately converted to lead peroxide. The electrolyte recovers its concentration and sp. gr. The plates in the Faure cell consist of grids or frames of antimony-lead alloy with 'pockets' and pores filled with the active paste. In the Planté cell the active material is formed on the plate surface itself, which is

LABADI BEACH, NEAR ACCRA

E.N.A.

consists of a number of interleaved, alternately positive and negative plates, one more negative than positive, so that every plate except the two outer negative ones is used on both faces. This prevents the buckling of positive plates on excessive discharge current. The plates are kept apart by porous separators of wood or plastics and are immersed in electrolyte. All the positive plates are connected together to one terminal, likewise the negative. The container is a rectangular box of glass, wood, or plastics. In the Planté lead-acid cell the electrolyte is dilute sulphuric acid; the active material is lead peroxide on the positive, and spongy lead on the negative, plate. The spongy material is 'formed' by repeated charging and discharging. The Faure cell differs from the Planté in having red lead as active material on the positive and litharge on the negative. During discharge the acid attacks both plates,

made with ribs and pores to increase the area. The lead A. gives a voltage of 2.2 V. when fully charged. This voltage depends on the active material alone. If higher voltage is required, more cells are connected in series, forming a battery. The current that can be obtained from a cell depends on the active area of the plates in contact with the acid. If more current is required than can be obtained from one cell, sev. cells are connected in parallel. Batteries are usually charged on about 2.7 V. per cell, and charging is continued until each cell reaches the specified voltage and the electrolyte the normal sp. gr. (1.2-1.3), these values being maintained when the charging is discontinued. Tests are made with a portable voltmeter and a hydrometer. An indication that the charge is nearly completed is given by the 'gassing,' i.e. escape of excess hydrogen and oxygen resulting from decomposition of the water.

The electrolyte should always cover rather more than the surface of the plates. Lowering of the level is due to evaporation of the water, not the acid, and batteries should occasionally be 'topped up' by careful addition of distilled water. The normal sp. gr. of the electrolyte is 1.2-1.3. It sinks on discharge, but should not be allowed to fall below 1.12 before recharging. The capacity of a battery is stated by the makers in ampere-hours (a.h.) at a given rate of discharge, usually 10 hrs. If a battery is stated to have a capacity of 120 a.h. at a 10-hr rate, it can safely be run on a 12-amp. load continuously for 10 hrs, but if discharged at a higher rate, say 24 amp., it will become discharged in less than 5 hrs. Usually the capacity at double rate is only 75 per cent of that at normal rate. On intermittent load the capacity is somewhat higher. The voltage decreases during discharge, but should never be allowed to fall below 1.8 V.

In alkaline A.s the active material is nickel hydroxide on the positive plate and either cadmium and iron oxides (Jurgner, Ni-Fe) or a mixture of powdered iron, ferrous oxide, and yellow mercury oxide (Edison) on the negative plate. The electrolyte is potassium hydroxide. The voltage on charging may be 1.7 V., but when charging ceases it soon drops to 1.3 V. It should never be allowed to fall below 1 V. The alkaline A. is more robust than the lead A., but it is larger and heavier. The above remarks on charge and maintenance apply also to alkaline A.s.

The widest use of lead A.s is in car batteries. Actually the major portion of the world's production of lead is used for A. plates. Batteries are also widely used in connection with series traction motors for delivery vans with a daily range of 20-50 m., and in trolley buses for manœuvring on depot premises. They are essential for supply to emergency lighting in power stations, factories, workshops, theatres, and cinemas, and for signalling on railways and in power stations, in aircraft and in ships. Their use in radio installations is well known. They are also much used in small, private power stations (q.v.) in connection with a Diesel generator set.

Accumulator, Hydraulic. Lord Armstrong's A. consists of a large cylinder in which a piston works through hemp or leather packing. The piston is driven up by the pressure of water forced in at the bottom of the cylinder by successive strokes from a small engine. When the top of the cylinder is reached a catch operates which automatically stops the engine. The piston is usually weighted so as to provide a pressure of about 700 lb. to the sq. in. The energy accumulated may be used to work cranes, dock gates, or any machinery where intermittent power only is required. There are varieties of the machine where pistons of different diameters are employed to give differences in pressure, and others where steam pressure is accumulated.

Steam accumulators are used on boilers

where the demand for steam is variable. Steam from the boiler is blown into a large cylinder when the demand is low. When load increases a reduction in pressure in the A. releases the steam.

Accursius, see ACORSO, FRANCESCO.

Aceldama (H.V. Akeldama), Aramaic for 'field of blood,' name used for the field bought by Judas (Acts i. 18), or by the chief priests, 'to bury strangers in' (Matt. xxvii. 6). It is also called 'the potter's field' (Matt. xxvii. 7, 10). By tradition this field is situated S. of the lower part of the Vale of Hinnom.

Acephali (Gk *akephalos*, headless), name given to sev. religious bodies who rebelled against their bishops and other heads of the Church. It was particularly applied to the Egyptian Monophysites, who declared themselves free from the authority of Peter Mongus, patriarch of Alexandria, in 482.

Acephalous (Gk, 'headless'), term in prosody applied to a line in which, by the normal scansion of the poem, the first syllable is wanting; an example is the second line of:

A red-cross knight for ever kneel'd
To a lady in his shield.

Acer, genus of trees, mostly deciduous, of over 100 species, chiefly native to China and Japan, though *A. campestre* is native to Britain and Europe; *A. macrophyllum*, *A. pennsylvanicum*, *A. rubrum*, *A. saccharum*, *A. saccharinum*, are timber trees of N. America; *A. pseudoplatanus* is the sycamore of Europe; and *A. palmatum* the parent species of ornamental Jap. maples used in the garden. *A. negundo*, N. America, is the box elder. See MAPLE.

Aceraceae, family of shrubs and trees which has for its distinguishing characteristics regular polygamous or dioecious flowers; 5 to 12 stamens; 2 ovules in each carpel. The fruit is double, and has 2 winged samaras; the seed is exalbuminous. The two genera, *Acer* and *Dipteronia*, are found in the N. of Asia, Europe, and America.

Acerbi, Giuseppe (1773 - 1846), It. traveller and naturalist, b. near Mantua. He journeyed through Lapland to Cupe North in 1799, and pub. in England in 1802, an account of his travels under the title *Travels through Sweden, Finland, and Lapland*. He founded a journal, the *Biblioteca Italiana*, at Milan in 1816. Later, as the Austrian consul-general to Egypt, he collected antique objects which he gave to It. and Austrian museums.

Acerenza (anc. *Acherontia*), It. tn in Basilicata (q.v.), in the Bradano valley, 13 m. N.E. of Potenza (q.v.). Together with Matera (q.v.) it forms an archbishopric. The cathedral is built in the Norman style. Pop. 5000.

Acerra (anc. *Aceræ*), It. tn, in Campania (q.v.), 7 m. N.E. of Naples (q.v.). It was once a Rom. tn, and was burnt by Hannibal (q.v.). The cathedral was rebuilt after an earthquake in 1788. There are sulphur springs. Pop. 24,600.

Acestes, mythical king of Sicily, son of the river-god Crimissus by Egesta (or Segesta); a Trojan woman who had been

sent by her father to Sicily to escape the monsters which infested the land of Troy. A. founded the tn of Segesta, and welcomed Aeneas on his arrival in Sicily.

Acetabulum (Lat., 'chalice'), cup-shaped socket in the innominate bone into which the head of the femur fits.

Acetaldehyde, see ALDEHYDE.

Acetamide ($\text{CH}_3\text{CO}\cdot\text{NH}_2$), solid, crystalline compound produced by distilling ammonium acetate in a stream of dry ammonia. As usually prepared it has a strong odour suggestive of mice, but this is due to impurities. It is soluble in water and alcohol, melts at 82° , and boils at 222°C .

Acetic Acid (CH_3COOH), earliest known acid, formed when wines and beer turn sour through exposure to the air. The change is brought about by the agency of bacteria (*Mycoderma aceti*). The bacteria find their way into the liquid from the atmosphere, are nourished by the food contained in the wine, rapidly multiply, and by means of an enzyme they contain cause the oxygen of the atmosphere to react with the alcohol, forming A. A. The sour liquid, or impure acid, is known as vinegar, and is usually prepared from wine that is otherwise unmarketable.

In the Ger. process the wine is allowed to percolate slowly through beech shavings smeared with a culture of *Mycoderma aceti*, meeting a current of air on its downward path. This is known as the 'quick vinegar' process, and requires only three days or so to go to completion.

Commercial A. A. is obtained by the dry distillation of wood in iron retorts at as low a temp. as possible. The products of the distillation are gases, an aqueous liquid, and tar. The liquid contains A. A. mixed with methyl alcohol, acetone, and other impurities. It is treated with quicklime, which causes the A. A. to be converted into calcium acetate. This solution is then evaporated, the tarry products being skimmed off. The acetate is then distilled with concentrated hydrochloric acid and the A. A. is separated. It is mixed with potassium permanganate to oxidise impurities and distilled once more, after which the product is sufficiently pure for commercial purposes. A. A. is also manufactured by passing a mixture of oxygen and acetaldehyde vapour over heated manganese dioxide or granular quartz.

When quite pure A. A. is a colourless crystalline solid, with a pungent smell, a blistering action on the skin, and a sour taste. A 50 per cent solution of the acid has the same sp. gr. as the anhydrous acid, and addition of water to a certain point causes the sp. gr. to rise, although the acid is denser than water. This circumstance renders it impossible to determine the strength of the substance by the use of the hydrometer.

The salts of A. A. are known as acetates, and some of them are of considerable commercial importance. Basic copper acetate, or *verdigris*, manufactured by leaving sheet copper in contact with vinegar, is used as a pigment. Lead

acetate, commonly known as sugar of lead, is used in the manuf. of the basic carbonate of lead (white lead). Ferric acetate and aluminium acetate are both used as mordants to fix the colours in dyeing and printing calico.

Acetic Ether, or **Ethyl Acetate** ($\text{CH}_3\text{CO}\cdot\text{OC}_2\text{H}_5$), a colourless liquid prepared by adding a mixture of alcohol and acetic acid to a mixture of alcohol and strong sulphuric acid, the whole being heated to 140°C . Ethyl acetate is characterised by a pleasant fruity odour, which has led to its being used for flavouring sweets and wines, and in perfumes, etc. It is also a useful solvent.

Acetone ($\text{CH}_3\text{CO}\cdot\text{CH}_3$), or **Dimethyl Ketone**, colourless mobile liquid produced when isopropyl alcohol loses 2 atoms of hydrogen by oxidation (see CRACKING OF PETROLEUM). It is the simplest member of the fatty ketones. A. occurs in small quantities in normal urine, but in far greater proportion in cases of *diabetes mellitus* and *acetonuria*. It is produced during the dry distillation of wood and other organic bodies, such as sugar and gum. Crude wood spirit consists mainly of acetic acid, methyl alcohol, and A. After the acetic acid has been removed by the action of lime, the methyl alcohol and A. are separated by fractional distillation. A. is also prepared by the dry distillation of calcium acetate, but the modern method of manufacture consists in passing the vapour of acetic acid over heated catalysts, e.g. alumina, thoria, or finely divided copper.

A. is miscible with water, alcohol, and ether in all proportions, and is an excellent solvent for many organic compounds, which renders it useful in the manuf. of cordite. It is also used in the preparation of sulphonal, trional, tetronal (drugs), chloroform, iodoform, and viscose rayon.

Acetophenone ($\text{C}_6\text{H}_5\text{CO}\cdot\text{CH}_3$), **Phenyl Methyl Ketone**, or **Acetylbenzene**, crystalline substance melting at 20° and boiling at 202°C . It is a typical member of the aromatic-aliphatic ketone class of compounds. It is most conveniently prepared by treating benzene with acetyl chloride in the presence of aluminium chloride. It is employed as a soporific under the name of hypnone.

Acetyl, the organic group which would result from the elimination of hydroxyl from acetic acid; it therefore corresponds to the formula CH_3CO . It is not stable in the free state (see RADICAL), but is looked upon as the radical of such compounds as A. chloride ($\text{CH}_3\text{CO}\cdot\text{Cl}$).

Acetylbenzene, see ACETOPHENONE.

Acetylene (C_2H_2), colourless gas of disagreeable odour (when impure), formerly used as an illuminant, but now important as an 'intermediate,' i.e. a compound manufactured as a stage in the manuf. of other compounds. It is also used in the oxyacetylene blowpipe for welding, etc. It can be synthesised from its elements by an electric-arc discharge between carbon poles in an atmosphere of hydrogen, but this synthesis, though very interesting chemically, is of no commercial importance. A. occurs in

small quantities in coal-gas, and is produced during the incomplete combustion of many organic substances, such as coal-gas, methane, ethyl alcohol, etc. The most important method of preparation is by the action of water on calcium carbide (CaC_2).

Calcium carbide is prepared by heating carbon with quicklime in an electric furnace. Under the influence of the high temp. the quicklime is converted into calcium, which combines with the excess of carbon, forming calcium carbide, a white solid when pure. It is difficult to eliminate all the impurities from the substance, and the dangers attending the use of A. were formerly due to the presence of impurities as well as to ignorance of the properties of the gas itself.

The method of preparation of A. from calcium carbide consists simply of bringing it into contact with water. The reaction is somewhat violent and is accompanied by the evolution of a considerable quantity of heat. Many types of generators have been invented in which the two substances are brought gradually into contact, either by allowing water to drip slowly upon the carbide, or by throwing small quantities of carbide into the water.

A. burns with a brilliantly luminous flame equivalent to about 240 candles for 5 cub. ft. of gas consumed. The quality of the light approximates to that of sunlight and renders its use advantageous when colour work has to be done by artificial light. It forms with air an explosive mixture which is much more dangerous than a mixture of coal-gas and air. The violence of the explosion is much greater and the limits of explosion much wider, as an explosive mixture is formed by mixing any quantity from 3 to 82 per cent of A., while for coal-gas the limits are from 5 to 28 per cent. Copper combines with A. to form an explosive compound, so that if copper gas fittings are used they must be kept well greased to prevent contact. The flame of A. burning in oxygen reaches a very high temp. (about 3000°C .); the oxy-acetylene blowpipe is therefore extensively employed in engineering and metal-working.

Apart from the use already mentioned, A. finds some application as an anaesthetic (under the name of narylene), and is also the source of valuable non-inflammable solvents such as westrosol (CCl_2CHCl). A number of synthetic rubbers have been developed by Germany since 1927, since the polymers contain butadiene which is synthesised from acetylene. Indeed, acetylene is the starting point for the synthesis of a large number of chemicals, this immense expansion of knowledge playing a fundamental part in Germany's chemical economy during the last war.

Achaea, anct dist. of the Peloponnesus, extending from the R. Larissus along the coast of the Corinthian Gulf to Sicyonia. It is a narrow strip of land bounded on the S. by the Arcadian Mts, and watered

by numerous small streams, many of which are dry in summer. The coast is low and has few good ports. It was originally called Aegialos, afterwards Ionia, sometimes Aegialeian Ionia, and was subsequently occupied by the Achaei, consisting of 12 cities or states. After the Rom. conquest of Greece Achaea comprised all Peloponnesus, with N. Greece, S. of Thessaly.

Achaeian Confederation, see **ACHAEI**.

Achaei (Achaeans), anct Gk people, of disputed origin. Their name first appears in a Hittite inscription of the 14th cent. bc. Homer uses it to denote the whole Gk race as far N. as Thessaly; but in classical times it was limited to the inhab. of a strip of land on the N. coast of Peloponnesus between the Gulf of Corinth and the mts of Arcadia. Twelve cities (Pellene, Aegira, Aegae, Bura, Helice, Aegium, Rhypae, Patrae, Pharae, Olenus, Dyme, and Tritaea) formed a league for mutual protection; but the Achaeian League played only a small part in affairs until c. 251 bc, when Aratus united to it his native tn, Sicyon. Corinth, Megaris, Epidaurus, Troezen, and Sparta also joined, and the league became the chief political power in Greece. It was, however, destroyed by the Romans, who under L. Mummius defeated Diaeus, the Achaeian general, and burned Corinth (then the chief tn of the league) to the ground, 146 bc. S. Greece then became the Rom. prov. of Achaea.

Achaemenes founded c. 700 bc a small kingdom at Parsumash, in the foothills of the Bakhtiari Mts to the E. of Shushtar, under Elamite overlordship. His son and successor, Teispes (675-640), enlarged the kingdom, which was divided on his death between his two sons, one of whom, Cyrus, is regarded as the first of the Achaemenid emperors of Persia.

Achaemenid Art, see **PERSIAN ART**.

Achaemenids, or **Achaemenidae**, name of the dynasty of Persian kings founded by Cyrus, grandson of Achaemenes.

Achard, Franz Karl (1754-1821), Ger. author of Fr. origin, wrote works on experimental physics, chem., and agric.; was the first to manuf. sugar from beet-root; and became director of the physical class at the Academy of Sciences, Berlin.

Achates accompanied Aeneas after the siege of Troy. In Virgil's *Aeneid* he is called *Fidus Achates*, a term often used for any faithful companion. A. is also the name of a riv. in Sicily.

Achelous, or **Aspropotamos**, largest riv. in Greece, rises in the Pindus Mts and flows S. into the Ionian Sea, its length being from 120 to 140 m. It cuts through deep gorges to a swampy delta, off which lie the Echinades Is., mentioned by Homer, Herodotus, and Thucydides. The god of this riv., the son of Oceanus and Tethys and the eldest of 3000 brothers, fought against Hercules for Deianira, was conquered, took the form of a bull, but was again conquered, Hercules taking one of his horns, which, however, he recovered by giving up the horn of Amalthaea. The Naiads changed the horn taken by Hercules into the horn

of plenty (Ovid, *Melam.* ix. 87). A. was considered to be a great divinity throughout Greece.

Achenbach, Andreas (1815-1910), Ger. painter and etcher, b. Kassel. He studied at Düsseldorf, and under Schadow, becoming one of the most remarkable representatives of the school formed by that master. His work consisted almost entirely of landscape paintings—views of Holland, especially of the canals, the North Sea, the Alps, Norway, Italy, and the Rhine. The titles of some of them are 'Hardanger Fjord,' 1843; 'Pontine Marshes,' 1846; and 'Fish Market at Ostend,' 1866.

Achenbach, Oswald (1827-1905), brother of Andreas A., was also a landscape painter, his works consisting almost entirely of lt. scenes. Most of his pictures are in the Ger. museums, but the Luxembourg acquired his 'Pier of Naples.'

Achensee, Austrian lake, the largest and most beautiful in the Tirol. 25 m. NE. of Innsbruck, it is 6 m. long.

Acheron, name of sev. rvs.: 1. Trib. of the Alpheus in Elis.

2. Riv. in Thesprotia, Epirus, flowing through Lake Acherusia into the Ionian Sea (Livy, viii. 24).

3. Riv. in Brutii, S. Italy, on which Alexander of Epirus perished (Livy, viii. 24).

4. Riv. in the lower world, round which the shades hover (Virgil's *Aeneid*, vi).

Acherontia, see ACERENZA.

Acherusia, Gk and Rom. name for many lakes, marshes, and caverns supposed to be connected with the lower world. The Acherusian Marsh where Acheron rose is in Epirus; the Lago di Fusaro into which Acheron was said to flow is in Campania.

Acherusia Palus, see FUSARO, LAKE OF.

Achery, Jean Luc d' (1609-85), Fr. Benedictine monk, b. at St Quentin. His chief work is a collection of documents concerning eccles. history entitled *Spicilegium*, 1653-77. Also collaborated with Mabillon in the *Acta Sanctorum* of the Benedictines, pub. 1733-8.

Acheson, Dean Gooderham (1893-), Amer. lawyer and politician, educ. at Harvard and Yale Univs. After being a successful lawyer he was assistant secretary in the State Department in Roosevelt's administration; under secretary, 1945-7, and secretary of state, 1949-53. As such he was in office throughout the critical period of the Korean War, when his moderate policy made him the target of violent Republican criticism.

Achi Baba, hill in Gallipoli, 709 ft high, 6 m. from Cape Helles. In the Gallipoli campaign (1915) it marked the limit of the Brit. advance. On its slopes Turkish forces numbering 200,000 men, protected by masses of artillery and machine guns, in an elaborate trench system, easily withstood repeated attacks by the Brit. 29th and the Anzac divs.

Achiet-le-Grand, Fr. vil. and railway junction, in Somme dept, which, in the First World War, was taken by Gen. Byng's army in 1917; recaptured by the Germans in the Somme battle of 1918,

and finally retaken by Gen. Byng on 21 Aug. 1918.

Achievement, see HERALDRY, Supporters.

Achill Island, co. Mayo, Rep. of I., the largest is. off the Irish coast, comprising over 36,000 ac. It is mountainous and heather-covered. The prin. vills. are Achill Sound, Dooagh, Dugort, which has seal caves under the cliffs of Slievemore (2204 ft) and Keel. Keem Bay lies below Croaghnaun (2192 ft). Shark-fishing is an industry.

Achillas, minister of the young Egyptian king, Ptolemy XII, with Lucius Septimius murdered Pompey and supported the king against Cleopatra. A. led the army against Caesar, until he was put to death by Cleopatra's younger sister Arsinoë, 47 BC.

Achillea (from Achilles, who received knowledge of the properties of plants from Chiron), a genus of perennial herbs of the Compositae. *A. millefolium*, common milfoil, or yarrow, is native to Britain. *A. pharnacia*, sneezewort, and *A. siberica* are good border flowers.

Achilles, hero of Homer's *Iliad*, son of Peleus, king of the Myrmidones in Phthiotis, Thessaly, and of the Nereid,

ACHILLES

Alinari

Greek sculpture in the Louvre, Paris.

Thetis. Educ. by Phoenix in eloquence and the art of war, and by Chiron, the centaur, in the healing art, he was the bravest of the Greeks, leading his troops of Myrmidones, Hellenes, and Achaeans in 50 ships against Troy. His quarrel with

Agamemnon about the beautiful Briseis caused him to sulk away from the war. Patroclus, however, persuaded A. to allow him to fight with A.'s men and armour, and when Patroclus was slain by Hector A. returned to the war. He then killed Hector, whose body he gave up to Priam, Hector's father, after dragging it thrice round Patroclus's tomb. (The *Iliad* closes with the burial of Hector.) A. was killed in the battle at the Scaean gate before the capture of Troy.

Achilles Tatius (3rd cent AD), Gk writer of Alexandria. His *Romance of Leucippe and Clitophon* influenced the growth of the novel in Europe. There is a text and trans. by S. Gaselee in the Loeb Library (1917). See E. H. Haight, *Essays on the Greek Romances*, 1943.

Achilles' Tendon, see **TENDON**.

Achilleum, tn on the promontory of Sigeum in the Troad, which was said to contain the tomb of Achilles.

Achillini, Alessandro (1463-1512), surgeon and philosopher, b. and d. at Bologna, was one of the first to dissect the human body. His chief works are *Corporis humani anatomia*, Venice, 1516, and *Anatomicae annotationes*, Bologna, 1520.

Achillini, Giovanni Filoteo (1466-1538), It. poet, brother of Alessandro, b. Bologna, where in 1511 he founded the Academy of Viridario. Among his works are *Il Viridario*, 1513; *Il Fedele*, 1523; *Annotazioni della lingua volgare*, 1536.

Achimenes (from Gk *a*, without; *cheimōn*, winter), tropical Amer. genus of plants, family Gesneriaceae, much cultivated for their flowers. A. *grandiflora* and its varieties are most esteemed for green-houses. They grow by means of their rhizomes, the leaves are variegated, and the flowers are variously coloured.

Achin, or **Atejh**, region in the NW. of the is. of Sumatra, with an area of about 21,300 sq. m. The is. has a backbone of mt. ranges from which numerous small rivs. descend to the coast on either side. The inhab. of A. are distinct from the other inhab. of the is., and hold themselves aloof. They have an admixture of Arab and Hindu blood. In their religion they are Muslims and retain the Muslim robe and turban. They are more industrious and intelligent than the neighbouring peoples, but they are very treacherous and unreliable. The social organisation of the Achinese is communal. The ter. was rich in gold and attracted merchants from the 16th cent., but the Achinese persistently opposed the estab. of commercial relationship with European countries. Much fighting precluded the Dutch estab. in A. in the year 1875. Pop. 1,000,000.

Achish, Philistine king of Gath who sheltered David from Saul, and was put to death by the latter (1 Sam. xxi).

Achitophel, or **Ahitophel**, native of Giloh in Judaea, and a counsellor of King David. He assisted Absalom in his rebellion (2 Sam. xv, xvi), and hanged himself when Absalom preferred the advice of Hushai (2 Sam. xvii).

Achondroplasia, congenital condition

in which bone formation within the cartilage does not occur in the normal manner. A. results in stunted growth of the long bones and of the bones of the base of the skull. A. is an inherited defect.

Achromatism, condition of a lens or combination of lenses in which chromatic aberration is almost absent; that is, where the object as seen through the lens has no coloured border. See **ABERRATION** and **LENS**.

Achromatopsia (Gk *a*, without; *khroma*, colour; *opsis*, sight), see **COLOUR-BLINDNESS**.

Acid, in chemistry, a substance capable of splitting off protons (q.v.), or which yields hydrogen ions when dissolved in water; or alternatively (but less comprehensively) a substance containing hydrogen which can be replaced by metals with the formation of salts. The earliest A. known to man was vinegar or dilute acetic A., whence the notion of acidity (*acidus*, acid) was bound up with that substance (*acetus*, vinegar). Nitric A. and sulphuric A. were known to the alchemists of the Middle Ages as being capable of dissolving substances otherwise insoluble. In 1668 Tachenius observed that all A.s could combine with alkalis to form salts. Boyle was therefore enabled to assert the following properties of A.s: (1) they act as solvents; (2) they precipitate sulphur and other bodies from their solution in alkalis; (3) they turn blue vegetable colouring matter red, which can be turned blue again by addition of an alkali; (4) they react with alkalis to form neutral salts. Lavoisier divided all substances into A.s, bases, and salts, the chemical characteristic of A.s being that they were produced by oxygenation. It was pointed out by Berthollet that prussic A. and hydrogen sulphide acted as A.s but did not contain oxygen, and Davy in 1808-10, by investigating the nature of hydrochloric A., helped to overthrow the oxygen theory, which gave place to a dualistic conception by which A.s were divided into two classes, oxyacids and hydracids, their salts being known as amphot salts and haloid salts. Later Berzelius enunciated his electro-chemical theory that in chemical combination there is neutralisation of opposing electricities. Every compound is thus divided into 2 parts, 1 positive and 1 negative. Sodium sulphate, for instance, was looked upon as soda and sulphuric A., each of those being again divisible into 2 parts. The effects of electrolysis, however, did not confirm this theory. In 1838 Liebig investigated organic A.s, and as a result propounded the theory that A.s were simply compounds of hydrogen, the replacing of which produced salts. Further, some A.s contained more than 1 atom of replaceable hydrogen, so that the formation of different salts of the same metal was explained. A.s containing 1 replaceable atom of hydrogen are known as monobasic; those containing 2, dibasic; those containing 3, tribasic; and so on.

The great majority of organic A.s are characterised by the presence of a

carboxyl group, $\text{CO}\cdot\text{OH}$, and their basicity is determined by the number of carboxyl groups. The prin. groups of organic A.s are the aliphatic and aromatic A.s. The aliphatic A.s may be looked upon as derivatives of the paraffins, the alcohols, and the aldehydes; the aromatic A.s are derivatives of benzene. Organic A.s yield metallic salts with bases, and esters (formerly known as ethereal salts) with alcohols.

Some A.s are used in medicine in a dilute form; when strong many of them are powerful poisons. They enter largely into manufs. For the properties and uses of particular A.s the separate headings may be consulted.

The chief inorganic A.s are: boracic, carbonic, chromic, hydrochloric, hydrobromic, hydriodic, nitric, nitrous, phosphoric, phosphorous, sulphuric, sulphurous, and hydrogen sulphide.

Organic A.s: acetic, benzoic, citric, formic, gallic, lactic, malic, oxalic, palmitic, salicylic, stearic, tartaric.

Among organic A.s not containing a carboxyl group may be noted hydrocyanic (prussic) A. (HCN), cyanic A. ($\text{HO}\cdot\text{CN}$), thiocyanic A. ($\text{HS}\cdot\text{CN}$), picric A. ($\text{C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$), and uric A. ($\text{C}_5\text{H}_4\text{N}_4\text{O}_3$).

The strengths of A.s are compared by measuring their hydrogen-ion concentrations at equivalent dilutions.

The acidity of a liquid is often represented in terms of the symbol pH , which stands for $-\log. (\text{H}^+)$, where (H^+) is the hydrogen-ion concentration in gramme-equivalents per litre. A knowledge of the pH of liquids is often very important in medicine, agriculture, biology, food analysis, etc.

Acid-amides, amides compounds which may be regarded as being derived from ammonia by the substitution of the acid or acyl groups for atoms of hydrogen. They are called primary, secondary, tertiary, etc., according to the number of atoms of hydrogen displaced. The chief are *acetamide* and *formamide* (qq.v.).

Acid Carbonate, see **BICARBONATE**.

Acid Rocks, igneous rocks containing more than 65 per cent of silica (SiO_2). The plutonic acid rock granite and types closely associated with it are among the most important components of the continental masses. Volcanic A. R. such as rhyolite, though less abundant, are widespread. See **IGNEOUS ROCKS** and **GRANITE**.

Acidalius, Valens (1567-96), commentator and Lat. poet, b. Wittstock, Brandenburg, wrote excellent commentaries on Velleius Paterculus, Tacitus, and other classical authors.

Acipenser, see **STURGEON**.

Acireale, coastal tn and bathing resort in Sicily (q.v.), on the E. coast, 8 m. NE. of Catania (q.v.). It is at the SE. foot of Mt. Etna (q.v.), and has a fine 17th-18th-cent. cathedral, which sustained some damage during the Second World War. There is a trade in wine, citrus fruits, silk, and sulphur, and there are hot mineral springs. Pop. 39,200.

Acis, Sicilian shepherd, son of Faunus and the nymph Symaethis, who was killed

with a rock by Polyphemus, the Cyclops, his rival for Galatea. Neptune changed him into a stream at her prayer. See **Ovid**, *Metam.* xiii. 750-968.

Ackermann, Louise Victorine Choquet (1813-90), Fr. poetess of strength and originality, but of pessimistic philosophy. Her chief works are *Contes en vers*, 1855; *Contes et poésies*, 1863; *Poésies philosophiques*, 1874; *Pensées d'une solitaire*, 1883. See **Anatole France**, *La Vie littéraire*, 1892.

Aekworth, see **PONTEFRACT**.

Acland, Sir Henry Wentworth Dyke (1815-1900), physician. He was Radcliffe librarian, Oxford, for over forty years, during which time he encouraged the study of natural sciences and medicine. Pub. in 1856 a memoir on cholera at Oxford, 1854; also pub. works on health; collaborated with John Ruskin in *The Oxford Museum*, 1859.

Aclinic (Gk *a*, without; *klinein*, to bend) **Line**, known also as the magnetic equator, is an imaginary line passing round the earth where there is no dip (q.v.) of the magnetic needle.

Acne, common, usually chronic, inflammatory disease of the sebaceous glands (q.v.), associated with seborrhoea (see **SKIN**), and occurring mostly about the face, chest, and back. It is related to endocrine development. The lesions may be papular (consisting of hard pimples) or pustular (containing matter). The disease occurs usually between the ages of puberty and 24 years, is usually worse in winter, and is associated with menstrual and gastro-intestinal troubles. The individual lesions consist of pink, pointed pimples in the centre of which there is a black-topped comedo, or blackhead. Occasionally a parasite, *Demodex folliculorum*, is found in each comedo. Treatment consists in steaming the face and then expelling the blackhead by the use of a small tube. Gentle friction is helpful, and irritation should be allayed by the application of cold cream.

A. rosacea is a distinct disease from the above. It is marked by redness of the nose accompanied by the formation of pimples. Although often thought to be due to alcoholism, it may occur in quite abstemious persons. It is apt to occur in conditions in which flushing is marked, hence it is often associated with the menopause in women.

Acemetæ (Gk *a*, without; *koimasthai*, to sleep), order of Gk monks founded about the middle of the 5th cent. who divided among themselves their service in such a manner that it was continuous and unceasing. A Rom. named Studius founded their famous monastery at Constantinople in 471. Pope John II excommunicated them in 533 for denying the suffering in the flesh, and consequently the incarnation, of the 2nd Person of the Holy Trinity.

Acolhuas, Acolhuans, or Acolhuas, tribe of central Mexico which is said to have founded the settlement of Tezcoco. They were a peaceable people, second in greatness only to the Aztecs.

Acolytes (Gk *akolouthēin*, to follow),

assistants to bishops and priests, who minister in the Christian sanctuary, lighting candles, serving mass, carrying lights, etc. Originally they formed a minor order.

Aeoncagua: 1. Prov. in Chile, S. America, the cap. of which is San Felipe. It is very mountainous in the E., and its fertile valleys, including that of the Aeoncagua riv., have subtropical vegetation. It is rich in mineral resources. The N.-S. line is very important to Chilean communications. Area about 3940 sq. m.; pop. 113,550.

2. Mt. peak of the Andes, on the frontier of Mendoza, Argentina, and Chile. It is an extinct volcano 22,835 ft high, and is probably the highest peak in S. America. First climbed in 1897. See E. A. FitzGerald, *The Highest Andes*, 1899. Ojos del Salado, lying between Chilean Atacama and Argentine Catamarca provs., is claimed to reach 23,292 ft.

Aconcio, Giacomo (Lat. *Jacobus Aconcius*) (c. 1500-c. 1566). It. theologian, b. Trent and d. London. He became a convert to Protestantism, and dedicated his *Stratagemata Salanae*, 1565, to Queen Elizabeth I.

Aconite, Winter, *Eranthis hyemalis*, species of the Ranunculaceae common in England. The solitary yellow flowers appear in Feb.-Mar. before the leaves.

Aconitin, vegetable alkaloid found in aconite which is one of the most powerful poisons known. It is inodorous, intensely bitter, and produces a tingling sensation, which causes it to be useful when applied externally in the treatment of neuralgia, gout, and rheumatism. As a poison it causes death by asphyxiation.

ACONITUM (MONKSHOOD)

Aconitum, Monkshood, or Wolf's-bane, genus of plants belonging to the Ranunculaceae, all species of which are poisonous. They are hardy, herbaceous plants, many of them of great beauty, and may be recognised by the galeate or helmet-shaped posterior sepal. *A. napellus*, the monkshood, a common

Brit. flower, whose blue helmet-shaped flowers appear in summer, is one of the most deadly species; *A. ferox*, the *bikh* or *bish* of Nepal, contains the fatal bikh poison in its root. In England *A.* is often called wolf's-bane, and in France *tue-loup*, or kill-wolf.

Aconitum, Properties of. As plants of this genus are of a poisonous character and contain the alkaloid *aconitin*, great care must be taken to use only *A. napellus* in medicine. The leaves, when chewed, produce a tingling sensation, but the root causes numbness as well as tingling. It diminishes the rate of the pulse and the heart-beats when taken internally, but leaves the brain unaffected. For internal use it is in the form of tincture or extract, and is employed as a sedative to the stomach, and as a relief in fevers and nervous diseases; for external use it is formed into ointments or liniments, and relieves neuralgia. In cases of aconite poisoning the stomach must be immediately emptied, until when no stimulants should be given; artificial respiration and application of hot-water bottles to the extremities will also probably be necessary.

Aconitius, beautiful youth of the is. of Ceos. To win the love of Cydippe, daughter of a noble Athenian, he threw before her, in the temple of Diana, an apple, on which he had written the vow: 'I swear by the sanctuary of Diana to marry A.' Cydippe picked it up, read it aloud, and threw it away; but the goddess had heard her, and when Cydippe was about to marry another she fell so ill that her father married her to A. (Ovid, *Heroides*, 20, 21).

Aconitius, Jacobus, see ACONCIO, GIACOMO.

Acorn, fruit of the *Quercus*, or oak (q.v.). It is a nut, being a large, dry fruit, which does not break open to free the seed, and its base is enclosed in a cupule. The A. cups of *Q. aegilops*, known as valonia, are used for tanning.

Acorn-shells, popular name of the crustacean *Balanus*, of the order Cirripedia and family Balanidae. The testa is white and consists of 6 pieces; the animals exist in all seas and are attached to rocks, shells, and floating bodies.

Acorus, genus of plants of the Araceae which has 2 species. *A. calamus*, the sweet flag, and *A. gramineus*, a Jap. flower. The sympodial rhizome has a sweet-scented oil, and by its branching reproduces the plant vegetatively.

Acosta, Gabriel, or Uriel d' (1585-1640). Portuguese, b. Oporto of noble birth. He was brought up as a Catholic, but adopted the Jewish faith and went to Amsterdam, where he opposed the Jewish teaching. For his *Examen dos tradiçoes phariseas*, 1624, he was charged with atheism, punished, and excommunicated. He shot himself in 1640. He is often regarded as a precursor of Spinoza.

Acosta, Joaquín (1799-1852), S. Amer. traveller, explored the valleys of the Andes and Socorro to the Magdalena in 1834, and studied Indian tribes in 1841.

Chief work, *Compendio histórico del descubrimiento y colonización de la Nueva Granada en el siglo XVI*, 1848.

Acosta, José de (1539-1600), Sp. writer, b. Medina. He was a Jesuit, and became prof. of theology at Ocaña. From 1571 to 1588 he lived in S. America as a missionary; during that time he wrote a hist. of that continent, pub. at Seville in 1590 under the title of *Historia natural y moral de las Indias*. An Eng. trans. of this work by E. Grimston was pub. in 1604. A. became a great favourite with Philip II and held various dignities. See L. Lopetegui, *El padre José de Acosta y las misiones*, 1942.

Acouchi, popular name of the *Dasyprocta acouchi*, found in Guiana and the Is. of St Lucia and Granada. It differs from the other agoutis (q.v.) in possessing a tail of about 2 in. in length instead of a mere tubercule.

Acoustics, term formerly applied to that branch of physics which deals with phenomena associated with sound waves. In recent years, however, there is a tendency to restrict its use to those properties which make a room or hall suitable or otherwise for hearing music and oratory. Sound waves are movements in the air which proceed in all directions from the source. The quality of the sound as heard by the audience is affected by reflection from the surfaces of objects in the building. The bad A. of a building are due to surfaces and apertures having dimensions which are large compared with the wave-length of the sound. In a large, bare hall, for example, there is considerable reflection from the roof and walls, so that the sounds heard are mingled with the echoes of those gone before. If the hall is large and has no peculiarities of structure, these echoes may be dissipated into negligible small waves by breaking up the surfaces with drapery, and by the floor being well occupied with chairs and people. All auditors of a concert ought to be in view of the performers to get the right effect, because if the sound waves have to flow round obstacles the small waves are cut off so that the quality of the music is changed. Everyone has experienced the change in the effect of the music when a band comes round the corner. At first one hears the drums and heavy instruments; the lighter clarinets, piccolo, etc., contributing their proper effect only when the band comes in full view.

One way to improve the A. of a large hall is to coffer the ceiling and walls and to render the coffers or sunk panels absorbent. As a complete determination of the possible echoes and focusing effects in an auditorium presents a complicated problem, it is in most cases sufficient to study sections through the building, and there are sev. methods of studying the reflecting characteristics of sections. Thus the necessity for imitating buildings of good design has disappeared with the modern practice of calculation from drawings, combined with tests on a model with the aid of ripple-tank and sound-camera.

A common method of locating echoes is by means of the 'echo-spotter,' a device for projecting a parallel pencil of sound waves of high frequency.

The problem of constructing a building with good A. is somewhat difficult to solve, because the building must be erected before its qualities in that respect can be demonstrated with certainty. Sensitive flames may be used to distinguish the effect of large obstacles and apertures, but experiment in these matters has led to no very satisfactory results. The whispering gallery, which is such an interesting feature of some churches, illustrates the effect of echoes; a whisper at one focus of an ellipsoidal roof is reflected at all points in the roof, bringing all reflections to a focus at one point, with the result that the whisper appears magnified many times. Consult W. C. Sabine, *Collected Papers on Acoustics*, 1927; A. H. Davis and G. W. C. Kaye, *The Acoustics of Buildings*, 1927; Sir James Jeans, *Science and Music*, 1937; H. Bagenal, *Practical Acoustics and Planning against Noise*, 1942.

Acquapendente, It. tn in Lazio (q.v.), on the Paglia, 22 m. NW. of Viterbo (q.v.). It is built on a precipitous mass of rock, 1400 ft above sea level, and has a fine cathedral. There was some damage during the Second World War. Girolamo Fabricius (q.v.) was b. here. Pop. 7000.

Acquaviva Delle Fonti, It. tn in Apulia (q.v.), lying at the foot of the Apennines, 16 m. S. of Bari (q.v.). Pop. (com.) 12,300.

Aquai (Rom. *Aquae Statiellae*), It. spa, in Piedmont (q.v.), on the Bormida, known since Rom. times for its hot sulphur springs. It has a medieval castle and a Gothic cathedral (partly 11th cent.). Napoleon defeated the Austrians here in 1796. Pop. (tn) 16,100; (com.) 18,200.

Aquisti, Luigi (1744-1824), It. sculptor, b. Forlì. The scenes of his labours were Bologna, Rome, and Milan, and his masterpiece is a group of 'Venus and Mars.'

Acquittal (from O.F. *aquiler*, to free or discharge), the setting free by a court of a person charged with a crime. In an Eng. court there must first be a verdict of 'Not guilty,' in a Scottish court of 'Not guilty' or 'Not proven.' A. by a jury must, however, be confirmed by the judge. If after an A. the person is again charged with the same offence, and if he can prove that he has been formerly acquitted (or pardoned), he is entitled to be discharged.

Acrolein, see **ACHOLEIN**.

Acre, or Acco (called **Ptolemais** during the sovereignty of the Greeks in Syria), tn on the coast of Israel, built on a small promontory which, with Mt Carmel to the S., forms a circular bay. It was taken by the crusaders, 1104; retaken by Saladin, 1187; taken by the crusaders under Philip Augustus of France and Richard I of England, 1191, and given to the Knights of St John; fell into the hands of the Egyptians, 1291; taken by the Turks, 1617; besieged by Bonaparte for 61 days, 1799, but saved

from assault by Jezzar Pasha and Sir Sidney Smith; taken by Ibrahim Pasha, 1832; taken by the English, Austrians, and Turks, 1840, Ibrahim Pasha returning to Egypt. Afterwards it was restored to the Turks. It was captured by Brit. forces under Gen. Allenby in 1918. Although awarded to the Arabs by the United Nations, it was captured by the Jews on 17 May 1948, and became part of Israel. A. is one of the most picturesque places in Palestine. The walls and earthworks—a perfect example of the late 18th-cent. fortress—are almost intact. From the direction of Haifa a good view is obtained of the S. battlements, the ruins of the 'Tower of Flies,' and the remains of the Phoenician breakwater. The tn itself is entered by an archway in which stand the original iron-plated gates. Within the gate is the 'White Market,' with its curious vaulted roof, and the general markets and bazaars extend along towards the harbour. Among its *khans* the most notable is the Khan Shahwarda, which contains old cannon of the time of Sir Sidney Smith. Of its 6 mosques, that built by Jezzar Pasha at the close of the 18th cent. is the most graceful, with its colonnaded courtyard. Under the citadel, which was either built or reconstructed by Abdallah Pasha in 1820, and under the girls' school opposite, are the crypts of the residence of the Knights of St John. In an adjoining part of the citadel is a small museum containing Phoenician glass and treasures uncarthed in the castle of Montfort. About half a m. to the E. of the walls is Tel ul Fukhar, where Richard I pitched his tent in 1190; and from this place, too, Napoleon directed operations in 1799. Pop. 17,000.

Acre = 4840 sq. yds = 160 sq. poles = 10 sq. chains. This is the statutory A. Historically it is the Eng. A. as distinct from the obsolete Scottish and Irish A.s of 6150.4 and 7840 sq. yds respectively. These magnitudes present an intriguing geometric aspect which can be illustrated by saying that an Eng. circular A. will fit in a Scottish square A.; a Scottish circular A. in the Irish square A.; and this Irish A. as a circle has a diameter of 100 yds, which is that of the outer earthwork circle at Stonehenge. See A. E. Berriman, *Historical Metrology*, 1953. See also METROLOGY.

Acre Territory, W. Brazil, on the borders of Peru and Bolivia. Famous rubber dist. Ceded by Bolivia, after negotiations led by Baron Rio Branco, in 1903. Area 59,139 sq. m.; pop. 115,000.

Acri, lt. tn, in Calabria (q.v.), 16 m. NNE. of Cosenza (q.v.). Pop. 16,000.

Acridine, $C_{12}H_8N_2$, organic compound found in crude coal-tar anthracene and used in the manuf. of dye-stuffs. It is crystalline, melting at 108° C.

Acisius, son of Abas, King of Argos, and father of Danaë (q.v.). See also PERSEUS.

Acrobat (derived from a Gk word meaning, literally, to walk on tiptoe), name applied to all those performers who exercise their skill in difficult physical feats. A.s can be divided into:

Acrobats pure and simple, who are essentially gymnasts and do amazing twists and turns with their bodies, walk on their hands, or perform on ropes or various kinds of apparatus, the more seemingly unsuited to the performance the better. These include tumblers, who specialise in falling from seemingly impossible heights into seemingly impossible positions and who never seem to hurt themselves. Tumbling also forms part of the art of a true clown—as typified by Charlie Chaplin. The appeal of seeing another human being fall over and get

Hulton Picture Library
THE TOVARICH TROUPE

into danger of severe injury is universal. Oriental A.s and tumblers are unequalled. They are adepts at forming human pyramids, mounting on each other's shoulders, limbs, and heads, and all supported by the central figure of the strong man—or 'underman.' Equilibrists, who balance themselves on tops of poles or on each other's hands and feet, are also A.s.

Trapeze artists, who are not A.s in the strict sense of the word but are more truly gymnasts, form the most sensational part of any circus or entertainment in which they perform. On their trapezes high above the ground and over the heads of the audience they perform the most sensational feats of daring and skill. Often a slip would be fatal. They can perform solo, in pairs, or in almost any number, and there are male and female trapeze artists of equal skill. As they swing in the air one leaves go, turning in

mid air, and is caught by the other with perfection of timing and physical effort. The skill of the 'catcher' is equal to that of the 'flier.' Hanging by his knees upside-down, swinging to and fro, he must so time himself that he catches the hands of his partner who hurls himself or herself at top speed from the other swinging trapeze, often doing somersaults *en route*. The catcher must not fail—it might easily mean death. Although the art of trapeze artists is old, the first to create a real sensation in this country was Leotard, who became known as 'The Daring Young Man on the Flying Trapeze.' He came to the Alhambra, Leicester Square, London, in the 1860's when that place was part music-hall and part circus, and electrified all beholders by his skill. Despite the daring of his tricks he never had an accident, but he *d.* young, at the age of 28. Victor Julien was another famous trapeze artist, but was outshone by Niblo, who did a double somersault in mid air between trapezes; he was surpassed by 'Lulu,' who did a treble somersault. Despite name and appearance 'Lulu' was a young man named Farini. The quadruple somersault is regarded as the blue riband of the trapeze act. There are trapeze artists of immense skill to-day, and the thrill they provide never palls.

Wire walkers; tightrope walkers. Walking the wire is an extremely specialised acrobatic feat. An early performer in this country was Hengler, who founded the circus family of that name, and who was a famous rope-walker (for tightrope walker and wire walker mean the same thing, the wire having eventually supplanted the rope used in earlier days). Walking the rope or the wire was—and is—performed by both men and women. Madame Saqui was an early female rope walker. She performed at night, in the open air with fireworks going off all round her. The greatest performer of all time was Blondin (q.v.), and many now living saw his astounding feats of balance. He walked across the Niagara Falls on the tightrope—a feat also performed by Harvey, a Canadian tightrope performer. Tightrope or high wire walking is not so prevalent to-day as it once was, but recently some incredible feats on the wire were performed by a Russian troupe which visited London with the Russian Circus—a circus with a wonderful tradition. The slack wire was much lower than the high wire or tightrope, and it was not stretched tensely but sagged in the middle. This was used more often on the music-halls than in circuses, although it was common to both and required just as much skill. Performers like Jolly Johnny Jones could do back somersaults on the slack wire and maintain their balance when swaying from side to side at immense speed. The tightrope or high wire exponent usually carried a long weighted pole to maintain equilibrium, and the slack wire performer used either a paper parasol or nothing at all.

Trampoline acts are a never-failing source of delight in circus or in variety. It is a form of acrobatic and balancing

art. The trampoline consists of a large sheet of canvas fixed to an apparatus which looks like the body of a bedstead. Beneath the canvas are powerful springs. The trampoline artist bounces high in the air, in ever-ascending height, falls on his face or back, rebounds on to his feet with apparent ease, and does all sorts of acrobatic tricks whilst bouncing like a ball. It all seems too easy until the inexperienced person tries it and discovers it to

Hulton Picture Library

KARL CARSONY, BALANCING ON ONE FINGER ON A BOTTLE, A TRICK WHICH TOOK HIM 5 YEARS TO PERFECT

be a miracle of mental and physical timing.

Kisley acts consist of balancing, mostly by the feet. The main performer lies on his back on a wooden frame, extends his legs in the air, and juggles with barrels, balls, and all sorts of objects, controlling them only with his feet. He does the same with human partners, throwing them round and round, up in the air, but never missing.

There are many other types of act, such as pole balancers, and ladder acts where a man or woman will ascend a ladder and balance thereon with no other support, performing tricks as he does so. Trick cyclists also perform—one, an

Amer. named Eddie Gifford, used to dive from the roof of the London Hippodrome into a tank of water on a bicycle, and he had only one arm. Another named Diavolo looped the loop on a bicycle round a wooden hoop of wide dimensions of which the arc in mid air, at the top of the loop, was missing entirely.

There are also A.s who stand on balls, and by strength of foot force them up steep inclines and circular ramps surrounding towers and down again. See CIRCUS.

Acroceraunia, promontory in Epirus, Greece, on the coast of the Ionian Sea, ending in Cape Glossa. Because of indentations and the deposit of silt the coast has always been dangerous to shipping.

(q.v.) is sometimes associated with A. When the growth in the anterior pituitary body is extreme pressure may interfere with the function of the optic nerves (the optic chiasma), leading to disturbances of vision and sometimes blindness. There is no certain treatment for A., but irradiation of the pituitary body has been tried.

Acromion (Gk *akros*, extreme; *ōmos*, shoulder), apophysis which in man constitutes the termination of the spine of the scapula, or shoulder-blade; it articulates with the extremity of the clavicle, or collar-bone, and gives attachment to the trapezoid and deltoid muscles. See SHOULDER.

Acropolis (from Gk *akros*, high; *polis*, city), fortified hill, rock, or elevation of ancient Greece. Among these strongholds

THE ACROPOLIS, ATHENS

Acro-Corinthus (Gk *akron*, a peak), steep rock, 1886 ft high, which is near the city of Corinth, in Greece. It contains the ruins of the Acropolis, ancient fortifications, a temple of Aphrodite, and the famous well, Pirene.

Acrodus (from Gk *akros*, at the top; *odus*, tooth), fossil fish found in the Triassic system.

Acrogaster (from Gk *akros*, at the top; *gaster*, belly), genus of fossil fish of the Berycidae, found in the Cretaceous system.

Acrolein, or **Acraldehyde** ($\text{CH}_2 = \text{CH} \cdot \text{CHO}$), colourless liquid formed during the partial combustion of fats. The disagreeable smell produced when a tallow candle is extinguished is due to the formation of A. It is an unsaturated aldehyde, boils at 52° , has an irritating action on the skin, and its vapours cause a copious flow of tears.

Acrolepis, genus of fossil fish found in the Permian system.

Acromegaly (Gk *akros*, extreme; *megas*, great), rare disease occurring in adults and due to an overgrowth of the cells of the anterior part of the pituitary body (q.v.) which causes increased production of the growth hormone (see HORMONES). In A. there is overgrowth of the distal parts of the limbs, the chin, the ears, and usually of the heart. *Diabetes mellitus*

were the A. of Corinth, called Acro-Corinthus (q.v.); that of Larissa at Argos; of Mt Ithome at Messene; of Thebes, called Cadmea; but the chief was the A. of Athens. This (called also Cecropia) is a rock about 150 ft high, 1150 ft long, and 500 ft broad, which in early times was partially surrounded by the Pelasgian wall. Here the first kings of Athens built their palace, and a temple of Athena, the Hecatompelon, existed before the Persian invasion. Later edifices were the Parthenon, the Propylaea, designed by Mnesicles 437 bc, a temple of Nike Apteros, the Erechtheum, the sanctuary of Artemis Brauronia, and the Pinacotheca. Many of the sculptures from the A. were brought to London by Lord Elgin in 1816. See M. L. D'Ooge, *Acropolis of Athens*, 1908; H. Payne and G. M. Young, *Archaic Marble Sculpture from the Acropolis*, 1936.

Acroscopic, formerly **acrostich** (from Gk *akros*, a tip, extremity; *stichos*, a line or row), verse or set of verses whose initial letters form a word, a phrase, or even a sentence. In the *Spectator* Addison notes compound A.s in which the end letters have formed the same word as the initial ones, and sometimes the same letters have run like a seam through the middle of the verse; these are known as single, double, or triple A.s. It has even been found possible to form a pentacrostic, in

which the same name occurs 5 times in so many columns. (Telestich, from Gk *telos*, end, is an analogous composition in which the final letters of the lines are employed.) This poetical conceit is of ancient date. Bishop Eusebius (d. 340) giving in his *Life of Constantine* a set of Gk verses, said to have been composed by the Erythraean sibyl, of which the initial letters formed the words *Iesous Christos Theou Uios Soter* (Jesus Christ, the son of God, the Saviour). These initials in turn form *ichthus*, a fish, which thus came to have a mystical meaning. Each div. of Psalm cxix contains 8 verses, each set of 8 beginning with the same letter, *aleph, beth*, etc. Several early Heb. poems are extant in which consecutive lines or verses begin with the successive letters of the alphabet; they are, we may say, Abecedarian poems. The comedies of Plautus are each preceded by an argument, the initial letters of which, when joined, read as the title of the play, and the Fr. poets from Francis I to Louis XIV partook of this literary trifling. The best-known Eng. A.s are contained in Sir John Davies's *Hymnes of Astraea*, 1599, in praise of the queen, consisting of 26 poems, each of 16 lines whose first letters form the words *Elisabetha Regina*.

Acrotatus (d. 264 bc), son of Areus, succeeded to the throne of Sparta in 265 bc. Before his accession he fought with success against Pyrrhus, King of Epirus, at the siege of Sparta, 272 bc; in the year following his accession he was killed in battle against Aristodemus, tyrant of Megalopolis.

Acroterion (from Gk *akrotērion*, extremity), in architecture, a pedestal placed on the apex or a lower angle of a pediment, and supporting a statue, vase, or other ornament.

Act, in drama, that portion of a play which is divided from other portions by an interval, or *entr'acte*. In the Gk drama there was no such div. of plays, for if the prin. actors were not on the stage the chorus was, but the Rom., like the present-day dramatists, utilised the break in presentation to imply passage of time. Rom. dramatists like Plautus and Terence always wrote their comedies in 5 A.s, as in later times did Shakespeare and some other Elizabethans, but modern writers often content themselves with 4 or 3 exposition, development, and conclusion.

Act of bankruptcy, in law, denotes an A. the commission of which by a debtor renders him liable to be adjudicated bankrupt if a creditor presents a petition against him within 3 months of such A. Such A.s include assignment of his property to trustees for the benefit of his creditors generally; fraudulent transfers of his property; charges on his property by way of fraudulent preference; departing out of the country or leaving his dwelling-house so as to defeat or delay his creditors; filing a declaration of his insolvency or presenting his own petition; notifying any of his creditors that he is about to suspend payment of his debts; or various other acts described in the Bankruptcy Act, 1914.

Act of Congress. A bill or resolution which has been passed by both the Senate and the House of Representatives becomes an A. of C. if accorded the consent of the president. If vetoed by the president and returned for reconsideration, the bill may then become an A. only on being passed a second time by a two-thirds majority in each house. A.s of C. are of two kinds, either public or private, the first being concerned with law and revenue. All resolutions are presented privately by individual members; they may originate in either the Senate or the House of Representatives, except those concerned with revenue, which must be initiated in the latter.

Act of God is the term used in law for any untoward occurrence not arising from human cause or negligence, but from natural causes such as could not reasonably have been expected to be foreseen and guarded against. Damage by storms, lightning, floods, or exceptionally high tides or sharp frosts, etc., may be attributed to the A. of God, and in the absence of any contract to the contrary, no person can be held liable for it. Nearly all insurance forms and shipping charter-parties, and most contracts, have a clause relating to non-liability in the case of an A. of God.

Act of Grace. An A. of the Scottish Parliament which compelled creditors to provide food for their imprisoned debtors who were without means of support. It was amended in the reign of George IV, and since the abolition of imprisonment for debt (1880) it has necessarily lapsed.

Act of Parliament, a law made by the joint action of the 3 estates of the realm—the lords spiritual, the lords temporal, and the Commons; in other words, by the king in parliament. The draft copy of a proposed A. is called a 'bill,' and a bill only becomes an A. when it has received the royal assent. This may be given either by the sovereign in person or by lords commissioners. A bill may be introduced into either House of Parliament with the exception of what are known as money bills, which the House of Lords may neither initiate nor amend. This practice is based upon the resolutions of the Commons of 1671 and 1678, and until the rejection by the Upper House of the famous Lloyd-George budget of 1909 it was generally assumed that the rejection of a money bill was a breach of the privileges of the Commons. The Parliament Act of 1911 definitely laid down this principle by statute, leaving to the Speaker of the House of Commons the decision as to what constituted a money bill, and in the case of other bills provided for joint sittings of both houses in case of dispute and for the final passage of a bill into law without the assent of the Upper House if for 3 successive sessions (since reduced to 2) it had obtained a majority in the Commons. No bill can be introduced more than once in a session, and it has sometimes been necessary to prorogue parliament in order that a bill which has been rejected may be reintroduced without delay. A bill

may be either private or public. A public bill may be introduced by any member of parliament, but nowadays only gov. bills have much chance of passing into law. Public bills are debated in principle on the first, second, and third readings, and in detail in committee or on report. A private bill, i.e. a bill in the interest of some individual or corporation, is introduced by the petition of the parties concerned, and passes through the same stages. If, however, the preamble of a private bill is not 'proved,' i.e. if the special committee to which it is referred after its second reading finds that there is no *prima facie* cause for it, it is thrown out. All A.s are public unless otherwise stated, they are binding on all, and do not need to be publicly promulgated, every citizen being presumed to know what is in them. The public A.s of the U.K. do not apply to the Crown, the Isle of Man, or the Channel Is. An A. may be temporary, and many temporary A.s (100 or so) are renewed from year to year by the Expiring Laws Continuance Act. An A. remains in force in England until repealed, but in Scotland A.s that have never been repealed are sometimes held to have lost their force owing to lapse of time. In citing an A. the name is given of the sovereign in whose reign it was passed, the year of his reign, and the chapter, i.e. the number of the A. among the other A.s of the same session. Thus 6 Geo. IV c. 62 would be cited for the A. passed in the sixth year of King George IV to amend the A. of Grace (*supra*).

Act of Sederunt. An ordinance or enactment made by the judges of the Scottish supreme court, the Court of Session, mainly directed to the end of regulating procedure in the courts and expediting the administration of justice. This power was conferred on the judges by King James V in 1532, and at one time had wide scope, approaching legislative power; but no such authority is now claimed by Scottish judges. A quorum of 9 judges is necessary to pass an A. of Sederunt. Similar enactments for regulating criminal procedure are passed by the High Court of Justiciary, and are known as A.s of Adjournal.

Act of Settlement, an A. passed by a Tory Gov. in 1701 in the reign of William III, which had for its object 'the further limitation of the Crown, and better securing the rights and liberties of the subject.' It was of great importance in settling the modern constitution of the country and arose out of the need for securing the Protestant succession to the throne. King William and his consort, Mary, were childless, as was also Anne, the heir-presumptive, the elder branch of the Stuarts were dead or Rom. Catholics; so the succession was settled on the Electress Sophia of Hanover, a granddaughter of James I, and her heirs, 'being Protestants.' In order to give effect to the A., an A. was passed in 1705 to naturalise the lineal descendants of the Electress Sophia. Thus her son, George I, was a Brit. subject. These two A.s were invoked in 1956 when the House of Lords

declared Prince Ernest Augustus, a lineal descendant of the Electress Sophia, to be a Brit. subject. In addition to arranging for the succession by a series of 8 important articles, the A. of S. restricted the power of the throne and guarded against abuses. The 2 most important articles were those relating to the appointment of judges (making them practically irremovable), and asserting the right of parliament alone to declare war.

Act of Supremacy, an A. of 1559, providing that the sovereign should be the supreme head of the realm in all spiritual matters. This confirmed the A. of 1534, repealed in Queen Mary's reign (1554).

Act of Toleration, an A. passed in the first year of William III (1689), and confirmed by 10 Anne c. 2, by which religious freedom (denied by the A. of Uniformity and the Five Mile Act, etc.) was granted to all dissenters from the Estab. Church except Catholics and Unitarians. In effect it repealed the Conventicle Act of 1664, but it did little more.

Act of Uniformity, an A. passed in 1662, in the reign of King Charles II, requiring all ministers to declare their unqualified assent to the Prayer Book. For failing to do so about 2000 were deprived of their livings.

Act of Union. Although the kingdoms of Scotland and England came under one crown when in 1603 James VI of Scotland became James I of England, and although Ireland had come effectively under Eng. dominance about the same time, it was not until 1707 that the Scots, and 1801 that the Irish, parliaments were merged with the Eng. by the 2 A.s of Union. The earlier A. provided that 16 elected peers and 45 members of the House of Commons (now 74) should represent Scotland at Westminster, and the latter A. secured for Ireland a representation in the Brit. parliament of 32 peers and 100 members. The Irish representation was subsequently increased to 103; but, from the creation of the Irish Free State, only N. Ireland was represented, namely by 13 members.

Acta Diurna ('Transactions of the Day') was the title of an official jour. pub. each day from 59 bc in republican and imperial Rome. It was the nearest approach in ant. times to the modern newspaper, for in addition to official announcements it contained the results of chariot-races, notices of births, marriages, and deaths, etc.

Acta Eruditorum, pub. at Leipzig from 1682 to 1782, a scientific and literary monthly printed in Lat. The first editor, Otto Mencke, was a prof. of the univ., and his son and grandson succeeded him in the editorial chair. Among its many able contributors was Leibnitz (q.v.), who first announced in it his method of differential calculus.

Acta Sanctorum (Acts of the Saints), series of vols. still uncompleted, recording the lives of the saints and martyrs of the Church. Suggested by a Flem. Jesuit, Hierbert Rosweyde, in 1607, the first vols.

were pub. in 1643 by John Bolland (q.v.). Other Jesuits who aided or continued the work were named Bollandists after their leader. Over 65 vols. have already appeared.

Acta Senatus, official record of the proceedings of the Rom. Senate. Though discontinued under the empire, they were preserved and remained accessible to historians, e.g. Tacitus.

Actaea (from Gk *akta*, the elder-tree, from a similarity to its leaves), genus of herbaceous perennials, family Ranunculaceae, which are found in America, Europe, and the N. of Asia. *A. spicata*, the baneberry or herb Christopher, well known in England, has a poisonous purplish-black fruit.

Actaeon, son of Aristaeus and Autonoe, daughter of Cadmus, was a famous huntsman trained by Chiron. He surprised Artemis bathing with her nymphs, was changed into a stag, and devoured by his own pack of hounds. Euripides makes him anger the goddess by boasting that he excelled her in hunting (*Bacchae* 330). See also Ovid, *Metam.* iii. 131, 232.

Acting, see THEATRE.

Actinism (from Gk *aktis*, a ray), term formerly used to express the property supposed to belong to certain rays of light—chiefly solar and lunar—by which chemical changes are produced as in photography.

Actinium (Ac), metal separated out from pitchblende by Debierne. It is radioactive—that is, it emits energy by virtue of its chemical identity, not of any physical relationship to anything else. Its atomic weight is about 230, and its atomic number is 89. See RADIOACTIVITY.

Actinolite, see AMPHIBOLE.

Actinometer, instrument invented by Sir John Herschel in 1825 to measure the amount of heat received from the sun upon a given surface in a given time. It consists of a thermometer with a large bulb, filled with a dark blue fluid, which is enclosed in a box. The sides of the box are blackened and the apparatus is covered with a thick plate of glass. Readings are taken in sun and shade, which by subtraction give the amount of expansion due to direct sunlight. The term A. or actinograph is now applied to many types of instrument used by photographers to estimate the actinic power of sunlight on any given occasion.

Actinomyces, small genus of soil-frequenting fungi, some species being injurious to root crops, such as *A. scabies*, responsible for potato scab.

Actinomyositis (Gk *aktis*, ray; *mykēs*, fungus), infectious, inoculable, parasitic disease, commonly known as 'lumpy jaw' or 'big jaw', first observed in cattle, and also sometimes occurring in man, characterised by chronic inflammation, and often resulting in tumours about the jaws.

Bollinger in 1877 gave a description of the ray-fungus (*Actinomyces bovis*) to which he had discovered the disease in cattle was due. One year later Israel of Berlin discovered the same disease in man. Infection normally takes place through the

mouth, teeth, and pharynx, the microbe generally being introduced with food. From an examination of 32 cases Boettroem concluded that the organism enters in association with certain cereals, chiefly barley; and it is noteworthy that those infected have generally been concerned in occupations dealing with cereals.

Most cases of A. have occurred in connection with the oral cavity. The patient complains of toothache and of difficulty in opening the jaw. A swelling appears at the angle of the jaw, which passes into suppuration, pus being discharged externally and into the mouth. From this the disease may spread downwards into any organ. Pulmonary A. is characterised by a cough and foetid expectoration, which on examination reveals the presence of the *Actinomyces*. The organism may also infect the intestines, where it grows upon the mucous membrane, leading to ulceration. Perforation of the serous coat of the bowel may occur, leading to peritonitis.

The diagnosis of the disease rests solely upon the discovery of the *Actinomyces*. The hardness of the borders of the ulcers and of the neighbouring muscles in oral A., and the yellow granules in the pus, are indications, but must not be considered conclusive until the identification of the microbe.

The course of the disease is chronic. Mild cases may recover in from 6 to 9 months, oral A. being the most favourable. Pulmonary A. is usually fatal, death resulting from pyaemia.

The treatment is mainly surgical, the part involved being excised, with a free use of disinfectants. Potassium iodide is used internally, often with success, but penicillin given in large doses over a long period is the most effective treatment.

Actinozoa, in zoology, class of the Coelenterata, animals of a simple type of organisation, distinguished by radial symmetry, hence the name, from Gk *aktis*, ray, and *zōon*, an animal. They are divided into 2 sub-classes, Zoantharia and Aleyonaria, the former including sea anemones, stony corals, and black corals, and the latter the precious red coral, sea fans, and sea pens.

The sea anemone, which may be taken as a typical example, has a broad base by which it attaches itself to a rock, a cylindrical column beset with warts or tubercles, and an upper disk which is encircled by numerous tentacles. In the middle of the disk is the mouth, which leads to a gullet communicating with the stomach cavity, from which other cavities radiate. The animal partly paralyses its prey (small fishes, sea urchins, etc.) by the use of stinging capsules, and ingests it whole. The corals are distinguished by the formation of a calcareous skeleton.

The class is sometimes known as Anthozoa.

Action, Least, Principle of, asserts that, subject to the condition imposed by the equation of energy (q.v.), the manner in which a conservative system passes from one configuration to another is always

such that the A . is a minimum. This principle, due to Maupertius, uses the word A . in the following sense. A particle of mass m and velocity v follows a path S . The A . of the particle over a very small section of the path, dS , is $mdvS$. The A . of the particle over the whole path is obtained by summing all these contributions.

This principle is but one of a number of so-called 'minimal' principles, of central importance in mechanics and optics.

Action and Reaction (Motion, Laws of), see NEWTON and MOMENTUM.

Action at Law. This term is usually applied to proceedings in a *civil* court of law to determine questions submitted by the parties. The person who brings the A . is called the plaintiff and his opponent the defendant (in Scotland they are respectively known as the pursuer and defender). The form of proceedings differs in various courts, and certain A s can only be brought in specific courts, but the main features are substantially the same in the courts of England and Scotland. The defendant is served with a summons directing him to appear in court. The questions which the court will be asked to decide are summarised in the plaintiff's summons and statement of claim; the issues challenged by the defendant are contained in his defence and/or counterclaim. Before the A . is tried certain details, such as the documentary evidence to be adduced, are settled by preliminary proceedings known as interlocutories. For instance, the court decide whether the A . shall be tried by a judge alone or with a jury. In certain A s, e.g. for defamation or breach of promise, either party can claim a jury as of right. In an A . tried by jury, the judge decides questions of law and the amount of any damages to which the plaintiff may be entitled. The decision of the court, in whichever party's favour it may be, is incorporated in an official order or judgment. Although the award of costs is discretionary, the loser of the A . is usually ordered to pay his opponent's costs. If the amount is not agreed by the parties, it is assessed or 'taxed' by a court official called a taxing master.

Theoretically since the Judicature Act, 1873, A s irrespective of their subject-matter may be brought in any div. of the high court. In practice common law A s (e.g. for defamation, negligence, or breach of contract) are heard in the queen's bench div.; A s concerning the validity of wills, the dissolution of marriage, and collisions between ships are the concern of the probate, divorce, and admiralty divs.; and certain matters involving questions of equity (q.v.) (e.g. the execution of trusts) are assigned to the chancery div. Certain A s have to be heard by co. courts (q.v.). Scots law never recognised a formal distinction between law and equity, so that all A s can be brought before the court of session, apart from certain applications which must be made to the inner house.

Scottish A s are also broadly divided as follows: declaratory, to define the nature and extent of the rights of the pursuer; rescissory, to set aside or rescind a fraudulent or erroneous document; petitory, to sue for debt or damages for breach of contract; and possessory, for an injunction restraining from interference with property—in other words, for the maintenance of the *status quo*. An A . upon the case signifies an A . under the common law prior to which particulars of the wrong complained of, or the case, were set down in detail.

As in Eng., so in Amer. practice and procedure, fixed forms of A . have been abolished by the majority of jurisdictions. For these there is now one single form for all causes. This is the outcome of what is called the Field Code of 1848, so called because it was framed principally by the labours of David Dudley Field (q.v.), who was appointed in 1847 to revise practice and procedure in New York state. This code was subsequently adopted by a large number of other jurisdictions, and its simplicity, free from the inherited jargon of legal pedantry or outworn Latin, is pre-eminently in accord with Amer. ideas. This reform also abolished the distinction between common law forms of A . and other forms, and, like Eng. procedure after the Judicature Act of 1873, it enabled equitable and legal remedies to be provided by one and the same court. But there is no actual fusion of law and equity any more than there is in Eng. procedure. For the rest, though Amer. procedure is so largely derived from the Eng., there is considerable difference arising from the fact that the Federal and States courts still follow their several systems of procedure.

Action Française, Fr. political right-wing anti-Semitic group formed in 1898 during the Dreyfus affair (q.v.) to restore the monarchy under the Bourbon-Orléans family, and having as its organ the paper *L'Action française*. Its political leader was Léon Daudet, its sole deputy in the House of Representatives, and its chief publicist Charles Maurras, who advocated prov. autonomy, a corporate state, and a privileged position for the Rom. Catholic Church. After 1940 A . F. supported Pétain's gov., and it was suppressed by de Gaulle's gov. after the liberation in 1944, because of its collaborationist attitude during the Second World War.

Actisanes, anct king of Ethiopia, who conquered Egypt in the reign of Amasis.

Actium, now Akri, tn and promontory at the entrance of the Ambracian Gulf on the W. coast of Greece. It is celebrated as the scene of the final overthrow of Antony and Cleopatra by Augustus, on 2 Sept., 31 BC. Apollo, from his temple on the promontory, received the title of Actius or Actiacus. For a description of the battle see Dion Cassius, Bk I.

Activist, in Soviet Russia a person, whether a member of the Communist party or not, who voluntarily assists the party in its directing and supervisory work in all organised spheres of life.

Acton, John Emerich Edward Dalberg-Acton, 1st Baron (1834-1902), historian, grandson of Sir J. F. E. Acton, B. Naples. He studied under Dr. afterwards Cardinal Wiseman at Oscott, but received his chief teaching from Dr. Dollinger, becoming leader of Eng. 'Liberal Rom. Catholics.' In 1895 he was appointed regius prof. of modern hist. at Cambridge, in which year he pub. his *Lectures on the Study of History*. After his death his great library was presented to Cambridge Univ. On Newman's retirement in 1859 he ed. the *Rambler*; in 1862 the *Home and Foreign Review*. His *History of Freedom in Antiquity* appeared in 1877, and he projected, but did not live to see the accomplishment of, the *Cambridge Modern History*, 1902-10. He was a devoted admirer of Gladstone (by whose influence he was raised to the peerage, 1869), and his *Letters to Mary, Daughter of the Rt Hon. W. E. Gladstone*, were ed. by Herbert W. Paul with an introductory memoir, 1904. A's efforts to secure a reunion of Christians of different communions, and his prolonged opposition to the proposed dogma of papal infallibility, made him unpopular with some of his fellow Catholics; but his own fundamental orthodoxy never faltered, and his religious sincerity influenced many outside his own Church. See *Lord Acton and his Circle*, ed. by Abbot Gasquet, 1908, and D. Mathew, *Acton: the Formative Years*, 1946.

Acton, Sir John Francis Edward (1736-1811), b. Besançon, the son of an Eng. doctor. He entered the Tuscan Navy, and in 1779 reorganised the Neapolitan Navy, becoming Prime Minister, Generalissimo, and Minister of Finance at Naples. In 1791 he succeeded to his cousin's title. In 1798 he fled with the King and Queen of Naples to Palermo on account of the Fr. invasion, but resumed his power on the king's restoration in 1799. In 1806 he again fled with the royal family.

Acton, municipal bor. of Middx., England, lying just W. of London. Still a vil. in the early 19th cent.; its modern development began c. 1860. It was a centre of Puritanism in Cromwell's time. Among its residents have been Richard Baxter, George Savile, Marquess of Halifax ('the Trimmer'), Henry Fielding, and Mrs Barry, the actress. A. returns one member to Parliament. Pop. 67,100. See also BEDFORD PARK.

Acton Burnell, Statute of, passed in 1283 by a parliament which assembled in the par. of this name 8 m. from Shrewsbury. The passing of this statute was indicative of the growing importance of the mercantile class, and its object, as set forth in the preamble, was to make provision for the more speedy recovery of debts. It also removed the staple (q.v.) from Calais to various tns in Britain.

Actor, son of Deion or Myrmidon, and grandfather of Patroclus, whose descendants were called Actorides.

Acts of the Apostles, The, fifth book of the N.T. The A., like the third Gospel to which it refers as 'the first treatise,' are

dedicated to Theophilus (Beloved of God), which may be the real or the assumed name of a Rom. convert, probably an imperial official as he is called 'Excellency.' The Gospel and the A. are identical in style; and early tradition, nowhere contradicted, assigned the authorship of the Gospel to Luke. This is borne out by an examination of the 'we' passages in the A. When 'we' is used it can always be shown that Luke is present, and when the third person, that he is absent. The A. were probably written between AD 63 and 69, for the author records the arrival of St Paul in Rome, but not his death. This is denied by those who place the Gospel later than the fall of Jerusalem in AD 70, for the Gospel certainly preceded A. The A. form the chief source of early Christian hist.: their authenticity has never been seriously questioned. The book was written in Greek and falls into 2 parts, the first 12 chapters dealing with the Church in Jerusalem and Judaea, with St Peter as the central figure, and the second, written often in the first person plural, treating of the Church among the Gentiles and the journeys of St Paul. Archaeology has again and again indicated the careful accuracy of St Luke as an historian, even in details of local colour and administration. 'Nowhere can he be convicted of a mistake. On many points on which he used to be supposed to be in error, he has now been proved correct (E. J. Bicknell, *A New Commentary on Holy Scripture*, 1928). See W. M. Ramsay, *St Paul the Traveller*, 1895; S. J. Caiger, *Archaeology and the N.T.*, 1939; W. L. Knox, *Acts of the Apostles*, 1948. The A. were not quoted often, nor very early. Papias, who was bishop of Hierapolis in Phrygia in the earlier half of the second century, was acquainted with them, as he refers to Philip the Deacon and his daughters (Acts xxi. 9), and Justus Barsabas (Acts i. 23). Irenaeus, Tertullian, Hippolytus, and Clement of Alexandria quote A. frequently; the echoes of them are to be found in the writings of Ignatius, Polycarp, and others.

Actuarius, Johannes (d. 1283), physician at the court of Constantinople. He wrote an important treatise on urinoscopy (diagnosis of disease by examination of the urine) and another on mental disease.

Actuary. The functions of the A. are primarily concerned with the application of the theory of probability, and of mathematical and statistical processes generally, to practical affairs, and especially to the financial and statistical problems connected with life assurance and pension funds. There are statutory requirements that certain of these functions should be performed by a qualified A.

The derivation of the word *actuary*, from the Lat. *actuarius* (the official who recorded the *acta* or deeds of the Rom. Senate), affords no clue to its modern significance. In England, during the 18th cent., de Moivre and other eminent mathematicians were commonly consulted on the valuation of annuities and other interests dependent upon human life.

Modern life assurance may be said to date from the estab. in 1762 of the Equitable Society with its scale of premiums properly graduated according to age. In the society's deed of copartnership, its chief executive officer was styled *Actuary*, and the widespread use of the word *actuary* to describe all those who were skilled in problems involving life and similar contingencies was almost certainly due to the character and abilities of Wm Morgan, F.R.S., the A. of the Equitable from 1775 to 1830, who may justly be regarded as the father of the actuarial profession. The skill in calculation required by the nature of the work of the A. led to a special emphasis on mathematical ability. Thus fellows of the Royal Society played a large part in the development of actuarial science in its early days, and in the 19th cent. fellowship of the Royal Society was accorded to such professional A.s as Benjamin Gompertz, Griffith Davies, Charles Ansell, and Peter Hardy.

In life assurance work A.s are almost invariably employees of the company, the prin. A. occupying a responsible executive position. He is required, among other matters, to fix premiums to and value the liabilities; he may also be concerned with the investment of the funds, the acceptance of risks, and legal and taxation matters affecting life assurance. A.s are also engaged in the supervision of the finances of pension funds, friendly societies, and similar institutions; in this sphere the A. usually acts in the capacity of a consultant. A.s are employed in the Gov. A.'s Dept. an important part of whose work is concerned with the finances of the National Insurance scheme, in the Admiralty, and other gov. depts, as well as by local authorities and public boards. Because of their familiarity with financial and statistical problems, a growing number of A.s are employed in administrative, financial, and statistical work in industry, both private and nationalised, and commerce.

The methods of assembly and analysis of statistical data form an essential part of the training of an A. He is thus basically a statistician who has also received a mathematical training of a practical character designed to fit him to apply the professional techniques developed in connection with the activities mentioned above. In view of their special preoccupation with vital statistics, A.s have always played an active part in the study of the problems of demography.

The professional qualification of an A. is secured in the United Kingdom by passing the examinations of either the Institute of A.s or the Faculty of A.s, bodies which were founded respectively in 1848 in London and 1856 in Edinburgh, and which have since been incorporated by royal charters. The standard of the examinations is high. Both these bodies are concerned not only with the granting of diplomas, but with the professional education and training of actuarial students. In this connection they administer, for the assistance of students, a joint Actuarial Tuition Service, which

provides tuition for the examinations of both bodies. To further the educational side of their activities, the Institute and Faculty have pub. from time to time a complete range of text-books. Both the Institute and Faculty seek to advance the standard of professional knowledge by the discussion at sessional meetings of papers submitted by members. A record of the proceedings at these meetings is preserved in the Jour. of the Institute and the Transactions of the Faculty. The councils of the two bodies collaborate in the conduct of a continuous investigation of the mortality of assured lives and annuitants, based upon data contributed by individual life offices.

The Society of A.s is a sister body operating in Canada and the U.S.A., and granting diplomas of standing similar to those of the Institute and Faculty. There are also actuarial bodies in a number of continental countries. International Congresses of A.s are held from time to time at which papers are submitted and discussed. Arrangements for successive congresses are part of the functions of the Comité Permanent des Congrès Internationaux d'Actuaires, with headquarters in Brussels, membership of which is international.

Acuña, Cristóbal de (1597–c. 1650), Jesuit missionary, b. Burgos and d. Peru. He wrote an account of a journey of exploration down the Amazon, which appeared in 1641 as *Nuevo descubrimiento del gran río de las Amazonas*.

Acupressure (Lat. *acus*, needle; *premere*, to press), method formerly used of compressing an artery with a needle to arrest a haemorrhage. The needle is placed perpendicularly to the artery near its opening, crossing over it in such a way as to exert pressure upon it, and thus stopping the flow of blood.

Acupuncture (Lat. *acus*, needle; *pungere*, to prick), in surgery, puncture of the skin with a needle for the exit of fluid, the relief of pain, etc. It was long used by the Chinese, who believed that by such an operation the harmful vapours which gave rise to certain disorders were released from the body.

Ad Duo Pontes, see PONTEVEDRA.

Ad libitum, or *ad lib.* (at discretion, at pleasure), in music, denotes that the part so marked need not necessarily be played strictly to time, but that the performer may pause or introduce any cadenza or addition of his own. An accompaniment is said to be *ad lib.* when it is not essential, and may be either played or omitted.

Ad valorem (Lat., 'according to the value'), commercial term implying that calculations for stamp duty, etc., are made on the value of a bond or other article. In rules and orders fixing certain duties, *a. v.* duties, as opposed to *specific* duties, are those levied according to the value of the goods imported. *A. v.* stamp duties, e.g. in the case of a lease or a bill of exchange, are, under the Stamp Acts, payable according to the value of the subject-matter of the particular instrument.

Adagio (It. *adagio*, at leisure), in music,

term indicating that the movement is slow. It is also used as the name of a piece of music, or as the distinguishing title of a single movement.

Adair, James (fl. 1775), trader and historian of the Amer. Indians, emigrated to America in 1735. He adopted the theory that the Amer. Indians, among whom he lived for 40 years, came from the lost 10 tribes, a theory subsequently elaborated by Dr Boudinot in his *Star of the West*, 1816. His *History of the American Indians*, dealing with their language, habits, and character, is a valuable and interesting work.

Adalbert (c. 1000-72), Archbishop of Hamburg-Bremen, declined the papacy offered by Henry III and desired to found a patriarchate in the N. He exercised great power over Henry IV, whom he educated, and though the nobles accomplished his expulsion from court in 1066, he was recalled in 1069. He assisted in the conversion of the Wends. See Adam of Bremen's *Gesta Hammaburgensis Ecclesiae Pontificum*.

Adalbert, St. (d. c. 740), b. Northumbria. As a deacon he accompanied St Willibrord (q.v.) to Friesland, and he was the patron of Egmont Abbey.

Adalbert, St., apostle of the Slavs (c. 956-997), b. of a noble Bohemian family, was consecrated Bishop of Prague in 983. He afterwards became a Benedictine monk in Rome, but twice returned to preach in Poland, Prussia, and Hungary. He was martyred near Danzig, and in 1880 his bones were reinterred in Prague Cathedral. St A.'s feast is kept on 23 April.

Adalia, see **ANTALYA**.

Adam, the first man. The word, linked with *adamah*, ground (Gen. ii. 7), and probably connected with the Heb. root *adam*, red, is used as a generic name for man in the Heb. and Assyrian languages. In Gen. the article is sometimes prefixed and sometimes not, giving us 'the man' as the first created individual, and 'man' as a species. *Adam* as a proper name does not really occur until Gen. v. 1. (The word for man in Gen. ii. 23 is *ish*, that for woman being *ishshah*.) Two accounts of the creation of A. are combined in the Bible. Gen. i.-ii. 3 describes it as taking place on the sixth day after that of the plants and animals. The more detailed narrative, starting at ii. 4, tells of the formation of man of the dust of the ground, and his installation in the Garden of Eden, in the midst of which grew the tree of life and the tree of knowledge of good and evil. The fruit of the latter tree was strictly forbidden him, but he was enjoined to cultivate the other plants and enjoy their fruits. The animals were then formed from earth substance, and were named by A. Then God caused a deep sleep to fall upon him, during which Eve was made from his own flesh and bone. Induced by the tempter to eat of the forbidden fruit, Eve persuaded A. to eat also, and for this disobedience both were expelled from paradise to become the progenitors of a fallen race. Much has been written in discussion of the question whether the story of A. was

intended as hist., mythology, or parable, and on its relationship to the findings of modern science. Scientific inquiry like that of Darwin classifies facts to arrive at the 'laws' or uniformities of nature, disregarding questions like creation and the ultimate destiny of man. The Gen. account, on the other hand, attempts to describe the relationship of God and man, stating the hist. of the human race in terms of such facts as were available, with a direct view to formulating a religious code. The aim of the writer being the spiritual elevation of mankind, the story of creation is told chiefly for its spiritual and moral significance. 'It is a popular account suited to the mentality of the writer's age, and directed to a purely religious purpose' (*Catholic Commentary on Holy Scripture*), so that fact and allegory are blended.

Many accounts of the creation from other sources contain elements of the Bible story. Among the anc. Egyptians, for instance, it was believed that men were produced from the mud of the Nile under the influence of the sun-god. Babylonian inscriptions describe a garden with 4 rvs. as being connected with an early state of innocence, and the serpent also features in Babylonian mythology. The prehistoric lore of the Hebrews was of course connected with that of their neighbours. The contrast between the spiritual truth and profundity of the Gen. narratives and the shallowness and gross polytheism of creation myths elsewhere shows the enlightening and refining power of inspiration. By adding together the years in the generations of the patriarchs, as given in Gen. v., Bishop Ussher arrived at the date 4004 bc as the time of A.'s creation. The value of such a method of computation is now understood to be nil; life began many millions of years ago, and man has been differentiated from the other animals probably for at least 100,000 years.

Later Jewish stories introduced fanciful accounts of A., as that he was of huge proportions, covering the earth completely. His first wife was Lilith, who fled from him and became a demon when Eve was created. In the Manichaean mythology, A. is not represented as a creation of God at all, but as the son of Satan, prince of darkness, by 'Sin' or 'Desire.' Satan had stolen light from heaven, which passed into A., and by diligent fostering by the spirits of good the prospect of light's finally overcoming the power of darkness in man was held out as the great hope of the Manichaean religion. Eve was given to A. by Satan, and represents the sensual element. She, however, was seduced by Satan; thus Cain and Abel were said to be the sons of Satan and Eve, the offspring of A. and Eve being Seth, who thus carried forward the tradition of light.

A Mohammedan account states that A. performed a penance lasting 1000 years in Ceylon. Augustine suggested that the cause of A.'s expulsion from Eden was that, after Satan's victory over Eve, A. was led by the power of love to share her shame and punishment. This idea is

adopted in *Paradise Lost*; Milton also used the Rabbinical accounts of the celestial hierarchy, Satan being identified with Lucifer, 'son of the morning,' who had fallen from heaven. Another Rabbinical tradition made A. the author of Psalm xli., the 'Sabbath Psalm.'

An attempt has been made to prove that A. was a so-called Palaeolithic man, to whom the Creator added prenatally the moral and spiritual qualities which differentiated Neolithic man from his immediate forerunners. (See M. Morris, *New Light on Genesis*, 1926, and *Man Created during Descent*, 1926; E. F. Sutcliffe, 'Genesis,' in *A Catholic Commentary on Holy Scripture*, 1953). Pius XII in his encyclical 'Humani Generis,' 1950, says that divinely guided evolution is a theory compatible with revelation so far as the physical organism of man is concerned, but not as concerning his soul; that Gen., however, clearly teaches the unity of the human race, descended from an original pair, so that polygenism (the appearance of truly human creatures—consisting of body and soul)—in different places, independently is not a permissible theory: such a theory cannot be reconciled with what the sources of revelation and the Church's authoritative teaching put forth concerning original sin.

Adam, famous Fr. family of sculptors, comprising Jacob Sigisbert A. (1670-1747), a sculptor of religious subjects and his 3 sons, all natives of Nancy. Lambert Sigisbert (1700-59) went to Paris in 1719, and after 4 years' study gained the *prix de Rome*. At the command of Pope Clement XII he executed a design of the Virgin appearing to St Andrew Corsini, and he became subsequently academicien of St Luke. He was much employed in decorating royal residences, and his works include 'La Seine et la Marne,' at St Cloud; 'Neptune et Amphitrite,' 1740, at Versailles; 'Vénus au bain,' 1742, for the château de Cholsy; and 2 marble groups, 'La Chasse' and 'La Pêche,' now at Potsdam. He pub. in 1754 a *Recueil de sculptures antiques grecques et romaines*. Nicolas Sébastien (1705-78) went to Rome with his brother, and was elected academicien for his 'Prométhée déchiré par un vautour,' 1762, now in the Louvre. Other works are 'Le Martyre de Sainte Victoire,' 1743, and the tomb of Catherine Opalinska, 1749, at Nancy. François Balthazar Gaspard (1710-61) also obtained the *prix de Rome*, and afterwards lived in Berlin as sculptor to the King of Prussia from 1747 to 1750. His works were of mythological subjects, such as 'Apollon,' 1748, and 'Diane au bain,' 1756. All 4 d. in Paris.

Adam, Adolphe (1803-56), Fr. operatic composer who studied composition under Boieldieu and wrote many comic operas. Among his best works are *Le Chalet*, 1834; *Le Postillon de Longjumeau*, 1836; *Le Roi d'Yvetot*, 1842; *Capitostro*, 1844; *Le Tordador*, 1849; and the ballet *Giselle*, 1841. His autobiographical *Souvenirs d'un musicien* and *Derniers souvenirs d'un musicien* were pub. 1857-9. See A. Fougis, *Adolphe Adam*, 1877.

Adam, Albrecht (1786-1862), lithographer and one of the finest painters of Ger. battle scenes, b. Nordlingen. He followed Beauharnais in Russia and Italy, and accompanied Radetzky in 1848. Among his best works are 'The Battle of Moscow' and 'The Battle of Leoben.'

Adam, Alexander (1741-1809), scholar, b. Moray. Educ. at Edinburgh Univ., he became rector of Edinburgh High School in 1771. Among his students were Walter Scott, Jeffrey, and Brougham. He received the honorary degree of LL.D. in 1780. His *Roman Antiquities*, 1791, obtained continental fame. See A. Henderson, *Account of the Life and Character of Alexander Adam*, 1810.

Adam, de l'Isle, see VILLIERS DE L'ISLE-ADAM.

Adam, James (1730-94), 3rd son of Wm A., architect, of Kirkcaldy, Scotland; studied in Italy, 1760-3; then practised in collaboration with his brother Robert (q.v.). Probably designed most of Portland Place, London, 1776-80.

Adam, Juliette, Fr. author, née Juliette Lamber (1836-1936), b. Verberie, Oise. Married to a lawyer, la Messine, she pub. under that name *Blanche de Coucy, l'enfance*, in 1858, followed by *Idees antiproudhoniennes sur l'amour, la femme et le mariage*. After her second marriage, in 1868, to Edmond A., prefect of police, she wrote largely under her maiden name, among her later works being *Le Siège de Paris*, 1873; *Le Roman de mon enfance et de ma jeunesse*, 1902; *Mes premières armes littéraires et politiques*, 1904; *Mes sentiments et nos idées avant 1870*, 1905; *Mes illusions et nos souffrances durant le siège de Paris*, 1906; *L'Angleterre en Egypte*, 1922; *L'Egypte: une leçon diplomatique*, 1924. She founded the *Nouvelle Revue* in 1879, and her salon was politically influential.

Adam, Paul Auguste Marie (1862-1920), Fr. novelist, b. Paris. His first book was the Zolaesque *Chair molle*, 1885; the second, *Soi*, 1886, a study of feminine egoism. He devoted himself to historical investigation, distinguishing between stories of his own day (*L'époque*) and those of a former time (*Le Temps et la vie*). He wrote *Robes rouges*, 1891, and *Le Mystère des foules*, 1896. Then came 4 romances of the Napoleonic time: *La Force*, 1899; *L'enfant d'Austerlitz*, 1902; *La Ruée*, 1903; and *Au soleil de juillet*, 1903, in which he was greatly assisted by the recollections of his grandparents. See C. Maunclair, *Adam*, 1921.

Adam, Robert (1728-92), architect, b. Kirkcaldy, Scotland; 2nd son of Wm A., architect. Travelled in Italy, 1754; then in 1757 surveyed Diocletian's palace at Spalato in Dalmatia, on which he pub. a magnificent folio vol. in 1764. He was appointed 'Architect of the King's Works' jointly with Sir Wm Chambers (q.v.) in 1761. His prin. designs, among a very long list of buildings, were the Admiralty Screen, 1760; Lansdowne House, 1762-8; the Adelphi (with his brothers), 1768-72; Mansfield Street, 1770-5; 20 St James's Square, 1772-4; Apsley House, c. 1775; 20 Portman

Square, 1775-7; S. and E. sides of Fitzroy Square, c. 1790-1800—all in London; Kenwood, Syon House, Osterley House, Kedleston Hall, Harwood House—all these were remodelling of existing mansions; Luton Hoo; Mellerstain and Gosford House in Scotland; Charlotte Square, 1791, and the Register House, 1774-92, in Edinburgh; also Edinburgh Univ., 1789-91, completed by Playfair 1815-34; Glasgow Royal Infirmary (since rebuilt). He and his brother pub. in 1773-9 *The Works in Architecture of Robert and James Adam*. See biographies by J. Swarbrick, 1903; A. T. Bolton, 1922; J. Lees-Milne, 1948.

Adam de la Halle, or Le Bossu (b. 1240, d. 1285-8), Fr. poet and dramatist, b. Arras. He wrote *Le Jeu de la feuillée*, the first Fr. comedy (c. 1277), and at the court of Naples he composed the first known comic opera, *Le Jeu de Robin et de Marion*, c. 1283. A complete ed. of his works, by Coussemaker, appeared in 1872. See H. Guy, *Essai sur Adam de la Halle* (2nd ed.), 1923.

Adam of Bremen, Ger. historian and geographer, was b. in the 11th cent., but the dates of his birth and death and definite particulars of his life are unknown. In 1068 he was made canon of Bremen Cathedral under Archbishop Adalbert (q.v.), and principal of the cathedral school. In the years 1072-6 he was engaged in writing the *Gesta Hammaburgensis Ecclesiae Pontificum*, his hist. of Hamburg and the spread of Christianity in the N.; the best ed. of this book is by Lappenberg, 1876. He d. on 12 Oct., probably in 1076.

Adamant (Gk *adamas*, unbreakable), now used only poetically for a hard substance, was formerly synonymous with a diamond, and also by false etymology connected with the lodestone.

Adamantine Spar, aluminium oxide, the mineral substance ranking second to the diamond in hardness, found in various coloured and colourless forms. See CORUNDUM.

Adamawa, or Fumbina, region of W. Africa, lying partly in Nigeria and partly in the Cameroons. It is included in the N. areas of the mandated ter. of the Cameroons. It has a good climate and a fertile soil, but it is mainly a cattle-rearing country. The N. part of A. is traversed by sev. trade routes connecting Bornu and Dikwa with Yola and Garua. Over these routes go the natron and black salt from the N. to Benue, and in addition to this through traffic a large tonnage of ground-nuts and locally woven textiles is carried. It is watered by the Benue R., a trib. of the Niger. Exports include hides and skins and ground-nuts. It is named after a chief, Adama, who founded the Yola emirate. The chief tn is Yola (British), and other tns are Nauman and Jalingo (British) and Garua, Ngaundéré, and Lame (French). A. was visited by Heinrich Barth (q.v.), the Ger. explorer, in 1851. Pop. 400,000.

Adamites, name of a Gnostic sect of the 2nd cent. in Africa, who sought to re-establish the innocent state of man at the

time of the creation, going naked and rejecting marriage. The doctrine was prevalent among some of the Beghards or Brethren of the Free Spirit (q.v.) in the 14th cent., and a similar sect appeared in Bohemia and Moravia in the 15th cent. They were massacred by Ziska in 1421.

Adamnan, or Adomnan, St (c. 630-704), famous as the author of the *Life of St Columba*, was b. of a family called Hy-Neill, in Ulster. He received his education at the monastery of Clonard. In 679 he was appointed abbot of Iona. While visiting his pupil Aldfrid, King of Northumbria, he became converted by the Venerable Bede to an acceptance of the Rom. observance of Easter, and to the adoption of the regulation tonsure. He endeavoured to inculcate the same change of view among his own community, but failed, although some success attended similar efforts in Ireland. His feast is on 23 Sept.

Adams, Arthur Henry (1872-1936), New Zealand poet and novelist, b. Lawrence. He was educ. at Otago High School and Univ., and afterwards became a journalist in Australia, where he wrote poems, plays, and novels. His *Collected Verse* appeared in 1913. His novels are *Tussock Land*, 1904; *Galahad Jones*, 1910; *A Touch of Fantasy*, 1912; and *Grocer Greatheart*, 1915. He also wrote an autobiography, *A Man's Life*, 1929.

Adams, Charles Follen (1842-1918), Amer. dialect poet, b. Dorchester, Massachusetts. He fought at Gettysburg, and subsequently became a dry-goods dealer in Boston, diverting himself by writing poems in Ger. dialect like the Breitmann ballads. *Leedle Yawcob Strauss* (1876) made him famous. His collected poems were pub. in 1910.

Adams, Charles Francis (1807-86). Amer. diplomatist, son of John Quincy A. (q.v.), b. Boston, Massachusetts. Studied diplomacy under his father at an early age in Russia and England, and returning to Harvard graduated in 1825. Studied law, and sat in the Massachusetts House of Representatives and Senate. Sat as a Republican in Congress; was appointed minister to Great Britain in 1862. He opposed the sailing of the *Alabama*, and succeeded in influencing Lord John Russell in stopping the *Alexandra* and 2 ironclads intended for the Confederate states. He left England in 1868 and sat at the Geneva Conference (1871-2). He ed. the works of John A. (1850-6) and the memoirs of John Quincy A. (1874-7). See life by his son, C. F. Adams, jr, 1900.

Adams, Clement (c. 1519-87), schoolmaster and author, b. Warwicks. Educ. at Eton and Cambridge, he became schoolmaster to the king's pages of honour. His Lat. *Anglorum Navigatio ad Moscovitas* is an account of Richard Chancellor's voyage to Russia, the first Eng. venture into that country; it was printed by Hakluyt in his collections of 1589.

Adams, Francois (1796-1861), doctor and scholar, b. Aberdeenshire. He studied at Aberdeen and London and practised medicine at Banchory. He trans. and

ed. the Gk medical writers Paulus Aegineta, 1844-7, Hippocrates, 1849, and Aretaeus, 1856.

Adams, Francis William Lauderdale (1862-93), Australian poet and novelist, *b.* Malta, of Scottish parents. He joined the staff of the *Sydney Bulletin*, in which many of his poems appeared, but, depressed by an incurable lung disease, committed suicide at an early age. His best-known works are *Henry and Other Tales*, 1884; *Leicester*, an autobiographical novel, 1884; *Australian Essays*, 1886; *Poetical Works*, 1886; and *Songs of the Army of the Night*, 1888. His play, *Tiberius*, is striking and original.

Adams, Henry Brooks (1838-1918), Amer. historian, grandson of sixth president of the U.S.A.; *b.* Boston. Graduated Harvard, 1858. Travelled in Europe, 1858-60; in England, 1861-8, as secretary to his father, Charles Francis A., the Amer. minister. His *History of the United States from 1801 to 1817* (first pub. 1889-90) is a standard treatise. Wrote, besides many essays and studies, *Mont-Saint-Michel and Chartres*, privately printed 1904, pub. 1913, and an autobiography called *The Education of Henry Adams*, privately printed, 1906, pub. 1918. He d. at Washington.

Adams, James Truslow (1878-1949), Amer. historian, *b.* Brooklyn. Educ. at Yale, he accompanied Col. House on his mission to Great Britain during the First World War, and thereafter turned to writing hist., his work *The Founding of New England*, 1921, being awarded the Pulitzer Prize. He wrote sev. other books on New England, a hist. of *The Adams Family*, 1930, and some social studies, including *Our Business Civilization*, 1929, and *The American*, 1944.

Adams, John (1735-1826), second president of the U.S.A.; *b.* Quincy, Norfolk co., Massachusetts. Educ. at Harvard (1755), he was called to the Bar in 1758. He was one of the Massachusetts representatives in the Continental Congress in 1774, and a promoter of the Declaration of Independence, 1776. He became ambas. to Holland, 1782; to Great Britain, 1785; President of the U.S.A. 1797-1801. He pub. *A Defence of the Constitution of the United States of America* in 1787. See also UNITED STATES, *History*. See bibliography to *Works*, ed. by C. F. Adams 1850-6; *Letters of John Adams Addressed to His Wife*, 1840-1; *Familiar Letters of J. Adams and His Wife Abigail Adams*, 1876; J. T. Morse, *John Adams*, 1885; M. Chamberlain, *John Adams*, 1899.

Adams, John Couch (1819-92), astronomer, *b.* near Luncheonston. He and Leverrier share the honour of having worked out the position of the undiscovered planet Neptune in 1846 after noting the irregularities in the motion of Uranus. In 1859 he was appointed Lowndean prof. of astronomy and geometry at Cambridge. His later work was connected with the orbit of the Leonid meteors, the motion of the moon, and terrestrial magnetism.

Adams, John Quincy (1767-1848),

sixth president of the U.S.A. and eldest son of John A. (q.v.), second president, *b.* Quincy, Norfolk co., Massachusetts. He studied diplomacy in Europe under his father in 1778; returning to America he graduated at Harvard, 1788. He became ambas. at The Hague, 1794; to Prussia, 1797; to Russia, 1809; in London, 1815; secretary of state of the U.S.A., 1817; President, 1825-9; defeated by Jackson in 1828, he returned to Congress in 1831. See also UNITED STATES, *History*. See C. F. Adams (ed.), *Memoirs of John Quincy Adams*, 1874-7; J. T. Morse, *John Quincy Adams*, 1883; James Truslow Adams, *The Adams Family*, 1930.

Adams, Joseph Quincy (1881-1946), Amer. scholar. He was educ. at Chicago, Cornell, London, and Berlin Univs. and became prof. of English at Cornell. From 1931 till his death he was Director of the great Folger Shakespeare Library in Washington. His works include *Shakespearean Playhouses*, 1917, and *Chief Pre-Shakespearean Dramas*, 1927; he was also general editor of the *New Variorum Shakespeare*.

Adams, Maude (1872-1953), *b.* Salt Lake City, Utah. Her mother being an actress in a stock company, Maude began playing child parts at a very tender age, becoming in her young womanhood one of America's favourite actresses. She created many star parts in plays by Barrie and Edmond Rostand, and was an intimate friend of Barrie.

Adams, Samuel (1722-1803), Amer. statesman, *b.* Boston, Massachusetts, U.S.A. He graduated at Harvard College, 1740. He took the popular side in the disturbances caused by the Stamp Act, 1765, and in 1764-74 was a member of the legislature of Massachusetts. He signed the Declaration of Independence, 1776, and became lieutenant-governor, 1789-93, governor until 1797, of Massachusetts. He devoted his life to the cause of the Independence of America, and wrote political essays. He was called the Amer. Cato.

Adams, Thomas, Puritan preacher who fl. from 1612 to 1653, called by Southey 'the prose Shakespeare of Puritan theologians.' He wrote sermons and theological works, and from 1612 to 1623 held the positions of preacher at Willington, Beds, vicar of Wingrave, Bucks, and preacher at St Gregory's under St Paul's Cathedral.

Adams, William (c. 1540-1620), navigator, *b.* Gillingham, near Chatham, and apprenticed as a sailor when twelve years old. He became pilot-major to a fleet from Rotterdam which, though bound for India, reached Japan, where A. lived until his death, becoming second in command of an Eng. settlement founded 1613, and making voyages to Siam and Cochinchina.

Adam's Apple: 1. In common parlance, the boss or projection in the neck caused by the thyroid cartilage of the larynx, most prominently marked in the male.

2. In botany, the *Citrus limetta*, or sweet lime, a pale yellow, roundish fruit with a boss at the point. Its name, *pomo*

d'Adamo, was given by the Italians, who thought the depressions on the surface resembled the mark of Adam's teeth. It belongs to the Rutaceae, the orange and lemon family.

Adam's Bridge, Indian Ocean, is a chain of sand-banks which, with the Is. of Manaar and Rameswaram, extend from Ceylon to the S. coast of India. It has sev. navigable channels for small boats. In the *Ramayana* it is said to have been constructed by the monkey-god Hanuman for the passage of Rama from Madras to Ceylon.

Adam's Needle, see YUCCA.

Adam's Peak, well-known mt of Ceylon, is 7360 ft high. It obtains its name from the popular Mohammedan belief that Adam's penance took place here after his expulsion from Eden.

Adamson, Patrick (1537-92), b. Perth, graduated M.A., St. Andrews, 1558; became minister of Ceres, Fife, 1563. In 1566 he went to France, returning about 1572, when he became minister of Paisley, chaplain to the regent, and Archbishop of St. Andrews, 1576. He came into conflict with the Church, was sent as ambas. to Elizabeth by James VI, 1583, was charged with heresy and excommunicated, 1585. He was afterwards pardoned, but again excommunicated, 1588. He was the author of many theological works in Latin, both prose and verse.

Adamson, Robert (1852-1902), prof. of philosophy at Manchester, 1876, and of logic at Aberdeen, 1893, and Glasgow, 1895. Among his works on philosophical subjects are *Roger Bacon: the Philosophy of Science in the Middle Ages*, 1876; *On the Philosophy of Kant*, 1879; and *The Philosophy of Fichte*, 1881.

Adana, chief tn of the Turkish il (prov.) of Seyhan (q.v.), situated on Seyhan R. about 30 m. from the Mediterranean. Exports wool, cotton, and grain. Pop. 172,465.

Adanson, Michel (1727-1806), Fr. naturalist, b. Aix, d. Paris. He was destined for the Church, but gave up the study for that of natural hist. In 1748 he went to Senegal, where he made collections in every branch of natural hist. His *Natural History of Senegal* was pub. in 1757; he became a member of the Academy of Science, 1759; and his *Families of Plants* appeared, 1763. He was reduced to misery and poverty during the Fr. Revolution, but was invited to become a member of the Institute of France, and received a small pension from the Fr. Gov.

Adansonia, see BAOBAB.

Adapazari, tn in the Kocaeli il (prov.) of Turkey. An important railway junction, it is a centre of the linen and tobacco trade. During the past 45 years the pop. has more than trebled and is now (1955) 55,126.

Adaptation (Lat. *adaptare*, to fit to), process of acquiring a fitness for new circumstances or new purposes. In literature and music the term is used to denote the modification of some form of art to allow of its suitable expression in another form. Thus we speak of the

A. of a play from a novel; or of a poem to music, where certain stanzas are omitted to suit the considerations of length usually called for in a song.

In biology A. means the variations in the structure and behaviour of animals occasioned by the necessity for continuing to live or procreate under somewhat altered circumstances. The term is sometimes carelessly used as if it meant a kind of conscious striving after fitness, but when we say that a frog is adapted to its surroundings, we simply mean that it cannot live the life, say, of a cod-fish. In the process of evolution of a species, variation in characteristics occurs in 2 ways. First, there is the influence of heredity, which tends to perpetuate certain characteristics, perhaps in the direction of the parent away from the type, or as reverting to the type away from the parent. If the direction taken is one that leads to survival, the animal lives to carry on what is perhaps a long process of A. But every individual has a certain power of reacting to its environment, and tends to alter itself in its own life-hist. If the variation achieves the object of survival, it may be called an A. Thus we may say that every distinctive characteristic originated in an A., even when it is being slowly modified in the direction of extinction, for such modification is the response to the demand for an economy in which all that is useless must be abandoned.

Adar, last month of the Heb. year, corresponding to our Feb. Veadar (lit. 'and Adar') was the intercalary month introduced into 7 of the cycle of 19 years.

Adda (anct *Addua*), lt. riv. which rises in the Ortler Group (q.v.) of the Alps, and flows through Lake Como (q.v.) and SE. across the plain of Lombardy to join the Po (q.v.), 8 m. above Cremona. Length 140 m. See VALTELLINA.

Addams, Jane (1860-1935), sociologist, b. Cedarville, Illinois. Studied economic questions in Europe and America; in 1889 she helped to found in Chicago Hull House, a social settlement. She shared the Nobel peace prize in 1931, having done much to relieve post-war distress in Europe. (See her works *Twenty Years at Hull House*, 1910, and *The Second Twenty Years at Hull House*, 1930.) For 3 years she held the post of inspector of streets and alleys. See her *Democracy and Social Ethics*, 1902; *New Ideals of Peace*, 1907; *The Spirit of Youth and the City Streets*, 1909. See biography by J. W. Linn, 1935.

Addax, genus of antelopes belonging to the Hippotraginae and allied to the oryx, found in N. Africa and Arabia. The *A. nasomaculatus* is a large animal with a white band round its muzzle, called by the Arabs *Abou-Addas* and by Pliny *Strepsiceros* on account of its twisted horns.

Adder (A.-S. *naedre*, serpent), name applied to sev. poisonous snakes of the Viperidae and to some non-poisonous Colubridae. *Vipera berus*, the European A., attains a length of 28 in., and its bite is seldom fatal. Wycliffe applies the term to the serpent in the Garden of Eden.

Adder's Tongue, popular name for the fern *Ophitoglossum vulgatum*, which belongs to the Ophioglossaceae and is found in Britain. It develops only 1 leaf each year, and reproduces vegetatively by means of buds on the root.

Addington, Henry, see SIDMOUTH, VIS-COUNT.

Addis Ababa, or **Addis Abebe**, cap. of the Federation of Ethiopia and Eritrea. A. A., which means 'Little Flower,' has many fine modern buildings, including an opera house, completed in 1955, and modern hotels. It is the main centre of gov. and commerce and the official residence of Emperor Haile Selassie I. A. A. is connected with the coast by rail to Djibuti in Fr. Somaliland 486 m. away; and it is the H.Q. of the Ethiopian Airlines which operate an international as well as internal service to more than 30 places. Pop. (1956) of municipality, 401,915 (which includes 10,859 foreigners, mostly It.). In A. A. proper—pop. (1956) 306,759—161,627 are Amharas, the next most populous ethnological group being Gallas, 56,755. There were registered, in 1956, 46,257 Muslims and 254,036 followers of the Orthodox Coptic Christians. A. A. was the scene of one of the worst massacres in modern history when for 3 days, 19 Feb. 1937, on the orders of Graziani, the whole city was given over to mass murder and rapine by the Italians. At least 30,000 are said to have been killed, many of them herded into houses which were set on fire. The massacre followed an attempt on the life of Graziani.

Addiscombe, dist. of Croydon, Surrey, England, contained the college for cadets of the E. India Co. in which were trained sev. notable men, among others Sir Henry Lawrence, Lord Napier, and Lord Roberts. Pop. 16,300.

Addison, Christopher, 1st Baron (1869–1951), Brit. politician and medical prof. After a period as medical prof. at Sheffield he was elected Liberal member for Hoxton, 1910, becoming first parl. secretary to the Board of Education and then Minister of Munitions. Minister of Health, 1919–21, when he inaugurated the medical panel in the National Health Insurance scheme and organised the Coalition Gov.'s housing scheme. He resigned during disputes over the latter scheme and joined the Labour party. Minister of Agriculture and Fisheries, 1930–1. Raised to the peerage in 1937. Secretary of State for Dominion Affairs, 1945–7. Lord Privy Seal and leader of the House of Lords, 1947.

Addison, Joseph (1672–1719), essayist, poet, and statesman, b. Milston rectory, near Amesbury, Wilts, the son of Lancelot A., who was dean of Lichfield, 1683. He was educ. at Amesbury, Lichfield, and Charterhouse, where he was a fellow pupil of Richard Steele. At the age of 15 he went to Queen's College, Oxford; but 2 years later he obtained a scholarship and went to Magdalen College, where he obtained a demyship, 1689, and his M.A. degree, 1693. His facility in writing Lat. verse first brought him into notice, and his

verses addressed, in 1694, to Dryden procured him the friendship and interest of that poet. He became acquainted with Lord Somers and Mr Montagu, afterwards Lord Halifax, and it was through the influence of the former that he obtained, in 1699, a pension of £300 to enable him to travel on the Continent to qualify for diplomatic service. On the death of William III he lost his pension, and he returned to England late in 1703. In 1704, after living for some time in London in a state of poverty, he was appointed by the Gov. to write a poem to celebrate the victory of Blenheim. This poem, entitled *The Campaign*, was so successful that he was appointed a commissioner of appeals, and held sev. appointments, 1704–10. He became under-secretary of state, 1706, accompanied Halifax to Hanover, 1707, and was appointed secretary to Lord Wharton, Lord-Lieutenant of Ireland, 1708. In 1709 Steele began the *Taller*, and A. soon became a contributor, taking a leading part in its production. The first number of the *Spectator* appeared 1711, and it was continued until Dec. 1712 by A. and Steele. Then followed the *Guardian*, the first number of which was pub. in Mar., and the 175th and last in Oct. 1713; Steele was the editor, and A. a contributor. In the same year A. brought out his tragedy of *Cato*, which procured for him still greater fame than any of his former productions had done. In June 1714 appeared the first number of a continuation of the *Spectator*, to which A. contributed until its termination in Dec. 1714. His prose comedy *The Drummer* was pub. 1715, but it was not a success. He then launched a periodical pub. in support of the Gov. under the title of the *Freeholder*. It consisted of 2 papers a week, and was continued until June 1716. In the same year he married the dowager Countess of Warwick, and in 1717 was appointed secretary of state. However, he retired from office, 1718, on the ground of ill health, but really in consequence of his entire inaptitude for debate in parliament, and for the ordinary business of his office. His health soon began to fail, his domestic life was not happy, and he d. at Holland House, Kensington.

As a poet and dramatist A. formerly held a much higher place than he now does; his greatness lies in the fact that he is one of the most famous of all Eng. essayists. His style is easy, polished, and graceful, and his essays are characterised by a delicate sense of propriety, a lively fancy, and a most original and exquisite humour. He was the founder of a new school of popular writing, and his works had the object of raising the manners and standard of life of the people, and of forming a good taste and sound opinion. Although many have attempted to imitate him, none has surpassed him, and his contributions to the *Taller*, *Spectator*, and *Guardian* are both amusing and instructive, and suited alike to the gay and the serious. In character he was supposed to have been somewhat cold; nevertheless he was kind and

magnanimous; and the ease and grace of his manners and conversation made him both popular and admired.

Eds. of A.'s works by Tickell, 1721; Hurd, 1800-11; Greene, 1858. *Spectator*, ed. G. Gregory Smith, 1897-8; *Tatler*, G. A. Aitken, 1898. Letters ed. W. Graham, 1941. See also lives by R. Steele, 1724; L. Aikin, 1843; W. J. Courthope, 1884; P. Smithers, 1954; and in *Johnson's Lives of the Poets*, 1781.

Addison, Thomas (1793-1860), physician, b. Long Benton, near Newcastle upon Tyne. He received his medical education at Edinburgh Univ., where he graduated in 1815. In 1820 he entered Guy's Hospital, to which he was appointed physician in 1837. He was F.R.C.P. in 1838. During his life A.'s fame rested upon his eminence as a physician, his skill as a diagnostician, and his great ability as a teacher. To-day he is remembered for his original descriptions of a disease of the suprarenal capsules (Addison's disease, q.v.) and of pernicious (or Addisonian) anaemia (1849). With Richard Bright (q.v.) he wrote *Elements of the Practice of Medicine*, vol. 1, 1839; he contributed many valuable papers to *Guy's Hospital Reports*, notably on pneumonia, tuberculosis, skin diseases, and anatomy of the lung. His *Published Writings*, 1868, includes a biography. See also Wilks and Bettany, *History of Guy's Hospital*, 1892.

Addison's Disease, syndrome of signs and symptoms associated with hypofunction of the suprarenal glands (q.v.). Thomas Addison (q.v.), physician to Guy's Hospital, first described the condition in a paper read to the South London Medical Society in 1849. Later, in 1855, he pub. a monograph, *The Constitutional and Local Effects of Disease of the Suprarenal Capsules*. Of the 11 cases described by Addison, 6 showed destruction of the adrenal glands by tuberculosis, 4 by malignant growths, and 1 only showed atrophy of the glands from no obvious cause. A. D. is rare in children and in those over 60 years of age. It is commonest in the second and third decades. The main features of the disease are muscular weakness, fatigue, loss of appetite, loss of weight, low blood pressure, and pigmentation of the skin and mucous membranes. It is now known that the disorders of function associated with A. D. are caused by a deficiency of the hormones secreted by the cortex of the suprarenal glands. The nature and mode of action of 2 of these hormones, deoxycortone and cortisone (q.v.), have recently been discovered. Knowledge regarding 2 other adrenal hormones, the fat-controlling hormone and the pigment-controlling hormone, is incomplete. In addition to these 4 hormones, the suprarenals also secrete androgens, oestrogens, and progesterone, which are a group of sex hormones. Until the discovery and isolation of deoxycortone and cortisone as therapeutic substances, progressive A. D. was a fatal disease, complete absence of suprarenal hormones being incompatible with life. Treatment now consists in giving deoxycortone and/or cortisone by injection

or by mouth. In this way the natural hormones, which owing to the destruction of the suprarenal glands are absent from the circulating bloodstream, are replaced by artificial means. There is no cure for A. D. The most that can be done is to maintain life by supplying the body with the essential hormones which it is unable to manufacture for itself.

Addition (Lat. *addere*, to put to) is the putting together of 2 or more magnitudes.

In arithmetic and algebra it is the first rule denoting the putting together or adding of sev. numbers or quantities of the same kind into 1 number or quantity, called the sum or total. The sign of this operation is +, pronounced plus, the Latin for more. Thus 2 + 3 means the number 2 added to the number 3, and $a + b$ means the quantity a added to the quantity b , and represents the sum of a and b .

Addled Parliament, The, nickname of James I's second parliament, which sat in 1614, and did not pass a single Act. The king wished to obtain supplies without settling the question of imposts, but to this the members—among whom were Pym and Wentworth—would not agree, and James therefore dissolved it.

Address, **Forms of**. The form of A. to and between persons has lost much of the ceremony that characterised the custom a few generations ago. Many of the methods and terms used to-day would then have been serious breaches of etiquette, but are adopted now with a great freedom from due ceremony. The forms of A. should be as follows:

Ambassador, British. Address: 'His Excellency (according to rank), H.B.M.'s Ambassador and Plenipotentiary,' then 'Sir' or 'My Lord,' etc., according to status. In conversation use 'Your Excellency.' Respecting the ambas.'s wife, the form 'Your Excellency,' though not correct, is often used.

Archbishop. 'His Grace the Lord Archbishop of —, My Lord Archbishop.' Later references in the same communication, 'Your Grace.' In formal documents to the Archbishop of Canterbury the following is used: 'The Most Rev. Father in God (full Christian and surnames), by Divine Providence Lord Archbishop of Canterbury, Primate of All England and Metropolitan.' To the Archbishop of York: 'The Most Rev. Father in God (Christian name), by Divine permission Lord Archbishop of York, Primate of England and Metropolitan.' Irish archbishops are 'The Most Rev. the Archbishop of —,' but if the archbishop is a temporal peer 'The Right Hon. and Most Rev.' is used. Rom. Catholic archbishops in England and Ireland are addressed as 'The Most Rev.'

Archdeacon. 'The Venerable the Archdeacon of —, Venerable Sir.' Afterwards the same.

Baron. 'The Right Hon. Lord —,' or 'The Lord —, My Lord.' Refer to 'Your Lordship.'

Baron's daughter. If unmarried, 'The Hon. (Christian name and surname).'

If married, 'The Hon. Mrs (husband's surname).' Begin 'Madam.' If married to a baronet or knight, 'The Hon. Lady (husband's surname).' Begin 'My Lady.' If married to a peer, or the son of a duke or marquess, A. accordingly.

Baron's son. 'The Hon. (Christian and surname).' Begin 'Sir.' In Scotland the eldest sons of Scottish peers are addressed, 'The Hon. the Master of (peerage title).'

Baron's son's wife. 'The Hon. Mrs (husband's surname).' Begin 'Madam.' If the daughter of an earl, marquess, or duke, A. accordingly.

Baroness, in own right or husband's. 'The Right Hon. the Baroness —,' 'The Right Hon. Lady —,' or 'The Lady —.' Begin 'My Lady.' Refer to 'Your Ladyship.'

Baronet. 'Sir (Christian name and surname), Bart.' Begin 'Sir.'

Baronet's wife. 'Lady (surname).' Begin 'Madam.' Reference 'Your Ladyship.'

Bishop, abroad. See Bishop, Scottish. *Bishop, Anglican and Rom. Catholic.* 'The Right Rev. the Lord Bishop of London,' or 'The Lord Bishop of London.' Commence 'My Lord Bishop.' Refer to as 'Your Lordship.' A bishop is addressed in formal documents as 'The Right Rev. Father in God (Christian name), by Divine permission Lord Bishop of London.'

Bishop, Irish. 'The Right Rev. the Bishop of Ossory,' or referring to the Bishops of Meath and Tuam, 'The Most Rev.' Commence 'Right Rev. Sir,' or 'Most Rev. Sir.' Rom. Catholic bishops in Ireland, 'The Most Rev.'

Bishop, retired. 'The Right Rev. Bishop —,' or 'The Right Rev. —, D.D.' Begin 'Right Rev. Sir.'

Bishop, Scottish. 'The Right Rev. the Bishop of St. Andrews, Dunkeld, and Dunblane.' The Bishop Primus is usually addressed, 'The Right Rev. the Primus.'

Bishop, Suffragan. 'The Right Rev. the Bishop Suffragan of Bedford.' Commence 'Right Rev. Sir.'

Clergy. 'The Rev. (Christian and surname).' Begin 'Rev. Sir.' If the son of a duke or marquess, 'The Rev. Lord.' If the son of a viscount or baron, 'The Rev. the Hon. (Christian name and surname).'

Companion of an order of knighthood. The ordinary form is used with the addition of the initials C.B., C.M.G., C.I.E., as the case may be.

Consul, British. —, Esq., H.B.M.'s Agent and Consul-General, or 'Consul-General,' or 'Consul,' or 'Vice-Consul,' according to rank.

Countess. 'The Right Hon. the Countess of —.' Commence 'Madam.' Refer to as 'Your Ladyship.'

Dean. 'The Very Rev. the Dean of —.' Begin 'Very Rev. Sir.'

Doctor. The ordinary form of A. is used with the addition of the initials D.D., M.D., LL.D., Mus.D., etc.

Dowager. The widow of the holder of a peerage becomes a dowager on the marriage of her son. She is addressed

as 'The Dowager Lady —.' The same title can be held by more than one person, hence the term is used less frequently to-day, and an alternative form, e.g. 'The Right Hon. Helen, the Countess of —,' is used, distinction being made by the use of the Christian name.

Duchess. 'Her Grace the Duchess of —.' Begin 'My Dear Madam.' Refer to as 'Your Grace.'

Duke. 'His Grace the Duke of —.' Commence 'My Lord Duke.' Further reference, 'Your Grace.'

Duke's daughter. 'The Right Hon. Lady (Christian name and surname),' or 'The Lady (Christian name and surname).' Commence 'Madam.' A. later as 'Your Ladyship.' If married to a peer, A. in husband's rank.

Duke's eldest son and his children. The courtesy title is treated as if it were an actual peerage. The eldest son takes the grandfather's third title and is addressed as a peer.

Duke's eldest son's wife. As if she were the wife of an actual peer.

Duke's younger son. 'The Right Hon. Lord (Christian name and surname).' Commence 'My Lord.' Refer to as 'Your Lordship.'

Duke's younger son's wife. 'The Right Hon. Lady,' or 'The Lady (husband's Christian name and surname).' Commence 'Madam.' Later refer to as 'Your Ladyship.'

Earl. 'The Right Hon. the Earl of —,' or 'The Earl of —.' Commence 'My Lord.' Refer to later as 'Your Lordship.'

Earl's daughter. See Duke's daughter.

Earl's eldest son, and eldest son's wife. Regard the title, which is by courtesy, as an actual peerage.

Earl's younger son and his wife. See Baron's son and his wife.

Governor-General of Dominion or Colony, Governor of Colony. 'His Excellency the Governor-General (or Governor) of —.' Rank will determine the beginning. Refer to as 'Your Excellency.'

Judge, English or Irish. 'The Hon. Sir —,' if a knight, or 'The Hon. Mr Justice —.' Commence with 'Sir.' He is only addressed as 'Your Lordship' or 'My Lord' on the bench.

Judge, Scottish. Same as Lord of Session.

Judge of County Court. 'His Honour Judge —.' Refer to, when on bench, as 'Your Honour.'

Justice of Peace, in England only. When on bench only use 'Your Worship.'

King. 'The King's Most Excellent Majesty.' Commence 'Sire,' or 'May it please Your Majesty,' or in the case of a Lord, 'Lord — presents his duty to Your Majesty.' Reference, 'Your Majesty.'

King's Counsel. Ordinary A. with K.C. added.

Knight Bachelor. Same as Baronet with Bart. omitted.

Knight Commander of the Bath, of St Michael and St George, or of the Star of India. 'Sir (Christian name and surname),' with the initials K.C.B.,

K.C.M.G., or K.C.S.I., according to designation. Commence 'Sir.'

Knight of the Garter, or of the Thistle, or of St Patrick. Ordinary knight A. with initials K.G., K.T., or K.P. added.

Knight's wife. See Baronet's wife.

Lord Advocate of Scotland. 'The Right Hon. the Lord Advocate.' Begin 'My Lord.'

Lord Chancellor. 'The Right Hon. the Lord High Chancellor.' Rank will determine beginning.

Lord Chief Justice. 'The Right Hon. the Lord Chief Justice of England.' If a peer commence according to status, otherwise, same as judge.

Lord High Commissioner to the General Assembly. His Grace the Lord High Commissioner.' Commence according to peerage rank. Reference, 'Your Grace.'

Lord Justice-Clerk. 'The Right Hon. the Lord Justice-Clerk.' Commence 'My Lord,' and refer to 'Your Lordship.'

Lord Justice-General of Scotland. 'The Right Hon. the Lord Justice-General.' Begin with 'My Lord,' and refer to 'Your Lordship.'

Lord Justice of Appeal. 'The Right Hon. the Lord Justice —,' or the 'Right Hon. Sir —.' Begin and refer to as for judge.

Lord Mayor of London, York, or Dublin. 'The Right Hon. the Lord Mayor of London,' or 'The Right Hon. —, Lord Mayor of London.' Commence 'My Lord,' and refer to 'Your Lordship.'

Lord Mayor's wife. 'The Right Hon. the Lady Mayoress of —.' Commence 'Madam.' Refer to 'Your Ladyship.'

Lord of Appeal in Ordinary and wife. See Baron and Baroness. Children do not take any title.

Lord of Session in Scotland. 'The Hon. Lord —.' Commence with 'My Lord,' and refer later to 'Your Lordship.' The wife has no title.

Lord Provost. 'The Right Hon. the Lord Provost of Edinburgh,' 'The Hon. the Lord Provost of Glasgow,' 'The Lord Provost of Aberdeen' (or of Perth). Commence with 'My Lord Provost,' or 'My Lord.' Refer to 'Your Lordship.' Wife has no title.

Maid of Honour. 'The Hon. Miss —.' Commence 'Madam.'

Marchioness. 'The Most Hon. the Marchioness of —.' Commence 'Madam.' Refer to 'Your Ladyship.'

Marquess. 'The Most Hon. the Marquess of —.' Commence 'My Lord Marquess.' Refer to 'Your Lordship.'

Marquess's daughter. See Duke's daughter.

Marquess's eldest son. See Duke's eldest son.

Marquess's younger son. See Duke's younger son.

Mayor. 'The Right Worshipful the Mayor of —.' Begin 'Sir.' Refer to 'Your Worship.'

Member of Parliament. M.P. is added to the usual form of A.

Minister Resident. —, Esq. (or according to rank), H.B.M.'s Minister Resident.'

Officers in the Army and Navy. The professional is prefixed to any other rank, e.g. 'Admiral the Right Hon. the Earl of —,' 'Lieut.-Col. Sir —, K.C.B.' Officers below captain in the Army or commander in the Navy are usually addressed by their civil rank with the initials of their corps, e.g. R.A., R.E., added.

Premier. According to rank.

Prince. 'His Royal Highness the Duke of —,' if a duke. Otherwise 'His Royal Highness Prince (Christian name).' In both cases commence 'Sir.' Refer to 'Your Royal Highness.'

Princess. If a duchess 'Her Royal Highness the Duchess of —.' Otherwise 'Her Royal Highness the Princess (Christian name).' Commence 'Madam,' and refer to 'Your Royal Highness.'

Principal of a Scottish University. If a clergyman 'The Very Rev. the Principal of —,' or 'The Very Rev. Principal (surname).'

Privy Councillor. 'The Right Hon.,' followed by name and title. Rank will determine beginning and reference.

Queen. 'The Queen's Most Excellent Majesty.' Commence 'Madam,' or 'May it please Your Majesty.' Otherwise, 'Lord — presents his duty to Your Majesty.' Reference 'Your Majesty.'

Recorder. 'Sir,' 'Your Worship,' 'The Worshipful' (London only), 'Right Worshipful.'

Secretary of State. 'His (or Her) Majesty's Principal Secretary of State for the — Department.'

Sheriff of London. 'The Right Worshipful.'

Viscount. 'The Right Hon. the Lord Viscount —.' Commence 'My Lord.' Refer to 'Your Lordship.'

Viscount's daughter, son, and son's wife. See Baron's daughter, son, and son's wife.

Viscountess. 'The Right Hon. the Viscountess —,' or 'The Viscountess —.' Begin 'Madam.' Refer to 'Your Ladyship.'

Correspondence between equals loses much of its formality, e.g. 'My dear Lord.' Persons of no superior rank usually adopt 'Sir,' 'Dear Sir,' or 'My dear Sir,' according to the degree of familiarity existing between them. To a firm 'Gentlemen' or 'Sirs' is usually the form.

In the U.S.A. the President, Governors, and all ambas. are addressed as 'His Excellency.' The Vice-President, heads of Executive Depts, Justices of the Superior Courts, mayors of tns, Senators, Congressmen, Consuls, Lieutenant-Governors, and the heads of State depts are addressed as 'The Hon.'

Addua, see ADDA.

Ade, George (1866-1944), Amer. humorist and playwright, b. Kentland, Indiana. He studied science at Purdue Univ., and after some years as a journalist started an original line with *Fables in Slang*, 1900. These moral tales of modern life, in a vernacular of his own devising, were so successful that he wrote half a dozen vols. of them under various titles. He also

wrote novels and a number of successful plays, including *Speaking to Father*, 1923, and *The College Widow*, 1924.

Adelaer, Kurt Sivertsen (1822-75), Dutch admiral of Norwegian birth, who assisted Venice against the Turks (1654), and was so successful in many naval battles that Frederick III, King of Denmark, made him admiral of the Dan. fleet, 1662, and gave him the title of A.

Adelaide (Amelia Adelaide Louisa Theresa Caroline) (1792-1849), Queen of Great Britain, wife of William IV, eldest daughter of George, Duke of Saxe-Coburg-Meiningen. She married William,

city. The belt of park lands encircling the city, preserved in the original plans, has been maintained and now provides A. with one of its notable charms. Bridges communicate between the N. and S. parts, and the streets are wide and well paved. The chief business dists. are Rundle and Hindley, Currie and Grenfell Sts, while King Wm St, about a mile long, is one of the finest traffic avenues in Australia. Four roadways, facing the cardinal points of the compass, known as N., S., E., and W. Terraces, are in the S. part. The classic *pièce de résistance*, approached from the new railway station,

ADELAIDE: NORTH TERRACE EAST

On the left is the national war memorial; the three buildings to the right of it are the circulating and public libraries and the museum.

then Duke of Clarence, in 1818. She helped to raise the moral standard of life at court, and was a devoted wife to William. All their children *d.* in infancy. See M. Hopkirk, *Queen Adelaide*, 1946.

Adelaide, cap. of S. Australia, on the Torrens R., 7 m. by rail from Port A. on the Gulf of St Vincent. It was founded in 1837, and named after the queen of William IV; and owing to the discovery of gold soon became an important city. It is situated on a large plain, bounded on the S. and E. by the Mt Lofty Range, and is the one Australian city planned at the outset with some coherent regard for principles. There are no slums. Modelled on the Gk ideal, A. is commonly named 'the Athens of the S.' Admirable foresight was shown in the laying out of the city, which is square in form and divided by the R. Torrens into 2 parts, the N. being the residential, the S. the business centre; the suburban area, however, has expanded considerably all around the

is N. Terrace, which is planned like a Parisian boulevard with lawns and flower-beds. Here are situated the museum, art gallery, parliament house (built of S. Australian marble), Gov. House, the hospital, and the leading clubs. A. is rich in marble statues. The national war memorial of marble, very large in scale, representing the Prologue and Epilogue of War, stands in front of Gov. House. A bronze equestrian statue at the corner of King Wm St commemorates the S. Australians who fell in the S. African War. There is also a bronze in Creswell Garden near the A. Oval to the memory of Sir Ross Smith, K.B.E., M.C., the aviator. Other notable public buildings are those of the univ., which plays a large part in the cultural life of the city and the state; the Anglican cathedral of St Peter's; and the Rom. Catholic cathedral. The botanic gardens and park and zoological gardens are 120 ac. in extent. A. is connected by rail

with Sydney, Melbourne, Perth, Brisbane, and other important tns and is the terminus of the overland telegraph from Port Darwin. There are also trolley and motor buses, and the tramway system's metropolitan and suburban routes cover 149 m. of single track. The water supply is good and is obtained from the catchment areas of the Onkaparinga and Torrens, and is stored in 5 reservoirs. A. is the emporium for S. Australia, exporting through Port A. wool, wheat, flour, and silver and copper ore. There are hardware, sheet-metal, and motor body building works. Pop. 500,000.

Adeler, Max (Charles Heber Clark) (1841-1915), Amer. author and journalist. He was on the editorial staff of the *Evening Bulletin*, Philadelphia, and ed. the *Manufacturer*. Among his works, mostly humorous, are *Out of the Hurly-Burly*, which procured him worldwide fame in 1874; *Elbow-Room*, 1876; *Random Shots*, 1879; *The Quakeress*, a novel, 1905; *By the Bend in the River*, short stories, 1914. Though in literature the most irresponsible of jokers, he was a very serious politician—a high tariff protectionist.

Adelges, formerly Chermes or Kermes,

Bedford Lemere

THE OLD ADELPHI TERRACE

'*Adelaide Advertiser*,' morning daily newspaper, estab. 1858, with a present circulation of over 170,000 daily. A. A. Newspapers Ltd also controls a network of 4 broadcasting stations and has a half-interest in the only Sunday newspaper pub. in S. Australia. The company's pubs. include the *A. Chronicle*, a weekly newspaper devoted to primary industries.

Adelard of Bath (12th cent.), philosopher and one of the most learned men of medieval times. After studying in France he travelled in Spain, Italy, N. Africa, and Asia Minor. He trans. Euclid's *Elements* from the Arabic, and wrote, between 1113 and 1133, a celebrated work *De Eodem et Diverso* (On Identity and Difference). It establishes him as the founder of the doctrine of indifference, according to which genus and species retain their identity in the individual. There is an ed. of *De Eodem et Diverso* by H. Willner (1903). See L. Thorndike, 'Adelard of Bath and the Continuity of Universal Nature' in *Nature*, xciv, 1915.

genus of minute gall-lice or aphids which infest conifers, particularly Norway and Sitka spruce. Typical is *A. abietis* of which the young insects feed at the base of leaf needles in spring, causing swellings or galls like false cones, which eventually contain 100 or more cavities, each harbouring sev. young aphids. The galls open in June; the escaping aphids are winged and fly to infest secondary hosts, such as larch, pine, or silver fir, for sev. generations, without forming galls, producing a winged generation in July of the second year, which flies back to the spruce to lay eggs and repeat the life cycle. *A. cooleyi* infests Douglas fir and Sitka spruce; *A. nusslini*, silver fir. Infestation of primary host shows in galls, of secondary host in small specks of sticky white down on leaf needles. Die-back of stems may follow, but damage is rarely severe on trees grown under suitable conditions.

Adelle Land, see TERRE ADÉLIE.

Adelphi, dist. S. of the Strand, London, deriving its name from *Adelphoi* (Gk,

'brothers') because its development was due to Robert Adam (q.v.) and his brothers James and Wm. They obtained a 99-year lease in 1768 from the Duke of St Albans for an area largely co-terminous with the site and grounds of the famous Durham House which had stood there since the early 13th cent. Land had to be reclaimed from the Thames, and great arched vaults served as foundations for the houses nearer the riv. Owing to the charm of its architecture and a fine situation the A. became a favoured residential dist. There have been many distinguished residents, including Garrick and G. B. Shaw. Latterly the character of the dist. has altered considerably, and very little remains of the Adam archi-

tecture. In 1935-8 the very fine A. Terrace was replaced by the large block of office buildings known as The A. There were at one time 4 streets in honour of the Adam brothers: Adam Street, Robert Street, John Street (now John Adam Street), and William Street (now Durham House Street). There has always been uncertainty about the part taken in the scheme by Robert Adam's brothers, but it appears that James and Wm had a little and John had nothing to do with it. See Charles Pendrill, *The Adelphi*, 1934.

Adelsberg, see POSTOJNA.

Adelung, Johann Christoph (1732-1806), Ger. linguist, lexicographer, and

grammarian, b. at Spantekow near

Anklam, Mecklenburg, and d. at Dres-

den. He devoted his time to trans. work,

philology, and languages, and was librar-

ian to the electoral library, Dresden, from 1787. His works include *Geschichte*

der Kultur, *Deutsche Sprachlehre für*

Schulen, *Umständliches Lehrgebäude der*

deutschen Sprache, *Grammatisch-kritisches*

Wörterbuch der hochdeutschen Mundart, and

Mithridates oder allgemeine Sprachen-

kunde.

Ademption means the revocation or

taking away of a grant or legacy. Thus

if a testator leaves a specific article in

his will, and before his death the nature

of the article or property bequeathed is

entirely changed, the legatee is said to suffer

from A., i.e. he gets nothing. The word

is also used in the legal sense of 'satis-

faction,' e.g. if a testator owing money

make a creditor a beneficiary under his

will to the same amount as the debt, or

more, then the legacy is held to have

extinguished the debt.

Aden, Brit. tn and Crown colony, which

also gives its name to the gulf of Aden, as

well as to the adjoining protectorate

(see below). It is the most populous and

important port of Arabia, and the total

pop. of the colony is 140,000 in an area of

75 sq. m. The tn stands at the end of a

ADEN HARBOUR

Fox Photos

rocky peninsula (which is joined to the

mainland by a narrow sandy isthmus not

1 m. wide), and is heavily fortified, being

indeed the only fortified point between

Egypt and Bombay. The Camp, as it is

called, or A. proper, stands in the crater of

an extinct volcano. Arid rocks surround

it, rising at the highest point to 1725 ft,

and the mean ann. temp. is 83° in the

shade. The other centres of pop. are

Steamer Point and Sheikh Othman,

towards the interior, and the Little A.

peninsula, site of a large oil refinery. A.,

a most prosperous tn under medieval

Turkish rule, was inhabited by 500-600

Arabs at the time Capt. Haines annexed

it after an almost bloodless coup (1839).

A system of rain-collecting cisterns was

once the chief source of water supply,

but water is now obtained from bore-

holes at Sheikh Othman, and the cisterns

(which are of unknown origin) are now

only of historical interest. By the

convention with Turkey the old bound-

ary, delimited in 1905, was extended

to a point on the coast opposite Bahrein

(q.v.) on the Persian Gulf. Adminis-

trative control used to be exercised

through the Gov. of India, the Colonial

Office being responsible for political

questions. In 1932 A. was separated

from the Bombay Presidency and formed into a prov. under a chief commissioner under the direct control of the Gov. of India. But it ceased to be a part of Brit. India in 1937, and is now a Crown colony under a governor, who is assisted by an executive council and a legislative council. The chief industries are salt and cigarette manuf., and the total sea-borne trade was estimated at £73,600,000 (imports) and £62,700,000 (exports) in 1955. The trade of A. decayed after the Portuguese discovery of the Cape route, but with the opening of the Suez Canal A.'s old importance revived, and it is now a most important oil bunkering and coaling station and port of call, besides being an emporium for the trade of the adjacent African and Arabian coasts. The Brit. Gov. has treaty engagements with, and subsidises, the neighbouring Arab tribes from the strait of Bab-el-Mandeb to Muscat. There is a court of unlimited civil and criminal jurisdiction, called the Supreme Court, from which certain appeals lie to the E. African Court of Appeal at Nairobi.

Perim, a small unfortified is. of 5 sq. m. (pop. 300), is included in the colony of A. The is. of Kamaran on the Red Sea about 200 m. N. of Perim, taken by Britain in 1915, is also under the control of the gov. of Aden. It is 22 sq. m. in extent (pop. 2200).

Aden Protectorate, a protectorate of approx. 112,000 sq. m. with an estimated pop. of 600,000, divided into a W. part, consisting of a score of sultanates, the chiefs of which, including the Sultan of Lahej, are in protective treaty relations with the Brit. Gov.; and an E. part, comprising the Hadhramaut (consisting of the Quaiti state of Shihr and Mukalla, and the Kathiri state of Seiyun), the sultanate of Qishn and Socotra, and the Wahidi sultanates of Bir 'Ali and Balihaf, all of which enjoy protective treaty relations with Britain. The Hadhramaut is the most important and best organised of the areas of the E. protectorate. The protectorate is bounded on the E. by the Qara country, which is part of the ter. of the Sultan of Muscat and Oman, and on the N. and W. by the Great Desert and the kingdom of the Yemen, whose S. boundary was provisionally fixed by the treaty of Sanaa (1934), by which the Brit. Gov. and the Imam Yahia of the Yemen agreed to maintain the *status quo* frontier as it was at the date of the treaty. The coastline of the protectorate, which is about 600 m. long, begins in the W. from Husn Murad, opposite Perim, and runs eastward to Ras Dharbat 'Ali, where it meets the sultanate of Muscat. The Mahri sultanate of Qishn and Socotra is the most easterly part of the A. protectorate, being bounded on the E. by Muscat and Oman. The Sultan of Qishn resides on Socotra Is. (1400 sq. m.), which lies 150 m. from Cape Guardafui. This is. was occupied by the E. India Co. in 1834 and came under Brit. protection in 1886.

Adenauer, Konrad (1876-), Ger. politician, educ. Freiburg, Munich, and Bonn Univs. He became a lawyer in

Cologne, was deputy-mayor, 1906, senior deputy-mayor, 1909, and lord mayor, 1917-33. He was again lord mayor of Cologne, 1945, but dismissed by Allied Military Gov., 1946. A prominent member of the Centre party (Catholic), he was dismissed from all his offices by Goering in 1933 and was imprisoned on political grounds for short periods by the Nazis in 1933 and 1944. He remained out of public life during the Nazi regime.

Embassy of the Federal Republic of Germany

DR KONRAD ADENAUER

After the Second World War A. was a foundation member of the Christian Democratic Union party, and its president in the Brit. zone of Germany, 1946-8. He represented N.-Rhine-Westphalia in the parl. council of the 3 W. zones, 1948-9, being president of the parl. council for most of this period.

In the elections held in the newly estab. Federal Ger. Rep. in Aug. 1949 A.'s party gained most seats in the Bundestag, and, by allying with other smaller groups, had a clear majority over its prin. opponents, the Social Democrats. The following month A. was elected first Chancellor of the Federal Rep. by the Bundestag. He combined the office with that of foreign minister. In the elections of 1953 the Christian Democratic Union increased their representation and A. was re-elected Chancellor. He relinquished the post of foreign minister in 1955.

A. has been a strong advocate of Federal Germany's participation in the defence of W. Europe against Communism, and much of his chancellorship has been taken up with problems relating

to the Ger. defence contribution, about which he has had to fight hard against the prin. opposition party, the Social Democrats. Though devoted to the cause of Ger. reunification, A. has throughout maintained that, whatever Russian declared policy, truly democratic reunification cannot be hindered in any way by Federal Germany being able to negotiate from a position of strength and security such as membership of N.A.T.O. gives her. In 1955 he visited Moscow, as a result of which diplomatic relations were estab. between Russia and Federal Germany, and sev. thousand Ger. prisoners still held in the Soviet Union sent home.

Adenitis (Gk *adēn*, a gland), term used in medicine to indicate inflammation of the lymphatic glands. It may be either acute or chronic. The function of lymphatic glands (or nodes) is to act as filters in the lymphatic drainage system. A., therefore, is a symptom, as a rule, of some disease process within the area of the body that is drained by the lymphatic channels on which the affected lymphatic glands are situated. In acute A. the disease is usually an infected wound or sore, the invading micro-organisms being carried away by the lymphatics and trapped in the glands, where, in turn, they set up inflammation and sometimes suppuration. Chronic A. may be due to a chronic infection, such as tuberculosis (q.v.). Lymphatic glands are also the seat of secondary cancer (q.v.), the malignant growth cells being carried along the lymphatic channels from the primary cancer. A blood disease, lymphadenoma or Hodgkin's disease, causes enlargement of the lymphatic glands.

Adenoids, or **Adenoid Growths**, enlargement of the lymphatic tissues at the back of the nose and throat. The condition occurs mainly in young children, and is evidenced by mouth-breathing (due to obstruction of the nasal air passages), liability to colds and irritable cough, nasal speech, and a characteristically dull facial expression. A. are frequently associated with chronic tonsil sepsis, and the infection spreads up through the Eustachian tubes (q.v.) to the middle ear and is a common cause of *otitis media*. Deafness in children is often caused by adenoidal obstruction of the Eustachian tubes.

Aderbaizan, see AZERBAIJAN.

Adersbach, see ADERSBACH.

Adhesion, in physics, the molecular force between masses or particles of different substances, as distinct from cohesion, the force between parts of the same substance.

Adhesion, in botany, the union of different organs.

Adhesion, in pathology, denotes union of two surfaces by the production of lymph after inflammation. It occurs, for example, after pleurisy (q.v.) when the two layers of the pleura adhere together. Peritonitis (q.v.) is also the cause of A. between peritoneal surfaces, and A.s may occur after abdominal operations. Sometimes intestinal obstruction results from peritoneal A.s. A.s of the two layers of

the pericardium (see HEART) may follow pericarditis. Normal healing of a wound by 'first intention' is an example of A.s performing a beneficial role.

Adhesives are prepared from many naturally occurring substances, starch, casein, bones and skins (see GLUE), and exudations of trees. A. are also prepared from synthetic resins (q.v.).

Starch, usually provided from maize, farina, tapioca, or sago, is prepared by disintegrating the vegetable matter and separating the starch granules by flotation. The whole process is carried out in the cold. When the starch is used as an adhesive, it is gelatinised in water either by heat or chemical action. Dextrin derived from starch is a material of widely varying properties according to manufacturing conditions. This is obtained from starch either by acid roasting, enzyme action, or acid hydrolysis. Dextrin is used as an adhesive either as a simple solution in water or modified by the action of chemicals, generally borax and other alkalis. **Casein** is prepared from sour milk by either acid or rennet processes. Acid casein is generally preferred for A. The casein can be dissolved to form an adhesive in two ways, either by the action of borax and other alkalis or by dissolving the casein in a strong solution of urea. Casein A. can be made waterproof by sev. means. **Exudations of trees** include natural rubber latex and numerous natural gums such as arabic, tragacanth, and karya. Natural rubber latex is the liquid collected as a result of incisions in the bark of *Hevea brasiliensis*. This is stabilised by the addition of ammonia and preservatives and concentrated by centrifuging. **Gum arabic** (*Acacia*) is a solid resinous exudation from many species of *Acacia leguminosae*, used as a viscous solution in water plus some glycerine. It is widely used as a re-moistening gum, e.g. on postage stamps. **Gum tragacanth** (gum hog tragacanth) is a solid leaf-like exudation from many Asiatic species of *Astragalus leguminosae*. Preparation and use are similar to gum arabic.

Some A. have particular application for special work. Thus **Canada balsam** is a resin obtained by piercing the bark of the Amer. balsam fir. Its chief property is its transparency when set, which makes it eminently useful in optical work for cementing together glass surfaces. **Paste** is used for cementing paper and is made from flour or starch, the flour being rubbed up with water and boiled. The addition of water before boiling improves the quality, making it thinner and stronger. In large quantities, for wall-papering and bill-sticking, it can be made by mixing a quarter of flour with a quarter of a pound of alum into a creamy consistency with warm water, and then pouring on boiling water and stirring. As this paste is liable to become mouldy and putrid, it can be made permanent by the addition of a little corrosive sublimate. **Liquid glues** are prepared from shellac, which is caused to dissolve by boiling with borax. **Red cement**, or Faraday's cement, is used by instrument-makers for cementing glass to

metals. It is made by melting five parts of black resin with one part of yellow wax and then stirring in gradually one part of red ochre in fine powder and previously well dried. *Mastic cement* is made by mixing twenty parts of well-washed and sifted sharp sand with two parts of litharge and one of slaked lime. This is mixed with linseed oil, which sets by its property of absorbing oxygen. It is used for repairing stone-work. Sodium silicate is also used for closing the pores and resisting attack. See also GLUE and SYNTHETIC RESINS.

Adiabatic, without transference of heat. If a change takes place in a system, and no heat enters or leaves during the process, the change is said to be an A. change. Rapid changes of pressure in gases, e.g. sound waves, are usually A. provided that the walls of the container are poor thermal conductors and thermal radiation is excluded. See THERMODYNAMICS.

Adiabene, region of N. Mesopotamia E. of the Upper Tigris, conquered by Trajan. In the Christian era it was trib. to the Parthians.

Adiantum, genus of ferns of the Polypodiaceae, which usually inhabit damp tropical woods. *A. capillus-veneris*, the maidenhair fern, is found rarely in Britain and Europe. About 200 species of A. are known.

Adiaphora (Gk. 'indifferent things'), word signifying such actions as the Stoics held to lie in the border region between good and evil. The Adiaphoristic controversy in the Ger. Protestant Reformation arose from a dispute over certain Catholic tenets. Seeking to reconcile his Catholic and Protestant subjects, the Emperor Charles V in 1548 drew up a temporary ritual and rule of faith pending the settlement of the matter by a general council. The A. were those customs and tenets declared in the Leipzig Interim by Melancthon and his followers to be indifferent. Luther and his supporters opposed this distinction.

Adige (Ger. *Etsch*, anct. *Athesis*), riv. of Italy, which rises in the Rhaetian Alps (q.v.), and flows E. to Merano, then S. past Bolzano, Trent, and Rovereto into the plain of Lombardy, then SE. past Verona, and finally reaches the Adriatic just N. of the Po (q.v.). After the Po it is the chief riv. of Italy; it is deep, and below Verona has a width of about 500 ft. but its rapid current makes navigation difficult. Many battles have been fought on its banks; in particular it was the scene of an Austrian defeat in 1799. Length 252 m.

Adigherat, or **Adigrat**, small tn of Tigré, Ethiopia, which, prior to the It. invasion of 1936, had an important market, and is of historical interest.

Adipic (Lat. *adeps*, thick) **Acid**, crystallised solid acid, obtained by the oxidation of certain fatty or waxy bodies. It is a dibasic acid, akin to oxalic and succinic acids. It is used in the manuf. of nylon 66.

Adipocere, wax-like substance produced by the exposure of fleshy tissue to moisture with the exclusion of air, as in the earth or under water. Human bodies in moist burial-places often undergo this change.

Adipose Tissue, collection of fat within the body of an animal. It consists of minute cells containing a secretion of oily matter. A substance is what is known as a connective tissue, i.e. it constitutes a sort of packing material between the harder tissues which form the framework of the body. Its uses are to protect the organs from external changes of temp. and to constitute a reservoir of material which may serve as food when other supplies fail. An excessive amount of A. T. is developed in the course of some diseases.

Adirondack Mts, very beautiful group in the N. of New York state, U.S.A. They may be regarded as the continuation of the Alleghenies, and they terminate abruptly in sheer cliffs on the shore of Lake Champlain. They stand on a plateau 2000 ft above sea level, cover an area of 5000 sq. m., and their highest peak, Mt Marcy, has an altitude of 5345 ft. The dist. abounds in lakes and waterfalls, and here are the head streams of the Hudson. A forest reserve of 4375 sq. m. is owned by the state. A certain amount of lumbering is carried on, but the region is principally noted for being a favourite summer resort.

Adit, horizontal entrance to a mine, sometimes called a drift. See MINING.

Adjective (Lat. *adjectivus*, added), name of one of the parts of speech used with a noun, or substantive, to express a quality of the thing named or something attributed to it; to limit or define it; or to specify or describe a thing, as distinct from something else. Thus in the phrase 'a good man,' 'good' is the A., and expresses the quality of the man.

Adjudication, an **Order of**, in Eng. law, is the order of a court adjudging a debtor a bankrupt and appointing a trustee to administer his estate. In Scots law A. means a process to attach the heritable property of a debtor—not necessarily a bankrupt. See BANKRUPTCY.

Adjustment of Average, term used in marine and fire insurance, but mainly in the former, to denote the settling of the amount to be paid by the underwriters to the insured person and each underwriter's share of the loss. The rules relating to the amounts to be made good vary in different countries. In the absence of agreement, adjustment of the amounts to be contributed in respect of general average will take place at and according to the law of the port of discharge, i.e. in general, the place to which the vessel is destined, unless the voyage is justifiably terminated at an intermediate port. See INSURANCE.

Adjutage, or **Ajutage**, tube attached to an orifice through which water is discharged. See HYDRAULICS.

Adjutant, army officer, not above the rank of major, often a captain, and sometimes a subaltern, who assists the officer commanding a battalion or regiment, particularly in the carrying out of administrative work. His duties are multifarious and include that of aide-de-camp in the field. He has charge of the correspondence and official records, and keeps the accounts. The officers' duty roster is prepared by him, he issues by the authority of

the commanding officer the daily orders, and is generally responsible for the discipline and efficiency of the unit. He supervises the drilling of recruits, and acts as prosecutor in all courts martial that concern his men. The appointment is held for about 4 years; in the auxiliary forces for 5 years. The *A.-General*, who is the second military member of the Army Council, has duties towards the army as a whole somewhat similar to those of the A. to his unit, i.e. he is entrusted with all matters pertaining to discipline and efficiency of the troops.

Adjutant (*Leptoptilos dubius*), bird of the stork family found in various parts of India, but more especially in the N. and near water. It resembles somewhat the marabou stork of Africa, but is larger, and when erect it stands about 5 ft high and measures from tip to tip of its extended wings about 15 ft. With its almost bald head and neck and its pouch (sometimes 16 in. in length), which hangs like a dewlap from the lower part of its neck, the bird presents an uncouth appearance. It has a voracious appetite, no carrion or offal or putrescent matter apparently being distasteful to it.

Adler, Alfred (1870-1937), Austrian psychiatrist, b. Penzing, Vienna. He qualified in medicine at Vienna Univ. in 1895 and at first practised as an ophthalmologist, but later turned to mental disease. He was a prominent member of the psycho-analytical group round Freud. In 1907 he advanced his theory of organ inferiority (*Studie über Minderwertigkeit von Organen*). Four years later he seceded from the psycho-analysts and developed his 'individual psychology,' which emphasised the role of inherited bodily defects in determining mental structure. His doctrine is described in his *Über die nervösen Charaktere*, 1912 (Eng. trans. 1917), and in *Practice and Theory of Individual Psychology*, 1920. See life by H. Orgler, 1939, and Phyllis Boltome, *Alfred Adler, Apostle of Freedom*, 1946.

Adler, Nathan Marcus (1803-90), chief rabbi of the Jews of the Brit. Empire, b. Hanover, educ. at Göttingen, Erlangen, and Würzburg. He was chief rabbi at Oldenburg, 1829, at Hanover, 1830, and appointed to the chief rabbinate in London, 1844, in which capacity he did much to reunite the various Jewish congregations. Pub. sermons and other works, including one on the Pentateuch. He was succeeded in office by his son Hermann A. (1839-1911).

Adlington, William (fl. 16th cent.), Brit. author, known for his *Golden Asse of Lucius Apuleius* (1566). A. as a translator ranks with John Florio or Philemon Holland; yet nothing is known of him. Inasmuch as he dedicated his work to the Earl of Sussex from Univ. College, Oxford, it is evident that he was at Oxford, probably in a tutorial capacity. It is said by some that he was the 'W. A.' who in 1579 pub. a verse tract, *A Speciall Remedie against the Furious Force of Lawlesse Love*. See C. Whibley's introduction to the 1893 ed. of *The Golden Asse*.

Administration. Of the two functions of gov., legislation and A., the latter is by far the larger and more important, and in recognition of this fact the gov. of a country is often termed the A. or ministry. In modern constitutional states this A. must be in accordance with the law, and in this country, in addition to being responsible to the legislature, the ministers are as liable as ordinary persons for maladministration.

Administrative Counties are those cos. or parts of cos., including the co. of London and the co. bors., which, under the Local Gov. Acts, 1888-1933, form separate A. C. of themselves for the purpose of managing, through co. councils, the administrative business of their respective areas. Yorks and Lincs have 3 administrative H.Q. (excluding co. bors.), Suffolk and Sussex 2 each. See LOCAL GOVERNMENT.

Administrative Law has been defined by Sir Ivor Jennings, a leading contemporary constitutional lawyer, as 'the law relating to the Administration. It determines the organisation, powers, and duties of administrative authorities.' The ever-increasing activities of gov. depts, local authorities, and public corporations require lawyers to be familiar with administrative processes likely to affect the rights and obligations of their clients. Montesquieu in the 18th cent. mistakenly thought that the legislative, executive, and judicial functions in England were entirely separate. Broadly speaking it may be accurately stated that Parliament makes law; gov. depts, local authorities, and public corporations carry out the laws passed by Parliament; and the courts adjudicate disputes according to those laws. A merely superficial examination of the powers of the administration (q.v.) will reveal the obvious misconception of Montesquieu's doctrine of separation of powers. The administrative authorities have executive, legislative, and judicial functions. Their executive functions are to carry out the duties imposed on them by statute (e.g. the collection of taxes, the inspection of factories, and the administration of social services). They may also have legislative functions; a statute may empower a minister to make detailed regulations having the force of law, e.g. the Factories Act, 1937, authorises the Ministry of Labour to make safety regulations for specific industries. A minister may have to exercise judicial functions when adjudicating on the competing claims of interests likely to be affected by some administrative act. For instance, the Minister of Housing and Local Gov. may appoint an inspector to conduct a public inquiry into the making of a compulsory purchase order (see COMPULSORY ACQUISITION OF LAND). Disputes between claimants and the Ministry of National Insurance insurance officers about social service benefits administered by the ministry are adjudicated on by local tribunals appointed by the minister. The merits of claims for social service benefits or objections to ministerial orders confirming the compulsory acquisition of

land cannot be determined by the courts, whose jurisdiction is limited to questions of law. For instance, the court will not entertain an action which seeks to obtain a declaration that a compulsory purchase order inflicts undue hardship; it may, however, quash such an order on the grounds that it is defective in failing to comply with statutory requirements.

The prin. criticisms of the working of administrative tribunals are: (a) they are appointed by a minister whose dept has made the decisions on which they are required to adjudicate; (b) the jurisdiction of the ordinary courts in such matters is ousted. Appeals to administrative tribunals on such matters as compulsory purchase, unemployment benefit, or proposed increases of railway fares should be distinguished from the ordinary litigation in which gov. depts may be involved. Since the passing of the Crown Proceedings Act, 1947, gov. depts, like other public authorities, may be sued for breach of contract or negligence. Their administrative acts, unless made unlawfully, even if carried out harshly, are outside the scope of the courts. This has caused such grave concern that in 1955 the Gov. appointed a committee under the chairmanship of Sir Oliver Franks to inquire into administrative tribunals and inquiries. Its terms of reference are to consider and make recommendations on: (a) The constitution and working of tribunals, other than ordinary courts of law, constituted under any Act of Parliament by a minister of the Crown or for the purpose of a minister's functions; (b) The working of such administrative procedures as include the holding of an inquiry or hearing by or on behalf of a minister on an appeal or as the result of objections or representations, and in particular the procedure for the compulsory purchase of land.

See C. K. Allen, *Law and Orders*, 1945; G. L. Williams, *Crown Proceedings*, 1948; Sir A. Denning, *Freedom under the Law*, 1950; W. A. Robson, *Justice and the Administrative Law*, 1951; J. A. G. Griffith and H. Street, *Principles of Administrative Law*, 1952.

Administrator, person appointed by authority to dispose of or administer the estate of an intestate deceased, or of a deceased who has made a will but named no executor, or if an executor dies before the distribution of the property. Such a person is now appointed by the probate div. of the High Court, but prior to the creation of this court in 1858 an A. was appointed by the bishop of the diocese. Letters of administration are generally granted by the court to the next of kin, or in default a creditor may obtain them. An A. can charge upon the estate he administers his actual expenses but no more, and he is usually required to give some guarantee of faithful and competent administration. In all the Eng.-speaking provs. of Canada, the A. is allowed a commission—usually 5 per cent—on the amount of money passing through his hands. Letters of administration must be applied for within 6 months of the death of the

deceased, and a person performing the functions without this licence may be mulcted in £100 fine, plus an additional fine equal to 10 per cent of the value of the estate. The essential difference between an executor and an A. is that the latter can do nothing without the assent of the court appointing him.

Admiral, title of the chief naval officers and the equivalent in rank to a general on land; in fact, the 4 classes of A.s (A. of the Fleet, A., vice-A., and rear-A.) are equal in precedence with the 4 divs. of generals (field marshal, general, lieutenant-general, and major-general). The word is derived from the Arabic *amir* or *emir*, meaning a 'lord' or 'commander' (cf. *amir-al-bahr*, commander of the sea), and found its way into European tongues, like many others of E. origin, during the holy wars of the 12th and 13th cents. The office is, however, considerably older, and before the word became used in this country under Edward III, the chief naval officer was known as the 'guardian of the sea' (*custos maris*). The early Eng. form of the word was *amiral* or *ammiral*, the latter form being used by Milton, Cromwell's secretary of state. The present spelling of the word probably arose from the belief that it was an abridged form of *admirable*, or that it was a compound with the Lat. *ad*. The office of Lord High A., which subsisted with breaks from 1405, when it was created by Henry IV, till 1828, when its administrative functions were vested in the present Board of Admiralty, was of great importance and carried with it certain judicial functions, which, since 1875, have been exercised by the Probate, Divorce, and Admiralty Div. of the High Court (q.v.). The first Lord High A. was the Earl of Somerset, and from his time onward the duties were exercised by an individual until 1632, when for the first time the office was put into commission, all the great officers of state being commissioners. During the Commonwealth, naval affairs were at first directed by a parl. committee, but afterwards Cromwell himself took control of them. When Charles II was restored he appointed his brother James to be Lord High A., which office he retained till 1683, when Charles himself assumed it. On James's accession to the throne the next year he resumed his former office, but at the revolution of 1688 the office was again put into commission. In this position it remained until 1828 if we except the 3 years 1707-9, and the 16 months (1827-1828) when the 'sailor prince,' afterwards William IV, was Lord High A. Eng. A.s are divided into the classes above mentioned. They are known collectively as flag officers; the ships flying their flags are named 'flag ships.' Formerly the A.s of all grades were subdivided into A.s of the Red, of the White, and of the Blue Fleet, but this is now abolished, as is also, owing to the entire structural alteration in the form of war vessels, the old practice of an A. flying his flag at the main, the vice-A. at the fore, and the rear-A. at the mizzen masthead. See also ADMIRALTY.

'Admiral Graf Spee,' see NAVAL OPERATIONS IN SECOND WORLD WAR.

Admiralty, name given to the gov. dept administering the navy. Formerly responsibility for maritime affairs was entrusted to the Lord High Admiral, one of the great officers of state; but to-day his functions are discharged by 'Commissioners for executing the office of Lord High Admiral,' commonly called the Lords Commissioners of the A. The growth in importance of the A. has been accompanied by some shedding of its functions and privileges. Thus its judicial function, except in matters of naval discipline, has been transferred to other courts, notably the Probate, Divorce, and A. Court (q.v.), while the A. Droits (q.v.) are now collected by the Board of Trade and paid into the public exchequer. The executive authority remained with the political Lords Commissioners, but the administrative work was transacted by a subordinate board of technical officials called the Navy Board, consisting of the prin. officers of the navy. The Navy Board had been constituted by Henry VIII in 1546 from existing officials whose origin developed out of the office of keeper of the king's ships, first created by King John on the appointment of Wm of Wrotham, archdeacon of Taunton, in 1214. Samuel Pepys was one of the prin. officers of the navy from 1660 to 1673, holding the office of clerk of the acts, and wrote most of his famous diary in the old Navy Office.

The A., sometimes in commission, and at times held even by the king himself, had no permanent quarters till the reign of William III, when Wallingford House, the old residence of the Duke of Buckingham in Whitehall, was rebuilt and occupied in 1695. The office was again rebuilt 1723-5, from designs by Thomas Ripley, and the screen erected in 1760, from designs by Robert Adam. The old board room contains some fine carving and sev. historic items. With the expansion of business a separate residence was erected, 1786-91, for the First Lord, adjoining the A. office. Reorganisation in 1832 abolished the Navy Board, which since 1786 had occupied Somerset House; and in 1869-73 the staff there was transferred to Spring Gardens till an extension of the A. buildings should be built. The new building (erected 1891-1906) was extended in 1910 by the erection of the memorial arch across the Mall, which commemorates Queen Victoria. On the new buildings is erected the A. wireless station, by means of which direct communication with war vessels is maintained by H.Q. A large fortress-like bomb-proof extension, known as the citadel, was built in the Second World War as alternative accommodation for H.Q. staff and communications (see below). The last Lord High Admiral, 1827-8, was the Duke of Clarence, who afterwards became William IV. The members of the Board of A. are denominated lords commissioners. Formerly the whole board changed with the gov., but normally only the political members change

nowadays. The board is appointed by royal letters patent, and any change necessitates the issue of a fresh patent. The number of commissioners has varied with the amount of business, having reached 12 in 1918. To-day the prin. members of the board are: 1. **FIRST LORD OF THE A.**, who is a member of the Cabinet and a Privy Councillor, and resigns when the gov. does; he has the general direction and supervision of all business relating to the navy and controls all appointments to the higher posts. Personal responsibility for operations of war falls on the shoulders of the First Lord, because *ex officio* he is the chief naval adviser to the gov. 2. **FIRST SEA LORD AND CHIEF OF NAVAL STAFF** is an officer of the R.N. and deals with questions of naval policy and maritime warfare, is responsible for efficiency of the fleet, controls the work of the naval staff, and is a member of the Chief of Staff's Committee. 3. **SECOND SEA LORD AND CHIEF OF NAVAL PERSONNEL** is an officer of the R.N. and is responsible for the manning of the fleet, mobilisation, and medical arrangements and discipline. 4. **THIRD SEA LORD AND CONTROLLER** is an officer of the R.N. and is responsible for the provision of all kinds of material, including ships, machinery, guns, ordnance and stores; controls design, manuf. and maintenance, inventions, and research. 5. **FOURTH SEA LORD AND CHIEF OF SUPPLIES AND TRANSPORT** is an officer of the R.N. and is responsible for coaling, victualling, transport, pay and allowances, clothing, and medals. 6. **VICE CHIEF OF NAVAL STAFF** is an officer of the R.N. and is responsible for the collection of intelligence, co-operation with aircraft, land and wireless telegraphy; deals with questions of maritime international law. He acts as deputy for the First Sea Lord when necessary. 7. **PARLIAMENTARY AND FINANCIAL SECRETARY** (political; first included in the patent in 1929) is an M.P. and resigns his appointment when the gov. does; is in charge of all questions concerning finance, expenditure, estimates, accounts, and contracts. 8. **CIVIL LORD** (also political) is an M.P. and resigns when the gov. does; he superintends all works services, general labour questions, and schools. If the Civil Lord is a member of the House of Lords he deals with all A. questions in that House. The **PERMANENT SECRETARY** of the A. is also a lord commissioner of the A. He is a member of the civil service, is in charge of the secretariat, has financial control of the A., is accounting officer for navy votes, and is responsible for A. procedure, organisation, and discipline of the civil branches of the A. (Samuel Pepys, as stated above, held a similar post in the Navy Office, 1660-73.) The coast-guard service, which was formerly under the admiral-superintendent of naval services—called in more modern days 'Admiral Commanding Coast Guard and Reserves'—came to the A. in 1858, and in 1923 was transferred to the Board of Trade. The older part of the A.

contains some fine mahogany panelling and marine paintings by eminent artists. In the Ger. *blitz* on London the A. sustained 3 direct hits on the night of 16 April 1941, which damaged the fine old board room, and cut a great slice out of the S. front facing the Horse Guards Parade. The most serious consequence was the interruption of communications by the flooding of the basement. Hence was built the fortress-like extension at the corner of the Mall and St James's Park, a building which has the appearance of some oriental mud fort or citadel. Inside are some 150 rooms, air-conditioned and lit by daylight lamps, giving accommodation for the board and for everyone who might be needed for the world-wide control of the Brit. fleets while London is under attack. During the war naval ratings there ran a score of lines of direct high-speed transmission to naval wireless stations all over the world. There were also 80 girls in this fort working teleprinters to all the naval H.Q. in Britain and the Continent. The complexity of modern warfare is truly reflected in the naval communication system, and this citadel is veritably a maze of machinery and conveyor belts. In 1955 the A. buildings had a narrow escape when a complete block was burnt out. Fortunately this block was under reconstruction at the time and no naval records were lost. For details of U.S.A. see NAVY DEPARTMENT OF THE U.S.A.

Admiralty Court. The function of this court, formerly exercised by the Lord High Admiral, or by a judge holding a patent from him, is to try and to give judgment in maritime causes. Since the Judicature Acts of 1873 and 1875, which estab. the Probate, Divorce, and Admiralty Div. of the High Court, these functions have been discharged by 2 judges, who, in addition to giving judgment in probate and divorce matters, exercise the jurisdiction of the old A. C. Its duties are twofold, as an instance court and as a prize court, functions which in former days were discharged by 2 separate courts, albeit the judge of the instance court was usually appointed to preside over the prize court. In its capacity as a prize court the court has jurisdiction in matters of capture in port or on land if the capture has been effected by a naval force, or a mixed naval and military force. The court can also try any questions referred to it by the Privy Council concerning booty of war, i.e. property captured by land forces. As an instance court it originally dealt with both criminal and civil causes, but a series of statutes transferring the criminal side of its work to other courts has rendered this branch of its jurisdiction practically obsolete. When the Central Criminal Court was estab. in 1836, Admiralty criminal causes were transferred to it, and the Admiralty Offences Act, 1844, provided that in cases where Admiralty jurisdiction would have applied, they should be treated as if they were offences committed in the country where the offender was apprehended. The Naval

Discipline Act, 1866, transferred to naval courts martial the authority hitherto possessed by the A. C. in the matter of discipline in the navy. In civil cases again part of the work of the A. C. has been entrusted to the co. courts. The more important questions that the A. C. has to decide comprise those arising from disputes between part-owners of vessels, suits by seamen for wages, where not within the jurisdiction of other courts, cases of salvage, including Admiralty Droits (q.v.), and actions for damages arising out of collision of ships, etc. There is a separate A. C. for Ireland, but matters of prize are vested in the Eng. court. The court of Admiralty for Scotland was abolished in 1831, and its jurisdiction transferred to the ordinary courts—session, judiciary, and sheriff—and the maritime law of Scotland is the same as that of England. Courts of vice-Admiralty exist in many Brit. colonies. Appeals from the A. C. lie to the House of Lords, and from vice-A. C.s to the judicial committee of the Privy Council.

U.S.A. By the U.S. constitution, as interpreted by the U.S. Supreme Court, A. jurisdiction extends not only to the high seas but to the great lakes and rlys. connecting them and to all public navigable waters in the U.S.A. The states long ago delegated the jurisdiction of their old vice-A. C.s to the Federal Gov. This jurisdiction comprises all maritime contracts, torts, injuries, or offences. The Supreme Court has no original jurisdiction in Admiralty cases, all suits being in the first instance brought in the U.S. dist. courts. An appeal both on law and fact lies from the latter courts to the circuit court of appeals, and this appeal is final except in cases touching the jurisdiction of the court, the construction of a treaty, cases of prize, the constitutionality of a state or Federal law, and cases of infamous crime, when the right of appeal is direct to the Supreme Court. The A. C.s have jurisdiction also in cases of piracy and collision and over crimes and offences committed upon the sea within the administration and maritime jurisdiction of the U.S.A.

Admiralty Droits of. These are certain perquisites that formerly appertained to the Lord High Admiral, chief among them being the right to property of an enemy seized at the beginning of a war, and derelict ships at sea. In the case of the latter the finders of the abandoned vessel were entitled to nine-tenths of its value, the A. D. being the remainder.

Admiralty Island, large is., 1664 sq. m. in area, of SE. Alaska, in Alexander Archipelago S. of Juneau; 90 m. long, 35 m. wide, rises to height of 4639 ft. There are fishing and lumbering industries. It was discovered by Adm. George Vancouver about 1793.

Admiralty Islands, in the Pacific Ocean, form part of the Bismarck Archipelago (q.v.). Area 800 sq. m. The largest is about 50 m. long. Exports, copra and pearls. Discovered by the Dutch in 1616, they came under Ger. protection in 1885.

They were occupied by the Australian forces in 1914 and after the First World War were placed under Australian mandate. Seized by the Japanese in the Second World War, they were recaptured by the Allies in Mar. 1944. Pop. 15,000.

Admittance in an alternating current circuit is the inverse of impedance, or the ratio of current to voltage, measured in mho. A. is composed of conductance, G, and susceptance, B. G is the resistance/(impedance)², B is reactance/(impedance)². The numerical value (modulus) of A. is $Y = \sqrt{(G^2 + B^2)}$. In alternating current circuits the conductance is not, as in direct current circuits, simply the inverse of resistance. See ALTERNATING CURRENT; CELL, VOLTAIC; CIRCUIT, ELECTRIC.

Adobe, Sp. term for sun-dried bricks made from any substance which hardens in the sun; also used of the buildings made with the bricks. The material is widely used where the climate is hot and dry.

Adolphus, John (1768-1845), barrister and writer, b. London of Ger. extraction. His chief success as a pleader was in his defence of Thistlewood, the Cato Street conspirator, in 1820. He pub. a *History of England from the Accession of George III to the Conclusion of Peace in 1783*, 1802, also a *History of France from the year 1790 to the Peace at Amiens in 1802*, 1803. See *Recollections of the late J. Adolphus*, by his daughter, Emily Henderson, 1871.

Adolphus, John Leycester (1795-1862), barrister and writer, son of John A. (q.v.). He was called to the Bar in 1822, and became a co. court judge in 1852. His *Letters to Richard Heber, Esq.*, pub. anonymously in 1821, demonstrated that Sir Walter Scott was the author of the Waverley novels; his *Letters from Spain in 1856 and 1857* appeared in 1858. At the time of his death he was engaged in the completion of his father's *History of England*. See J. G. Lockhart, *Life of Sir Walter Scott*, 1837.

Adomnan, St., see ADAMNAN.

Adonai, see JEHOVAH.

Adonis, son of Cinyras and Myrrha, beloved of Aphrodite. When he was slain by a boar, Aphrodite sprinkled nectar on his blood and from it sprang the anemone. Persephone, queen of the shades, refused to give him up to Aphrodite. Zeus, however, settled the dispute by allowing him to spend one-third of the year with each goddess in turn, one-third being at his own disposal. A. appears in poetry as the type of masculine beauty. See also TAMMUZ. See Ovid, *Metamorphoses* x. 298-729, and Shakespeare, *Venus and Adonis*.

Adonis, in botany, genus of ann. and perennial herbs, family Ranunculaceae, natives of Europe and Asia. *A. vernalis*, perennial, has large, yellow spring flowers; *A. aestivalis* and *autumnalis* are annuals; *A. amurensis* has scarlet petals fancifully connected with the blood of the mythological hero; and *A. amurensis* is a Jap. perennial for the greenhouse.

Adoptianism, 2nd-cent. heretical doctrine which was revived in Spain at the

end of the 8th cent. Elipandus, Archbishop of Toledo, and Felix, Bishop of Urgel, declared that Christ in His divine nature was the Son of God by nature and generation; in His human nature He was the Son of God by adoption and grace. Charlemagne condemned the 2 bishops at the synods of Ratisbon in 792 and Frankfurt in 794; Felix recanted, but Elipandus adhered to his views. See C. W. F. Walch, *Historia Adoptianorum*, 1755; A. Harnack, *Grundriss der Dogmengeschichte*, 1889; R. L. Ottley, *Doctrine of the Incarnation*, 1896.

Adoption is a custom widely prevalent and legally regularised in many countries, both ancient and modern, though until recent legislation it had no place in Eng. law. Broadly the term is used for the act of taking a person into a family with the intention of conferring on that person the rights and duties of his new family. The theory of A. is generally traced to 2 motives: first, the desire to increase the strength of the family or clan, and second, to ensure, as in ancient Athens and modern India, the performance of sacred funeral rites. It follows naturally that where parental rights are strong A. assumes its greatest importance, and in ancient Rome, where the relationship of father and son was akin to that of master and slave, the law of A. played an important part. There were 2 forms of A. in Rome: one, by a fictitious or formal sale of the child by its natural parent before a magistrate, and two, by abrogation, i.e. by a vote of the people in the *comitia curiata*, or, at a later period, by imperial rescript. In the case of abrogation it was necessary for the person adopting to be *sui generis* (his own master). A woman, having no parental power (*patria potestas*) over her own children, could not adopt a child. Considerable changes were introduced by the *Institutes of Justinian*, chief among them being that parental authority did not pass to the adoptive father.

Previous to the Act of 1926, A. in the U.K. was no more than voluntary guardianship. Under that Act the proposed adoptive parent must not be under 25 years of age and must obtain the sanction of a court to the A. When legal sanction has been given, the natural parent loses all rights in the person adopted and the adoptive parent takes his place in all respects. The Adoption of Children (Regulation) Act, 1939, was aimed at abuses in connection with the informal A. of children; made it necessary that A. societies be registered with the local authority; and imposed restrictions on A. abroad.

Adour (Rom. *Atur*, *Aturis*, or *Aturus*), Fr. riv., rising in the Pyrenees, and flowing through the depts of Gers and Landes to the Bay of Biscay, near Bayonne. Length 180 in.

Adowa, cap. of Tigré, Ethiopia, is a well-built town 6000 ft above sea level with a pleasant climate. The Ethiopians here severely defeated the Italians under Gen. Baratieri on 1 Mar. 1896. In Oct. 1935 the Italians launched an air attack on A., and the town surrendered after a few days.

Adoxa Moschatellina, perennial herb, known as the moschatel or townhall clock, with greenish, yellow-anthered spring flowers, musk-like in scent; the one species of the one genus of Adoxaceae.

Adra, Sp. port in the prov. of Almería, on the Mediterranean. It has a coastal trade, and is near sugar plantations. The Phoenician tn, Abdera, stood close by. Pop. 10,500.

Adrano (anet **Hadranum**), tn in Sicily (q.v.), at the SW. foot of Mt Etna (q.v.), 16 m. NW. of Catania. It has fine churches, a 15th-17th-cent. monastery, and a 12th-cent. castle. It is an agric. centre. Pop. 26,400.

Adrar, Sp. N. Africa, see RIO DE ORO. **Adrastus**, King of Argos, a legendary Greek, waged war for Polyneices as one of the Seven against Thebes. A. alone escaped alive. When the Epigoni (q.v.) later destroyed Thebes, and the son of A. alone fell. A. d. of grief. See Herodotus, i. 41-5; 67-8.

Adrenaline, hormone secreted by the medulla of the suprarenal capsules (q.v.). It can be produced synthetically, and when injected has a vasopressor action, i.e. it constricts the blood-vessels. This vasopressor action is useful in treating haemorrhage and for temporarily raising a too low blood pressure. A. has a dilating effect on the bronchi, and is therefore effective in relieving the bronchial spasm associated with an attack of asthma. A. also mobilises the glycogen in the liver and thereby raises the blood sugar; for this reason it is seldom used in diabetic patients. Because of its vasoconstrictor properties it is used with caution in patients with arteriosclerosis.

Adrenocorticotrophin Hormone, see HORMONES AND PITUITARY.

Adria (anet **Hadria**, **Hatria**, or **Atria**), It. tn, in Veneto (q.v.), lying between the Po and the Adige (q.v.). It was founded by the Etruscans (see ETRURIA), and was once an important port on the Adriatic (q.v.). It is now 14 m. inland. A. has Etruscan and Rom. remains, and has a modern cathedral. There is a trade in agric. produce, flax, leather, and pottery. Pop. 14,000.

Adrian, see HADRIAN.

Adrian, name of 6 popes:

Adrian I (772-95). He received aid from Charlemagne during an invasion of his realms by the Lombards. Some dispute arose concerning image worship, without, however, disturbing the friendliness of the Frankish alliance. He d. before the dispute was settled.

Adrian II (867-72). During his occupation of the papal chair Bulgaria was reattached to the patriarchate of Constantinople. A. was forced by the Emperor Basil to agree.

Adrian III, who was Pope from 884 to 885, was succeeded by

Adrian IV, the only Englishman to occupy the Roman See. His name was Nicholas Breakspear, and he was b. about 1100 at Langley in Herts. His father was a priest of Bath, who abandoned his son, entering a monastery. Nicholas went to Paris and became a monk at St Rufus

near Arles. In 1137 he was elected abbot. He was summoned to appear before the Pope at Rome as a result of a conspiracy to overthrow him, because of a strongly developed disciplinary attitude towards his monks. At the inquiry he distinguished himself by his successful defence and moreover won approval from the Pope. In 1146 he was appointed cardinal-bishop, and in 1154 was elevated to the papal chair. He d. in 1159, after entering upon a long contest between the popes and the house of Hohenstaufen, which dynasty was finally overthrown long after A.'s death.

Adrian V became Pope in 1276 and d. in the same year.

Adrian VI (1522-3). His administration was actuated by a desire to sweep away all existing abuses, but met with much opposition.

Adrian, **Edgar Douglas**, 1st Baron **Adrian** (1889-), physiologist, educ. at Westminster School, Trinity College, Cambridge, and St Bartholomew's Hospital. M.D. Cambridge. F.R.C.P., fellow of Trinity College. He was elected fellow of the Royal Society, 1923, was President, 1950, and was awarded its Royal Medal, 1934, and Copley Medal, 1946. He was its Foulerton research prof., 1929-37; prof. of physiology, Cambridge Univ., 1937-51; Master of Trinity College since 1951. He pub. *The Basis of Sensation*, 1928, *The Mechanism of Nervous Action*, 1932, *The Physical Basis of Perception*, 1947, and papers on the physiology of the nervous system in the *Journal of Physiology*, *Brain*, etc. Jointly awarded Nobel prize for physiology (with Sherrington), 1932; appointed to Order of Merit, 1942. Awarded Baly Medal of Royal College of Physicians, 1929; gold medal of Royal Society of Medicine, 1950. He was created baron in 1955.

Adrian, city in Michigan, U.S.A., an agric., chrysanthemum-growing area 60 m. SW. of Detroit. It manufs. metal, paper products, wire fencing, etc., and is the seat of A. College, a Methodist school estab. in 1859, and Siena Heights College, a Catholic institution for girls. Pop. 18,400.

Adrian de Castello (c. 1460-c. 1521), scholar, statesman, and ecclesiastic, b. of humble parents in Tuscany. Pope Innocent VIII sent him to England in 1488, and he became Henry VII's agent at Rome. In 1502 he became Bishop of Hereford, in 1503 cardinal, created by Alexander VI, and in 1504 Bishop of Bath and Wells. In 1517 he was accused of complicity in the plot to poison Leo X. and stripped of all his offices in 1518. Cardinal Wolsey succeeding him at Bath. He fled to Venice, and is thought to have been murdered on his return journey to Rome at the death of Leo X. He wrote a poem entitled *Venatio*, 1505, and 2 treatises.

Adrianople, see EDIRNE.

Adriatic Question, The, the question of the control of the Adriatic, involving, more or less, all the 4 littoral states, Italy, Yugoslavia, Albania, and Greece. The question of the control of the

Dalmatian coast of the Adriatic, apart from the necessity for securing her N. frontier, was that which primarily determined Italy's policy towards the belligerents in the First World War. The whole future development of the country was involved in the solution of the problem of Italia Irredenta, and Italy's participation in the conflict was to be obtained only on consideration that an appreciable guarantee was afforded of redeeming peoples traditionally regarded as It. in sympathy and blood. In 1915 Italy signed with Great Britain and France the secret pact of London, by which it was agreed to give to Italy Trieste, Pola, and part of Dalmatia. It is not surprising in all the circumstances that the price demanded by Italy for her active intervention on the side of the Entente met with a formal protest from the Serbs against any such concession being made. The Adriatic littoral is almost exclusively populated by the Croats and Serbs, and the fact that the principle of the liberation and unification of the nations—one of the predominant factors in the European crisis of 1914—and in particular the Slav nation, would be violated by any such arrangement, was of itself enough to enlist against Italy the sympathies of the Russian Gov. In the result the Croatian and Slav claims were ignored and the alliance of Italy was purchased at the price asked by that power.

(See also Fiume; LONDON, PACT OF; TRIPLE ALLIANCE.)

The *Adriatic* considered strategically. Italy's own E. shore possesses no harbours suitable as naval bases for a modern squadron (except Taranto, which is outside the Adriatic). The opposite coast contains many of the finest natural harbours in the world, like Pola, Sebenico, Cattaro, Durazzo, Trieste—flanked for the most part with an amphitheatre of hills, capacious enough to accommodate a large fleet; and the whole Dalmatian coast is thickly studded with sheltering is. It was therefore from motives based on security, as well as imperialism, that Italy sought a greater measure of control over the Adriatic 1915-45. From the time Italy achieved nationhood in the 19th cent. It. politicians consistently held that until the equilibrium of the Adriatic—which in old It. documents is significantly spoken of as *il golfo di Venezia* and in modern times is popularly referred to as *il mare nostro*—could be restored, Italy would never be in a position of adequate security to act from the point of view of national independence. This doctrine unquestionably influenced It. statesmen at the time of Italy's intervention in the First World War, and throughout it lent to It. action much of its initiative, enthusiasm, and driving force. In 1939 Mussolini, by seizing Albania, secured virtually absolute control of the Adriatic. In the Second World War It. control was first weakened by the torpedoing of half the It. battle fleet at Taranto (11 Nov. 1940) by the R.A.F., and by the Brit. naval victory off Cape Matapan (28 Mar. 1941). Later the successful operations

of Tito in Yugoslavia further jeopardised It. control, which was lost entirely when the Anglo-Amer. armies invaded Italy. In any case the phenomenal development of aircraft rendered the strategical control of the Adriatic impossible without control of the air.

Under the terms of the It. peace treaty of 1947 Italy ceded to Yugoslavia nearly all Venezia Giulia prov., Zara, and the is. of Pelagosa; and to Albania (already freed by allied and Albanian guerrilla forces) Saseno Is. She also gave up the Free Ter. of Trieste. She thus lost her Adriatic foothold completely. In 1954, however, an Italo-Yugoslav pact, also joined by the U.S.A. and Britain (and tacitly approved by the Soviet Union), ceded the city of Trieste to Italy and the surrounding ter. (the Istrian Peninsula) to Yugoslavia, as it was by this time clear that the terms of the peace treaty concerning the Free Ter. could never be made workable. Trieste remains a free port, however.

Adriatic Sea, large arm of the Mediterranean, between Italy and the Balkan Peninsula, 450 m. in length. Its S. end is the strait of Otranto (q.v.). The N. coast is marshy, and has many lagoons. The E. coast is rocky and broken up, and has countless small, rocky is. On the W. the coast is generally low. The chief rivers flowing into the sea are the Po and the Adige (qq.v.); they carry down a great quantity of silt, and for this reason many tns once on the shore are now inland, e.g. Adria (q.v.), from which the sea may have derived its name. The chief ports are Venice, Brindisi, Trieste, Fiume, Ancona, and Bari (q.v.). The water is very salt, but is rich in fish. Area 52,220 sq. m.

See C. Yriarte, *Les Bords de l'Adriatique et le Monténégro*, 1878; F. H. Jackson, *Shores of the Adriatic*, 1908; R. W. Seton-Watson, *The Balkans, Italy, and the Adriatic*, 1916.

Adršpach (Ger. *Adersbach*), Czechoslovak vil. in the prov. of Hradec Králové (q.v.), 11 m. WNW. of Broumov. Near by are grotesque sandstone rocks, sev. m. in length. Pop. 650.

Adsorption, concentration of a solute in the surface layer of a solvent. Positive A. leads to an increased concentration, negative A. to a decreased value, the action depending on the nature of the solute and solvent and always tending to the lowest value of surface tension (q.v.). The large A. of gases by activated charcoal at low temps. is used to produce high vacua. See **ABSORPTION**.

Adulis, anc. name of Zula or Thulla, on the coast of Ethiopia, near Annesley Bay. It is interesting as the locality in which Cosmas, a Christian merchant, discovered the Gk inscription known as the *Monumentum Adulitanum*—really 2 inscriptions united, one referring to Ptolemy Euergetes (246-221 BC), the other to an unknown Ethiopian king. It also describes the subjugation of the Ethiopians. A. was destroyed by an earthquake in the 7th cent. AD. See H. F. Clinton, *Fasti Hellenici*, Pt II, 1824.

Adullamites, political term applied derisively to the Liberals who voted

against Gladstone's Reform Bill of 1866. Bright compared the seceders to the fugitives who hid with David in the cave of Adullam (1 Sam. xxii); Lord Elcho spoke of Gladstone as Saul, and Bright as the armour-bearer. The Cave is another name of the group.

Adult Education, term used to describe a great many educational activities for adults in a variety of institutions. In Britain the traditions of A. E. go back more than a hundred years. The Mechanics Institutes, the Polytechnics Univ. Extension lectures, the Workers' Educational Association, the Y.M.C.A., the trade unions, and the Co-operative movements were pioneers in the provision of classes and lecture courses for adults. Since then a great variety of agencies and institutions concerned with A. E. have developed. They include those run by voluntary societies and those financed by public money.

An intimate relationship grew up between the univs. and adult student groups. The position at the outbreak of the First World War was that the term A. E. was commonly used to denote the activities of the Univ. Extension movement and the Workers' Educational Association. However, many other bodies working among adults were co-operating in this work. The three-year tutorial classes were a result of this co-operation. By 1914 there were 130 of them, 10 years later 282. This aspect of A. E. is primarily concerned with 'liberal' studies. In April 1921 the Board of Education appointed a committee to promote the development of liberal education for adults, and in particular to bring together national organisations concerned with A. E. so as to secure mutual help and co-ordination. From 1924 under the new regulations the voluntary bodies were encouraged to make provision for more varied types of courses. There developed in consequence more elementary and pioneer forms of A. E. with such names as preparatory classes, one-year courses, and terminal courses (all under the new regulations), and evening classes for adults, study circles, and a multitude of other groups (these were not organised so as to conform with the regulations and had a free choice of title). The number and variety of classes at once showed a great increase. The maximum grant for a univ. tutorial class was raised. Univ. extension courses and preparatory classes, which previously had been aided under the regulations for technical schools at low rates, based on the number of students multiplied by the number of hours of attendance, were now brought under rigorous standards of attendance and written work and were given a much higher grant. Advanced tutorial classes, preparatory tutorial classes, one-year courses, and terminal courses attracted students in increasing numbers so that by 1938 there were over 56,000 adult students. Summer schools were developed steadily (the first being the Oxford Summer School in 1910); in addition to Ruskin College and Fircroft, four new

residential colleges were opened: Hillcroft (for women, 1920), the Catholic Workers' College (1921), Avoncroft (1925), and Coleg Harlech (1927). All these colleges now offer courses of not less than one year. Their number has been increased by the addition of the Co-operative College, Newbattle Abbey, and Woodbrooke College. A full list of the short-term colleges (of which there are 23) can be found in the National Institute of A. E.'s directory *Adult Education in the United Kingdom*. The subjects in the short-term colleges range even more widely than in the long-term colleges. For most courses they are open to all whether a student has previously attended an A. E. class or not. Many of these colleges are sponsored by local education authorities, who have made a growing contribution to A. E. since the First World War. They have themselves provided courses and experimented in new types of activities or have assisted voluntary bodies already working in the field. The London Co. Council took the lead in developing the work of their literary institutes. Less formal courses were provided in the men's and women's institutes. Cambs local education authorities pioneered the development of vil. colleges (1930). Considerable impetus also came from the National Federation of Women's Institutes which was founded during the First World War. By 1950 there were some 438,000 members of 7281 institutes providing craft and cultural subjects. In urb. areas the Towns-women's Guilds played a similar role.

A reorganisation of A. E. took place under the 1944 Education Act. A. E. comes under the third stage, called Further Education. Under the Act local education authorities were made responsible for securing the complete provision of educational facilities at the primary, secondary, and further stages. This included the securing for their area of adequate facilities for the full-time and part-time education of persons over compulsory school age, and for the leisure time-occupation of them in such organised cultural training and recreative activities as are suited to their requirements. These facilities were to be provided for any persons over compulsory school age who were able and willing to profit by them. The intention was to set up co. colleges as the focal point and corner-stone of all part-time education for young people under 18 years of age. They were to provide vocational training so that a good deal of evening study could be transferred to the day-time. But they were primarily intended to encourage leisure time interests and activities. Post-war economies prevented the development of this integral aspect of the 1944 Act. Nevertheless, local education authorities have encouraged voluntary participation and have themselves developed many A. E. programmes. The Ministry of Education bears a large proportion of the expenses: incurred (about 75 per cent for 'liberal' subjects); fees for courses are virtually nominal, the rest of the money being provided through local taxation by the

local authority or in some cases through univ. funds. Co-ordination of facilities between local education authorities and between technical colleges and industry is fostered by the 10 Regional Advisory Councils for Further Education in England and Wales. Financial support is given directly to organisations called 'responsible bodies.' They include the Extra-Mural depts of the univs. (21 in number), residential courses maintained or aided by local authorities, and various other colleges and organisations. Of these the Workers' Educational Association is the largest.

In addition to these 'liberal' studies a very great many professional or vocational courses are provided as part of A. E. 'Day Release' classes on one day a week for general subjects are provided for young workers under 18 in co-operation with their employers—they number some 375,000. About 1,900,000 students attend evening classes, whilst 402,000 are part-time day students and 63,000 are full-time. Of the total number of students attending A. E. classes nearly 90 per cent follow professional or vocational courses. The kind of institution varies from large comprehensive colleges (where all kinds of students are catered for by the provision of courses meeting both their leisure interests and occupational ambitions) to colleges where the courses are related primarily to the needs of particular local industries. There are art schools, polytechnics, literary institutes, working men's colleges, and technical and commercial institutes. The latter, as their names suggest, have a vocational bias but might also, in fact, serve as a centre of cultural life in the neighbourhood. Together these institutions offer a sufficiently wide range of courses to suit every taste.

A list of the central depts, local education authorities, univs. and univ. colleges, and other responsible bodies associated with A. E. is given in the National Institute of A. E.'s directory *Adult Education in the United Kingdom*. The address of the institute is 35 Queen Anne Street, London, W.1. Other associations include the Central Joint Advisory Committee on Tutorial Classes (38a St George's Road, Victoria, London, SW1); Civil Service Council for Further Education (Treasury Chambers, Great George Street, SW1); Delegacy for Extra-Mural Studies (Bewley House, Wellington Square, Oxford); Y.M.C.A.; Y.W.C.A.

Adult education in the U.S.A. has its origins in the evening schools founded by the Christian Churches and philanthropic persons during the middle decades of the 19th cent. Presumably whilst at first intended for younger children they attracted older students anxious to improve themselves. When the national system was fully developed for children the schools remained for adults. A stimulus was given to A. E. after the Civil War through public-spirited attempts to deal with new problems. The desire of the Methodist Episcopal Church to improve the education of its Sunday-school

teachers led to the formation of short settlements lasting a few days or weeks during the summer. The Chautauqua (q.v.) movement, as it is called, spread very rapidly through the U.S.A., and hundreds of summer schools came into existence. The Young Men's and Young Women's Christian Associations of America have been very active in promoting A. E. In the larger cities bodies like the Pratt Institute, the Cooper Union, and the administrators of the Peabody and Slater funds further assisted in the work. Correspondence colleges played a great part in bringing education to less populous dists. They are still run by both private and public univs. Perhaps the most significant development in the U.S.A. has been in the public school and univ. system. This has made A. E. as known in Britain almost unnecessary. All children attend school until 16 and many until 17 and 18 by law. Beyond High School there are many opportunities to attend two year Junior Colleges, or four-year Liberal Arts or Teachers' Colleges. Many types of course are offered at the Junior Colleges, which are often maintained by municipal authorities. They include vocational studies and courses leading to the second two years of the Liberal Arts course. Technical and professional training is highly developed in the institutions of higher learning, many of which are maintained and financed by the various states. Fees for in-state students are low, and opportunities exist for students to earn whilst they study. Nearly a quarter of the age range, in fact, attend some sort of college. There is a growing provision of A. E. at the community level. These programmes include guidance and advisory services on personal, occupational, health, and social problems. See U.N.E.S.C.O., *International Directory of Adult Education*.

Adulteration (Lat. *adulterare*, to defile or render impure), act of mixing with a commodity some inferior stuff, or abstracting some material of value, for the purpose of extra profit.

The practice of A. has been known from the earliest times. The merchants of the E. and of anc. Greece and Rome were in the habit of mixing inferior wines with good in order to enhance their own profit. Complaints of the roguery of brewers, bakers, and other tradesmen in England are met with as early as the reign of King John, and at the present time, despite all legislation, the A. of various kinds of food-stuffs is still practised. In earlier times the dishonest attempts of manufacturers were crude and fairly easy of detection, but in these days the adulterator has called chemical science to his aid, and so well is he able to counterfeits the genuine article that it is only by pitting against him the trained analyst that he can be brought to book. It is probable, fortunately, that the measures directed against A. are gradually taking effect, and, coupled with the greater desire of the consuming public for pure food, will do much to abolish a dangerous practice. It may at once be admitted

that the fault is not all on the side of the vendor of the adulterated articles. His excuses are, no doubt, often specious, but the average customer demands an attractive appearance in the goods he buys, which can only be obtained by the addition of colouring matter. So much may be said for the difficulties of the tradesman, but when he protests that certain added materials are quite harmless, that they improve the flavour, or that the market price forbids a pure article, in the interests of the public health he should be repressed. Many adulterants may not be actively injurious and yet may do a great injustice to poor and ignorant people. They expect certain qualities in their food, and are defrauded if that standard is not reached. The practice of adulterating milk with water does not lead to poisoning, but it often means insufficient nourishment for the infants of poor parents.

Various Acts have been passed relating to the A. of food and drugs, the earliest ones being those of 1875, 1887, 1899, and 1938. The most recent is the Food and Drugs Act of 1955, which consolidates with amendments all the previous Acts. Under this Act the Minister of Agriculture, Fisheries, and Food and the Minister of Health are given powers to require from manufacturers information about the substances they use in the manu. of food and to control processes which might be injurious to health. The older Acts had already laid it down that food and drugs must not be mixed, coloured, stained, or powdered with any material injurious to health. No person is liable to conviction if he can show that he did not know of the A., and that he could not by the exercise of reasonable diligence have ascertained the fact. No person may sell to the prejudice of the purchaser any article of food or any drug not of the nature, substance, or quality demanded. It is not, however, illegal to add any ingredient not injurious to health, if required for the preparation of the food or drug as an article of commerce, provided the ingredient is not added fraudulently to increase the bulk or weight, or to conceal any inferiority in quality. Ingredients which are not of an injurious or a fraudulent character may also be added if the article is labelled to the effect that it is mixed. A person guilty of any offence is in effect liable to a fine not exceeding £100 or imprisonment for three months or both.

Many common food articles have been adulterated. For example, wheat flour can be adulterated with flour made from maize or rice, butter with margarine, milk with borax or soda as preservatives, jam with vegetable pulp, coffee with chicory, and cocoa with sago flour. Various Acts of Parliament have been passed to stop A., and inspectors are appointed by the co. and bor. councils to visit shops and examine the articles sold. An inspector can buy a sample of anything he thinks is adulterated and have it analysed. If the analyst finds it is adulterated the offender can be heavily fined.

All the states of the U.S.A. have passed laws for securing the purity and cleanliness of food. Most of these state laws adopt the general principles to be found in the Federal law as enacted in the Federal Food and Drugs Act, 1906, and amending Acts. This Act gives the Federal Gov. jurisdiction over all food intended for commerce, whether for foreign countries or as between state and state; but each of the states has control over all the food produced and consumed within its own borders. The above Act provides that food shall be free from injurious ingredients, etc., and that packages shall clearly state the quantity of the contents. It also provides two remedies for infringement, namely criminal prosecution and seizure of the goods, and both may be exercised concurrently. The purity or freedom from adulterants of such important foods as meat and tea is safeguarded by special Acts, empowering inspection by the Federal authorities. Tea shipments for entry into the U.S.A. are inspected in order to secure that the tea conforms as to quality to the standard laid down by the Secretary of Agriculture; while under the Meat Inspection Act all animals intended for slaughter, all carcasses for food, and all meat for canning, curing, etc., is examined, the inspection thus beginning with the live animal and ending only when the finished product leaves for consignment, whether from state to state or to a foreign buyer.

Adultery means sexual intercourse between a married person and someone not his or her spouse. In ancient legal codes it was, in theory at any rate, harshly punished, in many cases the death penalty being prescribed. Some modern states still regard A. as a crime, and treat it as such, some of the states in the U.S.A., until recently, punishing it by fine or imprisonment. In England A. is subject to no penalty other than social ostracism, but is ground for a civil action for damages and for divorce. Formerly only the husband could petition for divorce on the sole ground of A., a wife's petition requiring some additional ground, such as desertion or cruelty, but since the passing of the Matrimonial Causes Act, 1923, both sexes are on an equal footing in this respect. A petitioner who also has committed A. must seek the court's discretion, otherwise his (or her) petition will fail. *See also* DIVORCE.

Advancement, legal term for money advanced to a minor or other beneficiary under a will or settlement with a view to the A. or benefit of that person. A common form of A. is that of finding the capital for setting a person up in business, but money expended on education or apprenticeship is not technically considered A.

Advent (Lat. *adventus*, coming), season of 4 weeks preceding Christmas observed as a preparation for the festival of the nativity of Christ. Formerly A. was kept almost as strictly as Lent, public amusements and festivities being prohibited, and fasts observed. The first Sunday in A., commonly called A. Sunday,

is the Sunday, whether before or after, which falls nearest to St. Andrew's Day (30 Nov.); and since the 6th cent. it has been the start of the eccles. year, except in the Orthodox Church, where it begins on St. Martin's Day (11 Nov.). See also ESCHATOLOGY and MILLENNIUM.

Adventists (Lat. *adventus*, coming), or Second A., collective name of six groups of religious sects in America: the Evangelical A., Advent Christians, Life and Advent Union, Age-to-Come A., Seventh-Day A., and Church of God. They are Protestant evangelical groups which grew out of the worldwide discussion of the second advent of Christ in the early decades of the 19th cent. At that time godly scholars in many lands and of many denominations were led simultaneously to the conclusion, from their study of Bible prophecy, that the coming of Christ was near. In America Wm Miller stirred the country with the message that Christ would come in 1844. When the advent did not take place at the time specified the advent teaching was widely ridiculed, but a restudy of the prophecies for clearer light convinced many sincere believers that while they were mistaken as to the nature of the prophetic period terminating in 1844, the 'signs' of the approaching advent were multiplying in the earth, and they set themselves to look for and proclaim the 'blessed hope' of the second coming of Christ as the only solution of earth's ills.

The most active of the groups stemming from the advent revival is the *Seventh-Day A. church* (1844), which, as the name implies, observes the seventh day of the fourth commandment (Saturday) as the true Sabbath. Its members now number more than a million baptised believers around the globe. Evangelistic, medical, educational, and publishing activities are conducted in 722 languages and dialects. Other A. groups include the *Evangelical A.* (1845), who believe in the resurrection of the soul, that the just will reign with Christ through the millennium, and the unjust shall be tortured in hell for ever. The *Advent Christians* (1861) hold that at the second coming the just will receive immortality, the unjust annihilation. The *Church of God* (1864-5) resembles the Seventh-Day A. Church in all respects but in the application of the two-horned beast to the U.S.A., and in the acceptance of Mrs. Ellen J. White's writings as inspired. The *Life and Advent Union* (1860) believe that the wicked will remain asleep throughout eternity, while the good shall obtain everlasting life. The *Age-to-Come A.* (1851) maintain that eternal life is gained only through Christ. There are in the U.S.A. 30,000 church members of the Advent Christian Church and 285,000 members of the Seventh-Day A. See J. G. Wellcome, *History of the Second Advent Message*, 1874; D. T. Taylor, *The Reign of Christ*, 1889; L. E. Froom, *Prophetic Faith of Our Fathers* (4 vols.), 1955.

Adventure Bay, in Bruny Is., off the SE. coast of Tasmania, was discovered by Capt. Furneaux in 1773, and named after

his ship, the *Adventure*, which was later used by Capt. Cook on his visit to the bay in 1777. See Capt. J. Cook's *Third Voyage* (vol. 1), 1784, and W. Bligh's *Voyage to the South Seas*, 1792.

Adverb (Lat. *adverbium*, from *ad*, to; *verbum*, word, verb), name of one of the parts of speech used with verbs, adjectives, or other A.s to qualify their meaning, just as the adjective is used with substantives; e.g. in 'He sings well,' 'well' is the A. qualifying the verb 'sings'; and in 'an extremely delicate child,' 'extremely' is the A. qualifying the adjective 'delicate.'

Advertisement. A.s. in the legal sense of proclamations, decrees, or announcements of events, date at least to Roman times, when placards were commonly fixed to pillars in city forums or public buildings. In the more restricted modern definition of offers for sale of goods or services, A.s. appear able to claim at least as great antiquity. There is, for instance, some ground for belief that an enterprising Carthaginian of 500 BC would advise merchants of the arrival of one of his ships by sending round the business quarter slaves wearing shirts bearing the ship's name and a description of its cargo.

Until well into the Middle Ages there was little advertising, and indeed there was little need for it. Wants were few and simple and they were satisfied from the resources of the vil. or tn, supplemented by occasional visits from tinkers and packmen. Since few but priests could read and write, notices of forthcoming events and of produce for sale would have been of little use. Everyone knew what everyone else did and where he lived, and a sign on a house to symbolise a trade was sufficient guidance for strangers.

In Elizabethan times the wider spread of learning, together with foreign wars and voyages of exploration, encouraged the development of news sheets. In the *Mercurius Britannicus* of 1 Feb. 1625 there appeared one of the first Eng. A.s known to have been carried by a periodical: 'Here is this present day published an excellent Discourse concerning the Match between our most Gracious and Mightie Prince Charles, Prince of Wales, and the Lady Henrette Maria, daughter to Henry the Fourth, late King of France, etc., sister to Lewis the thirteenth, now King of those Dominions; Manifesting the Royal Ancestors of both these famous Princes, and truly explaining the severall interchanges of Marriages which hath been betwene France and England: with the Lively Picture of the Prince and the Lady cut in Brasse.'

During the Civil war news sheets multiplied and many carried publishers' A.s. Announcements of books by Milton and of Izaak Walton's *Compleat Angler*, for instance, were pub. in the *Mercurius Politicus*. The same jour. carried on 30 Sept. 1658 this interesting announcement: 'That Excellent, and by all Physicians approved, China drink,

called by the Chinese *Tcha*, by other nations *Tay* alias *Tee*, is sold at the Sultaness Head Cophee-House, in Sweeting's Rents, by the Royal Exchange, London.

During the next 50 years numerous periodicals saw the light of day, although in some cases not for long. Authority—not for the first time—sought to limit the activities of the press, and in 1712 a heavy stamp duty was imposed on each copy of a pub., and a tax of 1s. was charged on each A., if it were no larger than one line of type. With others Steele's *Spectator*, which had first appeared in the previous year, found the burdens too great. A little earlier, on 14 Sept. 1710, Addison had written in the *Tatler*: 'The third and last use of these writings is to inform the world where they may be furnished with almost every thing that is necessary for life. If a man has Pains in his Head, Chollic in his Bowels, or Spots on his Cloathes he may here meet with proper Cures and Remedies. If a man would recover a Wife or a Horse that is stolen or stray'd, if he wants new Sermons, Electurates, Asses' Milk, or anything else, either for his Body or his Mind, this is the Place to look for them in.' Describing some of the favoured attention-getting devices, he said: 'Asterisks and Hands were formerly of great Use for this Purpose. Of late Years, the N.B. has been much in Fashion; as also were Cuts and Figures, the invention of which we must ascribe to the Author of Spring Trusses. I must not here omit the blind Italian character, which being scarce legible always fixes and detains the eye and gives the curious reader something like the satisfaction of prying in a secret.'

Addison exaggerated a little in suggesting that the A.s of his time had universal appeal. The periodicals and news sheets and the daily newspapers, when they made their appearance—the *Daily Courant* in 1702 was the first of these—were read in the main in the coffee houses. The patrons of these estabds. had the time to read and discuss the news. They were not typical of the pop. as a whole and newspaper A.s likely to appeal to them would cover only a restricted field of interest. The 'Cuts and Figures' that Addison mentioned were wood-cuts of, for example, a ship with all sails set to distinguish announcements of sailing dates and destinations. A.s for missing slaves and apprentices were sometimes marked off by a wood-cut of a running man looking over his shoulder. This adventure in illustration did not last for long. So many advertisers wished to have their A.s decorated in this way that the continued repetition of the same illustration on a newspaper page defeated its purpose, and wasted a great deal of space. The newspapers placed an embargo on illustrations, which lasted for nearly 200 years.

With the arrival of the Industrial Revolution the need for advertising became evident. The vil. artisan had made, for example, 1 cooking pot a

day. The first factories, primitive though they were, could turn out perhaps 10 articles for each man they employed. By using their machinery to full capacity, it might be possible to produce 20 a day per man and show a still greater reduction in price. But where the vil. artisan had easily sold his 1 pot a day in the immediate neighbourhood, a wider market was needed for the output of the factory. Instead of the customers going to the workmen, the manufacturer had to go to find his customers. This situation led to a further div. of labour, for it soon became impossible for a factory owner to manage his factory and make the increasingly long selling journeys that were necessary. Salesmen were engaged. At first, like the earlier packmen, they would sell their goods from house to house, but it became evident that it was more economical to dispose of two dozen pots to the vil. blacksmith than to sell one to each of 24 housewives, and the retailer entered the picture. By logical extension of this process, a dealer might buy in two-gross or three-gross lots, and re-sell two dozen at a time to 10 or 12 retailers throughout a county, so becoming a wholesaler.

This development had advantages for the manufacturer, but there were drawbacks as well. He was no longer in touch with the final consumer. Wholesalers and retailers were interested in buying as cheaply and selling as dearly as they could and would play off one manufacturer against another to get the lowest possible price for a quality just good enough for the customer to accept. To the responsible manufacturer this was an unsatisfactory state of affairs, since even if his product gave satisfaction to the consumer, there was no certainty that it could be bought a second time. So to protect their business manufacturers began to brand their goods, placing their names or marks on each article so that it could be identified, and if it had proved satisfactory it could be asked for again. Some products such as sugar, dried fruit, and treacle had first to be put in packs, boxes, or tins before they could be branded, and this packaging not only identified the product, but gave a guarantee of weight or volume as well as delivering it in a more hygienic state.

But no one can buy a product if he does not know that it exists. People had to be told. The manufacturer, having perforce taken over the retailer's original function of choosing appropriate goods, warranting their quality and value and selling them in small quantities, was compelled to take the further step of telling the consumer public about his product.

The favoured method was, at first, the newspapers, although the A. tax and the ban on illustration were handicaps. About 1740 the first posters or bills appeared, and with the advent in 1850 of the Penny Post, what is now known as direct mail began to be used. But the greatest increase in A. dated from 1853, when the A. tax was abolished, to be

followed in 1855 by the newspaper stamp duty, and in 1861 by the duty on paper. In 1855 there were some 640 newspapers in Britain; by the end of the century there were more than 3000. By that time the illustrated weeklies had begun to allow 'picture blocks' in A.s, and in 1892 a map illustrating a railway prospectus appeared in the pages of *The Times*. Higher standards of education and almost universal literacy encouraged the launching of newspapers and magazines and the use of new methods of attracting readers to both the editorial content and the A. column. Halfpenny postage

greater impact than some of the older media, and there is evidence that when efficiently handled it will produce immediate results—and at a reasonable cost. It has been estimated that in 1956 a total of £9½ to £10 million was spent for advertising time on television.

Figures issued by the Advertising Association gave the estimated total cost of advertising in Great Britain in the year 1955 as just under £300 million, or less than 2 per cent of the national income, or 5d. in every £ of a consumer's expenditure, or about half of the tax on tobacco collected by the Chancellor of

The General Poster and Publicity Co. Ltd

A 'GARDEN' ADVERTISING SITE IN DUNDEE

for printed papers, introduced in 1880, greatly stimulated the distribution of leaflets and circulars through the mail. The other estab. media, such as posters, signs, car cards, booklets, display, exhibitions, and sampling, shared in the general activity which continued at an increasing pace only temporarily halted during the world wars and the depression years of 1930-1.

Commercial radio came into being in the late twenties when, in 1925, the first sponsored radio A. was broadcast from the Eiffel Tower. Radio stations, totaling 7 in 1939, were set up in Franco, Luxembourg, and S. Ireland, to broadcast programmes in English sponsored by advertisers. Of these 7 only Luxembourg now operates. On 22 Sept. 1955 the first commercial television station was opened in London (see INDEPENDENT TELEVISION AUTHORITY). By combining sound, vision, and movement, commercial television advertising has a

the Exchequer. It was made up, approximately, in this way:

Press	(£000)
National newspapers	40,500
Prov. newspapers	62,000
Magazines, periodicals	37,500
Trade, technical journals	32,000
Other pubs.	1,500
Production costs	9,500
	<hr/> 183,000
Posters, transportation	16,000
Outdoor signs	7,500
Radio	1,000
Films, slides	4,000
Catalogues, leaflets	28,000
Window, interior display	18,000
Exhibitions	12,500
Free samples, gift schemes	5,500
Miscellaneous	4,500
Administration	13,000
	<hr/> 293,000

About seven-tenths of the total sum represented advertising directed to the consumer; the remainder included advertising of components or semi-finished products to other manufacturers, financial advertising, company meetings, reports, and classified A.S. Advertising represents not far short of half of the revenue of the press, so that without it a daily newspaper might cost twice as much as it does.

Advertising in the United States began in much the same way as in Great Britain. Development was more rapid, and many of the innovations and improvements in techniques in the last 50 years were pioneered by Amer. organisations and individuals. The size of the N. Amer. continent prevents nation-wide distribution of daily newspapers, which are confined by the limitations on rapid transport to comparatively small circulations and circulation areas. The local character of newspapers offers an advantage to the advertiser who wishes to concentrate on one or more well-defined geographical areas. To advertise nationally he may use the weekly or monthly magazines, which offer the additional appeal of high-quality colour printing, and business or trade periodicals and farm magazines. Radio and television stations, which, with the exception of certain public-service foundations, draw their revenue from the sale of advertising time, offer the advertiser the opportunity to place his product or service before a single community in a spot or local campaign, or to cover the majority of the pop. through one or more of the networks. Outdoor, cinema, and direct mail advertising, which have been developed perhaps to a greater degree than in any other country, are equally flexible instruments.

Expenditures by manufacturers who require to cover the whole of the U.S.A. are inevitably heavy. General Motors spent in newspapers and magazines, business and farm papers, network radio and television a total of 121 million dollars in 1955. It has been estimated that the total spent on advertising in the U.S.A. rose almost continuously from 50 million dollars in 1867 to 9982 million in 1956, and in 1957 it is expected to reach 10,500 million dollars. Amer. advertising men were the first to develop research, replacing assumption by scientific inquiry into products, media, people, and the factors influencing their buying decisions. They were also the first to recognise that advertising and selling were not distinct activities, but part of the marketing process that covers the chain of events from the design and packaging of the product through to its delivery to the final consumer. *See also* ADVERTISING AGENCIES; ADVERTISING RESEARCH; MARKET RESEARCH.

Advertising Agencies. At the beginning of the 19th cent. it had become usual for advertisements intended for newspapers pub. in London to be accepted at 2 or 3 shops dispersed about the city, to save advertisers the trouble of making a journey to the newspaper offices. In time, as manufacturers began to advertise, the practice grew up of allowing a commission, usually 10 per cent, to those who brought a newspaper an order for space. Since rates were elastic, it soon became evident that a man could make a profit by buying space in bulk—say a whole page at a time—striking the best bargain he could with the newspaper, and selling the space in smaller sizes to a number of manufacturers. But a seller of space in one newspaper might cultivate a particular advertiser over a period, only to lose the order to a rival who was on the spot when the advertiser made his decision. The remedy for this state of affairs was to buy space in a number of newspapers and offer the advertiser a choice. The space seller, in effect, became a space broker. Later still the practice of buying space in advance was abandoned. The advertising agent, as he was becoming, advised the advertiser as to which media to use and only then placed the orders.

The first A. A. set up business in London in the early years of the 19th cent., and sev. are still in existence. But the last 100 years have seen fundamental changes in the agency's functions, some caused by competition, others by Amer. example. From advising on the media to use and buying the necessary space, the agent advanced to giving advice on how to fill it. He would write the 'copy' or text matter, and when illustration began to be allowed would make drawings and order engravings. Within the last 20 years still greater changes have taken place.

The description 'agent' is no longer correct in the legal sense, for the advertising practitioner is a principal who is himself responsible for the commitments he makes on behalf of his clients. It has come to be realised that to buy space and provide copy and illustrations is no longer enough; for advertising to be efficient it must be closely co-ordinated.

not only with the manufacturer's selling operations, but with his production planning. The modern service advertising agency includes departments to handle research, copywriting, typesetting, the planning and buying of display material and literature, the production of illustrations and photo-engraving, media planning, the buying of space in newspapers and magazines and on hoardings, the buying of time and the production of advertising in the cinema, on radio, and on television, the planning of packaging and display, marketing and merchandising, public and press relations, and the production and placing of overseas advertising and publicity in any medium available in the territories to be covered. Because of the variety of products and services handled by the large agency, it can give a client the benefit of specialised skills and a wider experience than he could provide from his own resources.

A. A. have their own organisation. As long ago as 1917 the Association of British Advertising Agents was formed. In 1927 the name was changed to the Institute of Incorporated Practitioners in Advertising, and membership became available not only to recognised agencies, but to qualified members on their staffs. To gain corporate membership as a Registered or Incorporated Practitioner an agency must: (a) be equipped to provide full advertising service and marketing advice; (b) include among its personnel fellows or members of the Institute; (c) be free from any vested interest in advertising media or other facilities; (d) pledge itself to observe the Institute's standards of practice.

Many retailers concerned only with local advertising do not use the services of an agency. In 1952 it was estimated that in that year almost one-half of the expenditure on advertising in Great Britain was placed by recognised A. A. In such media as national newspapers, magazines, and radio the proportion was very much greater.

Advertising Agencies in the U.S.A. John L. Hooper is credited with establishing the first American advertising agency in the early 1840's. In 1864 there was founded the firm of Carlton & Smith, which was taken over by James Walter Thompson in 1878. In 1916, with a turnover of 3 million dollars, Thompson sold out, believing that no further expansion was possible. But growth continued. A London office was opened in 1922; by 1933 J. Walter Thompson was recognised as the world's largest advertising agency; and in 1955, with 34 overseas branches, its annual turnover was calculated at 220 million dollars.

Advertising Research. In the early years of this century, Sir Arthur Bowley and Seebohm Rowntree, in their inquiries into the incidence of poverty, used methods which were later to be adopted for A. R. After analysing the problem and selecting representative samples of the population to be studied—in the case of the Rowntree inquiries the urban poor—

questionnaires were designed to bring out all the apparently relevant facts by simple answers at personal interviews. The answers were then grouped, analysed, and examined to determine what conclusions could be drawn and how valid these conclusions would be of the whole field under study. About the same time, advertisers began to show impatience with the secretive attitude adopted by newspapers and periodicals, who considered that the number of copies they sold was nobody else's business. The Advertisers' Protection Society campaigned for the publication of sales figures, and where these were not forthcoming provided estimates for their members. Soon after the First World War the society changed its name to the Incorporated Society of British Advertisers, which, in 1931, was mainly responsible for setting up the Audit Bureau of Circulations; the bureau provides, twice a year, the net sales figures of member publishers—of whom there were over 600 at the end of 1956, together with 257 advertisers and 211 agencies.

The first independent attempt in Great Britain to go beyond figures of sales was made early in 1932, when Topford Ltd. published *Investigative Press Circulations*, a report on 53,931 interviews throughout the country to determine family reading of a list of periodicals and daily and Sunday newspapers. The results were analysed by 3 income groups and 16 areas. In 1936 Sales Research Services Ltd. carried out for the Incorporated Society of British Advertisers 82,613 interviews covering a similar field. The results, analysed by 5 income groups and 10 areas, were published as *The Readership of Newspapers and Periodicals*. The title would not be considered accurate to-day, since the survey was in effect a breakdown of net sales and not circulations.

Readership—that is to say the total number of adults reading a given issue of a newspaper or periodical—was first investigated in 1939, when the Institute of Incorporated Practitioners in Advertising commissioned a large-scale survey. After the war, interest in media research continued to increase, and improvements in statistical method and sampling technique allowed the use of smaller numbers of interviews and therefore reduced costs. The year 1947 saw the appearance of 3 surveys, one by Attwood (Statistics) Ltd. using a sample of 20,000; the Hulton Readership Survey, which gave additional analyses by age group, domestic status, and special interest sections; and the Survey of Press Readership commissioned by the Institute of Incorporated Practitioners in Advertising. The Hulton Survey was carried out annually for 10 years, the last being issued in 1956. Hulton also distributed in 1947 surveys into the reading by retailers in 10 trades of newspapers, periodicals, and trade papers, and in 1948 issued a study of the relative attention value of different sizes of press advertisements. The Institute issued further readership surveys in 1954 and 1956—the latter intended to

be part of a comprehensive, long-term investigation.

In planning media schedules, it has become the practice to use readership data, because so many consumer goods appeal to women rather than men, or to one age or class group more than to others. A baby product, for example, will be of interest to mothers of children under 5, and it is only from the pub. readership surveys that one can find how many of this category are reached by different pubs.

Within the last few years it has been possible to get a more precise picture of the degree to which the desired sections of the pop. are reached. This cannot be achieved by adding together the percentages for individual pubs., since many people read 2 or more newspapers or magazines, so that there is duplication or overlap. To deal with this a schedule assessment service is available, using the cards that are punched for all of the informants in one or the other of the national readership surveys; these can be mechanically sorted to isolate attributes, such as housewives with children, home owners, or cigarette smokers. They can be sorted again to eliminate those who read any specified combination of newspapers or magazines. In this way it can be found how many of the desired group will be reached by, say, 3 national dailies, and how many new readers will be gained by adding any one or all of the remaining nationals, and further by using single magazines or groups of magazines as well. Problems of sample size have so far prevented all but a few of the most important prov. papers from being included in national readership surveys. Sev. newspaper groups have provided detailed studies of their readership or circulation at their own expense.

Posters and other outdoor advertising media have had attention too. Examination of the patterns of regular journeys within tns, and into tns from their hinterlands, has made it possible to devise a formula which gives the numbers of sites required for varying degrees of coverage and repetition. In Greater London figures of traffic density at various points of London Transport's system and at different hours of the day give an indication of the opportunities to see station posters, car cards, and bus bills.

The cinema industry was unwilling for a very long time to pub. details of its activities. Until the war the only authoritative study was *A Statistical Survey of the Cinema Industry in Great Britain in 1934*, and in July 1944 the committee reporting on *Tendencies to Monopoly in the Cinematograph Film Industry* said: 'It is regrettable that as soon as we attempted to pursue our investigations any distance into the realm of detail we found ourselves groping in conditions of statistical twilight.' Matters have improved in the last few years with the pub. by the Board of Trade of quarterly averages of attendance figures, analysed by geographical areas and seating capacity. As a result,

charges for advertising films have recently been revised downwards.

The period of the last 30 years has covered the introduction to this country of 2 new media—commercial radio, which began in 1925, and commercial television, whose début was made in London on 22 Sept. 1935. A *Survey of Listening to Sponsored Radio Programmes* was made in 1938, analysing listening to 5 continental stations and also to the B.B.C. programmes. The next to be pub. was in Jan. 1949, and further reports have appeared at intervals, giving details of listening by times, age and class groupings, and regions. Commercial television suffers from no lack of statistical material. Two meter services provide weekly reports of the number of sets tuned minute by minute to I.T.A. or B.B.C. programmes, and add a diary for the recording of the numbers of men, women, and children viewing each programme period or commercial. Other services are available to check the recall of programmes, or commercials, or both, and, by extension of the methods, to estimate the impression made by commercials and their sales effectiveness.

Of later years the information provided by Censuses of Production and Distribution have added much valuable information to industrial statistics. But in the changing conditions of these days it is not enough for a manufacturer to be able to compare, sev. years in arrear, his own production with the total output of his industry. Nor, if his product sells through hairdressers, chemists, etc., is it sufficient to know the total turnover of those outlets. Especially for those products that are seasonal, or where the wholesaler or the multiple firm plays an important part, monthly figures of factory sales can show alarming peaks and troughs. To plan economically it is necessary to know whether the market as a whole is growing or contracting and the rate of consumer buying of one's own and competitive products. For the last 16 years this has been possible for a variety of product groups sold through chemists and grocers, and more recently for confectionery and tobacco. Samples are constructed to be representative of the retailers in each trade, and trained field staff call every 2 months to take stock and record the quantity and cost of purchases, as shown by the manufacturers' and wholesalers' invoices, since their last visit. A manufacturer who subscribes to this service can learn in detail how retailers' purchases, sales, stocks, and displays of his product compare with those of competing lines.

Where a product is sold through a variety of types of outlet a consumer panel may be appropriate. A representative sample of households keeps a record in diary form of the brand, package size, and source of purchase of specified household goods, and in addition pantry or bathroom checks may be made quarterly by staffs of the organisations offering this service. Nor, in this connection, should we overlook the surveys

made by some of the national newspapers and magazines on the use of foods, beverages, household and toilet products. See also ADVERTISEMENT (with a bibliography) and MARKET RESEARCH.

Advocate (Lat. *advocatus*, from *advocare*, to call to one's aid) is the name given in ancient Rome and in many modern states, including Scotland (see ADVOCATES, FACULTY OF), to a forensic orator. In England the term is usually applied to barristers or counsel (q.v.), but solicitors appearing in magistrates' and co. courts are often called A.s.

Advocate, Lord, or, as he is sometimes called, **His Majesty's A.**, is the principal law officer of the Crown for Scotland, his duties corresponding in the main to those of the attorney-general for England. His office was created by James III in the year 1480, and his multifarious duties include that of public prosecutor. He has always played an important part in political affairs relating to Scotland, and for a long while was practically secretary of state for Scotland. He was *ex officio* a member of the old Scottish parliament, and after Walpole abolished the office of secretary for Scotland, and before the revival of that office in 1885, his power in Scotland was of a most far-reaching nature. Nowadays he is always a member of the ministry, but not of the Cabinet, and he and his assistants, the solicitor-general and the 4 A.s.-depute, resign when the gov. who appoints them resigns. A salary of £5000 is paid to him, but he is not precluded from taking private practice. The L. A. is often, but not always, a member of the Privy Council, but while in office is invariably addressed as the Right Honourable.

Advocates, Faculty of. All members of the Scottish Bar belong to this body and are called A. In privileges and liabilities their position closely resembles that of Eng. barristers. The F. of A. forms part of the College of Justice, which was founded in 1532; but A. in the King's Court existed for more than 100 years before that date. Limited in the first instance to 10, the membership of the F. of A. now exceeds 250, of whom about half practise. Admission to the F. of A. is by examination in general scholarship and in law. The general standard required is similar to that required in a Scottish univ. for the degrees of M.A. and LL.B. The fees payable on admission amount to nearly £450 at the age of 24. These fees include subscriptions to the widows' fund of the body and to the A. library maintained by the faculty. Higher fees are required for widows' fund contributions if the intrant is over 24 years of age. The Dean of Faculty is elected yearly and has precedence at the Bar over all other counsel except the Lord Advocate. The latter, together with the judges of the court of session and the sheriffs, as well as the Solicitor General for Scotland, is always elected from the F. of A. Only A. are allowed right of audience in the court of session.

The F. of A. continued to discharge

the duty imposed on A. by a statute of 1424 to assist poor litigants in civil cases, without fee (Poor's Koll), until the coming into force of the Legal Aid (Scotland) Act, 1949. Counsel for the poor in criminal cases, who act without fee, are appointed annually by the F. of A.

Advocates' Library, Edinburgh, founded in 1682 by Sir George Mackenzie for the use of the Faculty of Advocates. It was given to the nation in 1925 and is now the National Library of Scotland (q.v.). The law collection was retained as a professional library and is still controlled by the Faculty.

Advocation, process by which prior to its abolition in 1868 an appeal was made from the Scottish sheriff courts to the court of session.

Advocatus Diaboli (the devil's advocate), popular name of one appointed in the Rom. Catholic Church to set forth possible objections to any person whom it is proposed to canonise, i.e. admit to the calendar of the saints. His official title is *Promotor Fidei*. As the objections were generally not valid, and only made as a matter of form, the term A. D. has come to be applied generally to any person who knowingly puts forward arguments with which he himself is in disagreement.

Advowson, the right of presenting an eccles. benefice or 'living' in the Church of England. Such right rests in those who have founded and endowed churches, their heirs or executors, and those to whom they have transferred the right. An A. is a form of real estate and, subject to certain statutory regulations designed to prevent simoniacal practices, may be freely disposed of. It may pass with the sale of a manor, in which case it is called an *A. appendant*, or separately as an *A. in gross*. If the patron be a Rom. Catholic the right of presentation goes to the univ. of Oxford or Cambridge, whichever is nearest to the benefice. When the monasteries were dissolved, the A.s with great titles passed by Crown grant to some layman, called, in respect of tithes, an impropriator, and in respect of A. a lay rector or patron; but where no such separation has occurred the living remains a rectory. Recent legislation has much curtailed the right of sale of A.s and in time the right will cease altogether.

Ady, Endre (1877-1919), Hungarian poet, b. Erdmindszent, married Berta Boneza in 1915. The influence of modern Fr. literature (A. spent part of his youth in Paris) can be seen in many of his earlier poems. The violence, originality, beauty, and strength of his work make him the greatest poet of Hungary since Arany (q.v.). He d. in a Budapest sanatorium. See J. Kemenyi, 'Endre Ady, Hungary's Apocalyptic Poet,' in the *Slavonic Review*, 1944.

Adye, Sir John Miller (1819-1900), general, son of Maj. J. P. Adye, b. Sevenoaks, Kent, and educ. Woolwich. He served during the Crimean War and Indian mutiny. From 1870 to 1875 he was director-general of artillery, and in 1882 served in the Egyptian campaign. He was

promoted general in 1884. From 1882 to 1886 he was governor of Gibraltar. He unsuccessfully contested Bath in 1892. Pubs.: *The Defence of Cawnpore*, 1858; *Recollections of a Military Life*, 1895; *Indian Frontier Policy*, 1897.

Adytum (Gk *adyton*), place that may not be entered. In anct temples it was the innermost and secret chamber, where oracles were delivered and mysteries performed, and only the priests were allowed to enter therein.

Adzhara Autonomous Republic, in Georgia (Transcaucasia), formed 1921, lies in SW. Georgia, adjacent to the Black Sea and the Turkish border. It is largely mountainous; the seashore has a humid subtropical climate. Area 1100 sq. m., pop. 200,000, mostly Georgians and Russians. Some of the Georgians are Adzhars who became Muslim under previous Turkish rule. This area is the main producer of tea (since the 1880's) and citrus fruits in the U.S.S.R.; it also has oil refining and engineering. The cap. is Batumi.

A.E., see RUSSELL, GEORGE WILLIAM.

Aeacus, son of Zeus and Aegina, daughter of the riv. god Asopus. He was king of the Myrmidons, and for his justice and piety became one of the 3 judges in Hades. See Horace, *Odes*, II. 13; III. 19; IV. 8.

Aecidium (Gk *aikia*, injury), or **Cluster Cup**, fruit of a parasite plant belonging to the Uredinales, the rust fungi (q.v.). It is also the name of the genus of the fungi. *A. cancellatum*, the pear A., gives the pear-tree leaves a warty appearance in autumn; *A. berberidis*, the barberry blight, is responsible for the bright orange powdery-looking substance seen on the barberry, in reality the spores of the fungus.

Aediles, Rom. magistrates. The office was created in 494 BC. with the appointment of two plebeian A., whose name was derived from the *aedes* or temple of Ceres, centre of the plebeian cult. With the appointment of two curule or patrician A. in 367 BC, the office became representative of the whole people. It was elective, and its holders ranked next after the praetors. The duties of A. included (a) care of temples, public buildings, and markets; (b) supervision of public games. Until the time of Julius Caesar they also had charge of the city's corn supply, but in 45 BC Caesar appointed two *A. cereales* to perform this function, which was transferred by Augustus to the *praefectus annonae*.

Aedui, anct Gallic tribe inhabiting the modern Fr. depts of Saône-et-Loire and Nièvre and parts of the Côte-d'Or and the Allier, with their cap. at Bibracte. They were the first Gallic people to ally themselves with Rome, and rendered valuable aid to Caesar. In imperial times the A. were a *civitas foederata*, and the first members of their race to be represented in the Rom. senate.

Aedwine, see EDWIN.

Aeetes, son of Helios and Perso, King of Colchis, was the father of Medea and Absyrtus. See ARGONAUTS.

Aegadian Islands (It. *Isole Egadi*; anct **Aegades**, **Aegates**, or **Aegusae**), group of three small is. in the Mediterranean, off the coast of Trapani (q.v.) prov., NW. Sicily (q.v.). Their names are **Levanzo**, **Favignana**, and **Marettimo**. The defeat of the Carthaginians by the Romans in a naval battle here in 241 BC brought the First Punic War to an end (see CARTHAGE). The main industry is tunny fishing. Total area 15 sq. m.; pop. 6000.

Aegae: 1. Tn in Achaia on the Crathis, with a celebrated temple of Poseidon, originally one of the 12 Achaean tns, but its inhab. subsequently removed to **Aegira**.

2. Tn of Emathia in Macedonia, the anct cap. of Macedonia, and the burial-place of the Macedonian kings. It was also called **Edessa** (q.v.).

3. Tn in Euboea with a celebrated temple of Poseidon, who was hence called **Aegaeus**.

4. Also **Aegaeae**, 1 of the 12 cities of Aulis in Asia Minor, N. of Smyrna, on the R. Hyllus.

5. Seaport tn of Cilicia.

Aegaeon, son of Uranus (Heaven) by Gaia (Earth). A. and his brothers Gyes or Gyges and Cottus are known as the Uranids, huge monsters with 100 arms and 50 heads. Most writers mention the third Uranid as Briareus instead of A. Homer explains that men called him A., but the gods Briareus (q.v.). According to the most anct tradition, A. and his brothers conquered the Titans when they warred against the gods, and secured the victory for Zeus, who thrust the Titans into Tartarus, with A. and his brothers to guard them. Other legends represent A. as one of the giants who attacked Olympus; and many writers represent him as a marine god living in the Aegean Sea.

Aegagre, species of wild goat or ibex, found in the mts of E. Europe and of Persia, where it is called *pasang*. The oriental bezoar, a stone once supposed to possess medicinal virtues, is sometimes found in its stomach.

Aegates, see AEGADIAN ISLANDS.

Aegean Civilisation, the prehistoric culture first brought to light by the excavations of Schliemann and Dörpfeld at Troy, Mycenae, and Tiryns (qq.v.) in the second half of the 19th cent. It covers the period c. 3000-c. 1000 BC, extended over the whole Aegean area, and had as its twin centres **Cnossus** (q.v.) in Crete (q.v.) and Mycenae. The zenith of A. C. in Crete lasted from about 2000 to about 1400 BC; at Mycenae from the latter date to about 1000 BC, i.e. until the dawn of the so-called iron age. In 1870 Schliemann set out to find the site of Troy, and to prove that Homer's poems have some foundation. No site in the Troad can be certainly identified with Homer's Troy, but the mounds at Hissarlik, which have been thoroughly explored, first by Schliemann and afterwards by Dörpfeld, are accepted with much probability as the original site of Ilium. Schliemann dug with faith and enthusiasm, but without the scientific skill of the modern archaeologist. He reached his second stratum in 1873 and revealed a

burnt city, with treasures of gold, silver, and bronze. This find assisted in proving that the Homeric legend of Troy was not founded entirely on myth, but that a great civilisation fl. at least 1500 years before the starting point of Gk. hist. as given by Grote and others. Schliemann next (1876) excavated Mycenae. Here were found relics of a civilisation which acts as a link between that of Crete and the Gk.; the evidence suggests that a sudden introduction of Cretan civilisation took place. His belief that the tomb of Agamemnon lay within the gates of the citadel caused him to dig a pit some 100 ft sq., about 40 ft from the great 'Lion gate'; stone slabs were first unearthed, then a circular altar with steles carved in relief. Three feet below the altar lay the first of five shaft graves, hewn from the rock. The roofs had collapsed, and buried with the bodies beneath the debris was a remarkable treasure—gold masks, head-bands, breast-pieces, rings, pendants, daggers, and sword hilts, also objects of ivory, amber, silver, and bronze; 60 swords and daggers were found in one grave alone. Schliemann was convinced that these were the actual graves seen by Pausanias, containing Agamemnon and his household. Whether that is true or not we cannot prove; what was proved was the excellence of the metal work and other treasures, showing a highly advanced civilisation belonging to a wealthy prehistoric people. It is possible that this shaft-grave dynasty was estab. by some great family coming from Crete, bringing Minoan (Cretan) civilisation with them. The beehive tombs were explored next, the largest being the well-known 'treasury of Atreus'; it was strongly built, with a passage leading to a high vaulted chamber shaped like a beehive. The door to the chamber was 17 ft high, bordered with columns carrying a cornice masked with red porphyry, with spiral decorations, enriched with bronze and coloured marble ornaments; rich decorations were visible everywhere showing a high standard of artistic achievement. A tomb not far from the 'treasury of Atreus' that Schliemann explored, and believed to be the grave of Clytemnestra, showed beautiful designs in green alabaster and coloured marbles. Archaeological work at Mycenae is still (1956) in progress, and important discoveries were made as late as 1954. From Mycenae he went to Orchomenos in Bocotia, and here other excavations showed the same rich ornament and fine workmanship, influenced by Egyptian art. Later (1884) at Tiryns his work laid bare the entire plan of a citadel palace, with towers, galleries, sleeping apartments, and living-rooms. A frieze of alabaster carved in rosettes and inlaid with vivid blue paste was found, also excellent fresco painting. After Schliemann's death Dörpfeld and others continued his work. Mycenae was still considered to be the chief home of this great culture until Crete was explored.

Crete disclosed a period of civilisation belonging legitimately to the whole

Aegean, scarcely less ancient than that of Egypt. The untiring work of Sir Arthur Evans (1895-1930) has discovered for us the interesting conditions of art and architecture belonging to the Minoan periods. The prin. excavations in Crete have been at Cnossus, Tylissus, and Hagia Triada (see CRETE). It was here that the A. C. apparently had its fountain head. For the general evidence of this culture there are ruins of palaces, villas, houses, and beehive graves; the decorations and architectural features are columns, friezes,

Ashmolean Museum
FACSIMILE OF DAGGER INLaid
WITH GOLD LILY PATTERN
FROM MYCENAE.

mouldings, various mural paintings, and mosaic inlay, etc. Vessels have been found, from tiny pots to huge stone jars, and quantities of pottery. One of the general features of Aegean pottery is the stirrup-cup or false-necked vase, so-called from the fact that the neck to which the handles join is closed, or false, and another neck is fashioned further away from the handles for convenience in pouring out. These occur wherever this great culture has been brought to light, and are the typical pottery of that period known as Late Minoan III (Crete).

Many fragments of Cretan pottery have been discovered in Egypt, and it seems probable that a considerable trade was carried on between the countries. Similar objects have been found in Sicily and Spain, and there were colonies on the Syrian and Turkish coasts. Large quantities of amber from the Baltic show the extent of trade. The two famous Vaphio cups, discovered in 1889 by Dr Tsountas, were found in a beehive tomb; they were among many beautiful articles of gold,

silver, bronze, crystal, etc. The cups are of gold, decorated in relief with scenes depicting the capture of bulls; they belong to the late Minoan I period, and represent a triumph of ancient art. Thrones, seats, and tables in stone and terra-cotta have been found, objects of art in ivory and precious metals, small sculptured works, but no large ones, jewellery of various kinds, weapons in metal, only a few later ones being of iron, engraved gems and gem impressions. Tombs of pit or dome-shaped style were also found, paved roadways with bridges and an excellent system of drainage, and, lastly, two main systems of script which as yet remain undeciphered. The principal deity was a mother-goddess, both in Crete and Mycenae, her symbol of the double-axe being frequently discovered in excavations. The dead were not burnt, but buried with great honour, apparently with the hope of a future life; there was possibly a hero-cult of the dead. The social organisation indicates a considerable body of law and a luxurious ruling class. See A. B. Wace, *Antiquity*, 1943.

Aegean Sea and Islands, name used by the Greeks and Romans for that part of the Mediterranean Sea between Asia Minor and Greece. It contains, amongst many other is., the Cyclades and the Sporades and the Dodecanese group. The Dodecanese Is.—Rhodes, Carpathos, Cos, Symi, Astypalaea, Patmos, Casos, Castellorizo, Nisyros, Leros, Calymnos, and Telos—were in its occupation until late in the Second World War. Italy occupied some of the Dodecanese Is. during the Tripolitan war, 1911–12, at a time when they belonged to Turkey. In the First World War Greece, as the price of joining the Allies in the Dardanelles campaign, demanded the A. Is., but further bargaining by Venizelos (q.v.) was stopped by King Constantine, who dismissed his Premier. Later in the same year Italy demanded as compensation from Austria-Hungary the *de jure* sovereignty of the A. Is. In the post-war settlement Greece was granted all the coasts and is. of the A. S., but after further negotiations, by the treaty of Sevres, 1920 (not ratified), superseded by the treaty of Lausanne, Italy received the Dodecanese Is., Imbros and Tenedos went to Greece, and Turkey recognised Grecian sovereignty in Lemnos, Samothrace, Mitylene, Chios, Samos, and Nikaria. Following a short military campaign by Greece against Turkey the treaty of Lausanne, 1923, was more favourable to Turkey: in the A. S. Turkey received Tavşan Is., Imbros, and Tenedos; Italy again had the Dodecanese, including Rhodes, while Greece received most of the remaining is. On 16 Sept. 1943, following Italy's surrender, allied forces landed on Samos, Leros, and Cos, and joined the H. garrisons there. But on 3 Oct. the Germans delivered a strong attack on Cos, which they took. They then turned to invade Leros, which the British held until 16 Nov.; and as a result Samos was evacuated and the projected allied invasion of the Balkans had to be postponed. Had not the Italians

surrendered Rhodes and its aerodromes to the Germans without firing a shot, Cos and Leros might have been held, although in order to attack the is. the Germans had to divert land, sea, and air forces from Italy and Russia.

Aegeus, King of Athens, was the son of Pandion and father of Theseus, by whom he was restored to the throne (from which he had been driven by the 50 sons of Pallas). Theseus went to Crete to deliver Athens from the tribute it had to pay to Minos, promising that he would hoist white sails on his return as a signal of his safety. However, he forgot to do so, and A., thinking his son had perished, threw himself into the sea. From this event the Aegean Sea, according to one tradition, received its name.

Aegialos, see **ACHAEA**.

Aegidius Romanus, see **COLONNE**.

Aegina, small rocky is. and tn in the Gulf of A. or Saronic Gulf. On a hill in the NW. of the is. was the temple of Zeus Panhellenius, the ruins of which still remain. It was occupied by the Achaei (Homer, *Iliad*, II) and afterwards by Dorians. It became a place of great commercial importance (Herodotus, II. 178; VII. 147), and its silver coinage was the standard in most of the Dorian states. In the 6th cent. BC it was an independent and powerful state and the chief seat of Grecian art. In 429 BC the Athenians took possession of the is. and expelled the inhab. (Thucydides, II. 27). Area 32 sq. m.; pop. (is.) 9000, (tn) 5000.

Aegis, emblem of Zeus and of Athena, mentioned in Homer, where it is evidently a thundercloud. In later art, from the 6th cent. BC, the A. is represented as a goatskin covering the shoulders, or hanging from the left arm, of Athena. The fringe of serpents may signify the ragged edges of the cloud, though it is more likely that the confusion between cloud and skin is due to similarity between the Gk words for goat (*aix*) and hurricane (*kataigis*).

Aegisthus was the son of Thyestes, whom he placed upon the throne, driving away his uncle Atreus. According to Homer, A. took no part in the Trojan war, and during the absence of Agamemnon he seduced his wife Clytaemnestra (*Odyssey*, III. 329). He helped to murder Agamemnon on his return home, and reigned for 7 years over Mycenae (*Odyssey*, III. 388). Orestes, the son of Agamemnon, then killed A. (*Odyssey*, III. 242). Aeschylus, Sophocles, and Euripides also give accounts of this story.

Aegium, tn of Achaia, on the Corinthian Gulf, in ancient times chief city of the Achacan League. It was a legendary bp. of Zeus. Vostitza, the modern tn, exports currants.

Aegospotami ("goat's riv."), small riv. flowing into the Hellespont and a tn on it, in Thracian Chersonesus. Here Lyfander utterly defeated the Athenians, 404 BC.

Aegrotat (Lat., 'he is ill'), medical certificate given to univ. students to explain their absence from lectures. An A. degree is sometimes given to students unable to sit for their final examination on account of illness, but whose known

proficiency justifies the bestowal of a degree without examination.

Aegusae, see AEGADIAN ISLANDS.

Aegyptus, King of Egypt, son of Belus, and twin brother of Danaus, had 50 sons, and Danaus 50 daughters. Danaus, fearing the sons of A., fled with his daughters to Argos, where they followed him and demanded his daughters in marriage. Danaus granted their request, but, giving each a dagger, ordered them to murder their husbands on the wedding night. All perished except Lynceus, the husband of Hypermnestra, who disobeyed.

Aehrenthal, Aloys, Count von (1854-1912), Austro-Hungarian diplomat and politician, b. Bohemia, and educ. Prague and Bonn Univs. He entered the diplomatic service, 1877, as attaché to the Paris embassy; later he served in St Petersburg as attaché, councillor, and finally ambas. In 1906 he succeeded Goluchowski as Foreign Minister. Thenceforth he directed the foreign policy of the dual monarchy till his death. He was friendly to Italy; and had little belief in the disinterestedness of Ger. support of his annexation (in defiance of the treaty of Berlin) of Bosnia-Herzegovina, Oct. 1908: one link in the chain of causes of the First World War of 6 years later, although A. himself is generally identified with the peace party in Austria-Hungary.

Aelric (d. 1005?), distinguished Saxon prelate, became abbot of St Albans, Bishop of Wilton, and Archbishop of Canterbury (from 995 until his death). He was one of the most learned ecclesiastics of his time.

Aelric (c. 955-c. 1022), Brit. prelate and writer. He has been confused with A., Archbishop of Canterbury from 995 to 1005, and with A., Archbishop of York, but it is certain that he was a pupil of Aethelwold, and most probable that he was an abbot at Winchester. He afterwards became abbot of Cerne and of Eynsham; but he is most celebrated for his 2 books of *Homilies*, trans. from the Lat., and ed. by Thorpe for the A. Society (1844-6). They are a good illustration of the doctrine of the early Eng. Church. Among his other works are *A Latin and English Grammar and Glossary* (from which he is called Grammaticus), first printed by Somner, 1659, *Colloquium*, and *A Treatise on the Old and New Testaments*; besides trans., epistles, and other treatises.

Aelia Capitolina, name given to Jerusalem by the Emperor Hadrian when he expelled the Jews and there estab. a Rom. colony, AD 135.

Aelianus, Claudius (late 2nd-early 3rd cent. AD), Gk writer, b. Praeneste. All that survives of his work is the *Variae Historiae*, *On the Nature of Animals*, and some imaginary letters. These have been ed. by R. Hercher (*Aeliani opera*, 2 vols., 1864-5).

Aella, see ELLA.

Aelred, Ailred, or Ethelred, St (1109-1167), religious mystic and historian, b. Hexham, and at an early age entered the household of David I of Scotland. He refused a bishopric, becoming a monk in the Cistercian abbey of Rievaulx. Later

he was elected abbot of Revesby, Lincs, in 1143, and of Rievaulx itself in 1146. He was noted for his gentleness and asceticism. On a mission to the Picts of Gallows in 1164 he induced the chief to become a monk. His feast is on 12 Jan. His works, which have never been collected in a complete ed., include the *Vita et Miracula S. Edwardi Regis et Confessoris*, *De Bello Standardii* (fought in 1138), *De Spirituali Amicitia*, and *De Anima* (ed. C. H. Talbot, 1952). See the *Life of Aelred* by Walter Daniel, a monk of Rievaulx (ed. Sir M. Powicke, 1950) and T. E. Harvey, *Aelred of Rievaulx*, 1932.

Aeltre (Flom. Aalter), industrial tn in the prov. of W. Flanders, Belgium: manufs. canvas and exports oil. Pop. 7000.

Aemilian Way (Lat. *Aemilia Via*), famous highway of anc. Italy which continued the Via Flaminia from Ariminum (Rimini) through Bononia (Bologna) to Mutina, Placentia, and Mediolanum (Milan). It was constructed by M. Aemilius Lepidus, consul in 187 BC. It was afterwards extended to Aquileia, Augusta Praetoria (Aosta), and Segusio.

Aemilius Paulus, Lucius, see PAULUS, LUCIUS AEMILIUS.

Aenaria, see ISCHIA.

Aeneas, hero of Virgil's *Aeneid*, son of Anchises and Aphrodite; b. on Mt Ida, and was next to Hector, the greatest of the Trojan heroes. After the capture of Troy he left the city carrying his aged father on his back, but in the confusion lost his wife Creusa (q.v.). He sailed to Thrace, but, misinterpreting the oracle of Delphi, went to Crete, and thence to Ephrus and Sicily. From there he was driven by a storm to N. Africa, where he met Dido and tarried with her for a while. She vainly loved him, and on his departure killed herself. Finally he sailed to Latium, founded Lavinium, and married Lavinia, daughter of Latinus, King of the Aborigines. Turnus, to whom Lavinia had been betrothed, fought Latinus and A. and was killed. A. became sole ruler of the Aborigines and Trojans, uniting both nations into one. Turnus was killed by A., and A. himself was killed in battle with the Rutulians.

Aeneas Silvius, son of Silvius, and grandson of Ascanius, was the third of the mythical kings of Alba in Latium.

Aeneid, the greatest work of Virgil, and the national epic of the Rom. people. It was completed in 12 books, but as he had not revised it Virgil expressed a wish that it might be destroyed. It was, however, pub. after his death by order of Augustus. It contains an account of the wanderings and the settlement of Aeneas after the siege of Troy. It has been often trans. into Eng. both in prose and verse. See VIRGIL.

Aeoliae Insulae, see LIPARI ISLANDS.

Aeolian Harp, musical instrument consisting of a wooden box over which are stretched sev. catgut strings of different thicknesses tuned in unison. When exposed to the wind harmonious sounds are produced. It is supposed to have

been invented by St Dunstan, but the present A. H. was not known until about the end of the 16th cent. It is mentioned in Thomson's *Castle of Indolence*.

AEOLIAN HARP

Aeolian Islands, see LIPARI ISLANDS.

Aeolians, one of the branches of the Gk race, who originally dwelt in Thessaly. From there they settled in N. Greece and Peloponnesus. They also emigrated to the NW. of Asia Minor, establishing 12 cities along the coast dist. known as Aeolis, and to Lesbos and Tenedos.

Aeolipyle, or **Aeolippe** (from Lat. *Aeoli pylae*, the gates of Aeolus), a metallic ball partly filled with water, and having tubes projecting horizontally. When heated steam rushes out of the tubes, setting the ball in motion. It was first described by Hero of Alexandria.

Aeolis, see AEOLIANS.

Aeolus: 1. Ruler of Thessaly, and legendary founder of the Aeolic branch of the Gk race.

2. Son of Hippotes, or, according to others, of the god Poseidon. According to Homer he was the ruler of the Aeolian Is., and was given power over the winds by Zeus. See also Ovid, *Heroides*, xi. 65-128.

Aeon (Gk *aiōn*), an age or immense period of time, also a being that lives for ever. The Gnostics used the term to indicate manifestations from God, i.e. spirits which form a separate existence, having influence over phases of the world's progression.

Aepinus, Franz Ulrich Theodor (1724-1802), a Ger. natural philosopher, b. in Rostock, Saxony. He is most widely known for his works on research in magnetism and electricity. He pub. *Tentamen Theoriae Electricitatis* in 1759, and among other works memoirs on astronomy and kindred subjects.

Aepyornis, huge, wingless, extinct ratite bird, the existence of which may explain the fabled roc of Arab legend. It belonged to the order Aepyornithiformes containing a number of allied forms. The former existence of the bird was inferred from the eggs found in the marshes of Madagascar, which were 36 in. in circumference, and from the later discovery of bones which showed that the A. was much larger than the Apteryx or kiwi of New Zealand. It resembled the ostrich, had long, thick legs, 4-toed feet, rudimentary wings, and stood over 7 ft high.

Aequi, anct It. tribe which, together with the Volsci, waged continual warfare against Rome until their final subjugation in 302 Bc. Dwelling originally in the upper valley of the Anio, they afterwards extended as far as Latium. One of their prin. strongholds was Mt Algidus.

Aequum Tuticum, see ARIANA.

Aerated Bread is made from dough prepared by mixing the flour with water strongly charged with carbon dioxide. This process produces the requisite degree of porousness in a few minutes, as compared with hours by the ordinary yeast method.

Aerated Waters, water, solutions of salts, and diluted flavoured syrups or sweetened fruit juices artificially carbonated to form 2 to 5 vols. CO₂ in bottle, 5½ to 7 in syphons. They were first attempted by Thurneysser in 1560, later by Hoffman, 1708, and Geoffroy, 1724. Venel demonstrating his method in France in 1750. Joseph Priestley (q.v.) experimented, 1767-72, and proposed sev. improved methods, including the use of a pressure pump, these being developed by Paul, Schweppe, and Gosse commercially with success. The term A. W. is not here applied to natural spa waters (see MINERAL WATERS), or to beers, sparkling wines, ginger beers, etc., produced by fermentation (q.v.).

In former A. W. factories, CO₂ was generated on the premises from sulphuric acid and a carbonate, but in the U.K. and U.S.A. is now invariably purchased as liquid in cylinders, as a solid (dry ice) in blocks, or in bulk, a road tanker delivering the gas to a large medium pressure tank. A high degree of mechanisation obtains, carbonating apparatus being entirely automatic, while in most bottleries all component production machines are linked and synchronised by flat bottle conveyors and star wheel transfer devices to provide a continuous 'robot' line, the processes being mechanical uncasing of bottles, bottle-cleaner loading, automatic bottle-washing, clean bottle inspection, syringing, filling and closing (on one machine), mixing of syrup and charged water after sealing, contents inspection (visual or electronic), labelling, and mechanical casing. Palletisation, with or without automatic pallet loading, is widely employed for warehousing and lorry loading. Syrups are prepared and flavoured in stainless steel, etc., tanks, a high degree of automation being used, the 'syrupor' automatically dosing a fixed proportion of syrup to each bottle. The seltzogene for home use derives from Dr Nooth's apparatus, 1774; the syphon from Charles Plinth's 'Fountain', 1813, Patent No. 3680, syphons being introduced to the U.K. about 1837. Much later a home syphon to which a capsule of high pressure CO₂ was affixed and the gas absorbed was developed. The crown cork, invented by Wm Painter, 1892, is the usual small bottle closure, large vessels being secured by screw stoppers, screw caps, or swing stoppers.

For legal guidance codes of practice for soft drinks and spa waters have been drafted, the former citing quality standards for sweet drinks and 'soda water' (to contain at least 5 grains per pint sodium bicarbonate). The spa waters code covers natural mineral waters (q.v.) and manuf. types, e.g. lithia and potass waters, which must contain 'not less than

5 grains per pint of the appropriate bicarbonate.' As compared with a consumption of approximately 100 million gallons of 'unconcentrated' soft drinks (mainly A. W.) in 1938, the figure for 1955 was nearly 185 million gallons out of a total for all soft drinks produced in the U.K. of 302 million gallons (as a ready to drink product).

Aerial, or antenna, in radio communication, the conductor or system of conductors from which electromagnetic waves are emitted, or which is set in (electric) vibration by the waves at the receiving station. The simplest form is a vertical wire earthed at the base and of length equal to $\frac{1}{4}$ of the wavelength, in resonance (q.v.) with and coupled to the generating oscillatory circuit of the transmitter. The 'effective length' can be increased by inserting a variable reactance at the base. A more modern form is the dipole A. of $\frac{1}{2}$ wavelength, the current-wave having its nodes at the ends. It may be mounted horizontally or vertically. The A. is coupled to the transmitter by a capacitive tapping off the induction coil or by various forms of tuning circuit. A. arrays, loops, and frames of many different designs are used. Sometimes trees or balloons have served as A.s. In N. Sweden the conductors of the overhead high-voltage transmission lines are used as A.s for broadcasting (see BEAM WIRELESS).

Aerial Navigation is the science that deals with all points of practical flying, outside the actual working of the machine itself. It includes fixing geographical position, maintaining a course, and selecting an altitude favourable with regard to wind and weather.

The simplest way of fixing position is by recognising landmarks on the ground, and map-reading still forms an important part of a pilot's training. But many flights are made above cloud, over water, or at night, when no landmarks are visible, and navigators then fix their position by what is called dead reckoning. When working out his position by dead reckoning the navigator must know the aircraft's speed through the air, its direction of flight, and the strength and direction of the wind. If there were no wind and the aircraft flew at a steady 200 m.p.h. between two airports 400 m. apart, after one hour it would be half way. Obviously if it had a 20 m.p.h. tail-wind it would be more than half way, but the navigator could easily calculate its exact position, because the true speed of the aircraft would simply have been increased by 20 m.p.h. More often there is a cross-wind, tending to blow the aircraft off course. Then the navigator must calculate the effect of the wind, so that the pilot can fly the aircraft at an angle to its required course, known as the drift angle, to compensate for the wind. There are sev. ways in which the air navigator can supplement and check the information he obtains by dead reckoning. At night he can fix his position by 'shooting' the stars with a sextant. Many different radio and radar navigation systems are also available.

Most simple is radio direction finding, in which the compass bearing of a radio station or beacon on the ground is obtained by means of a small rotating direction finding loop aerial on the aircraft, which picks up the signal from the ground transmitter. Knowing the precise position of this station or beacon and the compass bearing of his own course, the navigator can fix his position at the intersection of the two bearings.

Radar systems usually involve the use of three ground stations, of which one is known as the 'Master' and the others as 'Slaves.' If the Master and one of the Slaves transmit signals simultaneously, the special receiving set in the aircraft can compute the time interval between the arrival of the two signals. As the signals travel at a uniform speed, the magnitude of the time interval fixes the aircraft's position as being on a curved 'position line,' at every point on which the difference in distance between the two stations is the same. By obtaining a similar position line from the Master and the second Slave, the navigator can fix his position at the point where the two position lines intersect. In some systems the navigator has to calculate this position by reference to special charts. In the Decca system the whole operation can be performed electronically, and the aircraft's position is shown with great accuracy as a continuous track drawn on a moving chart known as a Flight Log.

Many other navigational aids are in worldwide service, and in busy traffic areas, such as over the U.K., airliners have to fly at specified height and speed and on a specified course along rigidly controlled 'sky tunnels' known as airways, under radar control from the ground; whilst in the airways the position of each aircraft is kept under constant observation by ground radar observers, and a short-range version of their equipment, known as ground control approach (G.C.A.) equipment, can fix the position of an aircraft so accurately that it is used to 'talk down' a pilot—with the operator telling him his position and height at frequent intervals by radio—at night or in bad weather, until he can see the runway. An alternative 'blind' landing aid is the Instrument Landing System (I.L.S.), which fixes the aircraft's position automatically by the use of ground radar equipment, telling the pilot by means of simple instruments when he is on the correct glide path for a safe landing. See E. B. Williams and W. J. V. Branch, *Air Navigation, Theory and Practice*, 1952; D. C. T. Bennett, *The Complete Air Navigator*, 1954; P. V. H. Weems, *Weems System of Navigation*, 1955.

Aerial Perspective, see PERSPECTIVE.

Aerial Surveying is carried out by photographs taken from an aeroplane flying as nearly as possible horizontally, the camera pointing vertically downwards. Each part of the ground should be covered by at least 2 photographs and the positions of a number of points determined by ground surveying (ground

AERIAL SURVEY FOR TOPOGRAPHICAL MAPPING
Map produced from the photograph shown below. Scale 1 : 10,560, with contours at 50-ft vertical intervals.

AERIAL SURVEY FOR TOPOGRAPHICAL MAPPING
From this photograph was produced the map shown above, both reproduced by permission of Hunting Aerosurveys Ltd.

control points). In the 'Arundel' method a number of parallel strips overlap laterally by 30 per cent and the shutter speed of the camera is regulated so that successive exposures overlap in the direction of flight by 60 per cent, thus providing an area common to 3 successive exposures. This common overlap of 20 per cent is essential for joining the photographs of a strip together when used for mapping. Sometimes multiple-lens cameras are used, taking 1 vertical and up to 6 oblique photographs in one exposure. The obliques show hills, ravines, and other features. In plotting the map the ground-control points are first laid down and the details are traced from the photographs and fitted into the frame. Contours may be obtained by the use of a stereoscopic camera. Modern instruments such as the compound stereoscope and automatic plotter have facilitated accurate A. S. on a large scale, allowing for varying height and tilt of the aeroplane. A. S. requires elaborate and costly equipment, and interpretation of photographs and plotting of maps is a matter for experts, but the method is valuable for revision of existing maps and reconnaissance for roads, railways, and transmission lines, and yields important information on geological and archaeological features. It has been of great value in both world wars for detection of enemy movements and for revealing camouflage. Use of specially sensitised plates and light-filters enabled photographic evidence to be obtained from heights where visual observation was ineffective. A. S. was used for mapping 125,000 sq. m. of Ontario and for exploration of oil resources in Columbia. See M. Hotine, *Surveying from Air Photographs*, 1931, and C. A. Hart, *Air Photography Applied to Surveying*, 1940.

Aerial Warfare. Experimental period. Military aviation was in the experimental stage in 1912. The Central Flying School at Upavon was opened in that year and a beginning was made in the instruction of pupils in map-reading and signalling. In the same year military aeroplane trials were held on Salisbury Plain with a view to finding the most suitable type of fast good-climbing machine, able to take off and alight on rough ground, and to pull up within a reasonably short distance after alighting. These trials did not evolve a suitable machine, but they gave a real stimulus to the aeroplane industry. But the sole use in war for which the machines of the military wing of the Royal Flying Corps were designed and the men trained were reconnaissance. This was so up to the beginning of the First World War. It was in the stress of war that experiments in other directions, such as 'spotting' for artillery fire, were applied with practical effect on a large scale. The Brit. military wing was much smaller than the military air forces of either France or Germany, and was designed merely to operate with a O-Division Expeditionary Force as the 'eyes' of that force. Later, when the Germans were forced back from the

Marne (Sept. 1914), the function of co-operating with the artillery became one of the first importance. During the war, too, the aeroplanes usurped many of the duties hitherto believed possible only for the airship—namely, aerial photography, bombing, and the sending and reception of wireless messages.

The naval wing of the Royal Flying Corps developed on different lines from the military wing. Co-operation with the navy required conformity to the doctrine that the best defence is attack. Though aircraft were capable of defending the Brit. coasts, they were not as yet (1912-13) in theory capable of carrying war whithersoever the fleet might go. In 1913 the Admiralty adopted the policy of evolving 3 new types of machine: an oversea fighting seaplane capable of operating from a battleship as base; a scout to work with the fleet at sea; and a home-service machine for driving back enemy aircraft from our coasts and for patrolling the coast. Progress was slower than with the military wing because the problems were more difficult. The detection of submarines from the air and the use of depth charges by surface craft acting in co-operation were a problem which called urgently for solution. Experiments gradually yielded results, but it was not really until the Second World War that aircraft proved to be the U-boat's master.

Progress was made in the early years of the war in bomb attack by means of an efficient dropping gear, in the effective use of small-bore fire-arms against attack by Zeppelins, especially by the invention of the tracer bullet, and in the mounting of machine-guns on aeroplanes.

Development in First World War. The Ger. Army at the outbreak of war possessed 12 rigid airships and were constructing others. Their airship engines were of 200 h.p. and more, and were capable of modification for use in aeroplanes. Probably Great Britain had the fastest machines in Europe, but pre-occupation with reconnaissance handicapped the Brit. service in other directions, so that for a time both the Ger. and Fr. armies were more adequately equipped for A. W. than the small Brit. expeditionary force. Early in the war, however, the Brit. machines rendered most essential service. Numerous reconnaissances during the Great Retreat (Aug. 1914) gave Sir John French accurate information on the location of the enemy and of his batteries. The Great Retreat also saw the beginnings of fighting in the air as distinct from reconnaissance and artillery-fire direction. About this time an important change in organisation was made by the decentralisation of the Royal Flying Corps, so that certain squadrons were attached to the corps commands. This experiment, which followed the Ger. organisation, saved time by enabling observers to report direct to the corps to which they were assigned instead of going back to their own centre. In the Ger. Army the pressure of duties on so extended a front made

it impossible to do much more than reconnaissance work, although its flying force was very large. Its most active machines were the single-seater scouts and later, the 'trench-strafting' machines. The precursors of these latter were the escort squadrons originally estab. for the protection of 'working machines.' The function of the escort was to ward off attack from the 'working machines' which were carrying out patrols or observations. The 'trench - strafting' machines flew by day over Fr. and Eng. trenches, dropping bombs, and then, at night, flew behind the lines to damage billets, stations, and other objectives. The prin. duty of the artillery observation machines in the 1917 operations consisted in relieving the pressure upon the infantry by subduing the allied artillery (Alsne-Champagne front). In every group certain machines were told off to undertake fire control for Ger. long-range guns. Bombing squadrons came under the direction of the army groups, and were used against depots, camps, and other traffic centres. Duels in the air became very common in the later years of the war. The term ace became the accepted title of a Fr. airman who had 'bagged' a certain number of enemy machines. In the last 2 years of the war all the duties enumerated in this article had come to be performed by all the flying forces on either side, and A. W. had reached, under the stress of war, a pitch of development which before the war had hardly been dreamt of.

Later aerial warfare. Air raids and air attacks were extensively employed as an instrument of modern warfare in Ethiopia, China, and Spain; but in none of these instances was any effective resistance possible. In Ethiopia (q.v.) the abrupt termination of the war in the early months of 1936 was largely due to the terror inspired by air raids; in the Sp. Civil War, 1936-9, the bombing of Guernica, Barcelona, Madrid, and many other open towns by Franco's machines was a decisive factor against the Republicans, who had no great resources in either bombing machines or fighters; while the Jap. bombing of Hankow and Canton soon reduced those places to submission. Before the outbreak of the Second World War many experts made ingenious and not entirely inaccurate predictions of the kind of thing that would happen in the air in a new major war. In particular, numerous books appeared giving alarming accounts of the effects of bombing on large cities, and there were not altogether unjustified pictures conjured up of tremendous air battles. In this respect Gen. Douhet's works had considerable influence among air staff officers all over the world. Had Douhet lived he would have had some difficulty in adjusting the facts of the battle of Britain to his theories, for he expatiated always on the offensive qualities of aircraft, having little belief in their defensive powers. Yet if he did not foresee the power of the fighter he foresaw that of the bomber. He described almost exactly the kind of

tactics which the day bomber forces of the U.S. Eighth Army Air Force employed in its raids on Germany in 1943-5—the close formations which were held at all costs and the great fire power. But again he underestimated the effectiveness of the fighter defences against these attacks in many instances. Douhet wanted the armies and navies to be concentrated on defending and holding, while every effort should be expended on constructing huge fleets of bombers which would assume the entire responsibility for offensive operations.

Although no attainable bomber force in the Second World War could do what Douhet suggested—completely destroy a target in a single attack—the cumulative effect of repeated attacks was almost as destructive; while the lesson of Hiroshima and Nagasaki in 1945 proved that 1 aircraft carrying an atomic bomb could achieve more than the largest bomber force not armed with atomic bombs. A. W. developed enormously in the Second World War, and indeed it is not too much to say that the aeroplane became the master weapon, counteracting the earlier doctrines of sea-power and rendering gallantry in defence by large and well-equipped forces nugatory where these latter were inadequately supplied with aircraft, as, for example, in the Cretan campaign, the Gk campaign, and in the Jap. invasion of the Malay Peninsula. Moreover, in the Second World War, bombing of ins. as was expected, became a common feature. Against military objectives aircraft were often a decisive factor, e.g. in the attack by naval aircraft on the It. fleet at Taranto and in the constant bombing of the Ger. munitions centres in the Ruhr. The Jap. plane attack, without any previous declaration of war, on Pearl Harbour in 1941 was also decisive in immobilising Amer. naval power in the S. Pacific.

British policy of strategic bombing in Second World War. Early in 1942 parl. critics cast doubt on the military effectiveness of strategic bombing and regarded the Gov.'s decision to open a 'second front' at some time as implying an acknowledgment of the failure of its bombing policy. The escape of the Ger. ships *Scharnhorst* and *Gneisenau* from Brest, notwithstanding repeated bombings, lent plausibility to the arguments of the critics of long-distance bombing; but their arguments, if valid, would have discredited bombing as such, whether long distance or otherwise. There was little justification for the fear that strategic bombing was carried out without regard to the requirements of the other arms; indeed the bombing of Brest and Lorient was motivated by the hope of helping the navy and mercantile marine against the submarine menace. Moreover at times the great raids on Germany ceased whenever other and more pressing tasks called for the diversion of aircraft; e.g. there was a lull after the 1000-bomber raids on Cologne and Essen (May-June 1942) owing to the urgent requirements of the Middle E. Command,

where the situation had become very dangerous, and in order to co-operate with Coastal Command and the R.N. in the battle of the Atlantic, at that time the most vital of all theatres of war. The role of the R.A.F., far from being entirely independent, was also to co-operate with the army in the tactical field. This was shown by Air Vice-Marshal Tedder's brilliant operations in Libya in 1942 in support of Gens. Alexander and Montgomery against Rommel at El Alamein. Actually Bomber Command's strategical operations, though widely advertised, had not up to July 1941 done Germany's war potential any great damage, and no doubt the pilots and air crews were deceived on some occasions by the ingenious devices which the Germans adopted to mystify them, especially that of lighting large fires outside centres which were about to be bombed so as to induce the raiders to drop their bomb-loads there and not on the real target. Brit. bomb-loads in 1940-1 were puny judged by the standards of 1942 and later, and were incapable of doing any serious amount of damage, e.g. 15 tons was regarded as a formidable weight, but 1500 tons or more were often dropped in 1943 in well under an hour's bombing; and also the number of incendiaries dropped was insignificant in comparison with those subsequently scattered. The greatest load ever dropped on London or anywhere in Britain by Ger. bombers was 450 tons. The benefit which the Bomber and Fighter Commands' activities conferred on Britain's Russian allies was obvious from the transfer of fighter squadrons of the Luftwaffe from the E. to the W. front. Further, Bomber Command's activities in this earlier period kept the spirit of attack alive at a time when the Brit. Army could do but little and when the navy's work was obscured in the mists of the Atlantic. The only arm which could hit the enemy was the Air Arm, and while the Coastal and Fighter Commands struck whenever opportunity offered, Bomber Command struck all the time. Even in 1940 Brit. bombing raids were widespread. In 3 nights in Sept. of that year they attacked objectives in over 40 cities. Long before 1943 Ger. raids over Britain had grown insignificant; those over Germany had become avalanches.

Limitations of international law re-interpreted. Gradually Brit. bombing reinterpreted the limitations of international law concerning identifying targets and taking 'reasonable care not to bomb civilians' to the wider conception of bombing 'target areas.' Yet strictly area-bombing is legitimate, the question being, for example in a naval bombardment, whether the incidental destruction of civilian life and property can be justified by the military advantage to the attacking belligerent of the effective destruction or reduction of the enemy's capacity to make war. If, because of intense anti-aircraft fire or other reason, the only way to make sure of putting the objective out of action is to place a pattern of bombs over the area where it is known to be

situated, it is not contrary to international law to bomb that area, whatever the consequences to civilian life. But in any case the Germans could not logically question this or any similar practice. Not long after the change or development of Brit. bombing policy, bombs known as high-duty bombs were brought into use by the R.A.F. To the Germans they were known as block bombs, because they could destroy whole blocks of buildings. They were first used against Emden (31 Mar. 1941) and later with devastating effect on Cologne, Essen, Hamburg, Düsseldorf, and other towns with great industrial areas. Bomber Command's offensive was essentially a night offensive; but occasionally a daylight raid was made by heavy bombers, notably on 17 April 1942, when a score of Lancasters bombed Augsburg; and again on 17 Oct. 1942, when 94 Lancasters made a low-level attack lasting 7 min. on the Schneider armament works at Le Creusot, for the loss of only 1 machine, and that by mischance, there being no opposition. But medium bombers and fighter-bombers were more often used for daylight sweeps into the Low Countries and France. Fighter-bomber machines were also employed in these sweeps.

Technique of concentrated attacks. Brit. bombing policy gradually changed from night-long visitations to much larger and extremely concentrated attacks. The new technique of sharp, short, overwhelming assault was tried out by the R.A.F. on Kassel on 8 Sept. 1941, but the force employed was under 100 machines. The new and almost revolutionary development in the 1000-bomber raids on Cologne and Essen was their brevity in relation to their mass, the whole attack being over before the defences could adjust themselves to meet it. An equally strong attack on Bremen, 2 July 1942, was concentrated into half an hour. There were soon to be, in that year and later, innumerable further illustrations of the damaging effectiveness of these highly concentrated massed raids—blanket attacks leaving nothing untouched within a wide perimeter and overwhelming (as at Düsseldorf, 31 July 1942, and Kiel, 13 Oct. 1942) both guns and searchlights. Moreover a 'round-the-clock' bomber offensive became practicable in 1942, when the Amer. Air Force began its heavy daylight raids on enemy targets, with large formations of Fortress and Liberator aircraft; while the R.A.F. continued its night operations.

Strategic bombing policy justified. R.A.F. raids on Ger. targets in the first months of the war were delayed by the influence on the Allied Command of fears of reprisals. But Brit. bombs fell on the Ger. mainland before Ger. bombs fell on Britain (18 Whitley bombers attacked railway installations in W. Germany, 11 May 1940). This boldness in exploiting strategic bombing was justified, for, in fact, the bomber is a primary instrument for the repression of aggression and would seem to be the only weapon that can, in the long run, destroy

war; for it can smother and stifle war at source, and this was the policy of the Allies in their great bombing raids of 1943-5.

The allied strategic bomber offensive against Germany could not, by itself, win the war, as the effect on production and on civilian morale was over-estimated. One of the most successful targets was Germany's oil industry, and attacks on this, together with an all-out assault on enemy communications, hampered severely both the mobility of the Ger. forces and their supply. In addition, great emphasis was placed on destruction of Ger. fighter aircraft factories, especially by the U.S. daylight bomber forces, which also concentrated on shooting the Luftwaffe from the air by effective cross-fire from the heavily armed bombers and their fighter escort. The intensification of the allied bombing offensive in the last weeks of 1943 and through the early months of 1944 at length forced on the Luftwaffe the dilemma of either coming to grips with the bombers and suffering great losses—a dangerous risk in view of the then impending invasion of W. Europe—or of declining combat and leaving Ger. industry virtually undefended.

As the time for the Normandy landings approached, the allied air forces switched their main effort from Ger. oil plants and aircraft factories to railways and bridges. R.A.F. Coastal Command made new dispositions to meet the potential threat to the allied sea armada from Ger. U-boats and E-boats based on Fr. ports; defensive fighters took special precautions against reconnaissance aircraft; and 'intruder' planes destroyed as many as possible of the Ger. radio-location stations in N. France. On D Day the allied forces' 'sea-ground' services struck at the most vital target of all—the overland route to Berlin. Yet the Luftwaffe failed to appear. The R.A.F. and the Amer. Air Force had made it impossible. Just before allied troops stormed the beaches of Normandy, Amer. heavy bombers and large formations of R.A.F. heavy bombers joined with allied naval forces to smash at beach defences. A few small motor launchers, equipped with lights and radio beacons to guide the airborne troops, took up their positions in the Channel. The airborne troops, operating behind enemy lines, disrupted communications, seized cross-roads, and cut railway lines. The allied air forces bombed bridges over the Loire and the Seine to seal off the Normandy and Brittany battle areas from the rest of France. Largely because of this the enemy was unable to bring up reinforcements to the front. Gen. Patton's lightning drive through France in 1944 was made possible by the tactical support of the air forces, whose fighters and light bombers covered his otherwise unprotected right flank. Again, the incessant battering from the air of flying-bomb launching sites in N. France reduced the weight of the flying-bomb attacks on Britain to one-quarter of what they would have been. The operations of the 15th Air Force

heavy bombers based in Italy were directed mainly against Germany's oil installations, but it was this force that was able to give most direct support to the Russians, who had no strategic air force of their own. The advent of the giant Superfortresses opened up a new chapter in the hist. of air war. They made their first raids on the Jap. homeland in Aug. 1944, and one year later brought the Pacific War to an end by dropping atomic bombs on Hiroshima and Nagasaki. Probably the results already achieved with conventional bombs would have been sufficient to ensure Japan's surrender without the need for an invasion of that country. See PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

Technique of the 'pathfinder' and 'master-bomber.' In Sept. 1942 the 'pathfinder' technique was introduced. The basic principle of this was the employment of flares to light up the target. There were 3 successive phases of flare-dropping during a raid: first, a few aircraft flew ahead of the main body to drop flares to illuminate the general target area; a second wave of raiders dropped further flares over a more concentrated region; then the bombers dropped pink incendiaries over particular targets. That was the method of attack during the winter of 1942, and it represented a general improvement of 20 to 30 per cent in damage. It was then that the Germans began to develop their counter-measures in the way of dummy fires in open country to distract the allied bombers. They also set a network of electric-light globes close to the ground, and by flicking these on suddenly, in combination with arc-lamps, gave an effective impression of falling bombs. They also constructed dummy buildings filled with combustibles and set these on fire when the alarms announced the approach of allied aircraft. But these devices had only a short period of success, for the allied air command developed a new technique, that of the master-bomber. The master-bomber and deputy master-bomber, flying in Lancasters would arrive over the target 15 min. ahead of the main body, and drop a 250-lb. or 500-lb. bomb, which, exploding 300 ft. above ground, would emit a series of flares well above the level that could be reached by the normal 'fake conflagrations.' If the ground was not visible the process known as sky-marking would be adopted, and flares dropped over the target above cloud level. The main body would then bomb the area indicated by these flares. The development of new radio and radar navigation and bomb-aiming equipment greatly improved bombing accuracy.

Air strategy to-day. With the advent of even more powerful atomic and hydrogen bombs, the heavy bomber forces of America, Russia, and Britain remain a deterrent to future major wars. Local wars, such as the Korean campaign, follow the same general pattern as the Second World War; but all current ideas on strategy may be changed by the

perfection of long-range nuclear war-rockets, against which no defence yet seems possible. See also BRITAIN, BATTLE OF; Bomber; Fighter; Naval Operations in Second World War.

Aerodrome, see AIRFIELD.

Aerodynamics. The science of A. consists of the study of the forces which air can exert on a body, owing either to the motion of the body through the air or to the motion of the air past the body. It finds its most important application in the design and construction of aircraft, and the word A. is now generally used to refer to the mechanics of flight. In this sense the subject deals with (a) the origin and nature of the air forces experienced by an aircraft, and (b) the effect of these forces on the behaviour of the aircraft. A knowledge of A. is therefore essential for the determination of such important items as the strength of the structure, the capability of the aircraft to carry its load, and the degree of stability and controllability.

In so far as A. deals with (a) above it cannot be regarded as an exact science, for many of the air forces acting on an aircraft are not directly calculable from first principles, but have to be determined by experiment. Most of the experimental work is carried out on models, and in this work advantage is taken of the fact that the air forces are the same, whether the model is moving through still air or is stationary and the air is flowing past it, provided that the relative speed is the same in each case. The model is therefore kept at rest and mounted in a long box of circular or square cross-section, called a wind channel or wind tunnel, and the air is driven through the channel by the action of a propeller or jet propulsion system. In this way the air forces can be simply and accurately measured.

The fundamental law of A. states that, for all geometrically similar bodies inclined at the same angle to the air stream, the air force experienced may be taken with good accuracy to be directly proportional to the density of the air, the square of some linear dimension, and the square of the speed; and it is by the use of this law that data obtained from model experiments can be applied to the full-scale aircraft. Suppose, for instance, the full-scale resistance at 100 m.p.h. is to be deduced from the measured resistance of a $\frac{1}{10}$ -scale model at 50 m.p.h., the air density being the same in each case. Then, since every dimension of the full-scale aircraft is 10 times the corresponding dimension of the model, the measured resistance must be multiplied by 10^3 or 100 to allow for scale. Again, since the full-scale speed is double the model speed, the measured resistance must also be multiplied by 2^2 or 4. Thus the full-scale resistance at 100 m.p.h. is 400 times that of the model at 50 m.p.h.

Near the ground density variation is negligible, but the decrease of density at height is most important. For instance, the density at about 18,000 ft is only one-half that at ground level, and so the resistance at this height is halved also.

Although A. still depends to a great extent upon experiment, the mathematical theory of airflow has not been neglected, and modern research has thrown considerable light on the true working conditions of such important aircraft components as airscrews and aeroplane wings. Applied A. is now, in fact, a blend of theory and experiment, and it is possible to predict most air forces with considerable accuracy, except in the transonic region, where the turbulence and shock waves associated with airflow at the speed of sound (see SUPERSONIC SPEEDS) interfere with the natural order of wind tunnel or mathematical calculations. With this important exception, when all the air forces on an aircraft are known, A. fulfils its function with regard to (b) above by the application of the more exact principles of ordinary mechanics. See also AEROPANE. See A. C. Kermode, *Flight without Formulae*, 1951; R. C. Pankhurst and D. W. Holder, *Wind Tunnel Technique*, 1952; *Flight Handbook*, 1954; K. D. Wood, *Technical Aerodynamics* (3rd ed.), 1955; E. A. Bonney and others, *Aerodynamics, Propulsion, Structures, and Design Practice*, 1956.

Aero-Engines. There are 3 main types: reciprocating (Otto or Diesel cycles, i.e. normal internal-combustion engine with electric ignition, or solid-injection internal-combustion engine, q.v.); turbine; and rocket—the 2 latter appearing during the Second World War.

The essential requirement is high power for low weight. In the *reciprocating internal-combustion engine* this is achieved by attention to detail design, by the use of special materials and the careful machining of components, and by supercharging to obtain the highest possible power for cylinder vol. At the end of the First World War, dry weight was approximately 5 lb./h.p.; now it is only about 1 lb./h.p. Carburetion is complicated by the small amount of oxygen in the rarefied air at heights, which reduces the quantity of fuel that can be used and consequently the power of the engine. On small engines, i.e. up to 200 h.p., the effect on the fuel/air ratio is counteracted by an altitude control which reduces the fuel delivered at a given throttle setting; but this method only keeps the engine running, it does not maintain the power output at its sea-level figure. To maintain power superchargers (see INTERNAL-COMBUSTION ENGINE) are fitted. In Great Britain an automatic boost control is fitted to the carburettor (q.v.) so that the engine is not damaged by opening the throttle too much, and obtaining too great a power at a given altitude. The automatic boost control is a device, operated initially by a variant of the ordinary barometer, which overrides the normal throttle in such a way that the maximum quantity

of fuel admitted at any air pressure will not cause an explosion in the cylinders that will overload them. Freezing is another serious problem, which has to be overcome by having alternative heated air-intakes, by using injection carburetors (U.S. method adopted in Great Britain about 1943) where the fuel is squirted into the induction manifold instead of being sucked off a jet in a venturi, or by direct injection through nozzles in each cylinder (Ger. system). Owing to high power (largest piston engine 3800 h.p.) cooling is important. Air-cooled engines dissipate heat through fins on the

1. Air enters small opening in cowling at high speed.
2. Air expands inside cowling; speed drops and pressure rises.
3. Air heated by cooling engine expands further and is ejected through small outlet at high speed. Volume of air is controlled by varying size of outlet.

cylinders and are assisted by ducted cowlings (Fig. 3) which pass air round the cylinders without increasing drag. Liquid-cooled engines use a glycol/water mixture with a high boiling point, and the radiators are mounted in ducts (Fig. 3) where the air is passed through at low pressure and then ejected through a narrow outlet—giving thrust, not drag, at high speed.

Reciprocating engines (R.E.) can be classified as follows: *Otto cycle*: air-cooled radials, 3, 5, 7, 9, or combinations up to 4 rows of 7, cylinders: power 50–3800 h.p. (Fig. 2); air-cooled in-line or vee, 4, 6, 12 cylinders: power 50–500 h.p.; air-cooled horizontally opposed, 2, 4, 6, 8 cylinders: power 50–350 h.p.; liquid-cooled vee, 12 cylinders: power 1000–3000 h.p. (Fig. 1); liquid-cooled H. (Napier), 2 sets of 12 horizontally opposed cylinders driving separate crankshafts geared together: power 3000 h.p. *Diesel cycle*: not generally successful owing to weight, but low fuel consumption an advantage for long range; only really successful example Ger. Jumo 205 liquid-cooled, vertically opposed 2-stroke.

The *gas turbine engine* (T.E.) has only been practicable since 1939, its use depending largely on the development of heat-resisting alloys for the turbine. The gas turbine differs from the steam turbine (q.v.) at present, since it consists of a single or at most 3 turbine wheels instead of the sequence of wheels (or drum) that are used in the steam design. This is because it is only necessary to extract sufficient energy from the combustion gases to drive the air compressor; in fact it is the residual energy left in the fast-flowing gases which provides the thrust or power of the engine. There are 2 main principles: that of Sir Frank Whittle with a centrifugal compressor (Fig. 4), and the axial compressor type (Fig. 5). The basic principle of each is the same, viz. air taken in at the front is compressed, then expanded by burning fuel with it and ejected at high speed. Fuel/air ratio is adjusted for altitude by a capsule-operated barostat—this is a barometric device, similar to a boost control, that adjusts the fuel/air mixture to the correct combustion proportions for the varying air densities at different heights. T.E.s have a very simple cycle and the torque is small owing to the low weight of revolving parts, and the whole unit is very light for its power—this cannot be easily compared with R.E. since it is measured as lb. thrust, not as h.p. T.E. delivers its power by the jet of heated air expelled at the rear, the thrust being the reaction to the mass of air ejected. Efficiency depends on ratio of forward motion of engine to backward flow of jet, 100 per cent being when the speeds are equal. This engine is most effective at high speeds (500 m.p.h. plus), and at lower speeds it is more efficient to convert the s.h.p. of the turbine to thrust by gearing it to an airscrew. In this case the greater part of the energy in the gases is usually absorbed by the turbine. It can be converted into airscrew thrust by gearing direct from the compressor shaft, or, more efficiently, by taking the power from a separate turbine stage (Fig. 6). T.E.s are notable for running at high speeds, 10,000–15,000 r.p.m. as against the 3000 r.p.m. of a R.E.; but since the rotating masses are light, stresses are lower than in R.E. and the resulting engine is very light. Simplest jet engines are ramjets or athodyds (Fig. 7), consisting of a form of venturi in which fuel is burnt with the air taken in the front by forward speed; the gas is expanded by heating and is ejected with increased energy. This system requires the engine to be given initial forward speed to provide the initial air compression before the cycle comes into operation—at very high speeds it is efficient. Main disadvantage of all jet engines is high fuel consumption, due mainly to the high powers and to inefficient operation of the cycle at cruising and idling speeds. This difficulty is being overcome rapidly by refinement in design.

Rocket engines were developed by Germany in the Second World War, and are driven by liquid propellants which are

Aerolite, mass of stony or metallic matter known to have fallen to the surface of the earth from beyond the region of the atmosphere. Sometimes a distinction is drawn between A.s and meteorites, the latter being taken as the generic term and the former applied to those masses which are composed of stony matter only (see METEOR and METEORITES).

Masses of meteoric stone have been found weighing as much as 50 tons, but the largest actually seen to fall came down in Hungary in 1866 and weighed 547 lb. A collection of A.s may be seen

since, if we go back to mythology, we find the stories of Pegasus and later of Daedalus. Further, the monsters of Assyrian and Egyptian mythology give us examples of beasts that were supposed to be able to fly. During the Middle Ages and down until the beginning of the 18th cent. we get story after story of men fitted with artificial wings, either making or attempting to make flights. We have, for example, the story given us by Wm Dunbar, the poet, of how an It. magician gave an exhibition of flying for the edification of James IV. He purposed to fly from the walls of Stirling Castle, armed with wings which were composed chiefly of birds' feathers. Naturally he failed, being fortunate enough to escape with only a broken thigh, his explanation of his failure apparently being that his wings

were not made of eagles' feathers, but of those of the lesser birds of the sky. We have further references to the art of flying in Leonardo da Vinci and in Francis Bacon, and later still we find an attempt to prove that flight by means of man's own strength was impossible, this being argued chiefly from a detailed examination of the muscular strength of birds. The first science, however, to be more or less successful was aerostation. In the classics we get one reference which gives us an idea that the later method of aerostation by means of hot air was known to the ancients, this reference being to the dying dove of Achytas; but for a further development of this method we have to come down to medieval times. Roger Bacon (1214-94) speaks of attempting by means of a hollow globe and liquid fire to solve the problem, while in the following cent. he is followed by Albert of Saxony (fl. 1366-90), who also spoke of aerostation by means of fire in a light sphere. During the 16th and 17th cents., however, we get a number of fantastic ideas put forward. Laurus, for example, spoke of swans' eggs filled with sulphur or mercury being drawn up to the sun, while in the *Histoire comique* of Cyrano de Bergerac vessels filled with morning dew are supposed to have carried a man into the middle of the atmosphere. But also in the 17th cent. we get the beginning of much better ideas. Francis Lana came forward in 1670 with an idea which, though practically unserviceable, was nevertheless a great advance on previous ideas. He proposed that 4 hollow balls should be taken, made of brass of the very slightest thickness, and that these should be exhausted of air. To them should be attached a small boat and sail, and in that way a balloon would be contrived which could carry a man. The idea was not feasible, since the globes, made of brass only 1-250th of an in. thick, would have collapsed by reason of their own weight. But although Lana saw this difficulty, he argued that their shape would prevent that. It is not until the next cent. that we get the real balloon invented.

The beginning of the development of the balloon was the work of 2 brothers, Joseph and Etienne Montgolfier (q.v.), who came to the conclusion that a paper bag filled with 'substance of a cloud-like nature' would float in the atmosphere. They made a number of experiments which attracted attention and further efforts from others. Progress was made gradually, and the first man-carrying ascent took place in Oct. 1783, when Pilâtre de Rozier went up in a Montgolfier captive balloon. In Nov. of the same year the first free ascent was made by Rozier and the Marquis d'Arlandes, who made an ascent in a fire balloon. At the beginning of the next year (Feb. 1784) a balloon was liberated from Sandwich, and descended in Fr. Flanders; this was the first cross-Channel flight. The first woman to ascend was Mme Thible, who went up from Lyons in 1784. The first man-carrying cross-Channel voyage was made by Blanchard and Jeffries in

Jan. 1785. Blanchard had already in the previous year estab. a reputation as an aeronaut, and by this and succeeding voyages he became known as one of the most famous.

During the 19th cent. a number of long voyages were made, the 2 longest being voyages of over 1000 m., in 1859 in America, and in 1900 from Paris to Korostyshev, a distance of 1193 m. In 1897 an unsuccessful attempt was made by Andrée (q.v.) to discover the N. Pole from Spitsbergen by balloon.

Between 1850 and the end of the cent. a number of important ascents were made for scientific purposes; the most important of these were the ascents made by Glaisher between 1862 and 1866. The chief problems that these ascents tried to solve were: the height, density, and thickness of clouds, the direction and the rate of the various air currents, the amount of electricity in the air, and the comparison of readings of an aneroid barometer with those of the mercury barometer. The results of the observations were pub. in the Brit. Association reports between 1862 and 1866. A number of extremely high ascents have been made, but these have always been attended with much danger. The highest was made in July 1901, when a height of some distance over 34,500 ft was reached by 2 aeronauts from Berlin. To obviate the necessity of making these dangerous high ascents, unmanned balloons have been sent up with recording instruments attached that work automatically.

From the beginning balloons had attracted the attention of the military authorities, and we hear of their being used during the Napoleonic wars, the Amer. Civil War, and the 1870-1 siege of Paris.

From the time of the beginning of balloon flights it was recognised that the great problem before aeronauts was to be able to navigate the balloon safely through the air. The first means of propulsion tried was oars, but it was recognised that this means could never be really successful. The first attempt to navigate the balloon by means of a small, light engine came over 50 years later, in 1852, the experiment being made by Henri Giffard. From the year 1897 the development of the airship was the special work of Count Zeppelin (q.v.). In 1900 he made his first flight with a dirigible balloon which carried 5 men. It was made of aluminium, supported by gas-bags, and driven by 2 motors, each about 16 h.p. His first experiment met with some success, but the first Zeppelin airship was succeeded by another in 1905 with greater motor power; this was wrecked and was succeeded by a third which met with great success. This airship carried 11 passengers and attained a speed of about 36 m.p.h. The fourth Zeppelin airship succeeded in travelling about 250 m. in 11 hrs, but was wrecked by a storm in 1908, the wreckage catching fire and completely destroying the ship. In the meantime many other experiments had been carried out, notably by Santos Dumont (q.v.), who circled the Eiffel

Tower in the face of a fresh wind; while in England a number of experiments were carried out by the War Office with dirigible balloons. The most successful voyage was that of the *Nulli Secundus*, which, leaving Farnborough, sailed round St Paul's to the Crystal Palace, carrying 2 passengers and attaining a speed of about 20 m.p.h. See also AIRSHIPS and BALLOONS.

Aviation. During the latter part of the 17th cent. and the beginning of the 18th many theories were advanced and much research made concerning the theory of flight. Much experiment was done with artificial wings and with aerial screws. Amongst the names which may be mentioned in this connection are those of Bonelli, Morey, Pettigrew, and Cayley (q.v.). To Sir George Cayley is given the credit of being the inventor of the modern aeroplane. Prof. Berfét, in his book *The Conquest of the Air*, points out that every essential to successful flight was given in the airship invented by Sir George, which was described by its inventor in *Nicholson's Journal* in 1809, and in the following year he produced the apparatus itself—at first without a motor, but later with a motor as well. The invention, however, was not successful, and during the trials the machine met with disaster. The next attempt at aviation that we hear of is in 1842, when Henson, by a combination of aerial screws and supporting surface, tried to complete a successful machine. The attempt was not a success, although it was followed up in the succeeding years by many other attempts, especially by his partner, Stringfellow. During the years which followed many efforts to solve the problem of aerial flight were made, but none of them met with great success. The difficulties in the way were enormous: the science of aerodynamics had yet to be developed; flight in the air was flight through a substance the laws of which were only dimly beginning to be understood. The science of aerodynamics, which even now is only at its beginning, was developed during the latter part of the 19th cent. by Sir Hiram Maxim and Prof. Langley, an Amer. physicist. By 1896 experiments of Langley had been so successful that he made a model aeroplane which, although it did not by its own effort lift itself from the ground, flew for a distance of about half a m. along the Potomac R. Further experiments had in the meantime been carried out by Sir Hiram Maxim and M. C. Ader. The former to a very great extent helped to solve the problem of light motors by producing in 1894 an aeroplane with an engine which weighed not quite 2 lb. per 1 h.p. But in spite of this the aeroplane failed to fly. Ader seems to have been the first inventor to produce a machine which lifted itself from the earth by its own effort. Between 1890 and 1902 he produced 3 machines, none of which was very successful, but which embodied new ideas, and one of which flew for about 350 yds. The first aeroplane flight may be said to have taken place at Satory in 1896, when Ader's

machine lifted itself by its own power and flew for the short distance already mentioned. In the meantime experiments were being made with soaring machines and gliders, chiefly by Otto Lillenthal (q.v.), who, with an arrangement formed on the plan of birds' wings, attempted to imitate their 'soaring flight.' These wings were made of a light framework covered with a light fabric, with 2 rudders in the rear. In the centre of this framework Lillenthal was poised, and with an apparatus of this description he made over 2000 flights in safety. He broke his neck while using a biplane glider, falling from a height of about 80 metres. These experiments were further carried out by Chanute in New York and by the brothers Wright (q.v.). They followed up the ideas which had already been promulgated by Lillenthal and Chanute. The result of these experiments was that in 1903 the brothers Wright produced their first aeroplane. The first invention of the Wrights was simply an aeroplane that flew in a straight line, but this received many modifications; and in 1908 they came to France to carry on experiments, during which Wilbur Wright created a record by remaining in the air for over an hour while carrying a passenger. He also attained a speed of 60 kilometres an hour. During this period, however, great strides had been made by many other inventors. Farman had succeeded in producing a machine with which he remained in the air for nearly 45 min., and he was closely followed, and sometimes surpassed, by the Frenchman Léon Delagrè. The best results, however, were undoubtedly attained by the brothers Wright, who succeeded in remaining in the air for nearly 2½ hrs. The year 1909 may be taken as the real era of the beginning of successful aviation. In that year records were made only to be broken, and the ultimate success of the monoplane and biplane was proved by many successful experiments. On 25 July 1909 Blériot flew the Channel in a monoplane, but in the same year Farman covered a distance of nearly 140 m. in 4 hrs in a biplane. Between 1890 and 1908 the best distances flown were 164 ft by Clément Ader in France in 1890; 852 ft in 1903, 20½ m. in 1905, and 50 m. 1638 yds in 1908, all by Orville Wright in the U.S.A. For details of later technical development see AEROPLANE.

Compared with the First World War period and after, progress was relatively slow in the 5 years preceding that war. Up to that time the chief international records were: *duration*, 24 hrs 10 min. by Boehm (Ger.) in an Albatros biplane, 1914; *distance* (over circuit without alighting), 1200 m. by Landmann (Ger.) in an Albatros biplane, 1914; *distance* (in straight line without alighting), 486.87 m. by Deroye (It.) in a Blériot monoplane, 1913; *altitude*, 25,750 ft by Oelrich (Ger.) in a D.F.W. biplane, 1914; *speed*, 126.59 m.p.h. by Prevost (Fr.) in a Deperdussin monoplane, 1913. Passenger-carrying records were: *duration*, 19 hrs 47 min.,

9 passengers, pilot Noel (Fr.) in Graham-White biplane, 1914; *distance*, 68.3 m., 6 passengers, pilot Garaix (Fr.) in Schmitt biplane, 1914; *altitude*, 980 ft., 15 passengers, pilot Sikorsky (Russian) in Sikorsky biplane, 1914; *speed*, 66-85 m.p.h., 6 passengers, pilot Garaix in Schmitt biplane, 1914; *flying over sea*, 320 m., Cruden Bay (Scotland) to Kleppe (Norway), pilot Gran (Norwegian) in Blériot monoplane, 1914. Garros in Sept. 1913 flew 700 m. across the Mediterranean, but passed over Sardinia en route. Among the best Brit. flights of those years were 107 m. 1320 yds in 3 hrs 12 min. 40 sec. by T. Sopwith and 185 m. 810 yds in 4 hrs 47 min. by S. F. Cody, both in 1910. These pioneer records, if valuable, look unimpressive today. The First World War (see also AERIAL WARFARE) gave a great impetus to A. in all its branches, and progress during that period was directed along the lines of military necessity.

The transition of both heavier-than-air machines and dirigibles from the experimental stage to the practical, judged by the low percentage of accidents as compared with other modes of transport, by the immense distances flown without a stop, and by the regular use of air routes involving the carriage of more than 100,000 passengers annually (in Brit. aircraft) over a total distance of more than 1,000,000 m., was complete many years ago. A further indication of the progress made was afforded by the existence of national and international laws for the regulation of civil aviation, the creation of air ministries, and the establishment of aerodromes in all countries. The increasing reliability of heavier-than-air machines was shown by the long distances and spectacular flights of recent years. The most remarkable oceanic flight was the lone venture of Capt. Charles D. Lindbergh, U.S.A., in flying from New York to Paris in the *Spirit of St Louis* (see ATLANTIC FLIGHTS). Subsequent to Lindbergh's flight (3000 m. in 33 hrs) there were 12 flights across the Atlantic from W. to E., but there was no solo flight until that of the late Miss Amelia Earhart, who, in 1932, flew from Newfoundland to Ireland (2026½ m. in 13 hrs 30 min.). In 1933 Wiley Post flew from New York to Berlin (4000 m. in 26 hrs) and, concluding the journey to New York via Siberia, thus made the first solo flight round the world (16,500 m.). The first E. to W. transatlantic solo flight was made by J. A. Mollison in 1932 in a Puss Moth machine from near Dublin to New Brunswick (2400 m. in 30½ hrs). Mollison and Amy Johnson flew the Atlantic together from Pendine in Wales to Bridgeport, U.S.A., via Canada, in the same year, this being the first flight from Britain to the U.S.A.

The first flight to Australia was that made by the brothers Ross and Keith Smith and crew in 1919. Sir Alan Cobham flew there and back (28,000 m.) in 1926. Two years later Capt. Herbert Hinkler of Australia flew from Croydon to Port Darwin (10,340 m.) in 15½ days at

an average speed of 95 m.p.h., stopping at various large towns at intervals of between 400 and 900 m.; but in 1930 Sir Charles (then W./Cdr) Kingsford-Smith made the same journey in about 10 days. In 1930 Amy Johnson, in a Gipsy Moth, set up a record for a solo flight from London to India and, continuing her journey, reached Port Darwin in 19 days, having covered in all 9960 m. Several outstanding record flights followed, the most sensational being in 1934 when C. W. A. Scott, with T. Campbell Black, won the 'Mac Robertson' international air race from England to Australia. This race started from Mildenhall (Suffolk) on 20 Oct. 1934, and the 2 men, flying a de Havilland Comet, reached Melbourne on 23 Oct., their time being 70 hrs 54 min. 18 sec., but the handicap prize was awarded to the winners of the second place, Parmenter and N. Moll, flying a K.L.M. liner with passengers and mail, whose time was 90 hrs 13 min. 36 sec.

A successful trans-Pacific journey was that of Kingsford-Smith, pilot, and C. T. Ulm, relief pilot, with H. W. Lyon, navigator, and I. Warner, radio-operator, both of U.S.A., in a triple-motor monoplane. They flew from California to Honolulu, Fiji, and on to Melbourne, 7800 m., in 3 days 16 hrs, the features of the flight being accuracy of navigation and continuity of wireless communication.

The first Cape Town flight from England was that made by P. van Ryneveld and C. J. Quintin Brand in 1920. Next was a return journey by Alan Cobham in 1925 (a distance of 17,000 m.). J. A. Mollison flew from England in 4 days 17 hrs 19 min. in 1932, but this record was soon beaten by Amy Johnson, who flew from Lympne to the Cape in 4 days 6 hrs 54 min. In the same year 2 Fr. airmen, Goulette and Salel, flew from Le Bourget to Cape Town in 91 hrs.

In Polar regions Capt. Hubert Wilkins, the explorer, flew from Alaska to Spitzbergen (20,000 m.) in a monoplane with a Wasp engine, to demonstrate the superiority of the plane over the dirigible for Arctic flights. In 1926 Rear-Adm. Byrd, U.S. Navy, accompanied by Pilot Floyd Bennett, flew from King's Bay, Amsterdam Is., direct to the N. Pole, and back to his starting point—a total distance of 1600 m. in under 16 hrs. The same aviator also flew over the S. Pole.

In these days air records do not stand long unbeaten; but we may note the following aviation records and performances: a non-stop flight in 1929 from England to India (4130 m.) by Sqdn-Ldr A. G. Jones-Williams and Fl./Lt. N. H. Jenkins in an R.A.F. monoplane, taking 50 hrs 38 min.; by Capt. C. D. Barnard and the Duchess of Bedford, from Lympne to Karachi and back to Croydon in 7½ days, in 1929. The U.S. Army monoplane flight of 1929, lasting 150 hrs, was remarkable for the feat of refuelling in the air. In 1933 Sqdn-Ldr O. G. Gayford and Fl./Lt. G. E. Nicholson made a non-stop flight from Cranwell to Walvis Bay, 5309 m., in 57 hrs 25 min. in a Fairey (Napier) monoplane, while in the

same year P. Codos and M. Rossi flew from New York across the Atlantic to Syria, 5637 m., in 54 hrs 44 min. Two Lt. squadrons of flying-boats, consisting of 25 Savoia-Marchetti S.55 seaplanes, carried out a flight in formation to New York, via Holland, Iceland, Greenland, Labrador, and Montreal, covering in all 11,770 m., in 42 days, all but 2 machines returning. Jean Batten flew across the S. Atlantic from Dakar to Brazil in 13 hrs 15 min. (1935); in 1936 Mrs Markham made the first solo flight by a woman across the N. Atlantic from E. to W., flying from England to Cape Breton; Jean Batten, solo flight from Britain to New Zealand in 11 days 56 min. (1936), the first recorded direct flight, while in the following year she flew from Australia to Britain in 5 days 21 hrs 3 min.; J. A. Mollison, Newfoundland to Croydon in 13 hrs 17 min. (1936); Inuwa and Tsukagoshi, from Tokyo to Croydon, 94 hrs 18 min., a distance of 10,000 m. (1937); Merrill and Lambie (U.S.A.), Atlantic double crossing from Brooklyn to England (Sussex), 20 hrs 31 min., and from Southport (Lancs) to Quiney, Massachusetts, in 22 hrs 27 min. (1937); Gremov, Yumashev, and Danilin (Soviet), from Moscow over the N. Pole to California (6700 m.), being the record non-stop flight up to that year, in 2 days 14 hrs (1937); F/O. Clouston, R.A.F., and Mrs Kirby Green, from Croydon to Cape Town, 6870 m., in 1 day 21 hrs 6 min., and back to Croydon, 7135 m., in 2 days 9 hrs 23 min. (1937); F/O. Clouston and V. Ricketts, England to New Zealand, in 4 days 7 hrs 8 min., and back, the whole journey taking 10 days 21 hrs (1938); Mile Elizabeth Lion (France) flew from Istres to Basra, 7500 m., this being the longest flight by a woman (1938); Howard Hughes (U.S.A.) and 4 companions made a round journey from New York, via Paris, Siberia, Alaska, and Canada, to New York in 3 days 19 hrs 17 min. (1938). The long-distance record was held prior by the R.A.F. with the flight of 3 Vickers Wellesley bombers from Ismailia to Australia (Nov. 1938). L.2638 and L.2680 reached Darwin in about 48 hrs and L.2639, which had refuelled at Koepang, followed some 3½ hrs later, the non-stop distances flown being 7162 and 6600 m. A long-distance record of 11,229 m. was estab. by a U.S. Navy crew which flew non-stop from Perth, Australia, to Columbus, Ohio, in 1940. On 29 May 1947 a B.S.A.A. Lancaster flew to Bermuda in 20 hrs, refuelling in mid air. The first transatlantic automatic flight was made (21-2 Sept. 1947) by a pilotless U.S. Army Skymaster from Newfoundland to Britain. In 1949 a U.S.A.F. Superfortress bomber flew round the world non-stop, refuelling four times in mid air *en route*.

Speed records: The Schneider trophy (q.v.) contest has produced high speed records: 318.62 m.p.h., at Venice on 30 Mar. 1928, by Maj. Mario de Bernardi; 328.63 m.p.h., over the Solent on 7 Sept. 1929, by F/O. Waghorn (R.A.F.). On a Supermarine Rolls-Royce S 6 Sqn-Ldr

A. H. Orlebar set up, also in 1929, at Calshot, a world's record for 3 kilometres, averaging 355.8 m.p.h. This, however, was exceeded in 1931 by Fl/Lt. G. H. Stainforth, who averaged 388.67 m.p.h. at Lee-on-Solent, his fastest circuit being 408.288 m.p.h. The Schneider trophy contests ended in 1931, when Britain won the trophy outright. At Augsburg, in April 1939, a Messerschmitt 109 set up a record of 469.2 m.p.h. This last record was unbeaten for 6 years, when, on 7 Nov. 1945, 2 Meteor jet-propelled aircraft both averaged over 600 m.p.h.; Gr.-Capt. W. J. Wilson averaged 606 m.p.h. and Mr Eric Greenwood 603 m.p.h. Cdr Turner Caldwell, U.S. Navy, achieved an average speed of 640.7 m.p.h. over a 1.86-m. course in California, the highest speed reached being 653.4 m.p.h., on 21 Aug. 1947. Since then the record has been raised many times, the first over 1000 m.p.h. performance being by Mr Peter Twiss, who achieved 1132 m.p.h. in a Fairey Delta 2 in March 1956. An unofficial 'record' speed of 2026 m.p.h. has been achieved by an Amer. Bell X 2 research aircraft.

Altitude records: Fl/Lt. M. J. Adam, 53,937 ft. in 1938; Lt.-Col. Mario Pezzi (Italy), 56,017 ft. in 1938; Mr John Cunningham, 59,492 ft. in 1948; W./Cdr Gibb, 65,876 ft. in 1956; M. Randrup, 70,000 ft. in 1957.

Airship flights, etc. The *Graf Zeppelin* left Friedrichshafen on 11 Oct. 1928, and reached Lakehurst, New Jersey, in 11¼ hrs (return journey took 71 hrs), covering 6300 m., and going via France, Gibraltar, Funchal, the Azores, and Virginia. The commander was Dr Hugo Eckener, the designer, and with him was a crew of 40. The flight was successful despite storms, wind, and fog, and from the time taken indicates a considerable advance since 1919, when the Brit. dirigible R34 flew from E. Fortune, Scotland, to Mincola, New York, 3130 m., in 108 hrs. The only other crossings were in 1924 by the *Los Angeles* from Lake Constance, in somewhat better time, and by the Brit. airship *R100*, which flew from England to Montreal in Aug. 1930, taking about 5 days. The *Graf Zeppelin* was flown round the world in 1929, taking 21 days and reaching Lakehurst 29 Aug., and also in 1930. The loss of the Brit. airship *R101* in 1930 and of the Amer. airship *Akron* in 1933 has hardened public opinion against the continued construction of airships (q.v.).

A remarkable experiment, but only partly successful, was that of Juan de la Cierva, who in 1928 crossed the Channel in an autogiro at a speed of 90 m.p.h. and toured England for 3000 m. This machine was wrecked a few days later, owing, it seems, to a broken landing cable rather than to any structural defect (see *AUTOGIRO*).

In commercial development it is probable that the U.S.A. is ahead of Great Britain, in that the aeronautical industry has so far secured the co-operation of the banking and financial interests as to have

emerged from the subsidised or dependent state to that of an industry supported by the public as a whole. In this connection the trustees of the Daniel Guggenheim Fund, created to assist commercial aviation and to stimulate public interest in its development, are now able to concentrate on aerodynamics and cognate problems. (For designs of and developments in aeroplanes see AERO-ENGINES and AEROPLANE; for progress in theories of viscosity and allied topics see AERODYNAMICS.) See also AERIAL NAVIGATION; AEROPLANE; AIRSHIP; AIR MAIL; ATLANTIC FLIGHTS; AVIATION, CIVIL; BALLOON; ROCKETS and SPACE TRAVEL; ROTATING WING AIRCRAFT; SCHNEIDER TROPHY.

See J. E. Hodgson, *The History of Aeronautics in Great Britain*, 1924; C. H. Gibbs-Smith, *A History of Flying*, 1953; John W. R. Taylor, *Picture History of Flight*, 1955.

Aerophor, musical appliance for enabling a wind-instrument player to sustain his notes *ad infinitum*, invented by Bernard Samuels, flautist in the Duke of Mecklenburg-Schwerin's orchestra. It consists of a small bellows worked by the foot, with rubber tubing attached, ending in a metal reed fixed near the mouthpiece of the instrument played. The air from the player's lungs is prevented from passing into the bellows by a stopcock in the tubing. It was first used in Richard Strauss's *Festliches Präludium*, written for the opening of the Concert House, Vienna, 1913.

Aeroplane, any heavier-than-air winged aircraft. The earliest ideas about human flight derived from bird flight, and flapping-wing aircraft (ornithopters) have given rise to popular but unproductive designs since Leonardo da Vinci treated the matter seriously (c. 1500). No full-sized ornithopter has ever flown, but numerous models made in the 19th cent. and later have flown. The first successful heavier-than-air machine in model form was the helicopter toy (or Chinese top) which is described in the article ROTATING WING AIRCRAFT (q.v.), but at the end of the 18th cent. and the beginning of the 19th Sir George Cayley (q.v.) laid the foundations of mechanical flight. The modern A. derives directly from his brilliant work. He defined and investigated the basic problems of aerodynamics and aerostatics, made the first proper A. of hist. (the model glider of 1804), and later made a full-sized glider. Cayley pub. his researches on which subsequent inventors could build. Thereafter the idea of the fixed-wing glider and the powered A. was actively pursued in England and France. Henson's design (1842) gave a great impetus to research, but Stringfellow's model which derived from it (1848) is not now looked upon as successful. The first successful powered model A. was made by Penaud (1871), but vital work in aerodynamics had been pub. by Wenham (1866) and others, especially as a result of the founding of the Aeronautical Society (now Royal) in 1866. Other important designs or flying

models were made by Du Temple (1857), De Louvrie (1865), Moy (1875), Tatin (1879), and Phillips (1893), etc., with Hargrave inventing the box-kite in 1893. Meanwhile the petrol engine was being developed for automobiles and was to become light enough for A.s by the early 1900's. Ingenious but unsuccessful full-size A.s were made by Ader (1890 and 1897), Maxim (1894), and the Amer. Langley (1903), the latter having previously constructed successful steam- and petrol-driven models.

The other great stream of endeavour from which the practical A. finally emerged was gliding, and it was the vital achievements of the German, Otto Lilienthal (q.v.), in 1891-6, that led to valuable work being accomplished by the American Chanute (1896) and the Englishman Pilcher (1895-9), and then to the triumph of the Wright brothers (q.v.). The Wrights first mastered the art of gliding and developed their aerodynamic theories on their three gliders in 1900, 1901, and 1902, and finally built and flew their first engined A. (17 Dec. 1903), when powered, sustained, and controlled flights were made for the first time in hist., near Kitty Hawk, N. Carolina, U.S.A.

The European school of flying derived from Lilienthal, Chanute, Hargrave, and the Wrights, but owing to lack of basic information it was slow to develop, despite the excellent work of Archdeacon (1905), Voisin (1905 onwards), Blériot (1905 onwards), and Delagrange (1907). Technically the first powered A. flights in Europe were made by Santos-Dumont (q.v.) in 1906, but it was the inventors named above who really did the most important work; Voisin and Blériot, and later Levavasseur and Henri Farman, emerged as the outstanding early constructors. The Wright biplane, although talked about earlier, was not seen or flown in Europe until 1908, when its greatly superior qualities made the necessary impact on Fr. and Eng. inventors, and revolutionised aircraft construction. After that aviation made great strides, much aided by better aero-engines, and by 1909-10 the A. had become a practical vehicle. Blériot's flight across the Channel (1909) made a profound impression on the world's govs., and focused attention on the military prospects of the A. By 1914 a large variety of monoplanes and biplanes, landplanes and seaplanes, was in production, with experiments constantly being made in new methods of construction, etc. The First World War had the effect of accelerating every dept of flying, with specially designed machines being produced for various war purposes. During that war engine power increased rapidly, while aerodynamic design did not make great progress beyond the general adoption of the tractor arrangement because of its neater form. The biplane was the most general because it was easier to brace than either the monoplane or the triplane. Generally thin wing sections were used for speed because of their lower drag, although one designer,

Anton Fokker, had realised the possibilities of thick sections which could be used for internally braced cantilever wings.

Immediately after the war a boom in air transport led to the conversion of many of the larger military types, and to the building of some specialised air-liners; but to all intents and purposes the A.S. of the first decade after the war showed little advance on those of 1918— aerodynamically, structurally, or in performance. In 1929 the Brit. Air Ministry radically revised its ideas on military A.S. and the Hawker Hart light bomber and Fury single-seater fighter set a new standard in performance, the former being capable of nearly 200 m.p.h. and the latter

approach 300 m.p.h., the Bristol Blenheim. Up till this time Brit. A.S. had been renowned for their quality and dependability rather than for their performance, but for the next 10 years few other countries produced A.S. as fast as those designed for the R.A.F.

The period 1939-45 saw a somewhat similar development to that in the previous war: i.e. extra speed was gained mainly by adding more and more engine power, culminating in the advent of the jet engine. Outstanding among the A.S. of this period were the Spitfire, whose speed was raised by more than 100 m.p.h. between 1939 and 1945; the Brit. heavily armed, large load-carrying, 4-engined bombers, the Avro Lancaster,

FIG. 1. FOUR-ENGINE MONOPLANE AIR-LINER, 1945

Lockheed Constellation (Wright Cyclone 2500-h.p. engines) used for transatlantic flying; it has a pressure cabin to increase passenger comfort above 10,000 ft.

of over 200 m.p.h. About this time the monoplane began to come into favour on the Continent and in the U.S.A., first for air-liners and later for military use. With the advent of the monoplane there was also a gradual change over to wood, and then to metal-covered structures. During the period 1919 to 1931 the Schneider trophy contest gave a fillip to the development of high-speed A.S. and the Supermarine S 6 and Rolls-Royce R engine of 1929 and 1931 were the direct ancestors of the Spitfire and Merlin.

In the early 1930's the Americans started to use 200-m.p.h. air-liners, the Boeing 247, Lockheed Orion, and Douglas DC-2 being amongst the first. Gradually other countries followed their lead, although Great Britain, in particular, retained strut-braced, fabric-covered bi-planes until shortly before the Second World War for many civil and military purposes. In 1935-6 a number of outstanding prototypes appeared in Great Britain: the Short Empire flying-boat, the first really modern 200-m.p.h. large flying-boat; the first single-seater fighters to exceed 300 m.p.h., the Hurricane and Spitfire; and the first light bomber to

Handley Page Halifax, and Short Stirling; the fast wooden light bomber-fighter-reconnaissance de Havilland Mosquito; the Amer. high-altitude long-range Boeing Superfortress heavy bomber; and the Ger. Messerschmitt Me 163 (Fig. 2) and 262, the first jet-propelled, 500 m.p.h. fighters.

By the end of the war speeds of 600 m.p.h. (Gloster Meteor, Fig. 3); bomb loads of 10 tons (Lancaster); ranges of 5000 m. (Superfortress); passenger loads of over 100 (Boeing C-97); and ceilings of 45,000 ft (Spitfire XIV) were practical propositions, and not mere record performances. Post-war performance has increased rapidly. The first supersonic flight was made by Capt. Charles Yeager, U.S.A.F., in the Bell X-1 research aircraft in 1947, since when supersonic speeds have become normal for fighter aircraft. The Amer. Bell X-2 research aircraft is reported to have attained 2026 m.p.h.

To make possible such speeds, designers have turned largely to the use of thin swept-back wings or delta wings, together with new light-weight, heat-resistant metals such as titanium.

FIG. 2. TAILLESS ROCKET-PROPELLED FIGHTER MONOPLANE, 1944

The Messerschmitt Me 163, which, although not a great success, represents some of the latest ideas on high-speed design and was the first operational type capable of more than 550 m.p.h.

FIG. 3. TWIN-JET, SINGLE-SEATER FIGHTER, 1946

The Gloster Meteor IV (3000-lb. thrust Rolls-Royce Derwent jet engines), which, very slightly modified, broke the world's speed record at 616 m.p.h. on 7 Sept. 1946.

FIG. 4. DEVELOPMENT OF THE AEROFOIL SECTION AND THE EFFECT OF ANGLE OF INCIDENCE UPON LIFT

- | | |
|---|--|
| A. Flat plate—lift and drag, act at C.P., centre of pressure | G. Modern general purpose bi-convex section |
| B. Cylinder—drag only | H. High-speed thin symmetrical section |
| C. Streamline—low drag | I. Small incidence (α): moderate lift, low drag |
| D. Aerofoil section—combination of (A) and (C) giving lift and low drag | J. Large incidence: high lift, increased drag |
| E. Early thin, highly curved section | K. Stall: breakdown of air flow, no lift, large drag |
| F. Thick, high-lift section as used on gliders | |

Theory of flight. Briefly the lift of a wing is obtained from the suction above and pressure beneath a plate when it is passed through the air at speed (Fig. 4). Since a thin plate is not very efficient, and is difficult to construct, it is combined

FIG. 5A. THE PRINCIPAL FORCES ON AN AEROPLANE IN STATIC EQUILIBRIUM

FIG. 5B. THE ACTION OF THE THREE CONTROL SURFACES

with a streamline to form an aerofoil section. There are hundreds of such sections, the earliest being thin and highly curved (Fig. 4*b*); then they began to become thicker (and easier to make structurally), until with the advent of very high speeds after 1940 they were made thinner again (Fig. 4*h*).

The lift of the wing increases with the angle to the airflow (*a*), as does the drag, or resistance, until at a point called the stall the air ceases to flow smoothly over the wing and all lift is lost. This state of affairs also exists when the speed of the wing through the air is insufficient to cause enough suction to give lift.

When a wing moves through the air at high speed the boundary layer (or envelope) of air close to its surface moves at a lower speed than the rest, owing to its clinging to the surface of the aerofoil. If this boundary layer is flowing smoothly (laminar flow) there is little resistance, but if it is turbulent there is a great deal of drag. At the present time much energy is being expended in trying to induce this laminar flow, for as the speed of sound is approached the turbulent area

FIG. 6. EQUILIBRIUM AND CONTROLS OF A TYPICAL TAILLESS AEROPLANE

creeps forward until it breaks away in a shock wave. This shock wave is a sudden increase in pressure where the local velocity of the air exceeds the speed of sound. When this occurs there is a very sudden rise in the drag of the wing, while just before its onset there are sev. disturbing phenomena that upset the stability of the A.

A wing on its own would be of little use, and at the rear of the fuselage a fixed horizontal tail plane and a fixed vertical fin provide stability (Fig. 5*a*). Control is obtained by adding hinged flaps to wing, fin, and tail plane. A tail on the end of the fuselage is not essential to stability, although it is the simplest way of obtaining it. Many tailless A.s have been built and flown successfully. One of the commonest forms is shown in Fig. 6; the rudders are at the wing tip, while the ailerons and elevators are placed along the trailing edge of the swept-back wing—balance being obtained by this sweep-back. Obviously where there is no tail, weight and drag are saved, while recent aerodynamic research has shown that sweep-back has a good effect on air flow at high speeds, so that such A.s are becoming more common.

Since the air resistance of the wing is the greatest part of the resistance of the whole A., it has to be kept as small as possible. A small wing provides less

lift, so a compromise is made by fitting slots to the leading edge and/or flaps to the trailing edge. The action of these devices is shown in Fig. 7. Most modern A.s have flaps of some type and many have slots.

Structural developments. The essential need for an A. structure has always been lightness. This was once achieved by using frameworks of wood braced by wires and covered with fabric for both wings and fuselage; gradually there was a

with problems: it must be light yet capable of supporting sev. times the weight of the whole A. when it is brought violently to the ground; it has to be resilient to absorb such shocks and at the same time it must not be too springy or the A. will bounce badly when taxiing. Early undercarriages consisted of 2 light wire-spoke wheels carried on an axle tied to the apices of 2 wood or tubular vees by rubber cord, which served as the sole shock absorber. Later coiled

change to fabric-covered tubular metal structures (some still wire-braced, others welded) or to all-wood designs where the plywood skin of fuselage and wing (Fig. 8B) carried part of the structural loads. Since 1930 the tendency has been to make all classes of A. of the all-metal stressed-skin type (Fig. 8A). In this case the whole A. is usually made of an aluminium alloy, the fuselage having light longitudinal members (stringers), light transverse frames, and a sheet-metal covering; the whole being joined by riveting and forming, in effect, a light metal tube. The wing is of similar construction, but the main loads are taken by one or more transverse spars.

The alighting gear (undercarriage) of A.s has always presented the designer

with problems: it must be light yet capable of supporting sev. times the weight of the whole A. when it is brought violently to the ground; it has to be resilient to absorb such shocks and at the same time it must not be too springy or the A. will bounce badly when taxiing. Early undercarriages consisted of 2 light wire-spoke wheels carried on an axle tied to the apices of 2 wood or tubular vees by rubber cord, which served as the sole shock absorber. Later coiled

FIG. 8A & B. WOOD AND METAL AEROPLANE STRUCTURES

been designed using electric motors and screw jacks.

Originally piston engines (see **AERO-ENGINES**) were used to drive the airscrew, but now jet engines are replacing them for high-speed A.s. Where only moderate speeds are required the jet engine is inefficient and the turboprop engine is used. With this engine more thrust can be obtained at take-off and the cruising power is more economically converted into thrust. The airscrew has

been developed from a wooden 2- or 4-bladed type, first to a duralumin or steel one and then (in 1927) the variable-pitch mechanism was added. The object of this is to change the angle of the blades to suit the speed of the A., so that the engine can be run at its best r.p.m. whatever the speed of the A. Another advantage is that the blades can be feathered to present low drag if an engine stops in flight. The latest development is a reversible-pitch airscrew in

which the blades are turned right round to give a negative thrust and so slow the A. on landing. The reversible pitch can also be used for manoeuvring a multi-engined A. on the ground, or on the sea, rather as an oarsman backs water.

Seaplanes are of 2 general types: land A.s mounted on floats, and flying-boats, where the fuselage is turned into a hull. The flying-boat is generally used for the larger sizes, while the float plane is used for smaller and faster types. For a long time (from 1925 to 1939 approximately) the world's speed record was held by seaplanes because they were easier to land and take off at high stalling speeds. The advent of 'clean' monoplane landplanes and wartime construction of airfields all over the world brought a loss of interest in flying-boats. However, new hull designs and the use of jet power has made possible flying-boats with speeds of more than 600 m.p.h., and many are used by the U.S. Navy for mine-laying, reconnaissance, anti-submarine, and transport duties.

Langley, *Metal Aircraft Construction*, 1942; W. Lockwood Marsh, *The ABC of Flying*, 1945; L. Bridgman, *Jane's All the World's Aircraft* (ann.).

Aeroscope, instrument for measuring the purity of the air. Air is drawn by an aspirator across a film of glycerine for a given time. The particles adhering to the film are examined for quantity, and an estimation of the amount of dust in the air is arrived at.

Aerosol, a dispersing mist of fluid, usually fungicidal, insecticidal, or perfume, created by releasing under pressure. A.s are used in closed spaces—glasshouses, rooms, cinemas, etc.

Aerostation, lighter-than-air flight. See AERONAUTICS.

Aerotherapeutics, use of air for the treatment of disease. Air is used in the treatment of disease mainly in three ways: (1) by altering the atmospheric pressure on the body as a whole or on selected organs; (2) by modifying the composition of the atmosphere; and (3) by varying the temperature of the atmosphere. When a diver emerges suddenly from work in deep water under conditions of great pressure, symptoms somewhat resembling those of apoplexy sometimes present themselves. This disease, which is known as caisson disease, or diver's paralysis, may at once be checked if the patient is subjected in an air-lock to a pressure greater than that of the atmosphere, and the pressure then gradually reduced as the body accommodates itself.

The effects of high-altitude flying in a low atmospheric pressure are counteracted either by pressurising the skin of the aircraft, as in passenger-carrying planes, so that the atmospheric pressure

within the cabin remains relatively unchanged, or by the inhalation of oxygen. The latter method has to be used by high-altitude climbers. For some unknown reason a low atmospheric pressure is beneficial in whooping-cough and special chambers have been devised, similar to those used in caisson disease, for the accommodation of patients in a lowered atmospheric pressure for regular periods. Some cases of asthma have responded to periods of subjection to an increased atmospheric pressure. The use of air to exert pressure on particular organs is exemplified by the artificial pneumothorax treatment for collapsing and resting a diseased lung in pulmonary tuberculosis (see TUBERCULOSIS). Air at atmospheric pressure is introduced into the intrapleural space (see LUNGS, PLEURISY), and, since the pressure in the space is a negative one, the lung on the treated side collapses. Refills of air at slightly increased pressure are given at regular intervals to prevent the collapsed lung from re-expanding. Another treatment, with a mechanical action similar to that of pneumothorax, is that of artificial pneumoperitoneum. Air is introduced under slight positive pressure into the peritoneal cavity (see PERITONEUM), and this air collects under the diaphragm and restricts its movement.

The Drinker respirator, or 'iron lung,' is an apparatus for carrying out artificial respiration over long periods, for instance when the respiratory muscles have been inactivated by infantile paralysis. It consists of a large metal chamber, containing the patient's body but not his head, in which the air pressure can be alternately increased and decreased, affecting expiration and inspiration respectively.

The diminution of air pressure is the effective principle of Juwood's boot. A case of stiff leather is made to enclose the leg, so that when the air is exhausted blood rushes to the enclosed part.

The old treatment of 'cupping' consisted of the induction of a negative pressure within a metal cup placed over a particular part of the body surface, thus causing a hyperaemia in the blood-vessels of the area.

The composition of the inhaled air is modified in the treatment of certain respiratory diseases, but A. in this respect should not be confused with the administration of drugs by inhalation, as, for example, in anaesthesia or in medicated sprays. The use of the steam kettle in bronchitis aids expectoration by increasing the humidity of the atmosphere. Solutions of detergents, or wetting agents, are used suspended as droplets in an oxygen spray for the same purpose. Ammonia vapour removes sulphuric acid from a 'smog'-polluted atmosphere, and under such conditions it is used to purify the air in cases of respiratory disease. The inhalation of oxygen is often beneficial in cases of asthma, and also relieves the difficulty of breathing in pneumonia and heart failure.

The relaxing and stimulating effect of hot and cold air respectively is made use of in physiotherapy (q.v.).

Finally, the lethal effect of oxygen on many bacteria (q.v.) is the basis of the open-air treatment of tuberculosis and of fresh-air, open-window treatment of all respiratory infections.

Aerschot, see AARSCHOT.

Aertzen, or Aartsen, Pieter (1507-73), Dutch painter, called Peter the Long because of his height, was *b.* and *d.* at Amsterdam. Besides his historical and religious works he painted interiors and homely scenes.

Aeschines (c. 390-c. 329 bc), Athenian orator and prin. rival of Demosthenes (q.v.), with whom he was ambas. to Macedonia in 348 and by whom he was afterwards unsuccessfully prosecuted. In 330 he attacked the anti-Macedonian policy of Demosthenes in a prosecution directed immediately against Ctesiphon, who had suggested the award of a golden crown to Demosthenes as a mark of gratitude for his services to the State. A's speech *Against Ctesiphon* delivered on this occasion is extant; it was answered by Demosthenes in the *De Corona*. A. lost his case and went into exile, first to Asia Minor and later to Rhodes, where he estab. a school of eloquence. His style, though excellent in itself, is marred by lack of judgment. The text of his surviving speeches has been ed. (with trans.) by C. D. Adams (Loeb Library), 1919. See J. F. Dobson, *The Greek Orators*, 1919.

Aeschines Socraticus (4th cent. bc), Gk philosopher, a friend of Socrates. Having become bankrupt through the failure of his perfumery business, A. S. left Athens and retired to the Syracusan court. After the expulsion of the younger Dionysius (357 bc) he returned to Athens and taught privately. Some extant remains attributed to him are not genuine.

Aeschinite, see TITANIUM.

Aeschylus (525-456 bc), Gk tragic poet, *b.* at Eleusis; son of Euphorion, a member of the old Athenian nobility (Eupatridae). He fought at Marathon (490), A. first exhibited at the Dionysiac festival in 499, and won his first victory in 484. In 476, and again in 472, he visited the court of Hieron I at Syracuse. His third Sicilian journey, from which he did not return, was made soon after the production of the *Oresteia* in 458. He *d.* at Gela. A's reputation as the father of Gk tragedy is based upon the fact that he raised it above the status of a mere choral exhibition by introducing a second actor as well as by his improvements in staging. His verse is marked by tremendous vigour and loftiness of tone; his thought upon the great problems of life and death is profound. According to Suidas (q.v.) A. wrote 90 plays. We possess only 7, as follows: *Suppliants*, *Persae*, *Seven against Thebes*, *Prometheus Bound*, and the *Oresteia*, the only extant trilogy, consisting of *Agamemnon*, *Choephori*, and *Eumenides*. Our prin. source for the events of A's career is the 11th-cent. Medicean MS. at Florence. The first full text of the plays was pub. by Victorius

in 1557. The best complete modern ed. available to Eng. readers is that of Gilbert Murray (Oxford Classical Texts), 1937. There is a trans. by G. M. Cookson in Everyman's Library (1955). See G. G. A. Murray, *Aeschylus the Creator of Tragedy*, 1940 and F. R. Earp, *The Style of Aeschylus*, 1948.

Aesculapius (Gk *Asclepius*), god of the medical art, according to Homer was the 'blameless physician' whose sons were physicians in the Gk army. The common story is that he was a son of Apollo and instructed by Chiron in the art of healing and in hunting. He healed the sick and restored the dead to life, for which he was killed by Zeus; but later he was placed among the stars. The chief seat of his worship was Epidauros, whence it spread to Rome, 293 bc. The Asclepiadae (supposed descendants of A.) were an order of priests claiming a knowledge of medicine. Their prin. seats were Cos and Cnidus. See E. J. and I. Edelstein, *Asclepius* (2 vols.), 1945.

Aesculic Acid, see ESULIC.

Aesculus, genus of deciduous trees and shrubs, family Hippocastanaceae, about 25 species. See HORSE CHESTNUT and BUCKEYE.

Aesernia, see ISERNIA.

Aesir, see ASES.

Aesop (*Aesop*) (fl. c. 570 bc), Gk composer of animal fables. According to tradition he was a native of Phrygia and afterwards the slave of one Iadmon at Samos. Having received his freedom he visited Croesus, who sent him on a mission to Delphi. There he became involved in a dispute and was hurled over a precipice. It is doubtful whether A. left any written works; but it is certain that prose fables bearing his name were popular at Athens, and according to Plato, Socrates turned some of these into verse during his imprisonment. The fables now extant in prose and bearing A's name are undoubtedly spurious. See also BABRIUS. See A. Hausrath, *Corpus Fabularum Aesopiarum*, 1940.

Aestheticism. This word, which in its original and general sense implied an attachment to aesthetic principles, came to be applied particularly to a movement in art which in the seventies and eighties of last century was characterized by many whimsicalities and absurdities. Arising from a natural and healthy reaction against the ugliness and philistinism of the mid-Victorian era, and represented in different ways by Ruskin, Morris, Swinburne, Pater, and Whistler, it developed, under Oscar Wilde and others, tendencies which justly made it the butt of much ridicule, drawing down on it the shafts of satire of Ihu Maurier in *Punch*; and W. S. Gilbert in his operetta *Patience*, 1881, ridicules one Bunthorne, who walked down Piccadilly with a poppy or a lily in his medieval hand. As a movement it was non-creative, but the artists and thinkers whose ideas it tried to follow (and somewhat distorted) did much to renew an aesthetic sense among their countrymen.

Aesthetics is the name given to that

science or philosophy which treats of the beautiful and attempts to establish the principles and theories upon which works of art are based. The word is derived from the Gk *aisthētikos* (that which concerns feeling or perception), and it was in Greece that the theories of A. were first propounded. As instancing the importance attached to this subject by the philosophers of classical antiquity, one recalls the amount of attention devoted to it by Plato and Aristotle. The name of Plato will always be remembered in all discussions on the nature of the beautiful, whilst Aristotle, in his discourse on the theory of art in poetry contained in his *Poetics*, contributed to aesthetic literature the most important work among the ancients. In it he treats of tragedy, a form of dramatic art carried to great heights by the dramatists of his time. His canons of criticism, many of which are still valid, include the assertion that beauty is the mean between two extremes, neither too large nor too small. Plato's teaching on the subject is in keeping with his general theory of an absolute and perfect ideal behind all appearance. From this it follows that beauty in finite things arises from their correspondence to their ideal archetype. This doctrine of Plato is expressed by the poet Keats in his *Ode on a Grecian Urn*, in the oft-quoted lines, 'Beauty is truth, truth beauty—that is all Ye know on earth, and all ye need to know.' The science of A. has been divided into subjective and objective. The objective side deals, *inter alia*, with the relationship of art to nature, the classification of the sev. arts, and the definition of their functions and limitations. Subjectively the question is largely one of psychology and an attempt to determine the nature and origin of aesthetic judgment or taste, and this dept of the science is further subdivided into consideration of the conditions of artistic production and of artistic appreciation or perception. The latter aspect of the theory is put succinctly in the phrase that 'Beauty resides in the eye of the beholder.' The modern science of A. may be said to have been inaugurated by the pub. in Frankfurt at about the middle of the 18th cent. of *Aesthetica*, a book by Baumgarten, a disciple of the Ger. philosopher Christian Wolf. In this work, which earned him the title of the father of modern A., he differentiates between truth, which is apprehended by reason, and the beautiful, which is perceived by sense; sense, he maintains, is on a lower plane of intellect. Following Baumgarten came a whole host of Ger. philosophic writers, who can only be briefly enumerated here. First comes Winckelmann, who developed Baumgarten's theories. Lessing in his *Laocoön* defined the spheres of poetry, painting, and sculpture. Schiller, the poet, who by influencing Goethe influenced the current of European thought, defined the secret of art as the supersession of the matter by the form. Kant denied the possibility of a strict science of beauty, for he regarded it as subjective. Fichte

and Schelling, Herbart and Schopenhauer are the names of other Ger. aesthetic writers, the place of art being exalted in the latter's philosophy; but Hegel dominates all, his *Lectures on Aesthetics* being the chief work on the subject. Eng. writers include Hume, Burke, Alison, and Ruskin, the French contribute Diderot and Buffier, and the Italians Croce. See B. Bosanquet, *A History of Aesthetic* (4th ed.), 1917; B. Croce, *The Essence of Aesthetic*, trans. 1921; E. F. Carritt, *The Theory of Beauty*, 1923; R. G. Collingwood, *The Principles of Art*, 1938.

Aestivation (Lat. *aestivus*, belonging to summer), or **Prefloration**, in botany, term to describe the way in which the floral organs are arranged in the flower-bud, as veneration or prefoliation describes the arrangement of leaves in a leaf-bud. If the parts do not touch, the A. is *open*, if they touch but do not overlap it is *valvate*, if they overlap it is *imbricate*. When the A. is such that 2 parts overlap completely, 2 parts are completely overlapped, and 1 part overlaps at 1 edge and is overlapped at the other, it is called *quincuncial*; A. is *convolute* or *contorted* when each part overlaps another and is itself overlapped at one edge.

Aestivation (Lat. *aestivare*, to pass the summer), or **Estivation**, in zoology, state of dormant vitality in summer of some animals, such as land snails, in warm climates which prevents them from suffering from heat or drought. During dry periods the African and S. Amer. lung-fishes sleep in burrows in the mud. It is opposed to hibernation, which is a state of dormant vitality in winter.

Aetas, name by which the Negritos of the Philippine Is. are known among themselves. They are dwarfish in stature, with round heads, bulging foreheads, large eyes, and woolly hair, and are almost wholly uncivilised.

Æthelbald, **Æthelbert**, etc., see **ETHEL-BALD**, etc.

Aether, or **Ether**, medium once assumed to fill all space and matter, through which electro-magnetic waves were transmitted. The idea of an exceedingly tenuous medium pervading the whole universe has suggested itself to philosophers of all ages. In the Hindu mythology it is given as one of the 5 elements: earth, water, fire, air, and ether. Descartes elaborated a vortex theory of matter, in which he conceived all space to be filled with one substance whirling round in great vortices. It was thus he explained the formation of the solar system, particles flying off from the centre to the circumference constituting the light radiated from the sun. Leibnitz in 1671 declared his belief in an A., a fine substance permeating all bodies in the direction of the earth's axis and producing the phenomena of gravity, elasticity, etc. Kant pub. in 1753 a thesis which postulated an A. connecting all matter. It seemed necessary to him, in order to explain action at a distance, that bodies should operate upon each other by means of an elastic and subtle medium,

uniformly diffused through the universe. This medium, he was convinced, was the underlying substance of heat and light.

The later development of the conception of an A. occurred mainly in connection with the mathematical treatment of physical phenomena, particularly with regard to the propagation of light. Newton conceived light to be occasioned by particles moving with great velocity in straight lines from the source. He explained refraction by assuming periodic changes in the velocity of the light corpuscles; they have, he said, alternate fits of easy reflection and easy refraction, and it depends on which of these a particle is in when it reaches the surface whether it will be reflected or refracted. A ray of white light, he maintained, consists of many particles with differing periods of refrangibility and reflectibility, the most refrangible causing the sensation violet, and the least refrangible producing red. Newton objected to the wave theory held by Huygens and his supporters in that it did not explain the rectilinear propagation of light, or the phenomenon of double-refraction. It was inconceivable, he also said, that a medium should be so transparent that light could reach us from stars known to be enormous distances away. Nevertheless the wave theory was to triumph; investigation of the phenomena of interference and polarisation (q.v.) led to their being explained by undulatory motion, so that the corpuscular theory hardly survived the 18th century.

In 1801 Thomas Young once more put forward the hypothesis that luminiferous A. pervades the universe, that it is rare and subtle in a high degree, and that it is by vibration in this medium that light is propagated. The A. was conceived of as offering no opposition to the passage of material substances; 'it passes through them,' he said, 'like the wind through a grove of trees.'

The existence of A. having been assumed to explain light waves, it was therefore necessary, in order to avoid postulating different kinds of media, to discover some connection between light propagation and other physical processes acting through space. Faraday showed that iron filings spread on a card held over a magnet arranged themselves in a series of curved lines between the poles. These were called lines of force and indicated some disturbance or stress in the medium connecting the poles of the magnet. He also showed that an electric current was induced in a continuous conductor cutting the lines of force. For years he attempted to discover whether magnetism had any effect on polarised light, until in 1845 he succeeded in producing the rotation of the plane of polarised light by transparent dielectrics in a magnetic field. Thus magnetic force and light were shown to have a relation to each other, and the A. was now looked upon not only as the light medium, but as the medium of electric disturbances as well. Faraday's work was carried further by Clerk-Maxwell and Lord Kelvin. The latter

interpreted magnetic force in terms of a rotatory movement of the A., the energy of irregular translation constituting heat, the theory of the transformation of energy being thus considerably advanced. By calculating from the energy of solar radiation near the sun's surface, Kelvin proposed a value of 5×10^{-10} g. cm⁻³ for the density of A. The further investigation of mathematical values in connection with light-waves led Sir Joseph Larmor to the conception that A. corresponds to a solid with a density considerably smaller than any known substance and quite incompressible. To sum up: The A. has long been regarded as the vehicle of light. During the 19th cent. it was regarded as the medium, filling all space, through which light, gravitational forces, and electro-magnetic waves were propagated; it was widely believed that the A. was material, having the properties of matter, such as mass, rigidity, and motion. Matter itself was regarded as vortices in the A., but this view was abandoned as being illogical, since the A. could not consist of vortices in the A. Michelson and Morley in 1881 and 1887 attempted to discover the existence of an A.-drift at the earth's surface, and their experiments, which gave negative results, led to the principle of relativity. Sommerfeld says that 'nowadays we like to avoid speaking of the A., since the theory of relativity has deprived it of its material existence in the older sense,' but, as Eddington points out, 'this does not mean that the A. is abolished. It is agreed that the A. is not a kind of matter, and, being non-material, its properties are *sui generis*—it has definite characters of its own.' Sir Oliver Lodge indicated some of its properties: it fills all space in the most thorough manner, it is absolutely cold, it is absolutely transparent and undispersive, it is devoid of viscosity, it is the sole vehicle of radiation, i.e. of light, X-rays, wireless waves; electric and magnetic fields are forms of energy existing in the A., and since all varieties of matter are ultimately electrical in origin, being composed of protons and electrons, Lodge asserted that 'the A. is indirectly responsible for all physical and chemical activity. What other functions this universal medium may be found to possess, and whether life and mind can be in any way associated with those functions, it must be left to posterity to find out.' The view of most physicists to-day is that since a fixed A. is not observable the concept has a very limited application. However, whenever physical properties are ascribed to space, it can be said that some kind of ether is being proposed.

Aethicus, see ETHICUS.

Aethiopia, see ETHIOPIA.

Aethusa, anct name of Favignana, the largest of the Aegadian Is., in the Mediterranean. It is 6 m. long, and has a pop. of 7000.

Aetiology, see ETIOLOGY.

Aetion, or **Eetion**, Gk painter, b., according to Pliny, 350 bc. References are made to him by Cicero, Pliny, and

Lucian. He was contemporary with Alexander and Apelles. His chief work represented the marriage between Alexander and Roxana.

Aetius, 'the Atheist,' native of Coele-Syria, fl. in the 4th cent. AD. After following various trades he became a doctor, and gained distinction particularly in medical controversy. Leontius of Antioch installed him deacon, but his heterodox views caused his banishment from the tn. In AD 356 he went with Eunomius to Alexandria, only to be exiled by Constantius. He was recalled by Julian, and elevated to the rank of bishop. Here he used his influence on behalf of Arianism, but retired on the succession of Valens, and d. 367. A work entitled *De Fide* survives.

Aëtius (d. AD 454), Rom. general, b. Moesia; son of Gaudentius, Count of Africa. He spent some years of his early life as a hostage among the Goths and Huns, obtaining a knowledge of their ways which enabled him afterwards to accomplish their defeat. In 424 A. invaded Italy at the head of 60,000 barbarians to support Iovannes who had proclaimed himself emperor. After the latter's defeat A. was given supreme command in Gaul. In 432 he slew Count Boniface in single combat, and became thereafter the most conspicuous figure in the moribund Rom. empire. In 451 he led the imperial forces to victory against the Huns at Châlons-sur-Marne; but was assassinated three years later by Valentinian III, who suspected him of designs upon the Crown.

Aetius of Amida (502-75), physician, b. Amida, Mesopotamia. He was physician to Justinian I at the court of Byzantium and was the first Christian physician of note. His great *Tetrabiblion*, first printed in Gk text (vol. i only) in 1534, included the writings of earlier men who might otherwise have been forgotten. He also compiled a treatise on diseases of the eye and an important work on obstetrics and gynaecology. He described diphtheria, intestinal worms, aneurysm, and cirrhosis of the lung.

Aetna, see ETNA.

Aetolia, region of NW. Greece, now part of the dept of A. and Acarnania, divided from Acarnania proper by the R. Achelous. N. A. is mountainous, barren, and sparsely populated. The basins of the lower Achelous and Evenus are intensively cultivated and produce tobacco, currants, vines, and maize. The chief tn is Missolonghi (q.v.). The rivers are laden with silt and their deltas are marshy. Little is known of aet A. before the 4th cent. BC, when the Aetolian League was formed. It gained control of Delphi and was a major power in Hellenistic Greece, being a rival to Macedon and at first an ally of Rome. The League was defeated by the Romans when it sided against them with the Seleucids. A. then lost all real independence. It was under Turkish rule from the 15th cent. till 1912. Area 2990 sq. m. Pop. 220,100.

Aetolikon, see ANATOLIKO.

Afer, Domitius, Rom. orator, b.

Nemausus (Nîmes). Quintilian, who was for some time his pupil, calls him the greatest orator he had ever known. In the reign of Tiberius A. acted as an informer, and was responsible for the death of Claudia Pulchra. He was consul in AD 39, superintendent of the water supply under Nero, and d. as a result of his intemperate habits in AD 60.

Affettuoso, It. musical term, indicating that a passage should be played with feeling. *Con affetto* is used alternatively with this term.

Affidavit, statement of facts in writing made upon oath, or by a solemn affirmation, before a commissioner for oaths. The word is derived from the old Lat. form of a declaration on oath, which commenced thus, 'Affidavit M. N.' i.e. 'M. N. has sworn.' The employment of A.s is generally confined to litigation, but sometimes the A. is employed to lend force to a public statement, for the person who knowingly and advisedly falsely swears to an A. is liable to punishment for perjury. In judicial proceedings the A. is used in lieu of oral evidence, and particularly is this the case in interlocutory applications. Sometimes the whole of evidence may be taken by A., and this was especially the case in the old Chancery courts, but as a rule this practice is discouraged.

Affiliation. An A. order is an order made by an Eng. court of summary jurisdiction at the instance of the mother of an illegitimate child, or by the local authority where the child is in its care, ordering the father to pay a sum not exceeding 30s. a week for the maintenance and education of the child until the age of 16. The process is governed by the Bastardy Acts, 1845, 1873, and 1923, and the Affiliation Orders Act, 1914. The uncorroborated testimony of the mother is not sufficient proof of paternity, and an appeal to the quarter sessions may be made. Failure to comply with an order is punishable by imprisonment.

Affinity, in law, relationship through the fact of marriage. On the principle that man and wife are one flesh, one party to a marriage bears to the relatives of the other party a relationship by A. which is determined by the latter's blood-relationship, or *consanguinity* (q.v.). A. is only important in connection with the marriage law, which in England and Scotland is based in this respect on the Mosaic law as set forth in Lev. xviii. An important exception to the general rule that marriages are prohibited within the same degrees of A. as of consanguinity is provided by the Deceased Wife's Sister Act of 1907, which allows marriage between a man and a woman standing in that relationship. The objections to marriage within certain degrees of A. are distinct from consanguinity rest mainly on religious grounds; scientific observation having disclosed no reason for supposing that such marriages would result in degeneration.

Chemical affinity, the property by virtue of which atoms or groups of atoms tend to enter into chemical combination with

other atoms or groups. See CHEMISTRY; ELECTROLYSIS; VALENCY.

Affirmation, solemn declaration prescribed by the Oaths Act of 1888 as a substitute for an oath in all cases where for conscientious reasons a person objects to being sworn. An A. in court is subject to the same liabilities for perjury as an oath. The privilege of affirming was first granted to the Quakers in William III's reign, and gradually extended to other categories of people. See OATH.

Afforestation (from Lat. *ad*, to; Low Lat. *forestis*, unenclosed woods),

and paper-pulp plants. Simultaneously measures are taken to increase increment by afforesting more land, improving management in existing woodlands, and organising efficient protection from fire, grazing animals, insect pests, and fungal diseases.

At present Britain's industrial economy is dependent on timber grown abroad, mainly in N. Europe and N. America, 90 per cent being imported. For strategic and economic reasons A. must be extended to lessen this dependence, to make better use of hill lands, and to provide

Forestry Commission workers planting Scots pine on heather-covered mountain land.

planting and tending of trees for timber production, maintenance of shelter and landscape effects, and prevention of soil erosion. Nearly all countries now take part in A. through Forestry Depts, which extend and manage national forests, encourage planting by private land-owners, regulate tree felling, and undertake research and education. In Great Britain the responsible authority is the Forestry Commission (q.v.); in N. Ireland the Ministry of Agriculture; and in the Irish Rep. the Ministry of Lands.

The principle followed in forest management is that of sustained yield. The wooded area is surveyed, the existing vol. of timber measured, and an estimate made of the increment, or amount whereby vol. increases yearly. The quantity of timber felled each year is then kept in line with the increment, ensuring a constant reserve of standing timber and steady supplies of felled logs for saw-mills

rural employment. The ann. consumption of timber is about 1100 million cu. ft. or 22 cu. ft. per head of pop., roughly one-third being consumed as paper, cardboard, rayon, and other manuf. substances. The reserve of standing timber is only 4000 million cu. ft. and the ann. increment 140 million cu. ft.; 90 million cu. ft. is harvested and 50 million cu. ft. put to reserve. The object of forest policy is to increase the reserve to 10,000 million cu. ft. and both the increment and the harvest to 350 million cu. ft., so meeting about one-third of consumption from home sources. To produce so much timber, 5 million ac. of well-managed forests are required. The present forest area of 3.7 million ac. includes 1 million of Forestry Commission plantations; 0.4 million ac. of bare land earmarked for early planting; and 2 million ac. of woodland under private ownership and suited for economic

timber production; the balance of 0.3 million ac. is mainly of shelter, recreational, or amenity value. The commission is gradually acquiring a further 1.6 million ac. of poor land, of little or no agric. value, for forest extensions. The eventual total of 5.3 million ac. overall will occupy one-tenth of the land area.

Woods under private ownership are scattered throughout the country, numbering many thousands. Forestry Commission properties number 500, nearly every co. holding one or more; the larger forests include Thetford Chase in E. Anglia (50,000 ac.), the New Forest in Hants (65,000 ac.), and the Forest of Dean in Glos. (25,000 ac.). But most of the big new extensions lie in Scotland, Wales, and the hills of N. England, examples being Glen Trool in Galloway (55,000 ac.), Coed Morgannwg in Glam. (36,000 ac.), and Kielder in Northumberland (71,000 ac.).

The A. scheme in the Rep. of Ireland shows a progressively increasing rate of development. The area of woods and plantations under State control has increased from 160,000 ac. in 1948 to 237,000 ac. in 1957. Between 1948 and 1950 the ann. rate of intake of land was increased from less than 4000 ac. to 20,000 ac. and has been maintained at approximately the same level since. The area of State forest nurseries was increased from 300 ac. in 1948 to 600 ac. in 1951, resulting in an increase in the planting programme from 8000 ac. in 1948 to 17,500 ac. (i.e. nearly 30,000,000 trees) in 1957. A Practical Training Centre (at which students spend their first year) has been estab. at Kinnitty Castle, Birr, and a new School of Forestry (at which the remainder of the 3 years' course is completed) was formally opened at Shelton Abbey, Arlow, in Feb. 1957. Already State A. has become one of the largest employers of labour in the country.

Forest trees are raised from seed in nurseries; after 1 or 2 years in seed-beds they are transplanted to promote the growth of bushy root systems. When from 2 to 4 years old and 6 in. to 2 ft high they are planted out in the forest, usually 5 ft apart, requiring 1750 per ac. Often the land is ploughed and drained prior to planting; it is fenced against livestock and rabbits. Weeding is needed for 2 or 3 years; numbers of deer must be controlled. Protection against fire is secured by leaving fire breaks unplanted, keeping available beaters, pumps, axes, and spades for fire fighters, ensuring arrangements for quick transport and aid from fire services and troops, and organising observation by patrols or from fire towers during dry weather.

Harvesting of timber begins when crops are around 20 years old, taking the form of small poles thinned out to give other trees more growing space. On average nine-tenths of the trees planted, and half the vol. of timber grown, is removed in a series of 10 thinnings between the twentieth and eightieth years. The remaining main crop of big select trees is

then felled, and the ground replanted or crop naturally regenerated by self-sown seedlings. Smaller poles removed are used for fencing, pit props, telegraph poles, paper pulp, and hardboard. Larger thinnings and main crop logs go to saw-mills for boxboards, railway sleepers, building timber, and furniture stock. Nine-tenths of the demand is for softwoods from coniferous trees, which fortunately produce large volumes rapidly (70-100 cu. ft per year) on poor hill land. Norway spruce and Jap. larch and 3 trees from Brit. Columbia, namely Sitka spruce, Douglas fir, and Lodgepole pine, are widely planted in wetter W. dists.; Scots and Corsican pines are preferred in the drier E. Some 10 per cent of planting is done with hardwoods or broad-leaved trees, including oak, beech, ash, elm, and sycamore, on the better soils, mainly in the S. and midlands of England; these supply wood for furniture, tool handles, and specialised industrial purposes.

Large A. areas are often well suited to recreation, particularly where they include hills too high for tree planting. Eight National Forest Parks have been opened, namely Glen More in the Cairngorms (12,500 ac.), Argyll near Dunoon (58,000 ac.), Queen Elizabeth between Loch Lomond and the Trossachs (41,500 ac.), Glen Trool in Galloway (130,000 ac.), the Border in Northumberland, Cumberland, and Roxburghshire (123,000 ac.), Hardknott in the Lake Dist. (7000 ac.), Snowdonia in N. Wales (22,500 ac.), and the Forest of Dean and Wye Valley woods (33,500 ac.). Camp sites are provided.

A. gives increased employment in thinly peopled dists., needing one worker to 100 ac. of woods, plus one or more in related industries. New forest vils. have been built at Kielder, Glen Trool, and in sev. remote forests in the Scottish highlands and the Welsh mts.

Affre, Denis Auguste (1793-1848), Archbishop of Paris. b. St Rome-de-Tarn. Educ. at St Sulpice, he became in 1818 prof. of dogmatic theology. As archbishop he endeavoured to establish peace between the soldiers and insurgents during the rebellion of 1848. Wearing a green branch to denote his peaceful intentions, he mounted a barricade. He was killed by a stray bullet. Among his works are many valuable treatises and an *Essai sur les hiéroglyphes égyptiens*, 1834, where he showed Champollion's system of trans. to be faulty.

Affreightment, see BILL OF LADING and CHARTER-PARTY.

Afghan Hound, native of Afghanistan, where it has been used for centuries as a hunting dog and guard. Rock carvings of 2220 BC show the dog in the same form as it is now known. It was introduced to England and shown for the first time in 1907. In build it resembles a greyhound, but appears shorter and heavier on account of the long shaggy coat which covers flanks, shoulders, hindquarters, and legs. The smooth muzzle of the long narrow head is in strong contrast with

the silky top-knot surmounting the skull. The ears are heavily feathered and carried close to the head. Legs are straight and well boned; the sprightly ringed tail has a curl at the end. The A. H. is intelligent but shy with strangers. It is hardy, and is essentially an outdoor dog; it should not be kept in tns or in small houses. According to official standards the height at the shoulder for dogs is 27-8 in., and for bitches 24-6 in. A number of colours are found, but cream, fawn, golden, or red are preferred; the nose is black in all but light-coloured dogs, which may have a brown nose.

Afghanistan, country situated at the NW. of the Indian sub-continent. It is bounded on the W. by Persia, in the N. by the U.S.S.R. (reps. of Turkmenistan, Uzbekistan, and Tajikistan), and on the E. and S. by Pakistan. The N. boundary runs from Zulfiqar on the Persian frontier to Kushk, the railway terminus on the Soviet line from Mary (Merv), and thence to the Amu Dar'ya (Oxus). The frontier with Pakistan is that settled by the Durand agreement of 1893. The country extends 400 m. from N. to S. and 600 m. from E. to W. The 7 major provs. are Kabul, Mazar, Kandahar, Herat, Kataghan, Samt-i-Mashrigi (E. Province), and Samt-i-Janubi (S. Province). The 4 minor provs. are Badakhshan, Farah, Ghazni, and Parwan. Its area is approximately 245,000 sq. m., being twice the size of Great Britain and Ireland. Pop. (estimated) 11,000,000.

The mt. system of A. contains the Hindu Kush range, with its continuation the Koh-i-Baba and the Firozkhol plateau. Of the Koh-i-Baba peaks, Shah Fuladi (16,870 ft) is the highest. Next in importance to the Hindu Kush and Turkestan mts are the Safed-Koh, whose highest peak is Sikaram, which is 15,600 ft above sea level. The rvs. may be divided into the 3 prin. basins of the Amu Dar'ya, Indus, and Helmand. In the Amu Dar'ya basin the Murghab and the Hari-Rud owe considerable value to their geographical position, as well as to the richness of their valleys. Before, however, these rvs. reach the Amu Dar'ya they disappear. Indeed, of the many streams that flow from the N. slopes of the Hindu Kush, only 2 reach the Amu Dar'ya, these being the Kokcha and the Kunduz. In the basin of the Indus are the Kabul and its tribs., which flow from the S. slopes of the Hindu Kush and the valleys of the Safed-Koh; the Kurram, and those streams flowing from the Waziri Hills and the Sulaimans. The Helmand, fed by the Arkandab, the Tarvak, and the Afghanistan, waters the whole of SE. A.

The climate, owing to the different altitudes, is very varied, and suffers sudden and severe extremes. The temp. for the greater part of the year changes through the extraordinary range of 30° in a day. In the N. the winter is marked by a lasting and rigorous severity; while in the Amu Dar'ya country the heat of summer reaches 120° F. To the severities of the intense heat are to be added the frequent dust storms and fiery winds;

while the night-time is rendered almost intolerable by the radiating heat absorbed during the day by the vast masses of rock. The most temperate region is at Herat. Generally the climate of A. may be said to be dry, whatever rain it receives being derived from the SW. monsoon. From the athletic and handsome appearance of the pop. it would be expected that healthy conditions prevailed. But the existence of frequent and intermittent fevers, and the almost universal suffering from bowel complaints, brought about by the too heavy abuse of a fruit diet, prove very costly to life.

The pop. of A. is made up of very diverse elements—Pathans, or Afghans proper, in the E. and S. provs.; Hazaras in the centre; a few Persians in the W.; Tajiks, Uzbeks, and Turkmens in the N. The prevailing religion is Islam. The official languages are Pashtu and Persian. The literature is mostly poetic, being partly in Persian and partly Pashtu. The best-known poets are Abdur Rahman and Khushhal Khan. Justice is administered under the canon law of Islam (*shariat*) and under customary law (*adat*). Elementary schools exist in considerable numbers, but there are secondary schools only in Kabul and the prov. capitals. In Kabul there are 2 teachers' training schools and a univ. founded in 1932 with faculties of law, science, medicine, arts, theology, and literature.

The Gov. of A. is a constitutional monarchy in which supreme legislative power is vested in the Parliament consisting of the king, a Senate (50 nominated members), and a National Assembly (171 elected members). There is also a Grand Assembly (Loe Jirgeh), summoned on important occasions.

The land, if well cultivated, would be rich in yield. The natural productions of A. include castor oil and tobacco from Kandahar, wheat, barley, cotton, grapes, melons, and the mulberry from Herat. The ash and elm are grown, and the apricot, apple, plum, quince, peach, and pomegranate are the prin. fruits, a branch of cultivation which absorbs considerable attention. In some parts the pistachio, valuable for its dyeing qualities, is cultivated. Over 100,000 ac. are under irrigation from canals and *karez* or underground channels fed from springs. The farmer still, for the most part, ploughs with a trivet of sticks and reaps with a 15-in. sickle. The prin. revenue is from the land—the State's share of the crop being from one-tenth to one-third of the gross produce, though unirrigated land is scarcely taxed at all. Salt, copper, silver, lead, coal, iron, lapis lazuli, and rubies are found. Industrially the chief articles manuf. are carpets, *poshtins*, i.e. clothing made from sheepskin, and cloth materials from the many varieties of goat-hair. Silks are manuf. at Herat and Kandahar, which tns owe their importance to this industry. Kabul has small factories producing utility articles such as matches and buttons. There are cotton-ginning plants at Kunduz, Pul-i-khumri, and Gul Bahar.

Irrigation projects have recently been completed in Herat and Kandahar provs. and hydro-electric plants are under construction on the Kabul and Arghandab rivs. The main exports are to India and Pakistan and include karakul (lambskins), spices, fruits, carpets, raw wool, and cotton (of 47,000 metric tons produced in 1955 about 10,500 tons were exported). Cotton goods, sugar, hardware, leather goods, tea, cement, and paper are imported from India and Pakistan. The main imports from the U.S.S.R. are oil products and petrol. There are no railways in A. All the carrying, until fairly

Sadozai family, became King of the Durrani on the death of Nadir. By 1750 Ahmad Shah had extended his dominion over all the country of the Hindu Kush lying between the Indus and Amu Dar'ya (Oxus) rivs. Its N. and W. boundaries were approximately those of A. to-day, but the Persian prov. of Khorasan acknowledged his suzerainty. In 1756 Ahmad Shah occupied Delhi and in 1761 defeated the Mahrattas at Panipat, regarded as one of the decisive battles of the world. In 1762 he defeated the Sikhs near Lahore, and for a short time his empire extended from the Atrek R. to

The tomb of Sultan Mahmoud, the conqueror of India, is near by.

recent years, was done on the backs of camels and ponies; but to-day a number of the roads are fit for motor traffic except after heavy rain and snow, and though goods are still conveyed by pack animals, motor transport is rapidly supplanting pack transport as the chief means of conveyance. The prin. trade routes from A. to India are those connecting the Amu Dar'ya regions with Kabul, and those which lead from Kabul, Ghazni, and Kandahar to the Indian plains.

Available information on the origin and early hist. of the Afghan people is scanty and confused. What is now A. was at various times a part of the Persian, Ghaznavid, Mongolian, and Mogul empires and is often referred to by historians as the country of the Hindu Kush. There is no confirmation of the theory that the Afghans were of Heb. origin.

A. first emerges in hist. as an independent country in 1747 when Ahmad Shah Abdali, commander of Nadir Shah's (q.v.) bodyguard and a member of the

Delhi and from Tibet to the Indian Ocean. Before his death in 1773 he had given up the central Punjab to the Sikhs, retaining Peshawar and the N. Punjab.

Ahmad Shah's son Timur, who succeeded him, ruled for 20 years, and at his death the Durrani Empire still included Kashmir, Lahore, Multan, Peshawar, all A. S. of the Hindu Kush, Herat, and the provs. of Balkh and Khulm in the Amu Dar'ya valley. Thereafter, however, the empire rapidly disintegrated, and when in 1818 Dost Muhammad Khan of the Muhammadzai family assumed Ahmad Shah's throne in Kabul his dominion extended less than 100 miles in any direction. Afghan rule had passed out of the hands of the Sadozais, but Kamran Khan, the last of the Sadozais, had taken refuge in Herat where he maintained an independent principality.

In 1831 the Persians at Russian instigation laid siege to Herat, and Britain became apprehensive of Russian intentions. Russian and Brit. missions visited

Kabul, and eventually in 1838 the Brit. Gov. decided to replace Dost Muhammad by Shah Shuja, a previous amir who had taken refuge in India on his fall from power in 1809. This resulted in the First Afghan War and a Brit. force was eventually compelled to withdraw with heavy losses. In 1842 Brit. forces re-entered Kabul, and in 1843 Dost Muhammad was allowed to resume the throne. He continued to reign until his death in 1863. He succeeded in pacifying the country to a considerable degree and in re-establishing control as far N. as the Amu Darya and W. to Sistan. Herat was captured a few months before his death.

Dost Muhammad's successor Sher Ali's rule began in 1863 with a period of strife during which Kabul was lost to rebel forces, only being regained in 1868. Lord Lawrence, who was Viceroy of India at this time, pursued a policy of non-interference in Afghan affairs, but this was abandoned in 1876 on the appointment as viceroy of Lord Lytton, who advocated a 'forward policy' to guard against the threat to India thought to be implicit in Russia's continued advance in central Asia. This policy envisaged placing the Indian defensive frontier on the N. ridges of the Hindu Kush with outposts in the Amu Darya valley, and was to be achieved either by an exclusive alliance with an Afghan amir well disposed to Britain or by the conquest and annexation of as much of Afghan ter. as was strategically necessary. Sher Ali's involvement with the Russian Gov. and his refusal to agree to Brit. demands resulted in 1878 in the Second Afghan War and the subsequent occupation of Kabul, Kandahar, and the Kurram valley. Sher Ali fled, eventually dying in Mazar-i-Sharif.

Occupation of S. A. seemed likely to continue, but for various reasons the Brit. Gov. decided to adopt the alternative of backing a new candidate to the throne in the person of Abdurrahman, who pacified and greatly strengthened the country, kept the Russians at arm's length, and maintained friendly relations with Britain. The desired 'buffer' state was thus created. He died in 1901 and was succeeded by his son Habibullah, who was less favourably inclined towards Britain than his father. He was none the less constrained to accord to the British Gov. full control of Afghan foreign relations in exchange for an ann. subsidy of £160,000 and permission to import munitions through India. He faithfully maintained his obligations and preserved Afghan neutrality during the First World War in spite of Ger. blandishments.

The Amir Habibullah Khan was assassinated in 1919. Thereupon his brother Nurullah seized the reins of power, but was deposed by Amanullah, the third son of Habibullah. Amanullah's troops crossed the frontier of India in May 1919, but were speedily repelled by the Brit. troops, who advanced to Dacca, thereby compelling the amir to conclude peace (Aug.), but with a recognition of Afghan

independence. In 1921 a treaty was signed at Kabul by which Great Britain recognised the internal and external independence of A., and A. accepted the then existing frontier between India and A. subject to a slight adjustment near the Khyber. It was also mutually agreed to interchange diplomatic representatives, including consular officers at Delhi, Calcutta, Bombay, and other tns. By the same treaty A. was permitted to import free of duty such war material as might be necessary to her defence. In 1923 a trade convention was concluded, and though there is no exact information of trade statistics, it is estimated that the exports and imports between India and A. are of the average ann. value of not less than £1,000,000. In 1928 King Amanullah and his queen paid a state visit to Europe, visiting Italy, France, Great Britain, and finally the U.S.S.R. Everywhere they were cordially received, and presents showered upon them, mainly with the object of securing concessions in A. and of furthering divers political interests. Amanullah manifested considerable diplomacy in promising much and doing little, his dominant idea being to westernise his kingdom and to give most, no doubt, to the country which should render him the greatest benefit in this direction. He also concluded treaties of goodwill with Turkey and Persia, by which the different signatories agreed to adopt a conciliatory attitude towards each other in the event of disputes. On reaching his own country again, many reforms were put in train. Afghan students were sent to Europe to study modern methods of army administration and military training, political science, and engineering; and a comprehensive programme of public works, embracing railways and telegraphs and an aeroplane service, was planned at enormous expense for so poor a state. But perhaps the most striking reform initiated was the emancipation of women through the zeal of Queen Surayyeh, who, being a woman of Damascus, was not slow to appreciate the backward state of the women of her royal consort's country. European dress was also adopted by the king's council, even to the familiar European bowler hat. Still more ambitious reforms were the decrees of the king for the abolition of titles of nobility and the curtailment of the powers of the religious leaders, together with a bold attempt to introduce cabinet gov. It is not easy to say which of these drastic reforms caused the most unrest among the tribesmen, but the removal of the veil in public and the education of girls soon inflamed public opinion to danger point. The direct cause of the revolt which followed this westernising zeal, however, was the royal order to all tribesmen to become naturalised citizens of A., and under the lead of the Shinwari tribe, supported by the incensed Muslim priesthood, armed rebels were soon mustering for a general attack. The situation in Kabul became so critical, in spite of the initial defeat of the rebels by the king

himself, that all European residents were evacuated by aeroplanes sent out from Brit. India. Amanullah's position grew steadily worse during the autumn of 1928. His cap. was isolated and severe damage done to numerous buildings. He removed his court to Kandahar and, in a despairing effort to save his crown, deemed it advisable to recant his European doctrines by recalling the Afghan students and giving orders to foreign legations to leave the country. But it was too late, and in 1929 he abdicated in favour of his elder brother Inyatullah. But when the new king abdicated in his turn, Amanullah rescinded his abdication. Meanwhile the rebel leader Bacha-i-Saqao, under the name of Habibullah Khan, had usurped control at Kabul. Amanullah met with no better fortune, and in May fled with his wife and brother to Bombay, whence they journeyed to Europe. In Oct. Habibullah, defeated in his turn, fled from Kabul, which fell to Nadir Khan, former war minister under Amanullah, who later was elected king. This monarch was recognised by the Brit. Gov. and his position seemed to be comparatively secure, but he was murdered in 1933, and his son, Zahir Shad, proclaimed king. The new fundamental law, made in Nadir Khan's reign, declared A. to be completely independent, and, under the same law, slavery and forced labour were abolished and education made compulsory. A. was admitted to membership of the League of Nations in 1934, mainly at the instance of Russia and Turkey. In July 1937 A. signed, with Iran, Iraq, and Turkey, a pact of mutual non-aggression (treaty of Saadabad). In 1938 the Afghan Air Force was considerably expanded and work began on the building of military aerodromes at Herat, Kandahar, Mazar-i-Sharif, and Jalalabad. Plans for the industrialisation of the country were developed in 1939 and already cotton and other textile factories have been opened; while efforts are being made to exploit the almost untapped mineral resources of the N. part of the country. In 1946 A. applied for admission to the United Nations and was accepted.

After the transfer of power in India in 1947 a tense situation arose between A. and the new state of Pakistan. The Afghan Gov. declared all former treaties with the British null and void and staked out a claim for a Pathan state which would include Chitral, the NW. Frontier Prov., and the Pathan area of Baluchistan. The Pakistan Gov. rejected this claim, and by the middle of 1956 no agreement had been reached.

Apart from the brief period of anarchy in 1928-9 relations between Great Britain and A. have remained friendly since 1921, when diplomatic representatives were exchanged for the first time. Soviet relations were relatively close during the reign of Amanullah, who enjoyed the favour of the Soviet Gov. Soviet sympathy and reported military support accorded to him in 1928-9 caused some subsequent coolness, but correct relations

have been maintained throughout. A goodwill visit by Soviet leaders in 1955 was followed by a series of agreements on technical aid to be provided by the Soviet Union. A credit agreement was signed in Dec. 1955 under which A. received 100 million dollars.

Africa, one of the 5 continents, belonging to the 'Old World,' connected with Asia by the isthmus of Suez, and separated from Europe by the Mediterranean Sea. The name A. was first given by the Romans to their African provs. with the city of Carthage, and it has since been extended to the whole continent. Both Gk and Rom. writers called this continent Libya, and Herodotus (b. 484 BC) and Ptolemy (fl. AD 139) in their works give us information about this land. Herodotus records that Necho, King of Egypt (610-594 BC), sailed down the Red Sea, and in the third year of his voyage returned to Egypt after passing the Pillars of Hercules (Straits of Gibraltar). In the 7th cent. the Arabs were acquainted with the country S. of the Great Desert, and the Arab geographers, the chief of whom are Edrisi, Ibn Batuta, and John Leo (Leo Africanus), have left records which, though often vague and unsatisfactory, show a more extensive knowledge of A. than that possessed by the Greeks and Romans. In the 15th cent. the Portuguese made discoveries along the NW. coast, reaching between 1467 and 1494 as far S. as Sierra Leone, Fernando Po, Cape St Catherine, and the Congo. In 1487 Bartholomeu Diaz discovered the Cape of Good Hope, or, as he called it, the Cape of Storms; and in 1497 Vasco da Gama discovered the Cape route to India. The Portuguese soon made journeys into the interior, and during the 16th and 17th cents. settled along the E. coast. During the 17th cent. the French sent ships to the R. Gambia, and during the end of the 17th and the beginning of the 18th cent. they opened up the country of the Senegal, estab. trading stations, discovered Bambuk to be rich in gold, and obtained new information about the Niger and Timbuktu. The Dutch, the Danes, and the English then commenced to explore. Mungo Park made journeys in 1795, 1796, and 1805, discovering new land around Timbuktu, and sailing down the Niger. In 1822 Denham and Clapperton set out from Tripoli and reached Lake Chad; Laing and Caillie reached Timbuktu; and Richard Lander reached the

mouth of the Niger in Nov. 1830. About the middle of the 19th cent. expeditions were made to Ethiopia, the Upper Nile valley, and N. A., and about the same time attention was turned to S. A. David Livingstone reached Lake Ngami, 1849, went northwards up the Zambesi, and explored the regions round Lakes Nyasa and Tanganyika from 1859 to 1873. Burton and Speke discovered Lake Tanganyika, 1857, and Speke discovered the S. part of Victoria Nyanza. In 1860 Speke and Grant went up the White Nile and reached Gondokoro, and Baker discovered Albert Nyanza. Barth, Gustav Nachtigal, and Schweinfurth explored E. Sudan from 1850 to 1870. Cameron made discoveries in the Congo basin, and Stanley, after exploring the regions around Lake Tanganyika, arrived at the mouth of the Congo in 1877. Serpa Pinto, Thomson, Johnston, Grenfell, Pogge, Wolf, and Wissmann made many discoveries during the latter part of the 19th cent. in the basins of the Nile and Congo. N. A., especially the dist. between Morocco and Timbuktu, has been explored by Oscar Lenz. Grogan and Sharp traversed A. from the Cape to Cairo in 1901.

BOUNDARIES, SIZE, AND COASTLINE. A. is bounded on the N. by the Mediterranean Sea, on the W. by the Atlantic Ocean, on the S. by the Indian Ocean, and on the E. by the Indian Ocean and the Red Sea. Its greatest length from N. to S. is 5000 m., and its breadth from Cape Verde to Ras Hafun is 4650 m. Its area, including Madagascar and the other adjacent is., is nearly 11,500,000 sq. m., or 3 times that of Europe. The coastline is regular, with no deep seas, bays, or riv. estuaries of any size to afford climatic or commercial advantages; so that in proportion to its size A. has less coastline than any other continent, its total length being about 16,000 m.

ISLANDS. A. has very few is., and they are all small with the exception of Madagascar (228,000 sq. m.) which is one of the largest in the world. In the N. Atlantic are the Madeira Is. (Portuguese), the Canary Is. (Spanish), and Cape Verde Is. (Portuguese). Fernando Po (Spanish), Prince's Is. (Portuguese), St Thomas (Portuguese), and Annabon (Spanish) are 4 volcanic is. in the Gulf of Guinea. St Helena and Ascension (British) are solitary rocks in the Atlantic. On the E. in the Indian Ocean are Madagascar (French), Mauritius (British), Bourbon or Réunion (French), the Seychelles, Amirante, and Aldabra (British), Comoro (French), and Zanzibar (Brit. protectorate); and further N. is Socotra (British) and in the Red Sea are Perim and Dahlak.

SURFACE. The continent is an enormous plateau with terraced tablelands rising one above the other, terminating in the rugged mts of the E., where the Nile and the Congo take their rise. The interior plateau is bordered by mt ranges which run parallel with the coast and descend in terraces to it. The Great Desert or Sahara is shut in between the

Atlas Mts on the N. and the S. Plateau, and the Congo basin occupies the W. part of the peninsula. The S. Plateau is much higher than the N., having an average elevation of nearly 4000 ft.

MOUNTAINS. The mts of A. may be divided into 3 distinct systems: 1, the Atlas, 2, the W. Coast, and 3, the E. Coast. 1. The Atlas Mts occupy the N. portion between the sea and the Sahara, from Wadi Daa to Cape Bon. The E. portion, from 6000 to 8000 ft high, consists of 2 parallel ranges enclosing a plateau where salt lakes called shotts are found. The W. portion, known as the Great Atlas of Morocco, has an average elevation of 10,000 ft, and the highest peaks are over 14,000 ft high. 2. The W. Coast System consists of the Cameroon Mts, between 13,000 and 14,000 ft high, and the highlands of Lower Guinea, known as the Kong Mts. 3. The E. Coast System, which is the most important, consists of: (a) The S. section containing the Drakensberg with Mont-aux-Sources, 11,200 ft; the Randberg with Stritzkop, 7500 ft; and the Neuveld, with Compass Berg, 8000 ft. In Cape Prov. is the enormous plateau called the Great Karroo, great plains the total area of which is probably 100,000 sq. m., with a climate as dry and healthy as any in the world. (b) The section between the Zambesi and Ethiopia, containing the highest peaks in A. and the Great Lakes. Kilimanjaro, 19,500 ft, and Mt Kenya, 18,000 ft, are extinct volcanic peaks. The Livingstone Range, near Lake Nyasa, is 11,000 ft high; the Ruwenzori Range ('Mountains of the Moon'), between Lake Albert and Lake Edward, is from 16,000 to 20,000 ft high; and Mt Mfumbiro, between Lake Albert and Lake Victoria, is 11,000 ft high. (c) The Ethiopian System rises abruptly from the coast and gradually descends, and contains Ras Dashan, 15,000 ft, and Abba Yared, 15,000 ft.

PLAINS AND DESERTS. There are 2 great deserts, the Sahara, the largest desert in the world, in the N., and the Kalahari, a sandy rainless region, in the S. The Libyan and Nubian deserts are really a continuation of the Sahara. It must not be supposed that the Sahara and the Kalahari deserts are mainly extensive areas of sand. Thousands of sq. m. are rocky with scrub which can support small antelopes, ostriches, and camels.

RIVERS AND LAKES. Considering its size, and compared with other continents, A. has but few rivs., and her commercial prosperity has been greatly retarded by the want of navigable rivs. with good harbours. Most rivs. are impeded by cataracts. The most important are the Nile, Congo, Zambesi, and Niger. The Nile is of political, historical, and commercial importance, and its overflow is of vital importance to Egypt. The great lakes connected with the Nile are Victoria, Albert, and Edward. The Congo, which drains an equatorial rainy dist., has a constant water supply, and between Stanley Falls and Stanley Pool the riv. is navigable for 1000 m. Lake Tanganyika

supplies the Congo with a considerable amount of water. The Zambesi is the chief riv. in the E., and though navigable in some parts, its course is impeded by cataracts and rapids. The Victoria Falls, the largest in the world, are situated on this riv. The Niger is of great commercial importance, being navigable almost entirely from its source to its mouth in the Gulf of Guinea. The Orange R. is not useful for navigation, though imaginative schemes have been embarked upon to use

on many peaks in Ethiopia. The sides of the mts are in many cases very fertile, yielding different vegetation according to the height. The prevailing winds are from the NE. and the SE. The NE. winds, having come across Asia, bring no rain to N. A. The SE. winds bring moisture to the coastal dists., but owing to the mts it does not reach the interior, hence the Kalahari Desert. The region of the tropical rains extends from 18° N. lat. to 20° S. lat., where the vegetation is

THE ZAMBESI GORGE, RHODESIA

E.N.A.

The railway bridge, whose central span is 650 ft long, is 310 ft above high-water level. Motor traffic can use the bridge.

the water for irrigation and industrial purposes; but the Limpopo, with its mouth just N. of Delagoa Bay, is navigable for about 60 m. The Senegal, Gambia, and Ogoway flow into the Atlantic on the W., and provide navigable waterways for some distance from their mouths.

CLIMATE. Nearly three-fourths of the total area lies within the tropics, under the vertical rays of the sun, so that there is almost perpetual summer with definite seasons of rain and drought. The variations in the climate are caused by the prevailing winds and height. Ruwenzori and Kenya, almost on the Equator, are covered with perpetual snow for 2000 or 3000 ft downwards from their summits, and there is also perpetual snow

luxuriant and the soil productive except in the swamps near the coast.

PRODUCTIONS. The vegetation varies in different parts according to the climate and soil. In the regions bordering on the Mediterranean the olive, fig, orange, and vine are found. In the Sahara the date palm grows in the oases; but the vegetation of this dist. is very scanty. In the Lower Nile valley—the fertility of the soil of which depends on the overflow of the Nile—cotton, wheat, flax, rice, and maize are produced. The Sudan is a pastoral and agric. region. Cattle are reared, and cotton, durra, and maize are cultivated. In the W. dists. bordering on the coasts, and especially in Senegal and Gambia, the palm is found and palm oil is the chief article of export.

The W. equatorial regions consist of dense forest with thick undergrowth, and here the chief productions are palm oil, cocoa, a variety of timber, rubber, and bananas. The chief product of Ethiopia is coffee. The E. plateau produces millet, and the savannahs provide good pasture land. In the S. sheep, goats, and cattle are reared; wool, skins, and meat being exported; and the vine, maize, sugar, and tobacco are cultivated. Of the mineral products, the most important are gold, uranium, diamonds, and platinum; in the production of each the Union of S. Africa leads the world. There are vast quantities of coal, iron, copper, manganese, and asbestos. The occurrences of all these minerals are widespread, but it should be noted that copper is found in abundance in N. Rhodesia and in the Belgian Congo; asbestos in S. Africa and S. Rhodesia; cobalt in N. Rhodesia and the Belgian Congo; gold in S. Africa, S. Rhodesia, the Congo, and to a lesser extent in Ghana, Tanganyika, and Kenya. Ethiopia has gold, platinum, and other precious and base metals, but these have not been exploited in the modern sense. Tin is found in Nigeria, Uganda, and to some extent in Swaziland. There are other occurrences but they do not seem to be important. Diamonds are found in quantities in Sierra Leone, Tanganyika, and Ghana, in addition to S. and SW. A.

FAUNA. The fauna of A. is remarkable. The lion, hippopotamus, elephant, rhinoceros, leopard, hyena, buffalo, and giraffe are common. The crocodile is found in large rivers, and the monkey and baboon are found all over the continent. The zebra and the antelope are equally common; the camel frequents the N. deserts and is also used in the Kalahari. The ostrich is found in both deserts, and has become of commercial value on account of its skin, feathers, and meat which is converted to biltong. Birds, reptiles, and insects abound in great varieties.

RACES AND POPULATION. The pop. is estimated at 150,000,000, but is probably larger. Generally speaking the continent is sparsely populated on account of its great deserts, forest swamps, and arid and semi-arid areas. The most thickly populated areas are the Nile delta, the Lower Nile valley, and the basins of the Congo and Niger. There are pockets in Kenya and Uganda, for instance, that are densely populated; but the S. and extreme N. are not so thickly populated. In this continent are found many branches of the human race: (1) European settlers include Dutch, Portuguese, English, French, Spanish, Italians, Germans, and Turks, who estab. themselves in the extreme N. and S. (2) Asiatic settlers include Hamites, Semites, and Hindus. The Hamites from Arabia settled in Egypt, Nubia, and Libya, but have migrated towards both E. and W. The Semites, also from SW. Asia, followed the Hamites and settled in the Mediterranean coastal dists., the W. Sahara, and the Tibbus in the E. of the Sahara. There are many and distinct indications

of Semitic influence and culture as far S. as Ethiopia. Further N. their descendants are known as Berbers. Hindus are found chiefly in Natal, S. Africa, Kenya, and Tanganyika. The heavy influx of Indians continues. (3) The original natives consist of Negroes, Hottentots, Bushmen (qq.v.), and sev. dwarf tribes. The Negroes are denizens of the forest belts and areas stretching from Senegal to the Niger delta. They migrated over a period of cents. E. and then S., being partially absorbed on their way by indigenous tribes and other invaders from the N. through Ethiopia and Somaliland. The Bantu (q.v.) inhabit S. A. Bantu is a generic term applied to those who have a linguistic affinity. They have a strong infusion of Negro blood, and the most important tribe is the Zulu. Offshoots are found in the Rhodesias, i.e. the Matabele and the Mashona. The Hottentots originally inhabited the SW. coastal dists., and were a nomadic cattle-rearing people. They are light skinned, with high cheekbones, giving them an almost Asiatic appearance. The Bushmen are found in the Kalahari. The inhab. of Madagascar, the Malagasy, are not an African stock, but a branch of the Malay family.

RELIGION. Mohammedanism is the religion of the Hamites and Semites. Christianity prevails in parts of Upper Egypt and Ethiopia, and has been introduced into many parts by the Europeans. Many of the natives throughout A. S. of the Sahara are fetish worshippers and animists, and the vast majority believe in witchcraft in some form or another.

SOCIAL CONDITIONS. It is impossible to generalise. Where grazing is good the natives are pastoralists; but in areas which are semi-arid and where agriculture is impossible, e.g. the greater part of the Somalilands, the natives are also pastoralists and live by their cattle, goats, and camels. In areas such as Ethiopia and Kenya the natives are both pastoralists and agriculturalists according to the nature of the country they inhabit. In areas occupied by Europeans, such as the S., every form of agriculture and animal breeding is carried on, and industrial life thrives, ranging from basic mining to highly developed secondary industry. In other parts, such as Kenya, farming is the main occupation; and again, much depends upon the climate and size of the pop., which determines whether secondary industries are developed. In most parts of A. where European influence is no more than local, primitive conditions persist.

POLITICAL DIVISIONS. Almost the whole of the continent has come under European domination at one time or another. But there are now sev. independent states. Ethiopia was only under European domination for a few years following the It. invasion. Liberia was created a rep. and has remained so. The Sudan is now a rep., and Morocco and Libya are independent states. Somalia, ex-It. Somaliland, has been guaranteed independence by 1960.

French. Algeria, a large part of the Sahara and the Sudan, Tunis, Fr. Guinea, Senegal, the Ivory Coast, Dahomey, Wadai, Fr. Congo, Fr. Somaliland, Madagascar with the Comoro Is. and Bourbon or Réunion Is. belong to the French. The Fr. Cameroons are a trusteeship ter. under the U.N. Following the independence of Ghana, the French have indicated that Togoland will be assisted to the status of an independent state within the Fr. political orbit. Area 3,619,641 sq. m.; pop. (estimated) 5,000,000.

British. The Union of S. A., a dominion; 3 High Commission ters. with slightly differing constitutional relationships varying between colony and protectorate, i.e. Swaziland, Basutoland, and Bechuanaland; the Federation of Rhodesia and Nyasaland, consisting of the protectorates of N. Rhodesia and Nyasaland and S. Rhodesia, which virtually has dominion status. On the E. coast there is Kenya colony and protectorate, Uganda protectorate, and Tanganyika under Brit. administration (a trusteeship ter.). Brit. Somaliland is a protectorate. On the W. coast there is the Federation of Nigeria with which is incorporated the trusteeship ter. of the Cameroons; Ghana, a dominion, Gambia, and Sierra Leone. There are also the small is. of Mauritius, Ascension, St. Helena, Seychelles, Socotra, Zanzibar (a protectorate), and sev. others along the E. coast. Area 4,652,000 sq. m.; pop. (estimated) 73,000,000.

Egyptian. Area 383,000 sq. m.; pop. (1954) 22,500,000.

Portuguese. Madeira Is., Cape Verde Is., Portuguese Guinea, Portuguese W. A. (including Angola), and Portuguese E. A., i.e. Mozambique. Area 794,294 sq. m.; pop. 10,595,850.

Spanish. Sp. Sahara, i.e. Rio de Oro and Sekia el Hamra. Area (estimated) 105,409 sq. m., pop. 13,627, exclusive of 31,000 nomads. Sp. Guinea, including the is. of Fernando Po, Elobey, and Annabon. Area 10,582 sq. m.; pop. (1950) 214,271.

German. Under the treaty of Versailles, Germany relinquished all her colonies in A.

Italian. Following the It. surrender at Gondar, Italy lost her possessions in E. A. Eritrea was absorbed by Ethiopia, and is now a part of the Federation of Ethiopia, and It. Somaliland (Somalia) is now a trusteeship ter. In 1950 the U.N. passed a resolution by which Somalia obtains complete autonomy in 1960.

Belgian. The Congo (q.v.) and Ruanda-Urundi are held under trusteeship. Total area 923,590 sq. m.; pop. 13,000,000.

ANTHROPOLOGY. In the field of pure anthropology the most significant events of recent years have been the finding of a quantity of fossil and animal bones, and the skull and remains of an extinct type of man which was named the *Homo rhodesiensis*, or Rhodesian man, in a deep cave at Broken Hill, N. Rhodesia. The

Rhodesian man is closely related to the Neanderthal man in Asia and Europe. In 1913 a human skeleton was found at Oldanay in N. Tanganyika, which resembled that of a Negro-Hamitic skeleton unearthed by Dr L. S. B. Leakey at Lake Elmenteita, Kenya.

Social Anthropology. Researches in African social organisation have been steadily pursued in recent years, and the work of social anthropologists has added greatly to our information. Such occurrences as the Mau Mau insurrection in Kenya, for instance, provided an urgent stimulus to the study of Kikuyu tribal law and custom, for sev. reasons apart from the desire to ascertain facts regarding traditional views on land tenure. One of the 'weapons' for countering the great strength of the witch doctors, who administered binding oaths on the adherents of Mau Mau, was the administration of other oaths which were supposed to release the oath-taker from his obligations. In such tactics a better knowledge of beliefs and customs was necessary. Again, in 1957, the S. African Gov. introduced legislation to try to curb the practise of witchcraft. But in Basutoland medicine murders persist, and in W. A. human sacrifices, or ritual murder, have not yet been eradicated. Witchcraft and ju-ju (q.v.) are still general. Sorcerers are credited with being able to change themselves into animals; and though there are special laws and punishments for sorcery, witchcraft is recognised as being too deep-rooted in the African social organisation to justify a policy aimed at extirpation, regardless of the consequences to that organisation (see F. H. Melland, *In Witch-bound Africa*, 1923). In recent years there have been serious outbreaks of ritual murder in the Brit. Cameroons by Leopard Men—a secret society associated with ju-ju, whose activities led to mass intimidation. Their method of killing and subsequent extraction from the corpse of various organs showed a remarkable degree of surgical skill.

In any serious consideration of political or social problems in A., S. of the Sahara, including political and economic development, the latent power of the witch doctor over the unsophisticated African should always be borne in mind. For instance, in the organised boycott of the bus services in Johannesburg, in the early part of 1957, intimidation played an important part in maintaining the adamant attitude of the boycotters. In Ghana, just before the Second World War, there was an organised boycotting of the purchase of European foods; and cocoa was burnt by the growers, who refused to sell it at a price which they considered unfair. The Parl. Commission of Inquiry (Cmd. 5845, 1938) pub. a considerable amount of evidence showing that the boycotters were intimidated by threats of supernatural sanctions if they sold this cocoa. The boycott was extremely effective. In organised riots in Port Elizabeth, E. London, and Kimberley, S. A., in Oct.-Nov. 1952, the

power of the witch doctors was again in evidence. Communist inspired, the rioters were not content with looting and destruction of European and Indian property, but also killed. Among the victims was Dr Elsie Quinlan, a nun. She was burnt alive and parts of her body eaten by rioters. Two men and 2 women were subsequently sentenced to 6 months' hard labour for cannibalism (see gov. reports and H. Maclear Bate, *South Africa without Prejudice*, 1956). Mr Arundel Gray Leakey was buried alive by Kikuyu adherents of Mau Mau in Kenya, in furtherance of the demands of the witch doctors. Dr G. I. Jones, Ph.D., completed a report (1950) for the Colonial Office, dealing with one aspect of witchcraft—i.e. medicine murders in Basutoland. There is a great deal of evidence that W. civilisation has done little more than lend a veneer to the indigenous African as a whole. The momentous Tomlinson Report stresses the urgent need and desirability of further Christianisation, and stresses that no other influences for the general good of the people have proved so efficacious in the past or are likely to prove so beneficial in the future. Where the pop. is predominantly Muslim, as in N. Nigeria, the influence of the witch doctors is relatively negligible, although orthodoxy is not generally adhered to. It follows that anthropologists have a tremendous scope for objective and constructive work in many parts of A.

COMMUNICATIONS. The inland communications were very defective before the First World War. Except in the S. and in Egypt there were but few railways; and considering its size A. has but a small amount of navigable waterway. Inland communication is, therefore, carried on to a great extent by means of caravans. Camels are used in the N. and oxen in the S. as beasts of burden. Caravan routes cross the Sahara, the 2 chief being the E. caravan route from Tripoli to Lake Chad, and the W. caravan route from Tafflet in Morocco to Timbuktu. For sev. months in the year there is a weekly bus service from Kano, in N. Nigeria, to Algiers. Thus there is regular communication between the ports of the Niger and Lake Chad and the ports on the Mediterranean. With the help of a few railways and roads, there is natural water communication by riv. and by lake from the mouth of the Nile to the mouth of the Zambesi. The R. Niger and its trib., the Benue, are important means of communication between the Sudan, Nigeria, and the Gulf of Guinea, being navigable for large riv. steamers. The Congo brings the produce of the Belgian Congo to the Atlantic coast; and the Zambesi is navigable for a considerable part of its course, except where rapids and cataracts occur.

Railways. There had long been a project for a railway from the Cape to Cairo, which was to have run as far as possible through Brit. ter. This was a cherished dream of Cecil Rhodes (q.v.). It was, however, politically and physically

impossible. From the N. a railway has been constructed from Cairo along the Nile valley through Aswan, Dendur, Korosko, Wady Halfa, Abu Hamed, Berber, Shendi, to some distance beyond Khartoum. From the S. it has been constructed from Cape Town through to the Federation of Rhodesia and Nyasaland in the N.—with connections to Beira and Lourenço Marques on the E. and to Walvis Bay on the W. coasts. In Kenya a line runs from Mombasa through to Uganda, a distance of just over 1000 m.

Railroad construction has proceeded rapidly since the pioneer work of Cecil Rhodes. Of other than Brit. railways the most important completed work prior to the First World War was the Ger. trunk line from Dar-es-Salaam to Lake Tanganyika (800 m.), opened in 1914. Fr. railroads were not increased to any great extent, but in 1915 a line was completed from the Red Sea coast to the heart of Ethiopia. At Lobito Bay in Portuguese W. A. the Benguela railway has its terminus, a useful line giving the Katanga dist. of the Belgian Congo an outlet to the W. The commercial mind has begun to appreciate that the more practical route is across the continent from E. to W. With the completion of the railway from the Upper Congo at Kabalo to Albertville, on Lake Tanganyika, the first transcontinental combined rail and boat route was an accomplished fact. There is also E. and W. rail communication, though less direct, between Walvis Bay and Lourenço Marques, a 20-m. connection linking up the S. African Union and the SW. African railway systems. In S. A. in 1918 the line from Cape Town via Bulawayo and the Victoria Falls was extended to Bukama on the Luabala R. (Belgian Congo). In the colonies new Brit. railways are opening up and connecting the interior with the coast, though not for any great distance; there are now lines feeding the coal- and tin-mining dists. of Nigeria, a local line from Tabora, on Lake Tanganyika, which is projected to a terminus on Lake Victoria, and an extension of the Uganda railway has been in process of construction since 1921.

Road construction proceeds apace, especially in the Brit. W. African colonies, Uganda, and the Belgian Congo. Telegraphic communication in the course of the last few decades has been considerably extended, and the impulse given to wireless telegraphy by the First World War naturally had its effect in A., where modern high-power wireless stations were installed in E. A., SW. A., W. A., Algiers, etc., before the Second World War.

COMMERCE. The Portuguese were the first Europeans to trade with A., and they had commercial relations with Upper and Lower Guinea; but the Dutch were the first to settle in the S. Here Huguonots came in the 17th cent., but it was not until the end of the 19th cent. that trading relations began to exist between Europe and the interior, when British, Germans, French, Spanish, and Italians

began to settle in A. There is a local traffic between France and Algiers, but otherwise most of the ocean maritime trade of A. is in the hands of the British.

See AFRICA, SOUTH-WEST; ALGERIA; ANGOLA; ASCENSION; BASUTOLAND; BECHUANALAND; BRITISH SOMALILAND; CAMEROONS; CONGO, BELGIAN; EGYPT; ETHIOPIA; FRENCH EQUATORIAL AFRICA; FRENCH GUINEA; GAMBIA; GHANA; IVORY COAST; KENYA; LIBERIA; LIBYA; MADAGASCAR; MADEIRA; MAURITIUS; MOZAMBIQUE; NIGERIA; NUBIA; PORTUGUESE GUINEA; RHODESIA AND NYASALAND, FEDERATION OF; RUANDA-URUNDI; ST HELENA; SAHARA; SENEGAL; SEYCHELLES; SOCOTRA; SOMALILAND, FRENCH; SOMALILAND, ITALIAN; SOUTH AFRICA, UNION OF; SPANISH GUINEA; SWAZILAND; TANGANYIKA; TOGOLAND; TUNISIA; UGANDA; ZANZIBAR; also NEGROES and separate articles on native races.

Africa, German East, First World War. Campaign in. The conquest by the allied forces of this Ger. colony was virtually completed on 27 Nov. 1917, when the Mahenge Force under Col. Tafel, comprising 3500 officers and other ranks, surrendered to Gen. Van Deventer. The residue of the Ger. forces then took refuge in the adjoining Portuguese ter., but were gradually rounded up in the course of the next few months. In pre-1939 area Ger. E. A. was twice the size of Germany, and its conquest by the E. African Field Force under Gen. Smuts and Gen. Van Deventer after a campaign of some 20 months was a triumph of determination and resourcefulness over most difficult conditions. The country was one of almost impenetrable bushlands and desert, abounding in pestilential swamps, and crossed by mt ranges. From the nature of the terrain the difficulties in maintaining supplies were serious, the absence of roads and water in the greater part of the country making the support and transport of large armies, marching ever further from their bases, an extremely harassing undertaking. In a measure these difficulties were common to both antagonists; but the Ger. forces were not only more familiar with the country and consequently in a position to baffle pursuit for a considerable time, but in their retreat over a distance of not less than 1000 m. were approaching ever nearer to their supply bases and food depots. Finally the bulk of the Ger. forces were Negroes, hardened against diseases incidental to the climate and country, while the Allies, who were for ever groping blindly in the bushland after an indigenous and elusive foe, specially trained to the peculiar conditions of African bush warfare, comprised men from the temperate regions of S. Africa, Indian troops from the hills, and troops from the U.K.

The first stage of the campaign, from Aug. 1914 to Mar. 1916, when Gen. Smuts arrived, was the longest and most arduous of all, for the allied troops, being very few in numbers, were always in peril. Not only were they set the task of defending a frontier line of some 600 m., but the military situation was one of ever-increasing anxiety, as on every sector the Ger. forces were in occupation of Brit. ter., the opening attack on the enemy from the sea at Tanga having proved a more or less complete failure. The Ger. forces had between them and Mombasa no force other than a few Arabs under their picturesque chief Wavel (q.v.), while their outpost at Taveta was a direct menace to the Uganda railway, and their garrison at Longido threatened Nairobi, the cap. of Brit. E. A. This stage was

characterised throughout by sporadic fighting, chiefly in the Tsayo region and in the neighbourhood of the Longido line and Ngururhan. At the close of these operations Gen. Sir Michael Tighe, who had taken over the supreme command, made preparations for a general offensive, constructing a new railroad from Voi so as to link up Mombasa with the Ger. N. frontier. At the same time he ran a pipeline from the well-watered hilly districts of Bura to the desert around Maktan. The first battle was fought at Salaita Hill, where the Ger. forces were strongly posted, but the issue was indecisive. In the early part of 1916, when the enemy's forces numbered about 2700 Europeans and 12,000 natives, Gen. Smuts opened the second stage of the campaign with a brilliant attack near Taveta on the one vulnerable point in the enemy's mt line. This action marked the turn of the tide, for Gen. Van Deventer, the rains having set in, sent patrols as far into the enemy's country as Kondo Irangi. So far, however, the E. ter. had not been touched, and it was necessary to drive Kraut's army from the Pangani valley, so as to advance on the Central railway. This was done, but Kraut's force escaped, and it was only after the lapse of 2 months that Deventer was in a position, having reorganised his riv. transport, to advance on the railway. Gen. Smuts meanwhile forcing the passage of the Wami and isolating the chief tn of the colony, Dar-es-Salaam. Following on this success, Gen. Smuts overwhelmed the defensive system of the Uluguru Hills, driving the enemy as far S. as the Rufigi R., in the neighbourhood of which they took refuge during the rainy season. The third stage opened with the problem of dislodging the enemy from the valley of the Rufigi, a task which was accomplished by the S. African Infantry, while at the same time troops landed at Kilwa and elsewhere to drive the enemy from the coastal regions. Then followed a long and very disheartening period of campaigning through dearth of food, almost insurmountable transport difficulties, and the ravages of malaria. About this time Lt.-Gen. Sir J. L. Van Deventer became commander-in-chief in E. A., and thereafter conducted the campaign to its conclusion. By the end of Aug. 1918 the enemy had been repulsed with considerable loss at Lioma and barely escaped from converging attacks E. of that tn. The Ger. commander, Lettow Vorbeck, after the most stubborn fighting in the whole campaign—in the Lindi and Kilwa dists. in the latter part of 1917—had retired across the Rovuma into Portuguese E. A. with some few hundred white troops and about 2500 native troops. The Ger. force having made for the Songea area, Gen. Hawthorn was detailed to get troops there ahead of the enemy. The Ger. commander, who was now at New Utengule, marched further S., despite the vast and impassable swamps of Lake Rukwa, apparently with the object of attacking N.E. Rhodesia, in the hope of obtaining food and supplies.

Early in Nov. the enemy attacked Fife (which stands midway, near the frontier, between Lakes Tanganyika and Nyasa) in force, but was beaten off with loss by the N. Rhodesian Police. Hotly pursued from the N. by the 1st/4th King's African Rifles, he retreated towards Kayambi Mission, reaching Kasama on 8 Nov., Ger. E. A. being thus once more clear of the enemy. The next engagement of the campaign was fought near Kavembe, the 1st/4th King's African Rifles having caught up with half the enemy force at that place. After a stiff engagement the enemy was driven from his position, but all further operations stopped shortly afterwards owing to the news of the signing of the armistice. The last engagement was actually fought on 12 Nov. N. of Kasama, the interruption of the telegraph communications preventing Gen. Van Deventer from getting into touch with the Ger. commander before that date. On the morning of 14 Nov. the Brit. terms, based on Clause 17 of the armistice, were handed to Gen. von Lettow Vorbeck, in accordance with which the latter formally surrendered at Abercorn on 25 Nov. Under Article 119 of the peace treaty Germany, having renounced her overseas possessions, lost Ger. E. A., which was thereafter administered by Britain as mandatory. See also TANGANYIKA TERRITORY. See Francis Brett Young, *Marching on Tanga*, 1918.

Africa, North, Second World War, Campaigns in.

Battle of the western desert (Dec. 1940–Feb. 1941). This battle, resulting in the conquest of Cyrenaica by the Brit. Army of the Nile, began on 9 Dec. 1940, and reached the end of its first stage the following Feb. It was a spectacular achievement of desert warfare, alike in the scientific organisation of the supply services, in its brilliant strategic conception, in the speed and skill of the tactical manoeuvring, and in the remarkable disparity of the casualties sustained by the opposed forces. Five months previously, when, with France prostrate and her Syrian army immobilised, Italy had declared war on Britain and her allies, the threat to Egypt from Italy's army of 250,000 men seemed ominous indeed. The dramatic suddenness of Gen. Sir Archibald (later Viscount) Wavell's successful onslaught on Sidi Barrani, which opened the Brit. offensive, and the rapidity with which the Brit. Army of the Nile captured one stronghold after another until the whole prov., twice the size of Italy, had fallen into their hands, went far to restore Brit. prestige, besides spelling the doom of Italy in the whole war. As early as July, after Graziani (q.v.) had taken over the Libyan command from the deceased Balbo (q.v.), there had been patrol encounters at Fort Capuzzo, and air-raids on the aerodromes of El Adem and El Gubbi, on shipping in the Lt. naval base of Tobruk, and on troop concentrations on the Libyan-Egyptian frontier. Graziani crossed the frontier at Sollum on 13 Sept., drove back

the Brit. forces at Buq Buq, and reached Sidi Barrani on 16 Sept. in pursuance of the plan to strike in the Near E. at the same time that the Germans struck in the W. But the It. offensive was cautious and unimaginative, assuming almost the character of a defensive operation. Instead of boldly advancing, Graziani halted and wasted time on the preparation of a series of powerful perimeter camps. In Nov. the R.A.F. did considerable damage to It. aerodromes in Cyrenaica—an essential preliminary to the advance intended by Wavell. But at this moment Italy invaded Greece and the Brit. Gov. had to send a considerable part of the R.A.F. from Egypt to aid the Gk Army. The projected offensive was therefore delayed some weeks, until land and air reinforcements arrived, which included Australian troops.

The Brit. offensive began in early Dec. with an air attack on the It. camp at Nibeiwa, 15 m. S. of Sidi Barrani, all the It. aerodromes from Derna to Sidi Barrani having been previously so heavily bombed that Italy's total air strength in N. A. was already seriously crippled. Simultaneously with the attack on Nibeiwa, the R.N. bombarded the It. positions at Sidi Barrani and Maktila. The assault on Sidi Barrani was unique in its success. Almost at a single leap, across 75 m. of desert from Mersa Matruh, a strong detachment of Brit. and Australian troops advanced on positions which the Italians had fortified 3 months earlier, and entered the tn. At the cost of only 400 casualties the position fell to Gen. Wilson, together with 38,000 prisoners and stores of all kinds. A few days later Sollum, Fort Capuzzo, and Sidi Omar were captured and the threat to Egypt had gone. Bardia, Tobruk, Derna, Cyrene, and Benghazi all fell in rapid succession, the Italians never having recovered from the initial shock, and by late Feb. Cyrenaica had been entirely conquered and placed under Wilson as military governor. Some two-thirds of Graziani's army had been captured or destroyed, and the remainder hurried into headlong flight to Tripoli. Within 2 months the Army of the Nile had thrown back the Italians from firmly entrenched positions 130 m. inside Egyptian ter. and advanced over 500 m., with steadily lengthening lines of communication, in country practically devoid of good roads, water, and food, and subject to blinding sandstorms. Altogether over 120,000 prisoners were taken. Brit. casualties were less than 2000 in the whole of the operations.

The assault on Sidi Barrani was the crucial action of the campaign. The 4 great It. forts or perimeter camps there each measured about 2 m. in circumference, and they were defended by a ditch, a wall, barbed wire, anti-tank guns, and machine guns. The Brit. heavy tanks moved forward under a barrage and passed right round to the rear of the forts. Broadly, the heavy tanks were used for assault all through the campaign, the light tanks to carry out reconnaissance

and to isolate each successive It. stronghold; and, when the bigger tanks and the infantry saw success assured, the light tanks pushed on to the next objective.

The struggle for Libya: defence of Tobruk. After the conquest of Cyrenaica by Wavell the centre of military gravity shifted to the Balkans and Wavell's Army of the Nile was called upon to supply an expeditionary force for Greece. This depletion of the Nile Army was probably politically necessary: but it foredoomed the Brit. forces left in Cyrenaica. For while Tripoli remained in the hands of the Italians the road to Benghazi lay open to Ger. forces, provided these could be landed unobtrusively further W. and assembled for a determined surprise assault on Benghazi. Ger. armoured formations of first-rate quality were, in fact, landed in N. A. and formed the spearhead of an intended attack on Egypt from the W., to be co-ordinated with indirect attack from the E. through revolt in Iraq. Rashid Ali's *coup d'état* and the Ger. plan to seize Syria utterly failed, however, through the prompt action of the Brit. military commanders, and this in spite of the Ger. success in Greece and Crete. (See IRAQ AND SYRIA.) The Germans under Rommel (q.v.) first made their appearance up the E. coast of the Gulf of Sidra late in Mar., and the real strength of their force was cleverly concealed from the Brit. garrison in Cyrenaica until the road to Benghazi had been overrun. The Brit. garrison withdrew and in a few days the Ger. mechanised troops had captured Cyrene, Benghazi, Derna, and Bomba. By the end of April the enemy was standing about 5 m. across the Egyptian frontier, harassed by light forces of the Brit. armoured units. Tobruk, now isolated, remained in Brit. hands. In all, 4 Ger. mechanised columns were engaged, and in spite of the great length and the exposed nature of his lines of communication, the enemy succeeded in bringing up tanks and heavy motor vehicles.

The defence of besieged Tobruk was a veritable epic in Brit. military annals. The siege was, in fact, a deliberate piece of Brit. strategy invited by Wavell to halt the Ger. movement on Egypt. It changed the face of the campaign by becoming a nodal point of defence obstructing the enemy's lines of communication, and compelling him to maintain a large investing force at Tobruk which could not operate on Egypt. For months the small Eng. and Australian garrison, numbered in hundreds only, defied the armoured power and constant bombing of Rommel's troops.

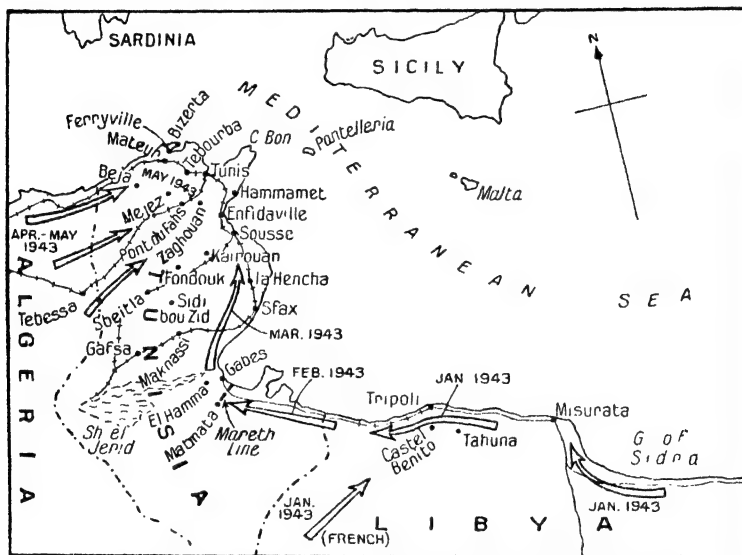

Frequent bold sorties by Brit. patrols were the feature of the next few months. Armoured forces, supported by mobile artillery, inflicted casualties on the enemy almost daily. The growing strength of the Army of the Nile rendered these tactics increasingly effective. By early Sept. the Commonwealth land and air forces standing between the Axis army and the Suez Canal were far more powerful than they had ever been since the war began. These forces included Brit.,

Indian, S. African, Australian, and New Zealand troops, many of whom had already been toughened in hard campaigns. With Axis forces blocked on a line stretching roughly due S. from Sollum the desert was now held by an army and an air force greatly outnumbering those which forced their way to Benghazi in the original Libyan campaign of the autumn of 1940. In July 1941 Auchinleck (q.v.) replaced Wavell.

Throughout this period Brit. submarines, destroyers, and bombers wrought

The It. Ariete Div. was in reserve at Bir el Gobi, some 80 m. SE. of Tobruk. The enemy's main infantry force was strung round the Tobruk garrison.

Second British offensive (Nov. 1941); battle of Sidi Rezegh. The second Brit. Libyan offensive began on 17 Nov. 1941, when Auchinleck opened the attack by the newly constituted Eighth Army under Gen. Cunningham, the conqueror of It. E. A. The Brit. plan was to strike right across the desert with their armoured forces by cutting in between the Ger.

THE NORTH AFRICAN CAMPAIGN: ALGERIA, TUNISIA, AND LIBYA

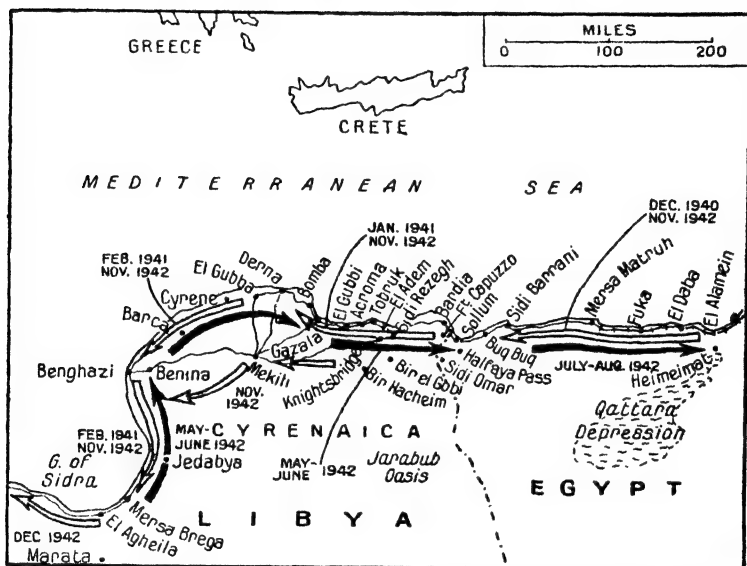

havoc among Axis supply ships, and on buildings, wharves, and moles at Tripoli, Benghazi, and other tus on the N. African coast. It was always evident that each side was now manoeuvring for an attack as soon as climatic conditions permitted. When at length the Brit. did launch their offensive, it was motivated partly by the policy of diverting pressure from the Russian armies defending the Caucasus. And when the offensive was begun Rommel was making his final preparations to reduce the indomitable Tobruk garrison, which had held out for more than 7 months. Rommel's forces, continually reinforced from Italy and Greece, now consisted of 3 armoured divs., the 15th and 21st Panzer and the 132nd Ariete (It.) Divs., and, in addition, a Ger. infantry div. (motorised) and 4 other motorised It. divs. The main Ger. armoured force was SE. of Tobruk, with another panzer div. on the coast some way to the E. of the tn.

tanks around Tobruk and the It. tanks at Bir el Gobi and leaving the strong frontier garrisons behind to be attended to first by mobile infantry and then, later, when the main objective should have been attained, to be reduced at will. The Eighth Army (or Army of the W. Desert) took up its preliminary stations on a broad front from the Jarabub oasis. The attack was launched at nightfall on 17 Nov., and at dawn on the next day the general advance began. As was to be expected, there could be no strategic surprise as in Wavell's victory, for each army fully expected an attack by the other at any time. Moreover enemy aeroplanes were active and the movement of troops in the desert even in ordinary times was difficult to hide. Auchinleck struck at the flank—bearing in mind that the coastal sector had been elaborately fortified by the Germans and Italians—but far to the S. of the point where

Wavell's blow had fallen. In 36 hours Gen. Cunningham's army had advanced 75 m., and very soon its foremost elements had captured the important stronghold of Sidi Rezegh, on the escarpment 10 m. SE. of the perimeter defences of Tobruk. Within the first 5 days New Zealand troops had taken Bardia and Fort Capuzzo, while Indian troops seized Sidi Omar Nuovo. But the hub of operations was the encounter between Brit. and Ger. armoured forces about Sidi Rezegh, SE. of Tobruk, an area of about 40 sq. m.

concentrated round Sidi Rezegh, where the fighting grew hourly more intense and more furious.

For sheer heroism there can have been little in this or any war to surpass that of those Brit. tank crews who, with lighter guns and thinner armour, stood up to and fought off time and again the massive Ger. medium tanks, armed with a gun twice the size of theirs. The attempt to contain the Ger. tanks within the area Sollum-Sidi Omar-Tobruk meant dividing up the Brit. armoured forces,

LIBYA AND EGYPT. ALLIED MOVEMENTS, WHITE ARROWS; AXIS, BLACK

A rough outline of the battle as a whole as it had shaped between 18 Nov. and 23 Nov. shows that when the order to advance was given Indian formations, which were stationed at the coastal end of the line, crossed the frontier and got behind the enemy forts there. New Zealanders, a little farther down the line, performed a similar operation, and went round Fort Capuzzo. Armoured divs., which were farther to the S., went straight ahead and then wheeled towards the coast, holding the Ger. armoured divs., which at the time were operating between Sollum and Tobruk. The tanks met the enemy on the coastal plain round about Sidi Rezegh. The enemy was completely surprised and, from that moment, strenuous efforts were made to prevent him from recovering from this initial blow. The great tank battle of 21-2 Nov. was bloody, but inconclusive. Throughout 22-3 Nov. action was

whereas the Germans could concentrate theirs upon 1 brigade at a time. Rommel's 2 armoured divs. were SE. of Tobruk and SW. of Bardia. Seeing the dispositions of the Brit. forces he moved the larger part of the div. near Tobruk to join that near Bardia, and from the morning of the third day of the offensive this formidable combined div. of light and heavy cruiser tanks was attacking and trying to knock out the Brit. tank brigades 1 at a time. Heavy bombing attacks on enemy tanks and armoured vehicles in the desert were constantly delivered by the R.A.F., and in the first 6 days of the offensive the R.A.F. destroyed 120 Axis aircraft. A bold diversionary raid made by a Ger. tank column towards the Egyptian frontier through one of the gaps inevitable in the long Brit. 'line' penetrated eastwards, crossed the frontier, and reached a point half way between Sidi Omar and Halfaya. Then it was met by Brit.

aircraft and later by ground forces, which destroyed a third of the enemy tanks. On the following days elements of the main Brit. forces joined detachments advancing from long-beleaguered Tobruk. All through there was the most bitter fighting for Sidi Rezegh, the focal point of the tank battles.

Rommel's German Afrika Korps. By the end of Nov. the battle had resolved itself into 3 main areas, but, as at the beginning, the main and by far the most important front was the tank-strewn area round Sidi Rezegh. Ger. armoured forces and motorised infantry penetrated the Brit. positions on 1 Dec., only to be thrown out again after extremely bitter fighting. The It. Ariete Div., after losing half its remaining tanks in a violent action E. of Sidi Rezegh, fled northwards with Brit. forces in hot pursuit. Brit. bomber and fighter aircraft always retained mastery of the air. It was found, however, that in the 1600 sq. m. of desert over which fighting raged, the air arm was robbed of a great part of the importance it had attained in a land of roads, railways, and large tus; for tanks in the open proved that they could not then be dominated by the air arm. Only armoured aircraft carrying quick-firing cannon were likely to reassert the authority of air fleets over land fleets. It may here be pointed out that the Germans had been specially trained as colonial troops. In Mar. 1941 the Ger. counter-offensive in Cyrenaica had been undertaken mainly by the specially trained Ger. Afrika Korps (q.v.), not an improvised organisation but the product of large-scale work by certain depts of the Ger. general staff. It was Afrika Korps troops that had made their dramatic appearance at El Agheila on the Gulf of Sirte in Libya late in Mar. 1941.

Siege of Tobruk lifted. During the intense tank battle at the end of Nov. in the area about Sidi Rezegh and Bir el Hamed, where the Germans made a desperate effort to break westwards through the Brit. and New Zealand troops, Gen. von Ravenstein, commanding the 21st Armoured Div., together with 610 other Ger. officers and men, was captured. Meanwhile Brit. mechanised patrols had reached the coast S. of Benghazi; while in the S., at Jalo, another force was preparing to strike N.-westward to the coast. Rommel now threw all his remaining armoured forces into the fighting round Sidi Rezegh, and succeeded in breaking through the Brit. corridor, and again cutting off Tobruk. At this juncture both sides paused to refuel but the battle was soon rejoined, and Rommel was again defeated near El Gobi and the Tobruk supply line was restored. The loss of this area was a blow to Rommel, whose tanks were now being driven W. To the E. of the chief battlefield the greater part of the country between the Tobruk-Bardia road and the El Gobi-Sidi Omar road was now cleared of the enemy, though Bardia itself still remained in Ger. and It. hands. In the central Mediterranean many blows were struck at the

enemy's sea-borne supplies, loaded supply ships and tankers carrying petrol and ammunition being frequently torpedoed, bombed, and sunk. The siege of Tobruk was lifted by 10 Dec.

The battle had now been in progress for over 3 weeks, but the quick decision hoped for by Auchinleck had not been obtained. Brit. tank losses had been severe, and the battle had not progressed according to plan, the armoured battle being inconclusive; and, but for strong pressure at Tobruk, the full force of the Ger. motorised infantry would have moved on Bardia to relieve the encircled garrison and thus have jeopardised the whole Brit. offensive.

Rommel's forces in retreat to Jedabya and El Agheila. British close in on Halfaya. The beginning of the third phase came with the storming of El Adem, on the escarpment due S. of Tobruk and 20 m. W. of Sidi Rezegh. Striking along the coast the New Zealanders from Tobruk soon reached Gazala, while other Indian and Brit. troops pushed up from the S.E.; and on the S. flank Brit. columns continued a slow but steady advance, mopping up enemy positions in their progress. After 5 days of intense fighting, in which all his remaining forces were flung into the battle, Rommel's front in Libya was broken, and his forces were in retreat.

But though the enemy had been driven out of the positions which barred the Brit. advance westward—with the exception of Bardia, Sollum, and Halfaya—his forces were far from destruction. The Brit. offensive was handicapped by the growing problem of transport over great distances of desert terrain. Cyrene and Apollonia were taken on 21 Dec. and by the 22nd the Eighth Army, now reinforced, were heavily pressing It. forces covering Benghazi, while Brit. mobile columns reached the coastal plain on the Gulf of Sirte, S. of the cap. Along this plain Rommel's Afrika Korps were retreating in some disorder, abandoning large quantities of war material. Benghazi was entered on Christmas Eve by the Royal Dragoons after it had been evacuated by the enemy. The enemy's main forces under Rommel were now in the Jedabya zone, where they were striving to repulse Brit. columns advancing from the S. Bardia was recaptured on 2 Jan. by S. African troops, supported by Brit. tanks, and over 1000 Brit. prisoners of war were thereby released. Nearly 8000 Axis prisoners, including 1000 Germans, were captured.

The Brit. forces (under the command of Gen. Ritchie, who had succeeded Sir Alan Cunningham in Dec.) had covered over 400 m. in their advance across the country, which had occupied 6 weeks. The heaviest toll had been taken of the enemy, and the war booty captured was enormous. On 6 Jan. It. infantry of the Trento Div. and the remnants of the Ger. Afrika Korps rallied on a line running S. from Jedabya, hotly engaged with Brit. troops of the Brigade of Guards. While Rommel was being

barred here, and in his subsequent retreat on El Aghella, Brit. forces had taken Sollum and were closing in on the exceptionally strong positions at Halfaya. The importance of the Halfaya positions to the enemy, and also to the Brit., was that they commanded 2 of the shortest roads from the coastal belt at Sidi Barrani and Sollum on to the escarpment.

Rommel, having been pushed out of Jedabya, now made a stand between Aghella and Marada, where a series of broad wadis provided a natural obstacle, and from that time (mid Jan.) he consolidated his positions while awaiting reinforcements.

Four months' lull. Rommel's counter-attack. There now followed a period of some 4 months of uneasy quiescence, during which there were intermittent patrol activities and air-raids. But behind these minor exchanges strenuous efforts were being made on both sides to reinforce and re-equip the opposed armies. On 26 May the storm broke. Rommel launched the Afrika Korps to the attack, his object being to defeat the Brit. armoured forces and to retake Tobruk. Probably the remoter objective was an advance on Suez concurrently with a break-through by the Ger. armies to the Caucasus. The Brit. Command, through air reconnaissance, had foreseen the attack, and the Eighth Army under Ritchie was fully prepared to meet it. The Brit. air forces opened a counter-offensive on the 21st Ger. Armoured Div. with heavy attacks against enemy forward aerodromes. On the night of 26-27 May the Afrika Korps passed to the S. of Bir Hacheim, moving N. with great rapidity towards Acroma, and also towards the old battlefields of El Duda and Sidi Rezegh, which were actually reached by some of its most forward troops. These were soon driven off by Brit. armoured forces. On the same night the enemy attempted a landing from the sea near Acroma, but was driven off by Brit. naval forces. Long before they approached El Adem, which is near Tobruk, or Acroma, the Axis armoured and motorised troops were brought to action by the 1st and 7th Brit. Armoured Divs., together with Brit. heavy tank brigades.

'Battle of the Cauldron': French defence at Bir Hacheim. The full brunt of the enemy initial advance to the E. of Bir Hacheim was taken by the 3rd Indian Motor Brigade Group, which was overborne by sheer weight of metal, but not until after it had inflicted heavy losses on the enemy. Meanwhile an attack on Bir Hacheim had been beaten off by the Free Fr. forces, with enemy losses. Rommel's attacks on the N. front of the Brit. main positions S. of Gazala, launched on the 27th, achieved little. Throughout 28, 29, and 30 May there was very heavy and continuous fighting between the Brit. armoured divs. and brigades and the Ger. Afrika Korps, backed up by the It. Mobile Corps. The battle swayed backwards and forwards over a wide area, from Acroma, in the N.,

to Bir Hacheim, 40 m. to the S., and from El Adem to the Brit. minefields, 30 m. to the westward. On 2 June an enemy column 18 m. long, headed by 60 tanks and containing 2000 motor transport vehicles and lorried infantry, and strongly supported by artillery, swept round Bir Hacheim in a SW. direction, and headed for the Brit. positions in the 'Cauldron,' an area lying between the gaps in the minefields. A series of exceptionally fierce engagements took place. An attack launched by Rommel's main armoured forces against the Brit. positions known as 'Knightsbridge' was stopped by Brit. and Indian infantry and artillery, and the enemy was driven back westwards. After nearly 2 days of furious fighting the first phase of the 'battle of the Cauldron' ended in a definite Ger. repulse; while in the S. the Free French, now surrounded at Bir Hacheim, held fast against almost continual attacks. This third Libyan campaign was waged by the Brit. Command on different lines from the previous encounters. This time Auchinleck was content to let his adversary take the offensive in the hope that he might whittle away his armoured strength by a succession of attacks on rock-like defences, and in mighty but fruitless battles with the greatly strengthened Brit. armoured units.

Rommel captures Tobruk. At this stage the course of the battle swung sharply against Ritchie's army. Ritchie's counter-attack on 4 June on Rommel's forward base in the Brit. minefield area was premature, and the Brit. forces were compelled to fall back before a fierce counterstroke and suffered considerable losses. Rommel was therefore able to concentrate his attention on Bir Hacheim. Ritchie tried to lift the pressure on this position by using mobile troops and intense air support, but on 10 June he decided that the risk of maintaining this isolated garrison was too great, and it was withdrawn. With the fall of Bir Hacheim the investing enemy forces were released for co-operation with the forces preparing to attack in the Knightsbridge-El Adem area, and 3 days later the Brit. had to abandon some positions there, which opened the way for Rommel to break through to the coast and try to cut off the 1st S. African and 50th Divs. in their position S. of Gazala. Rommel continued to press his attack in the El Adem area and estab. himself E. of the El Adem defended local area at Sidi Rezegh. After 4 days of the fiercest fighting Ritchie on 17 June withdrew his army to the El Adem-El Duda-Sidi Rezegh area, and concentrated his main forces towards the frontier, leaving a garrison in Tobruk. This proved disastrous. Rommel wheeled sharply round westward, and on 20 June attacked Tobruk from the SE. The attack on the Brit. garrison at Tobruk began in earnest with panzer thrusts of considerable ferocity and dive-bombing Stukas following a particularly heavy artillery barrage. Scratch units formed of engineers, men of the Ordnance Corps and Army Service Corps, together with

S. Africans, fought with desperate bravery against the most hopeless odds both in men and material. The Brit. and S. African forces retired inside the tu and put up a gallant fight, hurling back attempt after attempt of the Germans and Italians to enter the tu. Then dusk fell. Under cover of darkness the enemy crept up, entered the streets, and began to force the defenders out of the houses with grenades, Tommy-guns, and machine guns. House-to-house fighting ensued, and the garrison was forced to surrender, 28,000 prisoners being taken by the enemy, together with much material.

Explanation of the British defeat. Superiority of the German tanks and anti-tank guns. Thus for the third time in 2 years a Brit. force suffered a reverse in Libya, and each time the reverse followed what had appeared to be substantial victory, the enemy in the first 2 battles being driven back to the border of Tripolitania. In all the battles the fighting took place at great distances from bases, and not only was the vast battlefield barren, waterless, and uninhabited, but it contained only 3 natural defensive positions, and these were coastal tus. The only way to win a desert success on such a terrain was to assemble a force strong enough to defeat the enemy's armour so thoroughly that there was none left to get away. But in this, as in the 2 previous battles, the Brit. armoured force was inadequate for this task. With the armoured forces nearly equal in mere numbers, as was the case in this third battle, the decisive factor was hitting power. Apart from some serious blunders in tactics, the main reason for the Brit. reverse was the fact that they were out-gunned. The new Gen. Grant (Amer.) tanks carried excellent 75 mm. guns, but the bulk of the Brit. force consisted of tanks armed with a 2-pounder gun, which was useless against Ger. tanks equipped with at least a 47-mm. gun. It was his contempt for the Brit. tanks that led Rommel to make his confident sweep northwards in the opening days of the battle, and though the Grants were a surprise, they were not in sufficient numbers to prove decisive. The fact that victory so long seemed within the Brit. grasp was due to an improved recovery of damaged tanks, and to the commanders' skill and courage in individual encounters. Again, Rommel had the advantage in anti-tank guns, and showed much cleverness in their use.

But the Brit. reverse was not to be assigned entirely to the undoubted if temporary inferiority of their mechanised arms: for Ritchie still held Rommel's forces, and could still hope to win, until 13 June, when the main Brit. armoured force ran into an ambush, and of the 300 tanks with which the Brit. commander started the day only 70 (excluding light tanks) remained by nightfall. In those few hours the battle was lost, and lost on the spot, thus illustrating the truth that, in these mechanised desert battles, one false move or one brilliant tactical stroke might turn the course of a campaign.

Rommel's advance on the Nile checked. The fall of the fortress compelled Auchinleck to fall back before a victorious and better-armed foe to Mersa Matruh. Flushed with success Rommel now gathered his forces for an advance on the Nile delta (3 July), but his advance now received a very definite check at El Alamein. Having regrouped and replenished his tanks Rommel returned to renew the assault, but in a different direction, this time swinging his armoured forces NE., while his coastal columns attacked from the W. in the expectation of smashing the Brit. infantry in the Alamein 'box.' But the Brit. commander immediately turned his forces N. and went in against Rommel's flank and rear. The fighting that ensued was fierce but short-lived, and before dusk the Axis forces withdrew from the ridge to the S. of the Brit. positions, whence they had hoped to out-flank the defence. Every day of successful resistance and counter-attack served to reduce the peril to Egypt. Moreover the allied air forces, whose co-operation with the land and naval forces was growing daily closer, were now increasing their attacks to a scale unprecedented in the Middle E. For a vital change had come over the desert battle. The Axis momentum had spent itself.

Churchill visits Egypt. Appointment of Gens. Alexander and Montgomery. Before the fall of Tobruk most of the 6-pounder guns which were to be used in the coming battle had been dispatched, together with the more heavily armed and more heavily gunned Brit. tanks; while, in addition, Roosevelt sent over a number of Sherman tanks and a large number of self-propelled 105-mm. guns for contending with the Ger. 88-mm. high-velocity guns, all of which were destined to play a recognisable part in the forthcoming battle of Egypt. It was essential to bring the Brit. Eighth Army into a condition to regain the initiative and to resume the offensive, this being an integral part of the Allies' whole N. African strategy. By rearming the men on a gigantic scale, the disasters of the summer were eventually repaired and the defence of Egypt converted into a successful attack. Churchill, having visited Egypt, decided to make changes in the higher command, and Alexander (q.v.), the defender of Burma, replaced Auchinleck, who was later transferred to India, while Montgomery (q.v.) was appointed to command the Eighth Army. On 10 Aug. Churchill gave Alexander the instruction to take or destroy at the earliest opportunity the Ger.-It. army commanded by Rommel, together with its supplies and establishments. Intensive preparations were made behind the Brit. lines in face of an imminent attack by the Axis army. Rommel delivered his attack on the Eighth Army, which was now reinforced by the 44th Div., on the night of 30-1 Aug. Pivoting on the Italians in the coastal area he came round the Brit. open S. flank, which had been left free of the Qattara Depression in order to allow liberty of movement in the event of a turning operation, with the whole

Ger. Afrika Korps, including the 90th Light Div., 2 panzer divs., and a large part of the 20th It. Motorised Corps.

Renewal of the struggle at El Alamein. *Rommel driven back.* Rommel found himself confronted with stiff resistance and with artillery used on the largest scale and abundantly supplied with ammunition. After 3 days he withdrew with heavy losses. Rommel could ill afford losses, for he had been much hampered by the sinking of his supply ships by Brit. submarines and by Brit. and Amer. air attacks from Malta and Egypt. The heaviest fighting took place between Heimeimat, near the Qattara Depression, and the Ruweisat Ridge in the left centre of the Brit. line, and Rommel was forced to fall back slightly. The Brit. commander of the Eighth Army had wrested the initiative from Rommel by this date (2 Sept.), and 4 days later Rommel had been driven back to his starting point. Wherever he probed the Brit. lines for a weak spot he was hurled back with losses. During the whole attack, especially on 2-3 Sept., the Axis made air attacks on the biggest scale, sev. raids being carried out by as many as 100 aircraft, each time meeting with severe reverses.

The British victory of El Alamein (23 Oct.-7 Nov. 1942). By late Oct. Alexander was ready to pass to the offensive. There followed one of the most glorious victories of Brit. arms. It was realised by the Brit. Command that the enemy was converting the position in front of the Brit. line into a fortress, blasting gun-pits and trenches in the solid rock, and laying enormous and elaborate minefields. An attack round Rommel's S. flank would have led into difficult terrain, and was therefore impracticable. Yet, on the other hand, a frontal attack was a most formidable operation. It was, however, decided to attack frontally by putting up a terrific artillery and air barrage under cover of which the infantry would advance and clear the minefields for the subsequent advance of the armoured units, and these tactics were completely successful. On a 6-in. front of attack the Brit. had a 25-pounder gun or heavy weapon every 23 yds; it was necessary to effect penetration of about 6000 yds at the first stroke in order to get through the minefields, trenches, and batteries of the enemy, and this was successfully achieved, the Brit. and Amer.-manned air squadrons contributing signally to the successful operation. This aerial ascendancy was used with the most devastating effectiveness. Heavy blows, too, were constantly struck at Rommel's supplies by the navy. The Brit. naval and air forces sank 50,000 tons of Axis shipping over these few days. On 29 Oct. there was a big-scale encounter between opposing tanks, the Axis forces being driven off with considerable losses, and Brit. gains being held while tank losses were slight. From the moment that the seaward flank of the enemy was broken and the great mass of the Brit. armour flowed forward and successfully engaged the panzer divs., the fate of the

Axis troops to the southward, and to 6 It. divs., largely motorised, sealed. As the Brit. advance reached Daba, and later Fuka, the enemy's line of supply and retreat were equal, severed. They were left in a waterless desert to perish or surrender. Tactically the position had grown serious for Rommel on 1 Nov., when a corridor W. of Tel-el-Eisa was enlarged, and a lane cleared for armoured formations which were at last able to advance on to open ground. Thereupon Brit. and Indian troops advanced rapidly and soon widened the already formidable gap in Rommel's lines. The Axis retreat, which had begun methodically on 3 Nov., first N. of the Qattara Depression, had by 7 Nov. become a rout.

Halfaya Pass and Tobruk recaptured. Cyrenaica overrun. When this remarkable battle opened the Afrika Korps front line army was composed of some 100,000 mixed Germans and Italians with nearly 700 tanks, of which possibly two-thirds were It., and a very strong army of artillery and anti-tank guns. Well over half these tanks were totally destroyed or knocked out or captured, and the remainder were picked up in deserted workshops in the rear areas, 46 being found at El Daba. The majority of the guns (over 1000) were either destroyed or captured. Von Stumme, who had commanded the Axis forces during Rommel's brief absence in Berlin, was killed. Ritter von Thoma, commander of the Afrika Korps, and numerous other senior Ger. and It. officers were taken prisoner. By mid Nov. the number of Axis losses in men was more than 70,000. The Brit. casualties were 13,600. The race for the Libyan ports had now begun. Halfaya Pass fell a few days later, and Tobruk was once again in Brit. hands by 13 Nov.

Within a few days Sollum and Bardia were also in Brit. hands, and within 4 weeks from that time the Eighth Army had overrun the whole of Cyrenaica. While Brit. engineers were effecting repairs to the Benghazi (q.v.) docks to render the port practicable as a supply base, Montgomery's forces pressed hard on the heels of the Ger. Afrika Korps. In the last week of Oct. Rommel reached the powerful natural position of El Agheila, where, having received reinforcements, he hoped to concentrate his reorganised forces for resistance. But on 13 Nov. the Brit. Eighth Army outmanoeuvred him and turned his forces out of their strong positions at Mersa Brega, just E. of El Agheila, at little cost to themselves. Rommel's forces then renewed their retreat westwards, relentlessly pursued by the Brit. forces. Allied fighter-bombers, operating on an unprecedented scale, were employed to harass the enemy in his retreat, Axis air activity being entirely ineffective in preventing these operations.

Anglo-American landing in French North Africa. U.S. and Brit. forces landed in Fr. N. A. early on the morning of 8 Nov. 1942. The city of Algiers at once surrendered, and thus paved the way

for the occupation of the surrounding area. The only serious resistance was from navy and coast defence artillery, the mass of the Fr. armed forces having no wish to oppose the entry of Amer. troops. Brit. naval forces of great strength covered the expeditions. The landing forces, which were under the command of Lt.-Gen. Dwight D. Eisenhower (q.v.), commander of all Amer. troops in the European

allow Amer. forces to pass through Tunisia. Giraud, who had escaped from a Ger. prisoner-of-war camp and, later, from Vichy France, arrived in Algeria to assume the leadership of the Fr. movement and to organise the Fr. N. African army to fight beside the forces of the Allies. In a broadcast to the commanders of the Fr. fleet at Toulon Darlan (q.v.) asked them to bring the fleet over to N. A.

Crusader and Sherman tanks pass through Mersa Matruih.

theatre of operations, was led by U.S. Rangers in separate parties at strategic points, followed by armoured infantry and small numbers of marines and blue-jackets. Parachute troops seized vital airports and communications. Aircraft from carriers and heavy units of the Amer. and Brit. navies covered the landings. The landing parties swept inshore off the beaches near Algiers and Oran, capturing 3 air-fields. Resistance from coastal batteries was dealt with by allied naval forces under the supreme command of Adm. Sir Andrew Cunningham (q.v.). The capture of the naval base of Oran virtually ended all Fr. resistance in the Mediterranean. The immediate objective of the allied forces was Tunis, and Roosevelt requested the bey of Tunis to

Darlan's assassination soon afterwards left Giraud as the sole leader. This great N. African enterprise was planned in April and July 1942, when Marshall, head of the Amer. Army and Air Force, visited London with King, Commander-in-Chief of the U.S. Navy. Detailed negotiations with anti-Axis elements in N. A. were conducted by Clark, deputy-commander to Eisenhower, together with 3 Brit. and some Amer. officers, who met in a lonely house on the coast. The expedition, and indeed all the participants in this preliminary conference, narrowly escaped capture by the Vichy police.

The Tunisian campaign opens. Eighth Army's pursuit of Marshal Rommel. Fall of Tripoli. In the early days of the Tunisian campaign Brit. infantry

and artillery, on 17 Nov., reached the important pass at Djebel Aboid in the N., and, in their first rush after landing at Algiers, it seemed as if the Allies might capture Tunis without difficulty. Then the Germans, having landed heavy reinforcements and supplies from Sicily, stiffened their resistance. A general advance of all the allied forces in Tunis in co-operation with the Eighth Army under Montgomery now depended on the speed with which that army could advance into Tunisia. Advanced elements of the army cut Rommel's retreating columns in two at Wadi Matratin (50 m. W. of El Aghella) on 17th Dec., but the Germans succeeded in breaking out of the flanking trap. With the possession of advanced air-fields in Tripolitania the siege of Malta was virtually ended, and towards the close of Jan. the island's aircraft were co-operating in the Brit. offensive in Tripolitania. On the road to Tripoli the Ger. rearguards fought stiff delaying actions, notably near Tarhuna and Castel Benito. The Brit. flag was hoisted in Tripoli on 23 Jan. 1943—a symbolic act which in effect marked the end of Mussolini's colonial empire—but the Eighth Army passed rapidly on, Montgomery's aim being to come to grips with Rommel's army. Rommel left all along the road of his retreat—the longest known in military hist.—strong rearguards and minefields to hold up the Brit. advance. There was now no doubt that he would stand and fight along the Mareth line, 200 m. W. of Tripoli. This line was a strong series of connected defences, on the pattern of the Maginot line, which some years previously had been constructed by Fr. engineers, no doubt with the intention of holding Tunisia against any possible attack by the Italians. It started on the coast in the Gulf of Gabes, and extended through Mareth to Matmata (a length of 20 m.). At the W. end were deep wadis, and a chaos of hills offering strong vantage points for defence.

Rommel attacks at Sejenane and joins forces with von Arnim. Rommel takes the Kasserine Pass. Allies regain the initiative. The purpose of the Allies was to end Ger. occupation of N. A. as speedily as possible, particularly as the Germans were still able to land reinforcements and guns and tanks at Bizerta. To accomplish this purpose the Brit. First Army under Anderson must advance in the N. of Tunisia through Mateur to Tunis, and attack the forces of von Arnim. Further S. the Americans had Gafsa and Maknassi as their immediate objectives. Fr. forces were to co-operate, and the whole conception of the allied thrusts was to deprive the Axis forces of their control of the 'corridor' extending between the sea and mts from Gabes to Tunis, and to drive them into the sea. With Montgomery's arrival on the S. border of Tunisia in mid Feb. the other allied armies now had some opportunity of driving against the flanks of the road up which Rommel's Afrika Korps must if engaged and defeated at the Mareth line withdraw. But the Axis forces took the initiative on 14 Feb.,

when they began a twofold thrust towards the W. and NW.—through the Faid Pass against Sidi Bou Zid, 70 m. W. of Stax, and in the direction of Sbeitla, 60 m. W. of Sidi Bou Zid. Early in Mar. the Axis forces made repeated attacks in the Sejenane area and gained ground, though at heavy cost. It was soon clear that Rommel's long retreat had been skillfully executed, though harried the whole way by the Eighth Army and the R.A.F. In Tunisia he succeeded in joining hands with von Arnim and completing the occupation of a broad belt of ter. stretching from Tunis to the S. frontier, and he was now trying to seize the initiative by striking at first one foe and then another, while his adversaries, who, apart from the Eighth Army, had but small forces, had to withdraw into the mountains to regroup, having failed to pin Rommel against the coast. Following up his success Rommel captured the Kasserine Pass, 20 m. W. of Sbeitla, and then attacked at the pass of Sbiba, which was held by Brit. units of the Brigade of Guards. But these were temporary and comparatively slight reverses, for soon Rommel's detached forces N. of the Mareth line were hurled back through the Kasserine Pass and retreated on Gafsa. The plan to cut through Anderson's lines in N. Tunisia, and turn his positions from the sea to Jebel Mansone, was foiled with heavy losses, but the Germans persisted in their attacks. On 6 Mar. Rommel's infantry and tanks delivered 2 heavy attacks against the Eighth Army in the Mareth area, but the Germans suffered severe casualties, those of the Eighth Army being negligible. In other parts of Tunisia Axis offensive efforts were now being relaxed, and the Allies, after a long setback, had at last regained the initiative.

Battle of the Mareth Line. On 20 Mar. Montgomery attacked the Mareth line by a frontal and 2 flank attacks. The frontal attack began with hundreds of guns pouring tons of explosives on a sector less than a m. wide. Simultaneously with this, the main attack on the centre of the Mareth line, Brit. forces pierced the Axis coastal flank, and carried out another diversionary flank movement on El Hamma, 20 m. behind the Mareth line. There was desperate fighting for the Ger. stronghold by the Wadi Zigzaou. Crossing the Ger. minefields under intense fire Brit. troops spread into the wadi, crossed the ravine under cross fire, and clambered up the bank of the wadi with scaling ladders. But, although they estab. a bridgehead for a time in the Mareth line and took 3000 prisoners, they soon afterwards lost the bridgehead to a strong counter-attack by the pick of Rommel's troops. On 23 Mar. Montgomery transferred the main weight of his attack round the Matmata Hills, throwing in infantry and tank forces to support the outflanking units which had already been engaging the enemy behind the Mareth line SE. of El Hamma. While this change of plan was being carried out the Mareth forces continued to fight a holding battle, creating as best they could the illusion

that the battle for the bridgehead would be renewed. The capture of a dominant hill (known as Hill 184), which denied to the enemy any distant view of the broad amphitheatre between the Jebel Melab, 15-20 m. S. of El Hamma, and the Jebel Tebaga running to the N.E., in which it was intended to draw up the Brit. forces, was effected after the decision to switch the main attack from the centre, and was a vital part of the plan. The plan was to surprise the enemy by violation of the usual rule of attack by night and give him no time to make fresh dispositions. The R.A.F. started the attack on El Hamma at 2 p.m. on 26 Mar., and 2 hrs later the barrage of medium guns, howitzers, and 25-pounders opened. At the same time tanks and infantry went into action. By next day the Germans were caught between the hills to the E. and the allied forces, with no escape except towards the Mareth line, which by now was crumbling, or northward through Gabes. By the 28th the Eighth Army was in possession of the whole of the strongly organised defences of the Mareth line, the Axis forces withdrawing at great cost of tanks, guns, motor transport, and men (8000 prisoners), and retreating through Gabes, which was then being bombarded by Brit. warships.

British victory of Akarit. Eighth Army contacts American forces from Gafsa, Sfaz, Kairouan, and Sousse taken. Rommel's forces escape northward. The allied attack on Tunis and Bizerta. The Axis defeat at El Mareth was soon followed by another defeat at the hands of the victorious Eighth Army at Akarit, a very strong position N. of Gabes. In pitch darkness on the morning of 6 April some 500 Brit. guns opened up on the position. Under cover of the barrage Brit. and Indian infantry overwhelmed the surprised Axis forces, seized all key points, and estab. a bridgehead. A hole having thus been blasted in the centre of Rommel's defences, the Brit. tanks streamed through, chasing the retreating foe towards the N., and by nightfall of the same day the open country had been reached, and over 6000 prisoners taken. At the same time the Eighth Army made contact with the 2nd U.S. Corps from Gafsa. Four days later Montgomery's forces seized Sfax (90 m. N. of Mareth), and continuing a relentless pursuit were soon beyond La Hencha on the way to the port of Sousse. The air offensive was playing an even greater part in the operations than ever before. Cagliari had been heavily bombed some time previously, a 10,000-ton cruiser, *Trieste*, was sunk in La Maddalena, Sardinia, numerous cargo boats were sunk in their attempts to bring oil and other supplies to the Axis forces in Tunis, and scores of large Savoya and Junkers transport planes were shot down or destroyed on their air-fields in Pantelaria or in Sicily. Kairouan and Sousse were taken by 12 April, and the Eighth Army continued its advance through more difficult country in the face of demollition and mines. The first junction between Anderson's First Army and the Eighth

Army occurred on 11 April some 20 m. from Fondouk, S. of Kairouan, so that the Axis had now lost the greater part of Tunis, and were being hemmed in within the N.E. corner between Enfidaville and Pont du Fahs southward and Bizerta in the N. Some 20,000 Axis prisoners had been taken by the Eighth Army since 20 Mar. Though the Ger. armour suffered severely in an engagement between Kairouan and Fondouk on 10 April the bulk of Rommel's troops escaped northward to join von Arnim. On 14 April the Eighth Army's advance guard reached Ger. prepared positions on the ridge between Enfidaville (on the coast) and the Jebel Bou Hajar, a ridge running across the coast plain from the main mountain spine. Meanwhile Fr. forces had taken part of Jebel Mansour, a position dominating the valley of the Oued el Keb and the Pont du Fahs region, while the Brit. troops of the First Army in the N. were driving von Arnim's forces back along the Beja-Mateur road, so that the Allies had regained by now most of the positions they had previously occupied in the first rush through Tunis, only to lose them to von Arnim in Feb. By 15 April the total number of prisoners had risen to 30,000.

Axis forces driven into the perimeter of Tunis and Bizerta. From the Nov. day when the Allies landed in Algeria and the First Army (then no more than a div. strong) began its advance into Tunisia, it was obvious that the keypoint where the fate of N. A. would be decided was the old Arab port of Bizerta, now a first-class Fr. naval base. Most important of all to the Axis forces were the underground arsenal near Ferryville, S. of Bizerta, and the military oil port where sev. large tankers could berth together. But Bizerta, for all its underground arsenal and reservoirs, depended for replenishment on the It. merchant navy, and the continual pounding of the Axis supply service had already taken a tremendous toll. Since she had entered the war Italy had up to this time lost in merchant shipping sunk or captured well over 4,000,000 tons. On 19 April in one of the biggest aerial engagements fought in the African campaigns, an Axis air convoy was almost entirely destroyed by Amer. Warhawks and Brit. Spitfires. No fewer than 74 Ger. aircraft, including 58 huge Ju. 52 transports out of 100 or more, were hurled to destruction on the beaches or in the sea, together with many of their escort machines. By the closing days of April the Amer., Fr., and Brit. forces were in contact with each other in an arc from the N. coast through Mejez el Bab and Goubellat to Enfidaville, and were fiercely attacking the enemy's strongholds. The Axis forces were now penned into almost the immediate perimeter of Tunis and Bizerta, from which they could not escape by land, whilst evacuation by sea or air was hazardous in the extreme. There followed a period of the most bitter and bloody fighting, often hand to hand with knives and bayonets, for every yard of the

narrowing ground, every dominating ridge or hill in a terrain rugged with complex positions of great natural strength.

Gen. Anderson's resistance in Tunis. Strategy of the final plan of attack. The whole Tunisian campaign was now, however, to undergo a rapid and most dramatic change; for before the end of the first fortnight of May the whole Axis army had been destroyed, and the First and Eighth Armies, assisted by the 2nd Corps and Fr. colonial troops, had won one of the greatest victories in the history of the Brit. Army. This swift transformation was the more remarkable in view of the situation only 6 months earlier. The Allies had invaded Tunisia the previous Nov. with only the weakest forces, the Brit. First 'Army' numbering barely 1 div. The actual forces which then invaded Tunisia were 2 infantry brigades of the 78th Div., 2 commandos, 2 battalions of parachute troops, and a composite force consisting of 1 regiment of Brit. tanks, 1 battalion of Amer. tanks, 1 motorised company of the Rifle Brigade, a battery of the Royal Horse Artillery, and some armoured cars of the Derbyshire Yeomanry, together with some divisional artillery and ancillary services. These troops succeeded in rushing forward to the occupation of the important pass of Jebel Abiod, and, had the Fr. resident-general in Tunis stood firm against the Ger. demands, the Allies might have been in Tunis by Christmas (1942). But he gave the Germans facilities for bringing in men and supplies, and very soon large Axis reinforcements were pouring into Tunisia. For a short time the Brit. forces clung to Mejez, drove the enemy back along the Mateur road, held Tebourba, and even attacked Jedeida. Eventually the Brit. forces were obliged to reorganise their line with Beja as the base and Mejez as a salient. But they succeeded in holding the enemy until they were gradually reinforced by Amer. and Fr. troops, and by the 46th (Infantry) Div. and the 6th (Armoured) Div. The Eighth Army's advance from Tripoli at first increased the First Army's burdens, for Anderson found himself confronted by formidable enemy forces which hoped to defeat him before Montgomery could arrive. Hence the Axis during Mar. (1943) launched a series of attacks on the First Army which at times Anderson had great difficulty in resisting, the enemy advancing almost to Jebel Abiod and Beja, while Mejez was left at the apex of a very dangerous salient. The first task was to oust the enemy from these positions before delivering an attack, and on 28 Mar. the First Army, strengthened by 2 more infantry divs., set to work. The Beja-Mateur road was cleared by the 4th Div. almost to Sidi Nsir, while the 78th Div. attacked the Oued Zarga Hills on 7 April and, by a series of brilliant operations, cleared them almost to Mejez. Meanwhile the 6th Armoured Div. and infantry of the 46th Div. broke through at Pichon and Fondouk, joined hands with the Eighth Army, and pursued the enemy northwards to the Enfidaville line.

Thus was the stage set for the general assault which began on 22 April with an attack by armour in the Bou Arada sector, and on the next day the attack became general—the Eighth Army attacking along the Enfidaville line, the First on the Mejez sectors, and the 2nd U.S. Corps and some Fr. units in the hills on the First Army's left flank.

Alexander opens the final offensive at Mejez and Enfidaville. In planning his culminating attack Alexander, commanding the whole 18th Army Group, realised that the enemy had grouped all his 3 armoured divs. astride the Mejez-Tunis road to meet the Brit. blow, and the one element of surprise he could hope to invoke lay in an unexpected concentration of force at the point of impact. Surmising that von Arnim, the Axis commander, would assume that the Eighth Army would be used to strike the final blow, Alexander opened the offensive with a feint attack on the Enfidaville line, discreetly withdrawing in the meantime 3 divs.—the 7th Armoured, which had fought all the way from El Alamein, the 1st Armoured, and the famous 4th Indian Div.—which were now transferred to the centre of the First Army front at Mejez. It was left to the rest of the Eighth Army to carry on the task of containing the First Panzer Army in the Zaghouan massif behind Enfidaville. Though von Arnim had strengthened his front before Mejez, his main dispositions were made to meet the thrust from Montgomery in the S., and when the blow came from the W. he was unprepared and utterly overwhelmed. Indeed, the whole battle may be said to have been won before victory was visible; for the Axis steel ring from Bizerta to Enfidaville had been worn dangerously thin by the methodical progress of the infantrymen and gunners of the Brit. First Army through the difficult and tenaciously held mts and ridges commanding the Mejez-Tunis road. The armoured stroke which was delivered on 6 May, and split the Fifth Ger. Panzer Army in two, was essentially an exploitation of mastery already achieved.

Fall of Bizerta and Tunis. A breach was opened by the Brit. First Army's infantry in a night attack, and the armoured spearhead, its path blasted in advance by brilliantly organised air co-operation under Tedder, moved forward so rapidly that von Arnim's plan of defence—to hold Bizerta as an isolated enclave, and to wheel most of his Fifth and First Armies back, pivoting on Zaghouan, to the Cape Bon Peninsula for a final stand—was completely shattered. Half the Ger. Fifth Army was pushed N.-westwards from Tunis into a pocket the W. side of which was closed by the vigorous advance of the 2nd U.S. Corps—which had some time previously been transferred from Gafsa to the N. to co-operate with a Fr. force—from Mateur (which important rail junction was seized by the Amer. corps on 3 May, together with hundreds of Ger. prisoners) to Bizerta and the mouth of the Medjerda R. In this pocket nearly 50,000 Ger. troops

and 6 generals, including the general commanding the Fifth Army, capitulated *en masse*. Both Bizerta and Tunis fell later in the day of 7 May, the Americans entering Bizerta and the British Tunis.

Von Arnim's withdrawal to Cape Bon peninsula foiled. Von Arnim captured, together with a quarter of a million prisoners. It was the next stage, however, which justified still more strikingly the tactics of Alexander in transferring part of the Eighth Army to increase the weight and impetus of the First Army's break-through. If von Arnim's planned withdrawal to Cape Bon was to be frustrated and his forces, instead of effectuating a 'Dunkirk evacuation,' were to be decisively disintegrated, it was essential, on reaching Tunis, to have sufficient strength to fan out in 2 directions—one part of the spearhead to complete the encirclement of the enemy at the Medjerda R., the other to pursue the Fifth Army retreating eastwards from the cap. and, by forcing a way down the Hammam Liff-Hammamet valley, to cut off from Cape Bon the strong Ger. First Army which was held between Zaghouan and Enfidaville by the remainder of the Brit. Eighth Army and by the French who were now in possession of Pont du Fahs. This object was achieved. The Brit. armoured forces reached Hammamet and thereby disorganised all Axis resistance on their way. Cape Bon, with a large additional haul of prisoners, was quickly seized. The Ger. First Army was surrounded, and on 12 May the last resistance collapsed. Von Arnim and his staff were taken prisoner, but Rommel had escaped to Germany. The R.A.F. and navy prevented any Ger. repetition of a 'Dunkirk.' In all over 50,000 of the enemy were killed and nearly a quarter of a million prisoners (more than half being Germans) were taken. Only 638 escaped—mainly by air. The Brit. losses (killed, missing, and wounded) since the general offensive began were 35,000 in all (Eighth Army, 11,500; First Army, 23,500). Thus was won a mainly Brit. victory which afforded a truly classic example of military art, crowning the double campaign which had been begun 6 months previously by forces nearly 3000 m. apart. The Ger. defeat was not inglorious. With the greatest skill the Germans, defeated at Alameln, and threatened in the rear, having lost control of the air early in the campaign, gathered their forces to hold a bridgehead, while Rommel undertook a retreat which was masterly in its timing of moves, economy of forces, and organisation of transport.

See H. Rowau-Robinson, *Wavell in the Middle East*, 1942; H.M. Stationery Office, *The Battle of Egypt*, 1943; A. Moorehead, *The End in Africa*, 1943; P. Guedalla, *Middle East, 1940-42*, 1944; H.M. W. von Mellenthin, *Panzer Battles, 1939-1945*, 1955; H.M.S.O., *The Mediterranean and the Middle East*, vol. II, 1956.

Africa, South-West, is bounded N. by Angola, W. by the Atlantic Ocean, S. and E. by the Union of S. A. and Bechuanaland Protectorate. It lies between S. lat. 17° 25' and the Orange R., with a narrow strip between 17° 30' and 18° 20' S. lat., extending from 21° to 25° E. long., known as the Caprivi Zipfel, and giving access to the Zambesi. The boundaries are the Okavango and Kunene R.s in the N. and the Orange R. in the S. The total area is about 317,700 sq. m. (excluding Caprivi Zipfel, which is under the Bechuanaland Protectorate and Walvis Bay, 375 sq. m.). The estimated pop. (1951) was Europeans, 49,641, and natives, 381,266, of whom over 165,000 are estimated to be in Ovamboland. The prin. native race is the Ovambo (a Bantu race), and others are the Hereros and Hottentots. The Hereros are a pastoral race, but their tribal organisation was ruthlessly shattered by the Germans in the Herero war. Under the S. African mandatory rule reserves have been assigned for their occupation.

Physical features. The coastal areas of the W. are barren, especially between the Orange and Ugab R.s and towards the E. boundary, where a part of the Great Kalahari Desert is included in SW. A. There are good grazing dists. in the E., but the country as a whole is poorly watered, only the Orange and Kunene R.s having a perennial flow. For the rest, SW. A. depends on wells and the subterranean streams of the 'karst' region.

Under the SW. A. Affairs Amendment Act of 1949, the ter. elects 6 representatives to the Union House of Assembly (parliament). The ter. is also represented in the Union Senate by 4 senators, 2 of whom are nominated by the governor-general. The other 2 are elected, one for his knowledge of the ter.'s native races. Registered voters also elect 18 members to the SW. A. Legislative Assembly.

Commerce, communications, etc. Stock-raising is the chief industry, but there is some agric. activity in the less barren regions of the N. Diamonds form the staple product, and the stones, if small, are of good quality. Diamonds exported in 1954 amounted to 550,987 carats valued at £12,068,070. Minerals exported (1954) included lead, £6,736,875. Other minerals exported were copper, tin, vanadium, zinc, and manganese. Karakul skins exported in 1954 were valued at £3,866,529 and live animals at £2,779,685. There is an important fishing industry, and preserved fish exported (1954) was valued at £2,570,788. Excellent marble is found in quantity but is not worked to any extent. Meteorites are widespread. Imports (1954) totalled £22,660,018, and exports £36,848,432. The total length of the railway from the Cape within SW. A. is about 1300 m., much of the extension having been carried out during the campaign of 1915. There is also a line of 100 m. linking up the diamond fields near Lüderitz. There are over 21,000 m. of road in the ter. and railway motor services operate over 3237 m. The main towns are Keetmanshoop, Mariental, Windhoek

(cap., European pop. 13,000), Swakopmund, Walvis Bay, and Grootfontein.

First World War campaign. At the beginning of the First World War campaign the Germans seized Walvis Bay. Their forces, late in the campaign, were estimated at 5000 regulars and reservists, a high proportion of the white pop. of 13,000 being composed of well-trained reservists. Their total force was not large enough for operations in a colony of 320,000 sq. m. with a native pop. of 90,000, many of whom were still smarting under the memory of the Herero war. The Union forces under Botha and Smuts, in spite of rebellion and the mutiny of the troops, compelled the Germans to surrender by July 1915, thus bringing to an end one of the most brilliant campaigns of the 1914-18 war. Under the treaty of Versailles the colony was ceded by Germany—who had annexed the country in 1881—to the Union of S. A., which administers the ter. under mandate as an integral part of the Union.

In the course of the Nazi regime in Germany efforts were soon made to induce the Ger. settlers in SW. A. to agitate for the retrocession of the country to Germany. By 1938-9 the whole atmosphere of the country was clouded with political anxiety owing to the obvious efforts of the Nazi Gov. to make the most of every Ger. community in every part of the world as a cell or nucleus for promoting Ger. influence. In SW. A. there were in 1938-9 approximately 20,000 Union nationals as against 10,000 Germans, but they were not politically organised. Hence, to counteract the pressure exerted by the Nazis on the loyalist elements, they formed the SW. African League, the objects of which were to knit the Union elements more strongly together and generally to strengthen resistance to Nazi influences by enlightening them on Union and Imperial policy. The retention of SW. A. must remain a cardinal feature in the Union's external policy; for the Union can never permit the intrusion of a powerful and aggressive neighbour, nor does it desire the forces of anti-Semitism in the Union to be strengthened.

African Violet, *Usambara violet*, popular house plant. See SAINTPAULIA.

Afridis, a numerous tribe belonging to the Pathan or Pukhtun div. of clans and occupying the mountainous region on the NW. frontier of Pakistan. They are estimated to number some 250,000.

Afrikaans, modern language which has developed mainly from 17th-cent. Dutch introduced into S. Africa by the first settlers (see AFRIKANER). A. is one of the 2 official languages in S. Africa, English being the other. Applicants for public appointments are usually required to be bilingual. According to the 1946 census 57.3 per cent of the European pop. claimed A. as their mother tongue. In the rural areas, 82.4 per cent spoke A. in their homes; in the urb. areas the proportions speaking A. and English were equal. There is a growing literature in A. which is officially encouraged.

Afrikaner, person of pure European

descent, b. in S. Africa or of A. parents; generally, but by no means exclusively, applied to Europeans of non-Brit. descent. Usually the mother tongue is Afrikaans (q.v.). The main support of the National party is from the A. section of the community. It is a fallacy that A.s are anti-British *per se*, but they are essentially pro-S. Africans with republicanism an avowed political policy. The A.-Bond or Bond party was founded (1879) in Cape Colony by J. H. Hofmeyr, du Toit, and others, and had as its object the furtherance of A. or Dutch influence in S. Africa. From its object and personnel it naturally followed that it warmly sympathised with the Boer reps. in their war with England (1899-1902). After that war it changed its name to the S. African party. In the first parliament of the S. African Union this party, under the name of Het Volk (The People), secured a majority, and its leader, Gen. Botha, became Prime Minister. The chief A. leader against Gens. Botha and Smuts was Hertzog (q.v.), whose attitude in the First World War was equivocal. The rebellion which took place during the First World War was suppressed. For later developments see SOUTH AFRICA, *History*. See W. M. Macmillan, *Bantu, Boer and Briton*, 1929, and S. Patterson, *The Last Trek*, 1957.

Afrit, see IFRIT.

Afsluitdijk, dike in the Netherlands, extending from Den Oever in the prov. of N. Holland to Friesland, about 2 m. SSW. of Zürich. The dike is 19 m. long and separates the N. Sea from the IJsselmeer (q.v.). It was completed in 1932, and has an excellent roadway on its surface. There are locks at both ends of the dike.

After-image, in psychology, a sensory experience which persists after the ending of the stimulus. Immediately after looking at a red light which is switched off a vivid red A. may be seen for a short time. This is a positive A. A more common experience is that of the negative A. in which the form and size of the object which has been looked at with steady gaze are reproduced, but in the complementary colour. Thus a red object gives a blue-green A., and vice versa. Similar A.s are found in some other senses, but less strikingly than in sight. Positive A.s are the result of a burst of nervous impulses from a sense organ shortly after the stopping of the stimulus; negative A.s are attributed to the relative exhaustion of those sensory end-organs that have been made active during the previous stimulation.

Afterbirth, see PLACENTA.

Afterglow, phenomenon of a broad arch of light, either whitish or rosy, which sometimes appears above the highest clouds after sunset, and is due to fine particles of dust which affect the white light. The shorter waves are absorbed by the particles, the longer ones being more or less reflected. This phenomenon was widely observed in the red sunsets occasioned by the eruption in Krakatoa in 1883.

Aftermath refers to the growth of grass which follows cutting for hay or silage in spring. It may be left for grazing during the winter and is then known as fog or foggage. This is usually poor feed but will maintain cattle and sheep in store condition. The word is now used metaphorically for any sequence or consequent event.

Afyonkarahisar, or **Afium Kara Hisar**, tn in E. Turkey. It contains beautiful churches and mosques. Its chief trade is in opium, but it manufs. firearms, woollen and cotton goods, felts, and tapestry. Pop. 20,000. In the Gracco-Turkish war, 1921-2, the Greeks, heavily defeated in Sept. 1921, retired on Eski-shehr and repulsed Turkish attacks at A. in Oct.

Afzelius, Adam (1750-1837), Swedish botanist, studied under Linnæus, became demonstrator in botany at Uppsala 1785, and prof. of medicine 1812. He explored Guinea 1792, and wrote sev. works on natural hist.

Afzelius, Arvid August (1785-1871), Swedish writer and folklorist. He was the author of *Den Sista Falkengen*, a drama, and a hist. of Sweden up to the death of Charles XII. He ed. popular Swedish songs, and trans. into modern Swedish the *Elder Edda* and the *Hervara Saga*.

Aga, word signifying lord, of Turkic origin. The Turks used it for chiefs of the janissaries. It is in general use in Persian as the equivalent of 'sir'.

Aga Khan III, Aga Sultan Sir Mahomed Shah (1877-1957), Persian by descent and Indian by adoption, b. Karachi. The secular title A. K., without territory, was first bestowed by Queen Victoria on his grandfather, Hasan Ali Shah (1800-81), in recognition of his work in India and his relations with the Brit. Gov. A. K. III succeeded to the title at the age of 8, and became also the 49th head of the Ismaili Mohammedans, with a following of over 10 million throughout Africa and Asia. He was regarded in India as an elder statesman, and frequently acted as mediator between the Brit. Gov. and Indian nationalists before independence was achieved, as well as helping Brit. relations with the E. in general by his influence in the Islamic world. His personal association with the Brit. royal family began with a visit to Windsor Castle at the invitation of Queen Victoria, and his friendships with Edward VII and George VI were particularly memorable. He was a great authority on racehorse breeding, and was the owner of 5 Derby winners. His wealth was fabulous, but he was always generous in distributing money among his followers and elsewhere. He was succeeded in July 1957 by his 19-year-old grandson, Karim.

Agade, see **AKKAD**.

Agades, tn in the Niger colony, Fr. W. Africa, and centre of nearly all the most important caravan routes. It is the cap. of Ashen, S. of the Sahara, and is situated on the edge of a plateau. There is a Fr. garrison stationed at A.

Agadir, Moroccan tn and fishing centre.

It was once an important seaport owing to its situation at the mouth of the Sus, being the most southerly maritime tn in Morocco. The revolution of 1773, and the subsequent rise of Mogador, lessened its importance. In Aug. 1911 the A. incident, as it was known, nearly precipitated a European war on a large scale. The incident arose as follows: The treaty of Algeiras (q.v.), concluded in 1906, to which all the great powers, including Germany, were signatories, and in which France and Spain were entrusted with the task of preserving order in disturbed Morocco, was supposed to have settled the Moroccan question, but the sudden appearance off A. of the Ger. gunboat, *Panther* (replaced later by the cruiser *Berlin*), and the demand of the Ger. Kaiser for 'a place in the sun,' precipitated a feeling of exasperation in France, which, had it eventuated in war, would inevitably have embroiled England. The prolonged negotiations or 'conversations' between the 2 countries resulted in Germany agreeing to forgo her claims in respect of Morocco, in exchange for which certain portions of Fr. Congo were ceded to her. Pop. 5626.

Agallochum, see **ALOE WOOD**.
Agalmatolite (Gk *agalma*, image; *lithos*, stone), or **Pagodite**, soft mineral, hydrous silicate of aluminium, grey to pale green and red, which is used in China in the sculpture of small statues and other objects.

Agama, genus of lizards of the family Agamidae (q.v.), native to Africa and India. It is of sombre colour, has a triangular head, a conical tail covered with scales, is capable of inflating the skin, and inhabits ruins and rocky places.

Agamedes, legendary son of Erginus, King of Orchomenus, with his brother Trophonius was regarded as a supernaturally gifted architect. They built a treasure house for the King of Myria in Boeotia and systematically robbed it by means of a loosened brick. A. being caught, his brother cut off his head, to avoid identification of the body, and fled, but was swallowed up by an earthquake. According to Cicero, the two brothers built a temple to Apollo at Delphi, and prayed the god to grant them whatever reward was best for man. This was promised them on a certain day, and on that day they died.

Agamemnon, according to Homer son of Atreus, King of Mycenae, and grandson of Pelops. After the murder of Atreus, A. and his brother Menelaus went to Sparta, where A. married Clytemnestra, sister of Helen. He became King of Mycenae, and Commander-in-Chief of the Greeks against Troy. At Aulis, where the expedition assembled, A. killed the favourite stag of Artemis, for which a pestilence and calm delayed his start. To appease the goddess A. consented to sacrifice his daughter Iphigenia (q.v.). The army then sailed to Troy, and the quarrel between A. and Achilles is one of the most memorable events of the *Iliad*. When Troy was taken A. received Cassandra, daughter of Priam, as his

prize; and on his return home he was murdered by Aegisthus and Clytaemnestra, his wife. His murder was avenged by his son Orestes, who killed Aegisthus and Clytaemnestra. A. may have been an historical character.

Agami, the native name for the trumpeter of tropical S. America, to which Latham has given the name of *Psophia crepitans*. It belongs to the Gruliformes, and is closely allied to the cranes. It is a beautiful, many-coloured bird, gregarious, easily tamed; it chooses mts and upland forests for its home, and feeds on insects and fruit. The eggs, 10 to 16, are laid in a scratched-out hole, the young are covered with down, and the mature bird is about the size of a pheasant. Its name is obtained from its trumpet-like cry.

Agamidæ (Gk *a*, without; *gamos*, marriage; *eidos*, form), family of lizards, which has the agama (q.v.) for its type. It includes the *Chlamydosaurus* of Australia, which runs on its hind legs and has a curious frill on each side of its neck; the *Draco*, or flying dragon, common to Malaya; the *Moloch*, an Australian lizard, whose body is covered with large spikes; and the *Calotes* of India, which changes its colour.

Agana, or San Ignacio de Agana, fortified cap. of Guam, Ladrone Is. Its port is the U.S. base at Apra. Pop. 9000.

Aganippe, a celebrated fountain in Boeotia. It is situated at the foot of Mt Helicon, and was sacred to the muses, who were sometimes on that account referred to by anct writers as Aganippides.

Agapanthus (Gk *agapê*, love; *anthos*, flower), genus of African plants belonging to the Liliaceae. *A. orientalis* and *A. campanulatus* are grown in gardens.

Agape, Gk for love, used also in N.T. and primitive Church to signify love feasts connected with the Lord's Supper, at which the rich supplied food which the poor shared. For a time the A. and the Lord's Supper were celebrated consecutively during the evening, but human frailty led to scandals which St Paul deals with in 1 Cor. xi. Whether he himself separated the A. from the Eucharist at Corinth, when he arrived there later, is uncertain. From the 3rd cent. the banquets deteriorated in character, and the whole ceremony was banned by the Church. Cf. Jude xii.

Agapemonites, name given to persons who were members of a community which was founded by H. J. Prince, a former clergyman of the Church of England, and his rector, Starkey, at Charlifh near Bridgwater (Somerset) in 1846. The community lived in a single building, sharing their possessions under the leadership of Prince, whom they termed 'the Lord.' Agapemone, the name of the community, means 'the abode of love.' There were similar societies in England before this one, e.g. the Family of Love (q.v.) in the 16th cent., and also a later one about 1896 known as 'The Children of the Resurrection,' who built a place at Clapton which they called the Ark of the Covenant. It is not fully estab. whether Prince really permitted or proclaimed free

love at the Agapemone, but that there were serious breaches of decorum and manners there is evidenced by the proceedings taken in the Chancery Court in 1860.

Agapetae (from Gk for 'beloved'), virgins of the early Church, who were associated with bishops, priests, and deacons, to whom they were bound by ties of spiritual love, and to whose material needs they ministered. The institution was later abused; having been denounced by sev. councils and Fathers from the 4th cent. onwards, it was finally suppressed by the Lateran Council of 1139.

Agapetus, name of two popes. *Agapetus I.*, St (535-6), assisted in the estab. of a library of eccles. books at Rome and deposed Anthimus, the patriarch of Constantinople. He d. at Constantinople, where he had been sent by Theodahad, King of the Goths. The Rom. Catholic Church celebrates his festival on 20 Sept., the Greeks on 22 April.

Agapetus II (946-55), Roman by birth, appealed to Otto the Great of Germany against Berenger II, King of Italy, and attempted to free Rome and the papacy from degradation.

Agar-agar, otherwise known as Bengal or Japan isinglass. It is obtained from certain algae (*Gigartina speciosa*, *Gracilaria lichenoides*). It is similar to gelatine, though it requires more heat to liquefy it after it has once assumed jelly form. Its prin. use is as an artificial culture medium for bacteria.

Agardh, Karl Adolf (1785-1859), Swedish botanist, b. in 1785 at Båstad. He became prof. of botany there in 1812. Later he entered the Church, becoming Bishop of Karlstad in 1834. He wrote voluminously upon the algae, and on these great works our present knowledge of that botanical div. is based. His son, Jacob Georg, succeeded him in the professorial chair (1854-79).

Agaricus (synonym *Psalliota*), genus of fungi, family Agaricaceae of the Basidiomycetes, mostly known as mushrooms. *A. campestris*, common or field mushroom, *A. hortensis*, cultivated mushroom, *A. arvensis*, horse mushroom, *A. subvicolæ*, wood mushroom, *A. sylvatica*, brown wood mushroom, *A. pratensis*, fairy ring mushroom, and *A. haemorrhoidaria*, bleeding mushroom, are edible; while *A. xanthoderma*, yellow-staining mushroom, and *A. flavescens*, saffron-yellow-staining mushroom, are often poisonous to some people.

Agasias, Gk sculptor of Ephesus of the 1st cent. BC. The statue called 'The Borghese Gladiator,' now in the Louvre, was his work.

Agassiz, Jean Louis Rodolphe (1807-1873), celebrated naturalist, b. at Moutier in Switzerland. He was educ. first at home, and afterwards at the academy of Lausanne. He adopted medicine as a profession, studying at Zürich, Heidelberg, and Munich. In 1829 he took the degree of doctor of philosophy, and in the following year that of doctor of medicine. From that time he gave his energies to

the study of ichthyology, and became the most eminent authority on the subject. He was asked, previous to graduating, to complete a hist. of the freshwater fish of Brazil, which had been undertaken by Spix, who d. while on the work. His brilliant success earned recognition from Cuvier, who became his friend. In 1831 he accepted a professorship at Neuchâtel. He gained the London Geological Society's Wollaston Prize by the pub. of his *Researches on the Fossil Fishes* (5 vols. of this work appeared between 1833 and 1844). In 1840 he began a study of the glaciers of the Alps, expressing his views in the *Études sur les glaciers* and his *Système glaciaire*. Previously (1839) he had written a *History of the Freshwater Fishes of Central Europe*. In 1846 he went to America and delivered a course of lectures on zoology at the Lowell Institute, expounding his theories on the 'Plan of the Creation.' These lectures were most successful, and in 1848 he was appointed to the chair of zoology and geology at Harvard, and made expeditions of a scientific nature to Lake Superior. Distinction after distinction followed, and he had to decline invitations from Paris and Zürich to accept professorships. Incessant work had meanwhile undermined his health, and a holiday, afterwards an organised scientific expedition to Brazil, was arranged. He d. at Cambridge, Massachusetts, while engaged on the compilation of *Contributions to the Natural History of the United States*.

His son Alexander (1835-1910) was b. at Neuchâtel, and graduated at Harvard in 1855, studying chem. and engineering. In 1859 he became an assistant in the U.S. Coast Survey, taking a great interest in mining. (Incidentally he amassed a fortune from some copper shares which he held.) He made a collection of Peruvian antiquities for the Harvard museum, and became its curator. Among his other interests riv. dredging and deep-sea research occupied a large place. His works include a *Review of the Echini*, 1872-4, *Seaside Studies in Natural History*, 1865, and *Marine Animals of Massachusetts Bay*, 1871.

Agastya, Brahmin saint, supposed to have written sev. Vedic hymns and to have been a pioneer teacher and writer of Tamil literature. He is still said to dwell as a *yogi* on the peak of Agastyamalai, a hill in Travancore. The construction of the pond called Vishnu Puskarni Tirth in Bombay is accredited to him.

Agate, James Evershed (1877-1947), journalist, b. Manchester. He was educ. at Giggleswick and also studied music. Dramatic critic successively of the *Manchester Guardian*, the *Saturday Review*, and finally the *Sunday Times*, he also wrote novels and essays. His diary *Ego*, which ran to 9 vols., one appearing after his death, contains miscellaneous reflections on contemporary men and affairs.

Agate, one of the varieties of chalcedony, a form of silica SiO_2 . Most A.s exist in rounded nodules or in veins in volcanic rocks. They are probably

formed by deposits of water containing silica in lava when viscous. When depositions have not occurred sufficiently to fill the hollow in the lava, the A. is hollow. The stones are easy to polish and a considerable industry in A.-working has been carried on in Germany around Oberstein. At the present day, however, the A.s themselves are imported from Brazil. Naturally unattractive A.s are artificially stained, an art which is of ancient origin. The colorations are many, the chief being dark brown, red, blue, green, and yellow, while the appearance of others gives rise to the names star A.s, moss A.s, and clouded A.s. Many are found in Scotland under the name of 'Scotch pebbles.' Besides ornamentation, A.s are used in the making of knife-edge fulcrums for delicate balances, and for the manuf. of small pestles and mortars. Some of the finest A.s come from Ontario, a dist. on the edge of Lake Ontario being called A. Bay. India, New S. Wales, Queensland, and Africa also produce A.s.

Agatha, St. the patron saint of Catania, Sicily. According to a legend she was a Sicilian noblewoman of great beauty, who refused the love of the Rom. prefect. She was sentenced to be burnt alive, but at the application of fire to the stake an earthquake occurred. She d. in prison, and her name is found in the martyrologies of both the E. and the W. Church, and in the Canon of the Rom. Mass. Her feast is on 5 Feb.

Agatharchides, or **Agatharchus** (2nd cent. BC), Gk historian and geographer, b. at Cnidus. Extracts of his work on *Asia*, *Europe*, and the *Red Sea* have been preserved by Photius, who commends his style, modelled on that of Thucydides.

Agathareus, Athenian painter of the 5th cent. BC. Vitruvius says he was the first painter to execute scene-painting, but his work in this direction would be the wooden front of a stage building which could be used on all occasions. Alcibiades, it is said, forcibly compelled him to paint the interior of his house, which testifies to the popularity of the decorative painting of rooms.

Agathias (AD 536-81), Byzantine historian and poet, b. at Myrina in Asia Minor. He studied law, and practised in the courts of Constantinople. Literature, however, became his favourite pursuit. He wrote sev. short love-poems called *Daphniaca*, and compiled an *Anthology of Epigrams*. He also wrote a hist. of his own times in 5 vols., which is the chief authority on the period 522-58. This has been ed. by L. Dindorf in vol. II of *Historici Graeci Minores*, 1871. The poetry is ed. with trans. in vol. III of W. R. Paton's *Greek Anthology* (Loeb Library), 1917.

Agathis, Kauri Pines, family Pinaceae, a genus of conifers with broad, lance-shaped, leathery leaves, native to the E. Indies and Australia. *A. alba*, Amboya Pitch Pine, *A. australis*, Kauri or Cowrie Pine, and *A. resinosa*, Fijian Kauri Pine, are sources of resin for varnish.

Agathocles (361-289 BC), tyrant of Syracuse, was b. at Thermae in Sicily.

His father was a potter, and A. was put to the same trade, afterwards serving in the army. In 333 he married the widow of his patron, Damas, a distinguished and wealthy citizen. Banished from Syracuse for endeavouring to overthrow the oligarchy, he returned in 317 at the head of an army, and within a few years subjugated all Sicilian territory which was not in Carthaginian hands. In 311 A. was defeated by Hamilcar and besieged in Syracuse. But he managed to escape, and carried the war into Africa. After a number of successful campaigns he returned in 307 to Sicily, where his power was threatened by the revolt of sev. cities. His last years were embittered by domestic feuds, in the course of which his son was murdered by his grandson Agatharcus, at whose instigation, some authors tell us, he was himself poisoned. It is more probable, however, that he d. a natural death.

Agathodaemon, map designer of Alexandria who lived probably about the 2nd cent. AD. Ptolemy's *Geography* contains in the MS. 27 maps said to have been executed by A.

Agathodaemon, Gk spirit of good fortune for cornfields and vineyards. Wine was drunk in his honour after every meal.

Agathon (c. 447-400 BC), Athenian tragic poet, immortalised in Plato's *Symposium*, which is an account of a banquet given by A. to celebrate his first victory in 416 BC. Aristotle remarks on the originality of his plots, while Aristophanes considered his choruses 'voluptuous' and parodied them accordingly. See A. Nauck, *Tragicorum Graecorum Fragmenta*, 1926.

Agave, family Amaryllidaceae, genus of large rosette plants, sometimes called Century Plants, of which *A. americana*, Mexico, is well known, with long leathery leaves, flowering stems to 25 ft high, and roots with detergent properties, often used for washing. *A. sisalana* is the source of sisal, a strong fibre, and of the Mexican drink, pulque, made from the fermenting sap.

Agbatana, see ECBATANA.

Agde, Fr. tn in the dept of Hérault, on the Hérault, 4 m. from the Mediterranean. It has a considerable trade in wines. Pop. 7600.

Age, in common law, at which a marriage is valid is 16 years. The A. giving the privileges of an adult, and at which a person ceases to be an 'infant' in the eyes of the law, is 21; the computation of these years is curious, for the day of birth is included and fractions of a day are unconsidered, so that a person may attain his majority nearly 2 days before his twenty-first birthday. The canonical A. in the Rom. Catholic Church is 21 for a sub-deacon, 22 for a deacon, 24 for a priest, 30 for a bishop. In the Anglican Church a man may become a deacon at 23 and a priest at 24.

Age, in physiology, is divided into 5 periods of development and decay in humankind—infancy, which extends to the end of the seventh year, and childhood

to the fourteenth; adolescence in males and females varies, but averages to about the twenty-first year, adult life to about 50 years, and after that period comes old A. The limits of human existence are unknown, but Thomas Parr ('Old Parr'), the oldest known Englishman, whose dates are not properly authenticated, is said to have d. at the A. of 153. Cases of persons attaining a century of existence are of common occurrence.

'Age.' The, Melbourne, influential independent morning newspaper, founded 1854. Extensive coverage is given to international and Australian affairs, with special attention to political and financial news. It has estab. a reputation for its authoritative leading articles and its literary pages.

Age of Animals is difficult of determination, as it can be studied only in creatures in captivity, the unnatural conditions tending to shorten life considerably. Among the low forms of life a sea anemone (*Actinia mesembryanthemum*) lived in captivity from 1828 to 1887 in the botanical gardens of Edinburgh, while a clam, *Tridacna gigas*, lived for a century; oysters and edible snails exist for about 4 years, and crabs can attain 50 years. Insects frequently die after a few hours or months, though the larva may have endured for sev. years. Lord Avebury kept an ant once for 15 years; among bees the workers die after 6 weeks, while the queen may reign for 5 seasons. Fish are usually devoured by larger species, but the more ferocious sometimes survive for an enormous period, a pike having been reported to live for 267 and a carp for 200 years. But these figures are not reliable. Tortoises have been known to live for more than 100 years, and most likely can reach 2 centuries; frogs die sooner than toads, which may live for 36 years.

Small birds, such as canaries, average about 15 years in captivity, though parrots and swans may live for 80 years. Prolific animals are usually short-lived, swine seldom passing 20 years; large rodents, such as hares and rabbits, 10 years; small rodents, such as rats and mice, 5 years. Among domestic animals, cats may live 12 to 25, dogs 16 to 18, horses and asses 15 to 30, cattle 25 to 30, sheep and goats 12 to 14, deer 10 to 15 years. Wild animals, such as the elephant and the hippopotamus, cannot be fairly judged in captivity, but under such a condition they have attained 35 years, and one elephant lived for 69 years. Monkeys soon die when in this cold climate, and lions do not here reach their estimated 30 years.

The determination of the A. of domestic animals is usually accomplished by noting their dentition. In sheep and goats the incisors appear during the first month, the first permanent molars by the sixth month, the milk-teeth fall at the A. of 2 years, the true molars are complete in the fifth year. The milk-teeth of a dog come out between the third and fourth month, and the animal ceases to be a puppy at the ninth month. In horses the

front incisors appear at the end of 8 days, the middle at the end of 5 weeks, the back between the sixth and eighth month. They show signs of wear in order of appearance; at 2 to 2½ the front teeth fall and are replaced; at 3½ to 4 the middle teeth fall, and at 4½ to 5 the back incisors. At 6, 7, and 8 respectively the front, middle, and back teeth decay. In cattle both dentition and the rings on the horns indicate A., the first ring appearing at the A. of 3. The A. of a stag can be ascertained approximately by the branches of the antlers up to the seventh year, but the oldest stag never has more than 10 or 12 branches. See G. L. L. Buffon, *Histoire naturelle*, 1749, and Sir E. Ray Lankester, *Comparative Longevity in Man and the Lower Animals*, 1870.

Age of Discretion in Law is the time at which an infant is supposed to have attained sufficient understanding to judge the morality of his actions. A child under the A. of 8 is presumed to be incapable of criminal responsibility; a child of 8 years of A. but less than 14 is *prima facie* incapable of criminal liability, but this can be rebutted by evidence that such a child knew that he was doing wrong. It is a misdemeanour for one over 16 years of A. to ill treat a child under 16 who is in his charge. A person under the A. of 21 cannot be sued on a contract except for necessities (e.g. food, clothing, apprenticeship). Such a person if made party to a civil action must be represented by someone over 21.

Age of the Earth. The most recent estimate puts the A. of the E. at 4500 million years. Rocks have been forming on or within the crust of the earth from early times to the present, and various techniques have been employed to establish their A. The absolute A. of a rock, or the time that has elapsed since its formation, may be found if it contains any mineral in which a radioactive element is present, which can be extracted together with the product of its radioactive decay. The ratio which the radioactive element bears to its breakdown product will be a function of the time which has elapsed since breakdown began and hence of the A. of the rock. Uranium, thorium, and the radioactive isotope of potash (K 40) are elements which have been used to provide data of this nature. The relative A. of rocks can be found by observation of their relations in the field, which will often show the sequence in which they formed. This was appreciated first by Wm Smith (q.v.) in the 18th cent. when he realised that the youngest rocks in a succession of beds must be those at the top of the sequence. The relative A. of fossiliferous rocks may be estab. by comparison of their fossil faunas. However, many rocks are unfossiliferous, particularly those deposited on land, and usable fossils are not known from rocks formed in the first 4000 million years of the earth's hist. in Pre-Cambrian time. Our knowledge of Pre-Cambrian chronology is thus largely dependent on radioactive determinations.

Age of Trees may be computed, in temperate zones, by counting the annular

or growth rings at the base of the stem. These rings are formed by the difference in colour and cell structure between the spring and summer wood. In some woods the difference is marked; in others it is not apparent. Tropical woods do not often form ann. rings, as the alternation of the seasons is not sharply marked as in temperate lands. Many trees attain a great A. The Big Tree of Tule in Mexico, a species of *Taxodium*, is reputed to be 6000 years old, while the *Sequoias* of California are thought to exceed 3000 years in some cases. See FORESTRY and TREE.

Agen, Fr. tn, cap. of the dept of Lot-et-Garonne, on the Garonne. It is the seat of a bishopric. It has chemical manufs., and is known for its preserved fruit. Scaliger and Jasmin (qq.v.) were b. here. Pop. 33,400.

Agent. An A. is one who is authorised by another to do acts for him and in his name, the person who authorises him being called the principal or constituent. There are many kinds of A.s, public and private, and they are known by many names, such as broker, bailiff, factor, ambas., consul, etc., and the title of A.-general is borne by many Brit. colonial officials who represent the self-governing colonies in the home country. For transactions other than those of minor importance it is usual for an A. to receive his appointment in writing, and an A. by deed cannot bind his principal otherwise than by deed. The granting of such instructions is called the granting of 'power of attorney.' An A. acting under a commission *del credere*, i.e. undertaking to be surety to his principal for the solvency of his principal's customers, is, in these customers' default, held accountable for debt, but in all other cases he is not liable. As a general rule the act of an A. is considered as an act of the principal, and the principal is in general liable for damage occasioned to third persons by the negligence or unskillfulness of his A. See COMMISSION.

Agent Provocateur, one employed, during political or social conflicts, in the guise of an adherent, to stir up compromising action. The method was in vogue in Tsarist Russia when the Gov. used A.s P.s to foment risings to use as the excuse for suppressing revolutionary movements. They have also been used in other countries in the struggle between govts. and revolutionary movements. Also, in labour disputes, their purpose is to try to induce strikers to commit unlawful acts, so provoking armed clashes. In international politics A.s P.s have been used to provide pretexts for interventions.

Ageratum, genus of ann. or biennial plants, family Compositae, chiefly Amer. *A. houstonianum* and varieties are popular garden half-hardy anns.

Ages of the World, periods into which the hist. of the world is divided, each period being marked by some special feature. The idea originated among the Greeks, and in the works of Hesiod 5 periods are mentioned: 1. The Golden Age, when Saturn reigned, was a time of perfect

innocence and happiness, without work. 2. The Silver Age, when Jupiter reigned, was a time of godlessness, when troubles and labour commenced. 3. The Brazen Age, when Neptune reigned, in which war, violence, and lawlessness prevailed. 4. The Heroic Age, which was an improvement on the Silver and Brazen A. 5. The Iron Age, when Pluto reigned and Hesiod himself lived, was the most miserable and wicked of all, for virtue had gone out of the world. Ovid, in his *Metamorphoses*, mentions the Golden, Silver, Brazen, and Iron A. European hist. has also been divided into periods: The Middle A. (q.v.), or the period after the fall of Rome until the 15th and 16th cents., which were marked by the Reformation and the discovery of America. The Dark A. (q.v.), a period marked by the decline of classical learning and civilisation, extended from the invasions of the barbarians into Europe until the time of the Renaissance. It is also common to speak of such periods as the Homeric Age, the Augustan Age, and the Elizabethan Age; and also the Stone Age and the Bronze Age.

Agglomerate consists of a large mass of blocks or bombs of all sizes and shapes. It is of volcanic origin, and is frequently found in the necks of the craters of ancient volcanoes. These blocks sometimes consist of igneous rocks, sometimes of sedimentary rocks, and sometimes of both.

Agglutinative Languages are those languages which combine into a single word various linguistic elements, each of which has a distinct fixed connotation and a separate existence: e.g. in Basque the word *ponetekitlakoakin* means 'with him who has a cap (*ponet*)'. The prin. A. L. are the Mongolian, Turkish, Finnish, Hungarian, N. Amer., the Dravidian (Tamil and Telegu, etc.) In S. India, and some other languages.

Aggression, term first used officially in the treaty of Versailles, 1919, which speaks of 'the aggression of Germany.' It is incorporated in the Covenant of the now defunct League of Nations, member states undertaking 'to respect and preserve against external aggression the territorial integrity and existing political independence of all members' (see COVENANT OF THE LEAGUE OF NATIONS). The Mutual Assistance Pact, 1923, and the Geneva Protocol, 1924 (q.v.), were vain attempts to found the definition of an 'aggressor nation' on rejection of arbitration. In 1944 the Dumbarton Oaks Conference produced a plan that, unlike the 'call to repentance' of the Covenant, invoked no principles, but contained practical arrangements for restraining an aggressor. The conference looked to a 'Security Council' to decide whether the conduct of a nation amounted to A. and, in fact, alone to shoulder the burden of keeping the peace. These proposals were incorporated in the following year in the Charter of the United Nations. See SAN FRANCISCO CONFERENCE AND UNITED NATIONS CHARTER.

Aggtelek, vil. of Hungary, in Borsod-Abaúj-Zemplén co., 25 m. NNW. of

Miskolc (q.v.). Its famous stalactite caverns, known as the *Baradla* caverns, extend for 14 m. (of which 4 m. are in Czechoslovakia). Another separate cave system has been discovered near by.

Aghrim, see AGHRIM.

Aghuat, El, see LAGHOUAT.

Agia Wood, see ALOES WOOD.

Agincourt (now Azincourt), Fr. vil. in the dept of Pas-de-Calais, 33 m. NW. of Arras. Pop. 110. It is famous for the battle in which the Eng. forces of Henry V defeated a vastly larger Fr. army, 1415. See further under AGINCOURT, BATTLE OF.

Agincourt, Battle of, fought 25 Oct. 1415 between an Eng. army, under Henry V, and a much larger Fr. force, resulting in a decisive Eng. victory, which opened the way for an Eng. conquest of virtually all France.

The battle began with dense flights of arrows from the Eng. archers. The heavily armoured Fr. knights replied with a charge, but their horses sank into the muddy ground and their immobility made them an admirable target for their opponents. The result of the battle was decided within about the first half-hour. Contemporary records make it clear that Henry V had inspired his little army (which had previously marched for 17 days with only one day's rest, covering 260 m. in that time) with a religious, patriotic fervour similar to that with which Joan of Arc was subsequently to inspire the troops under her command.

The French, on the other hand, were clearly over-confident. The battle was ruthless; at one point Henry ordered that no prisoners must be taken. Fr. losses were said to have been about 10,000 killed and 1000 prisoners, including Charles, Duke of Orleans (see under ORLEANS, DUKES OF). Eng. losses were probably a few hundred. Henry V showed great personal bravery in the battle. See A. H. Burne, *The Agincourt War*, 1956.

Aginskoye, Russian vil. in the Chita Oblast of SE. Siberia, 75 m. SE. of Chita, cap. of A. Buryat-Mongol Nat. Dist. (formed 1937), and local cultural centre. Founded 1811. Pop. (1956) 4000.

Agio (It.), term denoting difference between (i) actual and face value of money; (ii) the metallic moneys of different countries; also appreciation or depreciation from fixed rates of exchange.

Agira (formerly San Filippo D'Argiro; anct *Agyrium*), tn of Sicily (q.v.), 15 m. NE. of Enna (q.v.). It has a ruined Norman castle, and has sulphur mines and marble quarries. It was the bp. of Diodorus (q.v.). Pop. 16,200.

Agis, name of 4 Spartan kings, of whom the first is legendary, being supposed to have reigned in the 11th cent. bc. The historical A. I (or II), who reigned 427-397 bc, was a distinguished general, and led the Spartan army at the battle of Mantinea. A. II (or III) (338-331 bc) was a prominent member of the league of the Grecian states against Alexander the Great, and defeated the Macedonians under Corragus. He was killed in battle

at Megalopolis. A. III (or IV), the most noted, who reigned 245-241 BC, endeavoured to remedy the poverty of the Spartans by a system of land redistribution, but his schemes were suspected of being dangerous to the welfare of the state, and he was put to death.

Agistment (law), agreement entered into with an owner of land, whereby the latter, known for the purposes of such agreement as the agistor, allows cattle to pasture and lie on his land; also, the profit accruing to a landowner from such transaction. In this latter sense the word applied formerly more especially to pasturage in the royal forests.

Agitator, in Soviet Russia a person engaged professionally or voluntarily (see ACTIVIST) in the political indoctrination of the people on behalf of the Communist party.

Agnadello, It. vil. in Lombardy (q.v.), 19 m. NW. of Cremona (q.v.). It was the site of 2 famous battles: the defeat of the Venetians by the French under Louis XII (q.v.) on 14 May 1509; and the defeat of Prince Eugène (q.v.) by the French under Marshal Vendôme (q.v.) in 1705.

Agnano, Lake, situated in the crater of an extinct volcano near Naples (q.v.), was drained in 1870 on account of its malarial properties. The waters are now used for remedial baths. On its shore is the famous Grotta del Cane (q.v.).

Agnate (law). *Agnati* signified in Rom. law persons related through males only, *cognati* (cognates) being those in whose relationship one or more female links intervened. The distinction between *agnati* and *cognati* was founded on the peculiar institution of *patria potestas*. See FAMILY and TWELVE TABLES.

Agnatha, class of primitive, fish-like, jawless vertebrates, including the living Cyclostomes (lampreys and hagfishes) and the fossil ostracoderms (q.v.).

Agnes, St. Christian virgin in the reign of Diocletian, was, according to legend, in her thirteenth year publicly humiliated and martyred in Rome for refusing the praetor's heathen son. Her name occurs in the Canon of the Rom. Mass. Her *Acta* are untrustworthy. Her feast is on 21 Jan.

Agnesi, Maria Gaetana (1718-99), It. scientist and scholar, b. Milan. In 1780 she succeeded her father in the chair of mathematics and natural philosophy at Bologna. Her prin. work was the mathematical treatise, *Istituzioni analitiche ad uso della gioventù italiana*, 1748.

Agni, in the Hindu religion god of the fire of sun and lightning.

Agnolo, Baccio d' (1462-1543), b. and d. Florence, where he practised wood-carving and architecture. His prin. wood-carvings are the choir-stalls and organ case at S. Maria Novella, Florence. His chief buildings are the Bartolini and Borgherini palaces in Florence; the Bartolini and Borgherini villas outside Florence; and the *campanili* (bell-towers) of S. Spirito and S. Miniato in Florence. In 1506 he took charge of the building work of the cathedral at Florence.

Agnone, It. tn in Abruzzi e Molise (q.v.), on a W. slope of the Apennines, 22 m. NW. of Campobasso (q.v.). It has copper mines, and sulphur and other mineral springs. Pop. 9600.

Agnosticism, the name invented by T. H. Huxley in 1869 for the doctrine (in itself old) that man does not and cannot in the nature of things know anything about a spiritual existence, either of God or man or of any after-death state. The term would appear to have been suggested to Huxley by the Gk words *agnōstō theō* (to the Unknown God), which we learn from Acts xvii. 23 was the inscription which St Paul found upon an altar in Athens. Certain it is that the teaching of agnostics is fundamentally contrary to that of the Gnostics (q.v.). The latter was an intensely mystical doctrine of the early Christian Church that claimed special revelation of the nature of the divine, whereas the agnostic asserts that man's only cognition can be of the phenomenal world. This is not to say that there may not be a noumenal entity or soul behind the phenomenal—a First Cause—the 'thing in itself' of Kant; in fact, the agnostic would repudiate as dogmatic materialism or atheism (q.v.) the denial of this possibility. His one answer to all such questions is that we do not know and there are so far no reasonable grounds for believing that we shall ever know. In other words man, being finite, can never comprehend the Infinite. In this country A. had many able exponents in the seventies and eighties of last century, chief among them being Huxley, Tyndall, and Herbert Spencer. The 'Belfast Lectures' of Tyndall and Spencer's *First Principles* did much to popularise A., but most of the conclusions of modern A. may be found in the works of Kant, the great Ger. philosopher. Two books for and against the theory are *An Agnostic's Apology*, by Leslie Stephen, 1893, and Dr James Ward's Gifford Lectures, 1899, entitled *Naturalism and Agnosticism*.

See also R. Flint, *Agnosticism*, 1903, and F. von Hügel, *The Reality of God and Religion and Agnosticism*, 1931.

Agnus Dei (Lamb of God), a title of Jesus given in John i. 29. This passage forms one of the prayers in the Canon of the Mass, also called the *Agnus Dei*. The term also denotes the symbol of Christ risen (a lamb supporting a banner), and the waxen tablets bearing this image distributed by the Pope at Easter, and worn as medallions.

Agonic Lines (Gk *a*, without; *gōnia*, angle), irregular imaginary lines on the earth's surface, passing through the magnetic poles on which the magnetic needle shows no deviation or declination, i.e. points true N. and S.

Agora, public market- and meeting-place of auct Gk cities. The most famous is that of Athens which has been excavated, and where the Stoa of Attalus has been restored by Amer. archaeologists. See the *Journal of the American School of Classical Studies at Athens*, 1932 onwards.

Agoraphobia (Gk *agora*, public place;

phobos, fear), neurosis characterised by fear of crowded open spaces.

Agosta, see AUGUSTA.

Agouti, Marie Catherine Sophie de Flaviigny, Comtesse d' (1805-76), Fr. writer, b. Frankfurt. She was educ. in a Paris convent. She left her husband, Comte d'A., to live with Franz Liszt; by him she had 3 children, of whom Cosima married, as her second husband, Richard Wagner. Under the pseudonym Daniel Stern she pub. *Nélida*, 1846, *Lettres républicaines*, 1848, *Esquisses morales*, 1849, and *Histoire de la révolution de 1848*, 1850-3. *Mes souvenirs*, 1806-33, was pub. in 1877 and *Mémoires*, 1833-54, in 1927.

Agouti, S. Amer. rodent of the genus *Dasyprocta*, belonging to the same family as the guinea-pig. It does considerable damage among sugar plantations.

Agra, tn of Uttar Pradesh state, India, situated on the Jumna R., 840 m. NW. of Calcutta. A. was for 150 years the cap. of the Mogul rulers, but was superseded in 1658 by Delhi as the seat of their gov. It was captured from the Mahrattas by Lord Lake in 1803, and was unsuccessfully besieged for some months during the Mutiny. Its most famous feature is the wonderful Taj Mahal (q.v.), the marble tomb built for his favourite wife by Shah Jehan which for sheer beauty is justly accounted one of the wonders of the modern world. Other outstanding architectural features of the city are the Moti Masjid, or Pearl Mosque, and the Jama Masjid, or Great Mosque. In the suburb of Sikandra is the mausoleum of the city's founder, the Emperor Akbar. The old city of A. covered 11 sq. m., half of which is still inhabited; the fort has a circuit of over a mile, with walls 70 ft high. The modern city, which is a busy railway and commercial centre, has fine buildings and hotels, and is well known for its carpets, gold and silver embroidery, and inlay work on white marble.

Agra and Oudh, United Provinces of, see UTTAR PRADESH.

Agram, see ZAGREB.

Agarian Laws, see LAND LAWS.

Agreement, see CONTRACT.

Agricola, Georgius (1494-1555), Ger. metallurgist, his Ger. name being Georg Bauer, b. 24 Mar. 1494 (some biographers give the year 1490, but the best authorities accept 1494) at Glauchau, Saxony, and educ. at Leipzig Univ. Studied philosophy, medicine, and natural science in Italy. Became tn physician in Bohemia in the midst of a mining dist., where he studied the mines and metallurgy. In 1530 there was pub., by Froben at Basel, his dialogue *Bermannus*, a catechism of mining. In 1533—about which time he became city physician of Chemnitz—he issued *De Mensuris et Ponderibus*; and then he began writing his chief work, *De Re Metallica*, which, however, did not appear till after his death. *De Ortu et Causis Subterraneorum*, in 5 books, was pub. 1546. He was a member of the diet of Freiburg, went afterwards on political missions to sev. foreign princes, and attended diets at Leipzig, Torgau,

and Dresden. An Eng. trans. of *De Re Metallica*, by Herbert Clark Hoover (later president of the U.S.A.) and Lou Henry Hoover, was pub. with the original illustrations in a thick folio vol. in 1912.

Agricola, Gnaeus Julius (AD 37 or 39-93), Rom. soldier and statesman, b. Forum Julii (Fréjus). In 59 he served under Suetonius Paulinus in Britain; was quaestor in Asia 63, tribune in 65, praetor in 68. Two years later he was placed in command of the XXth legion in Britain. Returning to Rome in 73, A. was raised to patrician rank (his family had hitherto belonged to the equestrian order), and served as governor of Aquitania from 74 to 78. In 79 he was consul suffectus, and was appointed governor of Britain. Here he spent at least 7 years, consolidating Rom. power, and, in the intervals of campaigning and exploring, contributed much to the romanisation of the prov. His success aroused the jealousy of Domitian, who recalled him to Rome, where he spent the remainder of his life in retirement. Shortly before his appointment to the gov. of Britain A. gave his daughter in marriage to the historian Tacitus (q.v.). See Tacitus, *Agricola* (trans. H. Mattingly), 1948.

Agricola, Johannes (1494-1566), pioneer of Protestantism, also known as **Magister Islebius**, from his bp. Eisleben, was educ. at Wittenberg and Leipzig. Sent by Luther to Frankfurt in 1525, to establish there the reformed religion, he preached awhile in Eisleben. In 1536 he was appointed to a chair at Wittenberg, but was compelled to resign in 1540 owing to his Antinomian controversy with Luther and Melancthon. He left for Berlin, where he became court preacher to the Elector Joachim II of Brandenburg. His best-known work is his famous collection of Ger. proverbs, 1528. See G. Kawerau, *Johannes Agricola*, 1881, and Latendorf, *Agricolae Sprichwörter, ihr hochdeutsche Ursprung*, 1862.

Agricola, Rudolf (1443-85), Dutch humanist, whose real name was Roelof Huysman, b. near Groningen. He was educ. at Louvain, then went to Paris and Ferrara, where he attended the lectures of Theodore Gaza on the Gk language, and at the same time lectured on the language and literature of Rome. He went to Heidelberg in 1482. A. is one of the founders of Ger. humanism, less perhaps through his works than through his personality. He trans. Gk poems into Latin, wrote a biography of Petrarch, and in his last years began to learn Hebrew. Besides being a scholar he was also a musician and a painter.

Agricultural Adjustment Act, Act passed by the U.S. Congress in 1933 in order to assist Amer. farmers. It provided for the setting up of an A. A. Administration to regulate prices of agric. products, partly by subsidising farmers in consideration of restricting cultivated acreage in accordance with a policy of soil conservation, and partly by purchasing and storing surpluses. For these purposes the A. A. Administration spent some

\$500,000,000, annually. It was originally intended to secure reimbursement of the subsidy by taxes on industries engaged in processing agric. products, but the Supreme Court in 1936 declared these taxes void and funds had to be appropriated from other budgetary sources.

Agricultural Credit involves the problem of finding an adequate agric. substitute for the industrial joint-stock method of obtaining working as well as initial capital. These 2 capital needs of agriculture are met by the short-term, the co-operative, and the long-term credit.

Short-term credit is necessary to the farmer to finance marketing operations. Without this credit he may be forced to put his produce prematurely upon an unwilling market in order to meet his immediate liabilities. In the U.S.A. and Australia co-operative marketing associations receive the produce from the growers and make them an advance upon it. In Great Britain the best source of short-term credit is from the joint-stock banks. The security is that afforded by title-deeds, etc., or the loan may take the form of an overdraft. Agric. wealth—stocks and crops—is not a recognised security with a bank, except by a bill of sale, and the publicity attaching to this form of advance prejudices it in the eyes of the farmer.

Co-operative credit in Great Britain had some provision made for it under the Agricultural Credits Act, 1923. It was not successful, owing to the reluctance of the individual farmers to use the provisions, and the State has since withdrawn its financial support. On the Continent the co-operative system on the Raiffeisen model, originating in Germany, has been a conspicuous success, depending on the deposits of a large number of peasant proprietors rather than on the resources of the State, as in Great Britain.

Long-term credit is not the business of the joint-stock bank. In Great Britain there had been no machinery enabling the farmer to obtain long-term or intermediate credit, necessary for farm purchase or permanent improvement. Provision is made under the Agricultural Credits Act, 1928, for long-term loans to be made to farmers by an agric. mortgage loan company, assisted financially by the Treasury. Under this Act the farmer's short-term requirements are also met by a floating charge on his stock and crops available through the banks.

A proposal to inaugurate a Central Land Bank was put forward in the *Report on Agricultural Credit* (Economic Series No. 8), pub. by the Ministry of Agriculture in 1926. The sequel was the creation of the Agric. Mortgage Corporation—the first agric. mortgage bank to be estab. in Great Britain. The corporation is owned by banks and the dividend was limited to 5 per cent, subsequently reduced to 3½ per cent under the Agriculture (Miscellaneous Provisions) Act, 1944. See CO-OPERATION.

Agricultural Holdings (Scotland). In Scotland the prin. Act is the Agricultural

Holdings (Scotland) Act, 1949, which consolidates a series of statutes dating from 1883. As in England a tenant on leaving the holding is entitled to compensation for certain specified improvements. The amount payable is determined, failing agreement, by an arbiter appointed by the Secretary of State for Scotland. Compensation for disturbance and for damage by game is also payable as above. The Act allows a tenant freedom to practise any system of cropping subject to certain safeguards. It also defines the liabilities of landlord and tenant in regard to the provision and maintenance of buildings and other fixed equipment. Elaborate provisions are made for the regulation of notices to quit and the removal of tenants. The effect of this is to render eviction difficult. A tenant has power to bequeath his tenancy to any person subject to the landlord's right to object to the legatee, in which case the matter is decided by the Land Court. If not bequeathed the tenancy passes to the tenant's heir.

Special provisions are made for tenants of small holdings under the Small Landholders Act, of which the prin. one is that of 1911, and for crofters (q.v.).

Agricultural Holdings Act, 1948, consolidating Act which confers on tenants of A. H. a certain measure of security of tenure and rights of compensation for improvements and disturbance: (a) **Security of tenure.** A tenant of an agric. holding must be given at least 1 year's notice to quit. Within a month of service of the notice the tenant may, under section 24 of the Act, serve on his landlord a counter-notice that the notice shall not operate without the consent of the Ministry of Agriculture. Such a counter-notice is ineffective if the notice to quit is expressed to be given for, *inter alia*, breach of covenant, bankruptcy of the tenant, or a certificate of bad husbandry issued by the minister. (b) **Compensation for improvements.** A tenant on quitting his holding is entitled to compensation for new improvements made by him, but generally not if he himself terminated the tenancy. The improvements are classified: (1) long-term improvements for which the landlord's consent is required (e.g. planting of gardens or orchards); (2) long-term improvements for which consent of landlord or approval of minister is required (e.g. reclaiming waste land, installation of electric light or power); (3) short-term improvements for which no consent is required (e.g. chalking, liming, or artificial manuring of land). Compensation under (1) and (2) is the increase attributable to the improvement in the value of the land as an agric. holding. The compensation under (3) is based on the value of the improvement to the incoming tenant. (c) **Compensation for disturbance.** This is payable where a landlord gives notice to quit except for any reason which excludes the operation of a counter-notice. The amount of compensation is usually the equivalent of 1 year's rent, although in certain circumstances a disturbed tenant may

recover a sum equivalent to 2 years' rent. The tenant may claim compensation for damage caused by game which he has no right to kill. An outgoing tenant may, in certain circumstances and on giving notice to his landlord, remove tenants' fixtures.

Agricultural Machinery and Implements have undergone in the 20th cent. a rapid development, chiefly in the direction of adapting mechanical power (steam, petrol, or electricity) to their use. For motive power 3 classes of engines are used: the portable, tractor, and stationary. The portable engine, mounted on road wheels, when not needed for threshing can be belted up to any of the machines used on a large estate for such operations as sheep-shearing, wood-sawing, etc. The tractor is used for ploughing and harrowing, and can haul mowers, binders, etc. Steam ploughing has been largely superseded by motor-tractor ploughing. The type of tractor with a high-speed engine on a light frame certainly has advantages, but the heavy tractor, if the soil can carry it, saves expense in repairs. The stationary engine can be installed in the barn or shed to drive fodder and dairy machines. Generally small petrol engines or electric motors are used.

The various agric. implements may be classified under the following heads:

Tillage implements. Ploughing breaks up the soil into furrows, exposing it to the action of the atmosphere. Most ploughing is now done by tractors, but both plough and tractor must be adapted to the particular soil. Two distinct types of plough are the mouldboard plough and the disk plough, the former being more widely used. The function of grubbers, or cultivators, is to rend the soil with their curved teeth. The newest form of cultivator has a steel frame with sickle tines, able to penetrate the hardest ground. The spike-tooth or drag harrow is used to prepare the seed-bed after ploughing. The disk harrow is suitable for a stubble surface, and the spring-tooth harrow for hard or stony ground. Rollers are used to break up the clods and to smooth the surface after sowing. The most common type is the ring-roller. Various kinds of horse-hoes are used to stir the soil while the crops are still growing, at the same time destroying weeds.

Seeding machines. Seed-sowing machines scatter the seed either broadcast or in furrows, according to the class of seed sown and the crop required. The seed drill deposits the seed in the soil at equal depths, and there is a device for covering the seed with fine soil after it has been deposited. The potato planter can be hand-fed or fully automatic and plants the tubers at regular intervals. The machine may be adapted to apply fertilizer at the same time.

Harvesting Machinery. The self-binder cuts the standing corn and passes the cut corn on to a sheafing deck, where it is bound and knotted and finally ejected on to the ground. For hay harvesting the reaper works in connection with the

swath-turner and collector. There are also machines for loading, stacking, and pressing the hay. For potato-raising the machine is fitted with forks, which throw out the potatoes without bruising or scattering them. The sorter is a machine which grades 5 tons of potatoes per hour in 3 sizes.

Threshing machinery. The thresher separates the grain, chaff, and straw, and each is delivered separately from the threshing machine. The grain is collected in sacks and the straw baled before stacking.

Combine-harvester and pick-up baler. The spread of mechanised farming has led to the introduction of a variety of labour-saving machines, notably those which combine the operations of 2 or more existing ones. Amongst these is the combine-harvester, which combines the 2 operations of cutting and threshing grain (see REAPING). Another machine of this type is the pick-up baler, which picks up hay from wind-rows in the field and packs it into bales.

Manure distributors of various types admit of either broadcasting or drilling, and are able to deal with all kinds of fertilisers. The dung-spreader is simply towed by a tractor and distributes the manure evenly over a large strip of ground.

Food-preparing machines save labour in preparing food for the various animals. Such are grist-mills, chaff-cutters, root-pulpers, machines for slicing and shredding roots, breaking oil-cake, etc.

See also DAIRYING and CULIVNS. See H. J. Hine, *Tractors on the Farm*, 1942, and C. Culpin, *Farm Machinery*, 1952, and *Farm Mechanisation: Costs and Methods*, 1952.

Agricultural Research establishes the fundamental natural principles on which progress in agriculture must be based. It is allied with experimental work, which aims at directly improving farm methods. A. R. began with the experiments carried out in 1834 by Joseph Boussingault (q.v.) on his farm in Alsace. Since then institutes for research in agriculture have sprung up all over the world, and it is now the recognised duty of a state to develop its agric. resources. As regards Great Britain, a development fund was started in 1909 with a capital of £2,000,000, and State grants have been made increasingly to all research stations. A. R. is organised throughout the Commonwealth, and in 1927 an Imperial Research Conference was called with the object of providing 'a stimulus for the development and co-ordination of A. R. overseas in the interest of Empire trade and production.' In England, Wales, and Scotland the research institutes are controlled by independent bodies, usually attached to univ., but dependent on the State for funds. In N. Ireland the work is entirely administered by the Ministry of Agriculture for N. Ireland. The A. R. Council, created in 1931 as part of the organisation for the scientific supervision of Gov.-aided research in all spheres, advises the development commissioners

and the agric. depts upon the application of moneys voted by Parliament for the furtherance of A. R., besides itself promoting research with the aid of funds from Parliament or from any other source.

The problem of agric. science may be classified under the following heads:

Soil. The Rothamsted Experimental Station, founded by Sir T. B. Lawes (q.v.), is famous for its research into the chem. of the soil.

Plant-breeding. The Cambridge Plant-breeding Institute is especially important in breeding new cereal varieties, the general aim being the combination of high yield and good quality. Grassland farming is studied at the Welsh station, Aberystwyth, and the Scottish station, Corstorphine. The testing of new herbage plant strains and other work on pasture is largely the concern of the Grassland Research Station at Hurley.

Plant physiology, referring to the inner processes of growth, is studied at the Research Institute in Plant Physiology, London. Field experiments, allied to this work, with hay, barley, and wheat are conducted at Rothamsted, with oats at Llandudno, Dumfries, and with clover hay at Harper Adams College, Newport, Salop.

Fruit research is centred at Long Ashton, Somerset, at E. Malling, Kent—famous for research in layered root stocks—and at Cambridge, in connection with the fruit-growing area there.

Plant diseases have been combated by practical research throughout the U.K. Pests which affect glasshouse crops are investigated at Cheshunt Research Station.

Stock-feeding, in England, is the concern of the Animal Nutrition Institute at Cambridge Univ., and, in Scotland, of the Rowett Institute at Aberdeen Univ. As part of a pig research scheme, feeding trials are conducted at Harper Adams College.

Animal-breeding is the subject of extensive research at the Physiological Institute, Cambridge, while the work at the research station, Edinburgh, is noteworthy.

Dairying. Clean milk is an outcome of the activities of the National Institute for Research in Dairying, estab. at Reading in 1912. In 1920 a farm of 340 ac. and a dairy herd were acquired. In Scotland the Hannah Dairy Research Institute at Kirkhill undertakes important investigations, particularly into the nutrition and physiology of dairy cattle.

Animal Diseases. The Institute of Animal Pathology is at Cambridge, and the scope of research at the Royal Veterinary College, London, has been enlarged. The London School of Hygiene and Tropical Medicine, which studies animal and plant parasites, is equipped with field laboratories at St Albans. In Scotland the Animal Diseases Research Association, transferred to Moredun, near Edinburgh, now works in conjunction with Edinburgh Univ. In N. Ireland provision for the study of animal diseases is made at the State laboratories at Stormont, Belfast. In Mar. 1924 a committee of pathologists was appointed to investigate foot-and-mouth disease. Research was conducted

at the Gov. laboratories, New Haw, Weybridge, and at the Foot-and-Mouth Disease Experimental Station at Pirbright. See H.M.S.O., *The Agricultural Research Service*, 1953; also reports of individual research stations.

Agriculture (Lat. *ager*, field; *colere*, to cultivate) in the strict sense is the art concerned with tillage of the ground and the raising of crops, but is now generally understood to include every branch of farm practice, upon which all the natural sciences have more or less of a bearing, as epigrammatically summed up in the motto of the Royal Agric. Society, 'Science with Practice.' He who would pursue A., or the allied industries of horticulture and forestry, with the maximum success should not only realise the possibilities presented by advances in science and be conversant with every practical detail, but must also know how best to adapt his methods of procedure to local conditions.

History. In W. Europe, as elsewhere, a great stride was made in civilisation when prehistoric man, during the polished stone or Neolithic age, ceased to be a mere wandering hunter and adopted a more settled life, resulting from his discovery of the possibilities of tillage of the ground and domestication of animals. The Neolithic farmer lived in vil. communities, his habitations being sometimes in the form of lake dwellings; his domesticated animals included the dog, horse, ox, sheep, goat, and pig; his crops included wheat, barley, and millet; and he practised the arts of spinning, weaving, and pottery-making. Such primitive prehistoric beginnings, improved by numerous successive stages, ultimately led to the evolution of the vil. system prevalent in England during Saxon times and for long afterwards. The houses of the villagers clustered together in the centre of an area partly consisting of pasture, but to a larger extent of arable land, divided into 3 fields, one under grain, a second under peas, beans, or grain, and the third fallow, i.e. without a crop, and in a state of preparation for receiving one in its turn. The introduction of potatoes, red clover, and turnips in the 17th cent. marked a considerable advance, and the next cent. was epoch-making in sev. ways. During its latter part the most important name is that of Jethro Tull, who demonstrated the advantage of thorough cultivation of the soil, and initiated the practice of drilling as against broadcasting seed, thus causing the crop plants to grow in rows, the intervals between which can be stirred and cleaned by horse-hoeing. This led to the abolition—in most cases—of bare fallow, largely a device for thorough cleaning of land, and found a place for turnips and other root crops. Hence the replacement of the '3-field' system of the vil. community by the Norfolk or 4-course rotation, initiated by Charles, second Viscount Townshend ('Turnip Townshend'). The cultivation of turnips and other root crops on a large scale rendered possible the winter feeding of cattle, and thus did

away with the extensive use of salted meat during that season, a practice very detrimental to the health of the community. The 18th cent. witnessed great improvements in farm animals, due to the pioneer work of Robert Bakewell, who effected great advances in the quality of horned stock and sheep, largely by means of in-breeding. Among other benefits derived therefrom was a great reduction in the age at which bullocks and wethers were ready for the butcher. In the earlier half of the 19th cent. we find *improved methods of draining land*, largely due to Elkington and Smith. Associated with these advances came marked improvements in tillage implements, and much enclosure of land as a result of the 'new husbandry' rendered possible by Tull's work. During the 19th cent. many advances took place in continuation of those just mentioned, and sev. new lines of progress were initiated, but the years 1815-40 were marked by disastrous agric. depression. The following dates are significant as marking the beginnings of various forms of agric. activity which have had far-reaching results: Bath and W. of England Agric. Society, 1777; Highland and Agric. Society of Scotland, 1784; Chair of A. and Rural Economy in Edinburgh Univ., 1790; Board of A., 1793; Smithfield Club, 1798; Royal Agric. Society of England, 1838; Rothamsted Experimental Station, 1843; Royal Agric. College, Cirencester, 1845. The 19th cent. witnessed the improvement of crops by means of *artificial manures*, dung and various forms of rubbish being the only kinds of fertiliser previously employed. Bones came first, though Sir Humphry Davy (lecturing 1802-12) also mentions phosphate of lime, sulphate of potash, and salts of magnesia. Nitrate of soda and guano were first imported in 1830; superphosphate resulted from the researches of Lawes and Liebig, and began to be used on a large scale in the early forties; potash manures, prepared from the Stassfurt deposits, came later, and were followed by the discovery of basic slag. The *improvement of wheat by crossing* was commenced by Knight towards the end of the 18th cent., and taken up by Maund much later; while Shirreff began to improve cereals by *selection* in 1819, a variation of his method being subsequently practised by Hallett (1857). Practically all kinds of crop plants were improved on similar lines. During the 19th cent. also the necessity of using *clean seed*—first realised in Denmark—was increasingly recognised. The implements of tillage were still further improved; *reaping machines* and other contrivances for harvesting and after-treatment of crops were evolved in profusion, and different forms of *power* employed for working many of them. During the cent. great advances were also made in the knowledge and treatment of *plant diseases*, especially those due to the attacks of parasitic organisms. The rapid improvement in biological appliances (especially microscopes) and technique not only placed the study of *injuriously fungi* on a scientific footing, but also

enabled the science of *bacteriology* to be created, largely as a result of the pioneer work of Pasteur. Bacteria were found not only to be agents of infectious disease, but also to play an important part in the chemical changes which go on in the soil, in dairy processes, and so forth. Equally valuable progress was also made in respect of *livestock*. Many breeds were improved or estab. on Bakewell's lines, and the formation of numerous breed societies in the latter part of the cent. secured the maintenance of high standards. The biological advances above mentioned led to great improvement in the treatment of *animal diseases*, while at the same time the importance of *farm hygiene* came to be realised. *Concentrated foods*, of which linseed cake was the first (1795), gradually came to play an important part in winter feeding and the promotion of early maturity. Gilbert in England and von Wolff in Germany, with many others, placed the feeding of stock on a scientific foundation. (See CATTLE. *Scientific Methods of finding Feeding Standards*.) The invention of the *cream separator* proved of great importance in the improvement of dairy work. A. has continued to make considerable advances during the present cent. on all the lines indicated. The application of *Mendelian principles* to the breeding of plants and animals, especially the former, is leading to considerable results, as in the production of *rust-resisting wheats* by Biffen, improved cereals, etc., at Svalöf, and so forth. Further progress in research, horse-breeding, and education are assured by the estab. of a *Development Fund*.

The soil. Crops derive most of their food from the soil, in the form of a very dilute solution of mineral substances, though the air provides them with carbon dioxide gas and they breathe in its oxygen, while the nitrogen of the atmosphere is fixed for their use by certain soil bacteria and—in the case of leguminous plants—by other forms of the kind living in swellings or nodules on the roots. As, too, animals depend directly or indirectly on plants as their source of food, it is obvious that a thorough knowledge of the soil is essential to the intelligent practice of A. By whatever agencies different soils may have been formed, a certain amount of organic substance, *humus*, due to the decay of organisms, must be present in addition to the mineral particles formed by disintegration in order to secure fertility. The *physical properties of soils* largely determine the rate and amount of growth of crops, and therefore require notice. A particular soil consists of particles of varying size, with narrow interstices between them, collectively forming the *pore space*. Each particle is closely surrounded by a film of water, and it is these films which are utilised as *plant food*. The free water in the interstices is more or less removed by drainage, and if this goes on too slowly a free circulation of air must be promoted by artificial means, especially when a large proportion of clay is present. As the water in the

soil is used up, fresh supplies rise from below by capillary action, which also replaces the loss by surface evaporation. While drainage gets rid of superfluous moisture, it is often necessary in a hot climate or season, more particularly in the case of sandy soils, to *conserve the moisture* present. This is effected by constant stirring of the surface, by hoeing and otherwise, evaporation being thus checked. In some cases *mulches* of decaying vegetation, or other substances more or less impervious to moisture, answer the same purpose. Such conservation is practised to a very large degree in 'dry' farming, a comparatively new system in arid regions, such as parts of the U.S.A. The *temperature* of the soil, partly determined by colour and aspect, is also of importance, more especially because seeds require a certain amount of heat in order to germinate, so that whether a given crop is early or late very largely depends upon this factor. The *classification of soils* is based on their *chemical composition*, and depends upon the proportions they contain of sand (mainly silica), clay (impure silicate of alumina), carbonate of lime, and humus. *Sand* is warm, and easy to drain and till, but apt to become too dry, and but little retentive of plant food. *Clay* is cold, retentive of moisture and plant food, hard to drain, and difficult to work. A proportion of *carbonate of lime* is important, because it furnishes one kind of plant food, helps to break down organic matter, and improves the texture of clay. *Humus* supplies nitrogenous matter, and its presence is associated with important *bacteria*, some of which effect *nitrification* of organic substances—with production of *nitrates* valuable as plant food—while others are *denitrifying agents* and lead to loss of nitrogen. Most soils are of *mixed* character, *loams* being primarily a mixture of sand and clay, while *marls* are made of clay and calcareous matter. Medium loams, with a certain admixture of calcareous material and humus, are the best soils for general purposes.

Improvement of soils is effected in a great variety of ways, the aim being to impart such desirable physical and chemical characteristics as are naturally lacking or deficient. *Artificial drainage* of heavy soils, for example, removes superfluous water and promotes the circulation of air, and in such case *winter ploughing* exposes the clods to the disintegrating action of frost. The lighter soils, on the other hand, require *consolidation*, as by the treading of sheep folded upon them. It may also be said in general that *tillage*, by means of ploughs, cultivators, harrows, and so forth, artificially imitates disintegration by natural agents, and produces a seed-bed of fine texture (tilth) made up of innumerable particles. The application of suitable *manures*, though in some cases of physical importance, is mainly directed to supplying forms of plant food present in insufficient amount, such as—more particularly—lime, nitrogen, phosphorus, and potash. A distinction may here be

drawn between natural and artificial manures. Among the former may be mentioned quicklime, ground limestone, and *farmyard manure*, or *dung*; and among the latter *superphosphates*, *sulphate of ammonia*, and *miriade of potash* (see MANURES). The two liming materials are not only important for soils deficient in calcareous material, but are also valuable in improving the texture of clays and mellowing sour soils by their power of neutralising the excess acids causing sourness.

Crops in the widest sense are divisible into what is broadly termed 'grass' and plants which are grown upon arable land. *Temporary grassland* bears grass, with clover and sometimes other plants, and after a time is reconverted into arable (see LEY FARMING). *Permanent grassland* includes *pastures*, which are grazed but not mown, and *meadows*, which are mown for hay either every year or at less frequent intervals. The *botanical composition* varies with the kind of grassland, and it is obvious that the manurial treatment must also vary, especially when it is remembered that grazing stock effect a certain amount of natural manuring; while meadows do not benefit in this way to the same extent, and the hay crop is a continuous drain upon the resources of the soil without any manurial return. The *seed mixtures* employed when land is laid down to grass are different according as temporary or permanent grassland is the object in view, as also in relation to the kind of soil. In the case of *temporary grass*, rapid growth is of most importance, and perennial species need only be added should it be intended to maintain the area under grass for some years. A 1-year ley may even consist of broad red clover only, a plant which botanically is not a grass at all. The seed mixtures employed for the production of *permanent grass* chiefly consist of grasses and various leguminous plants, to which are sometimes added composites (yarrow), rosaceous species (burnet), and umbellifers (sheep's parsley). Land, before being laid down to grass, should be very thoroughly cleaned, autumn ploughing being followed in spring by harrowing and rolling, by which means a finely divided seed-bed is obtained. It is a common practice to 'nurse' the young grass by sowing it with a corn crop, and sowing is followed by light harrowing and rolling. By mowing the first year, and giving either a complete dressing of dung or a suitable mixture of artificials, the incipient permanent grass will be given a fair start. In subsequent treatment chain-harrowing is of importance for pulling out moss and some injurious grasses, while the manuring varies according to the local character of the soil. Grazing cattle make best use of the grass when they are folded on it behind a fence consisting of an electrified wire attached to posts, which can be moved each day so that the field is grazed in strips. Even without electric fencing good results can be obtained where cattle and sheep are maintained in suitable proportions. Owing to the lack of fresh

grass during the winter months, conservation as hay or silage is important (see HAY AND ENSILAGE).

It is generally recognised that the best results are obtained with crops on arable land when the same kind of plant is not grown continuously in any particular field, but a regular change or *rotation of crops* is practised (see ROTATION OF CROPS).

Cereals. *Wheat* is best suited to soils with a considerable proportion of clay, and does best in a warm dry climate. As in cereals generally, the production of straw as well as grain must be borne in mind when selecting a variety for any particular locality. The choice of a suitable kind of wheat (and the same thing is true for any other cultivated plant) may to some extent be guided by *variety tests*, where different sorts are grown side by side under similar conditions. Nitrogenous manuring is most important but phosphates are often used in addition. Wheat should be harvested before it is quite ripe, and the average yield is about 30 bushels per ac., with 30-35 cwt of straw. *Oats* may be grown on a great variety of soils, and do best in a cool damp climate. They must be harvested before becoming ripe, as the mature grains easily fall out. The average yield is 40-60 bushels per ac., with 30 cwt or more of straw. *Barley*, most important for malting, is most successfully cultivated in the lighter calcareous soils, and in areas where the climate is dry. Owing to the necessity for uniform quality in the grain, the cultural operations have to be unusually thorough and careful. Average yield 32-40 bushels per ac., with about 20 cwt of straw. *Rye* is very little grown as a grain crop in Britain, but yields 24-32 bushels per ac., with 30-40 cwt of straw. It is more often employed as a forage crop, which should be fed off early. It is harder than the other cereals, and thrives in soils and under climatic conditions where these do badly. *Pulse crops.* *Beans* do best on heavy soils, especially when these are of calcareous nature. Potash and phosphoric manures are of most importance, for, like all leguminous plants, beans enrich the soil in nitrogen. The yield is 30-40 bushels, with 25-30 cwt of haulm. *Peas* differ from beans in being better suited to the lighter soils. The average yield is about the same. **Root crops.** *Mangel* is adapted to stiff soils and a dry climate. Very thorough preparation of the soil and after-cultivation are necessary. The average yield is 15-25 tons per ac. *Sugar-beet* is closely allied to mangel, and needs the same kind of treatment, but more labour is required, for the cultural operations have to be carried out with great attention to details. Attempts have now been made for some years past, with aid of a Gov. subsidy to promote the growing of sugar-beet on a large scale in Britain, and there appears to be no difficulty in raising the crop. *Fodder beet* is derived from a cross between sugar-beet and mangels and is a fodder root with a high dry matter content. Average yield 20 tons per ac. *Swedes* are

a valuable variety of the turnip, and belong to a different natural order (Cruciferae) from that (Chenopodiaceae) including mangel, so that it is not surprising to find their requirements somewhat different. They thrive best in the lighter soils, and in a cool climate, provided plenty of moisture is available. The crop is shallow-rooted, and phosphatic manure is the one most necessary. Yield 12-20 tons per ac. *Turnips* proper are comparable to swedes in most respects, but give on the average a larger yield, though not so valuable for feeding purposes. *Carrots*, a valuable crop for feeding horses and dairy stock, are only suited to light soils free from weeds, and require a fine seed-bed. The cost of production is considerable. Average yield 10-20 tons per ac. *Farnips* are a similar crop, but, being tolerant of frost, can be left in the ground until wanted. Average yield 8-14 tons per ac. *Potatoes* are best suited to deep loose soils with a moderate amount of humus, but they can be successfully grown on almost any soil—except those of the heaviest kind—by adapting the treatment. They vary from early to late according to the time of maturity, and the production of the first kind is a very paying industry. The crop is usually propagated by 'sets,' which are either the entire tubers (thickened underground branches or portions of the same, including at least one 'eye' (bud). After a time a variety so cultivated begins to deteriorate, and fresh kinds are constantly being raised from seeds produced by crossing, though only a small proportion of these are of economic value. Manurial treatment may be by dung alone, by a complete mixture of artificials, or—and best—by a mixture of the two. Potash is particularly essential. Average yield 6-15 tons per ac., or less in the case of early potatoes. *Kohl rabi*, *thousand-headed kale*, and *cabbages* are cruciferous forms which, though they do not produce thickened underground parts, may broadly be classified with the root crops, and receive much the same treatment. They are very healthy, resist frost and drought, are extremely nutritious, and can be transplanted, thus increasing the time for cleaning the land. Average yield per ac.: kohl rabi, 20-5 tons; thousand-headed kale and cabbage, 20-40 tons. *Cruciferous forage crops.* Strictly speaking, a forage or fodder crop is one grown for the feeding value of its stems and leaves. The last 3 crops named are therefore sometimes included here. *Rape* is cultivated in much the same way as turnips, and *white mustard* is often grown as a summer catch crop, i.e. a crop which is not part of a regular rotation, but grown in an interval. It is obvious that rapidly growing plants are best suited for this purpose. The average yield per ac. of the 2 preceding crops is 10-15 tons. *Leguminous forage crops.* *Velches* or *tares* are grown to provide spring or summer fodder, and are a common catch crop. Potash manure is most essential, and some form of phosphate is usually added. When grown for

seed the average yield is 25-30 bushels per ac., with about 25 cwt of haulm. *Lucerne* and *sainfoin* are perennial deep-rooted species suited to loams of calcareous nature. They may either be used for forage or converted into hay. *Crimson clover*, commonly known as *trifolium*, is a catch crop sown for the production of forage in the spring and early summer. *Clovers* and '*seeds*', i.e. various clovers plus grasses, constitute an important course in rotation, sown with a cereal, or somewhat later, and coming into use a year afterwards. *Weeds* are plants belonging to various natural orders which are harmful in the main, using up nutrient matters to the detriment of crops, and helping fungoid and insect pests to tide over unfavourable seasons. It has been shown experimentally that they may reduce the yield by as much as one-half. They are best kept down by using clean seed and keeping land in a high state of cultivation, to which a locally suitable rotation conduces in no small degree. The use of the hoe on arable land, constant cutting of thistles on grassland, and spraying charlock with MCPA, may be mentioned as typical examples of remedial measures.

Farm stock. These chiefly consist of horses, cattle, sheep, goats, and swine. *Horses* are divided into *light breeds*, including thoroughbreds, hunters, hackneys, ponies, Clevelands, and coaching horses; and *heavy breeds*, to which belong shires, Clydesdales, and Suffolks. Horses, especially the heavy breeds, are of declining agric. importance as tractor numbers increase (see HORSES). **Cattle.** Nearly a score of breeds are officially recognised in Britain, some of which are valued as beef-producers, others for milk, and still others for both purposes. Among the first kind may be mentioned Aberdeen-Angus (black), Galloway (black), Hereford (red), Highland (black), N. Devon (red), and Sussex (red). *Dairy breeds* are Ayrshire (various), Friesian (black and white), Jersey (fawn), Guernsey (yellowish), and Longhorn (various). *Dual-purpose cattle* are Dexter (black), Kerry (black), Red Poll (red), Shorthorn (and Lincoln Red) (various), S. Devon (yellowish), and Welsh (black). (The predominant colours are given in parentheses.) *The polled* or hornless breeds are Aberdeen-Angus, Galloway, and Red Poll. *Longhorns* are particularly interesting because they were greatly improved by the pioneer breeding work of Bakewell, but their horns were against them, and they were superseded by the Shorthorns. The latter, now more widely favoured than any other breed, first rose into prominence in the latter part of the 18th cent., owing to the production of a famous Durham strain by the brothers Colling. Other notable strains were subsequently estab. in Yorks by Booth and Bates, and in Aberdeenshire by the brothers Cruickshank (see CATTLE). The feeding and management of cattle are difficult arts, affording opportunity for the display of much skill and intelligence. The modern farmer is aware that the requirements of

farm hygiene cannot be safely neglected, and the choice of concentrated feeding-stuffs is now so large that the difficult question of *mixed rations* is receiving increasing attention. *Dairying* has reached a high pitch of perfection, especially in Denmark and other foreign countries—Canada, New Zealand, and Australia—the branch least successful financially—in Britain—being butter production. Sev. important factors have conduced to the modern development of the industry, and these include improvement of stock, rational feeding and management, and the keeping of *milk records*, so that the worth of individual cows may be accurately known. The cream separator and other machines, and the introduction of power in large dairies, have reduced the labour bill and enabled some of the work to be effected in an improved manner. Even more important results have followed from the discovery that dairy processes are largely dependent upon the action of *bacteria*, some of which are beneficial and others harmful. Strict *cleanliness* in all stages is the best method of combating the latter. By the employment of *artificial cultures* of cream-ripening (lactic acid) bacteria it is possible to ensure butter of uniform quality, and this point has told strongly in favour of the Dan. and Ger. products, which have competed so successfully against us in our home markets. The standard of stock, for both milk and beef, is being improved by artificial insemination by pedigree bulls: this service is under the control of the Milk Marketing Board. See DAIRY and DAIRY FARMING.

Sheep are conveniently grouped into: 1. *Longwool breeds*—Cotswold, Devon Longwool, Kentish or Romney Marsh, Leicester and Border Leicester, Lincoln, Roscommon, S. Devon, and Wensleydale. 2. *Shortwool breeds*—Clun Forest, Dorset Horn, Hampshire Down, Oxford Down, Ryeland, Southdown, Shropshire, and Suffolk. 3. *Mountain breeds*—Black-face Mountain, Cheviot, Exmoor, Herdwick, Limestone, Lonk, and W. Mountain. See SHEEP.

Pigs are divided into Whites, Blacks, Berkshire (black with white points), Tamworth (golden-red), and Lincoln Curly-coated. As users of waste they play an important part in A., and are invaluable to the cottager and the small holder. Owing to their comparatively small stomachs they require concentrated food, given at frequent intervals. Some of the best results are obtained from cross-bred animals.

Fungoid pests and bacteria. The lower forms of plant life known as *fungi*, and the still simpler microscopic *bacteria*, are unable to subsist on the simple compounds sufficing for ordinary green plants, the living substance of which, aided by the characteristic green pigment *chlorophyll*, can utilise the energy of sunlight for building up complex substances from water, carbon dioxide gas, and certain mineral matters. Fungi and bacteria, in fact, somewhat resemble animals in their

way of feeding, and are either *saprophytes* (e.g. mushrooms), depending on dead organisms or the products of their decay, or else *parasites*, which prey upon living ones. Many of the latter attack cultivated plants and domesticated animals, and are therefore very detrimental to A. They propagate by means of dust-like *spores*, which are readily disseminated by the wind. Rusts are able to inflict losses of the most serious kind upon cereals and grasses, and the estab. of resistant varieties appears to be the most promising method of combating them. *Smuts* are fungi which prevent the formation of grains, these being replaced by powdery black spores. *Oat smut* (*Ustilago avenae*) may be checked by treating the seed grain with organo-mercury disinfectants. *Bunt* (*Tilletia caries*) is nearly related to the preceding, but is distinguished by its greasy nature and unpleasant fishy smell. *Ergot* (*Claviceps purpurea*) attacks rye and meadow grasses, causing the grains to be replaced by hard spur-like bodies. These are particularly objectionable because they cause abortion in cows and ewes. *Potato blight* (*Phytophthora infestans*) attacks all parts of the potato plant, and is a pest of the most serious kind. Spraying with Bordeaux mixture (dilute solution of copper sulphate and quicklime) is the best method of treatment, especially as a preventive measure. *Black scab or wart disease* (*Synchytrium endobioticum*) is due to a fungus of doubtful affinities, and is so serious as to be notifiable. Destruction of infected tubers and thorough disinfection of the soil are necessary, and the planting of a different crop for a time is highly advisable.

Speaking generally, fungoid pests of plants are best combated by high farming and rational rotations, by which vigorous and healthy plants are produced, able to resist the attacks of parasitic fungi, especially in the critical early stages of growth. A knowledge of the life histories of injurious forms often indicates the methods which can most advantageously be employed in dealing with them.

Animal pests. Among *mammals* the most pernicious forms are probably rats, mice, and voles, which all belong to the order Rodentia (gnawers). Rats and house mice are omnivorous, while field mice, harvest mice, and voles are vegetarian. All are exceedingly prolific, and when favoured by local circumstances some of them—especially *field voles* (*Microtus agrestis*)—may make their appearance in vast numbers and become veritable plagues. *Rats* are objectionable in another way, for they help to disseminate the disease known as *trichinosis*, due to minute thread-worms, while some of the fleas which infest them are known to spread the germs causing *oriental plague*. In coping with injurious rodents their natural enemies—such as owls and weasels—should not be ruthlessly hunted down as ‘vermin’. Ferrets, traps, poisons, and forms of ‘virus’ (bacterial cultures) are all employed, with varying success. Only a systematic campaign, supported by legislation, is likely to

achieve anything like full success. *Hares* and *rabbits*, which are also rodents, may do much damage to crops, and the ravages of the latter in Australia are matters of common knowledge. Recently the deliberate or accidental spread of a virus disease—myxomatosis (q.v.)—has done much to reduce the rabbit populations of Australasia and Europe.

Wild birds have a varied relation to A. Some are wholly or mainly beneficial, others are undoubtedly harmful in the main. Nor must it be forgotten that species are liable to change their habits. *Starlings*, for example, at one time predominatingly beneficial, have begun to attack fruit in some dists. It may be remarked in passing that the interests of the farmer and fruit-grower are not identical in this direction, for birds which may be useful to the former are pests to the latter. Among birds entirely or mainly beneficial are game birds, birds of prey (except the sparrow-hawk), owls, swallows, martins, swifts, and cuckoos. More or less harmful are the sparrow-hawk, pigeons and doves, hooded crow, bullfinch, greenfinch, hawfinch, house sparrow, blackcap, and other warblers. *Molluscs*, especially field slugs, are able to do considerable damage. Repeated applications of quicklime are here to be recommended. *Insects*, owing to their extraordinary variety, great powers of rapid propagation, and powers of flight, are among the most serious foes with which the farmer has to contend. Many of them have a complicated life-history, hatching out as a voracious larva (e.g. caterpillars of butterflies and moths), which passes into a pupa or resting stage, capable of remaining dormant through the unfavourable season of the year, and giving rise in spring to the adult or imago. *Beetles* constitute an exceptionally large order, including many pests. The cockchafer, for example, lives below the surface as a larva (grub), feeding upon roots and underground stems. When adult it devours foliage. *Wireworms*, the subterranean larvae of click-beetles, are especially notorious, but can now be controlled by chemical means using ‘Aldrin.’ Turnip ‘fly’ is in reality a small beetle, and various long-snouted weevils attack the roots, flowers, or seeds of sev. crops. The Colorado beetle, whose grubs and adults both eat potato leaves, is a dangerous visitor from abroad. By the exercise of drastic measures this pest has so far been prevented from establishing itself. Some beetles, however, are useful, such as the little ladybirds, the larvae of which devour large numbers of plant lice (aphides). The order (Hymenoptera) including bees and wasps embraces the harmful sawflies, which in the larval stage infest turnips and various fruits. But we must not forget the benefits conferred by bees, important fertilising agents, while the hive-bee yields honey and wax. The ichneumon flies also do much service by laying their eggs in the eggs or larvae of many injurious forms, thus bringing about their destruction. Butterflies and moths (Lepidoptera)

are almost always injurious, for their larvae (caterpillars) are among the most serious enemies of crops. The extensive order of *bugs* (Hemiptera) includes many injurious forms, of which those variously termed *green fly*, *plant lice*, or *aphides* are perhaps the most notorious. They attack cabbages, turnips, beans, potatoes, hops, cereals, and other crops, and are probably the most prolific insects. The *two-winged flies* (Diptera) are in many cases injurious to both crops and stock. Of those injurious to crops, the *crane-flies* or *daddy-longlegs*, with their underground larvae, are most universally known, while the *Hessian fly*, *corn-midge*, and *frit-fly* attack cereals. Probably the most injurious member of the order infesting stock is the *ox-bot* or *warble-fly*, of which the larvae live in the skin of cattle, damaging the hide, and reducing the value of the meat ('licked beef'). *Preventive measures* directed against insect pests include the high farming and rational rotations also useful in connection with fungoid infestations. The grease-banding and tarring of fruit-trees are means of arresting the ascent of wingless female moths (e.g. winter moth) from the ground, where the pupae are found. *Spraying* and *dusting* are important remedies, the poisons used varying according as the pests possess biting (e.g. beetles) or sucking (e.g. plant lice) mouth parts. The aim in the former case is to poison the food, and in the latter to block up the breathing pores of the insect or otherwise destroy it by contact. *Spiders*, destroying as they do many injurious insects, are decidedly beneficial. *Mange*, *scab*, and *itch* are examples of animal diseases due to the presence of these pests. Mites infesting plants are combated in much the same way as insects. The notifiable disease called *sheep scab* is caused by a parasitic mite (*Psoroptes communis*), and is dealt with by means of various dips. *Ticks* are large mites which suck the blood of domesticated animals, and are not only directly injurious in this way, but may also introduce the germs of diseases (Texas fever of horned stock, and probably louping ill in sheep). In some parts of the world, e.g. E. Africa, they are exceedingly detrimental and often fatal to stock, but regular treatment with suitable dips seems likely greatly to further the interests of A. in such regions. The farmer has to contend with a host of parasitic worms, some of which are able to inflict serious losses. The notorious *liver fluke* (*Fasciola hepatica*) is sometimes found in large numbers in the liver and hepatic ducts of sheep, causing 'liver rot.' The parasite has a very complicated life-hist., and part of its existence is spent in a small water snail (*Limnaea truncatula*) often found on damp low-lying land liable to be flooded. The best precautionary measures consist in thorough drainage and proper control of the drinking water. *Tapeworms* (*Taeniae*), when adult, generally live within the small intestine of man or domesticated animals ('final hosts'), absorbing the digested food found therein. Two tapeworms highly injurious to stock

live when adult in the intestine of the dog. The bladderworm stage of one (*T. coenuus*) is found in the form of large cysts on the surface of the sheep's brain, and is responsible for the disease variously known as *staggers*, *gid*, or *sturdy*. The huge compound cysts of the other (*T. echinococcus*) are found in the liver or other abdominal organs of man and various hoofed mammals. It is clear that an accurate knowledge of the life-hists. of parasites such as those enumerated is essential for coping with them successfully. Some of the lowly microscopic creatures known as *Animalcules* (Protozoa) are the cause of *malarial diseases*, part of the life-hist. being passed within the bodies of *dapple-winged mosquitoes* (*Anopheles*), the bites of which cause infection of the blood of human beings. As the larvae of mosquitoes live in stagnant water, it has been found possible, in some places, to get rid of malarial diseases by drainage, or by pouring petroleum into ponds infested by the larvae. A number of particularly deadly blood diseases of human beings and stock are caused by Protozoa, which in a certain stage of their existence are known as *trypanosomes*. The chief agents of infection are flies and ticks. In tropical Africa the bites of certain *tsetse flies* (*Glossina*) lead to *nagana* or *fly disease* of horse and ox, and *sleeping sickness* of human beings. Most likely a *gad-fly* introduces the germs of *surra* into Indian ruminants.

From what has been said regarding pests of all sorts it will be gathered that there is almost unlimited scope for scientific research, and upon this almost entirely depends the agric. development of tropical regions now rendered unhealthy by malarial diseases, or uninhabitable by serious parasitic maladies such as sleeping sickness.

Agriculture during and since the First World War. During the First World War sev. temporary Acts were passed with a view to increasing the amount of home-grown corn in the country. These included the Small Holdings Colonies Act, 1916, which provided for the purchase of land by the State for experimental small-holding colonies; the Corn Production Act, 1917, which made provision for payments to growers of corn where the average price of wheat or oats was less than the minimum, and for a minimum rate for agric. wages, and gave power to the Board of A. to enforce proper cultivation; and the Agricultural Land Sales (Restriction of Notices to Quit) Act, 1919. The weakness of the U.K., however, in this its oldest industry was emphasised by the war. Notwithstanding that the command of the seas remained with the Brit. Navy in so far as the unrestricted Ger. U-boat warfare failed to account for more than a certain percentage of mercantile shipping, the shortage was much more acute than it would have been had A. been in a flourishing condition immediately before the war. In spite of various Acts, such as those designed to encourage town-dwellers to go back to

the land, the state of A. in the U.K. grew steadily worse. The Corn Production Act was repealed in 1921 and depression soon followed. Corn markets were adverse, with the result that the acreage of ploughland gradually diminished. By 1927 the area of ploughland in England and Wales had declined by about 700,000 ac. since the opening year of the war, and in Scotland by some 20,000 ac. The state of A. in Great Britain, in face of adverse economic forces, became critical in 1927, and chief hope was reposed in agric. credits. By the Agricultural Credits Act, 1923, the Ministry of A. is empowered to organise agric. credit societies or, in other words, approved societies registered under the Industrial and Provident Societies Act, 1893, having for their object the making of advances to members for approved agric. purposes. The Agricultural Credits Act, 1928, provides for loans secured on farming stock or other assets, through a company formed out of public funds. Provision was made by the Agricultural Development Act, 1939, for increasing the resources of this company.

High costs and low prices in the first decade after the war spelt losses and a generally uncertain outlook for Brit. A., which led, in 1930, to persistent agitation for Gov. intervention. The large stocks of grain produced in Canada, the U.S.A., and Argentina had an increasingly detrimental effect on the prospects of A. in Great Britain, and in some quarters a tentative suggestion was made for reciprocal arrangements with the Dominions, whereby foreign wheat should be subject to a tariff for the benefit of both Dominion and home-grown grain. Other critics as emphatically advanced the theory that better marketing arrangements were the real panacea, and in any event a far more scientific remedy than the much-boomed policy of 'free trade within the Empire.' Similarly, in the U.S.A., A. became an urgent national economic problem requiring solution, according to different schools of thought, by such measures as the tariff, improved transportation, and the formation of a Federal Farm Committee to devise remedies in the way of co-operative marketing and clearing-houses for agric. products. As in Britain there was a growing realisation of the ramifications of A. and an appreciation of the fact that it was by no means a single industry, capable of regeneration by a simple panacea, but rather a congeries of specialised and mutually exclusive industries, depression in any one of which must have its repercussion on the rest. Thus remedies by a single legislative measure were not widely advocated, while attention became more closely centred on scientific research and on investigation of the causes of depression.

The Wheat Act of 1932 provided a standard price for farmers of 10s. per cwt for millable wheat sold to an approved buyer; the difference between this price and the average ann. market price was paid to growers from a fund raised by a levy on every sack of flour produced.

Under the Ottawa Agreement Act, 1932, the Board of Trade in consultation with the Ministry of A. could regulate the importation of frozen meat and chilled beef. At the same time some forms of production, e.g. sugar beet, were encouraged by a direct subsidy. By the Agriculture Act, 1937, a price insurance scheme was provided for barley and oats. For livestock a subsidy was introduced as a temporary measure in 1934, but prices remained low and so the subsidy was put on a permanent basis by the Livestock Industry Act of 1937. Marketing was generally badly organised, but the Agricultural Marketing Acts of 1931 and 1933 enabled the producers of any agric. product to set up a marketing board, elected by them, which could exercise considerable control over marketing. Boards were actually set up for hops, potatoes, milk, and bacon pigs, though the last had an extremely chequered career.

Generally speaking it may be assumed, however, that world conditions before the Second World War produced a second industrial revolution in which supply had outrun consumption. Prices might be artificially raised through quantitative regulation of imports, combined with measures calculated to secure a better organisation of different sections of the industry; but the opinion was widely held that more drastic measures were required to put the country on a footing that would ensure that it could rely on itself for its food supplies for any length of time in an emergency.

With the advent of war the need arose for immediate price control and food rationing coupled with a high level of home production of the staple foods such as milk and wheat.

After the Second World War, however, the damage caused by the war and the dislocation of agric. production led, in 1946, to a serious fall in the world production of wheat. A large number of countries, including the largest producers of grain, had reaped abnormally small crops, and the world was faced with conditions which threatened famine, besides setting back all plans for reconstruction. But apart from abnormal conditions modern A. always requires assistance from research in agric. science and from improvements in agric. machinery. Many farms in Great Britain have been worked out and would, under present conditions, prove too costly to restore to a profitable state of cultivation. Soil, too, even under rotation cultivation, needs replenishing with expensive manures, and the cost both of manuring and draining poor soil is prohibitive. Legislation to assist farmers to increase the fertility of their land was exemplified in the Agricultural Act of 1937, and after the war the need for further legislation of this type was readily apparent.

The Agriculture Act, 1947. In principle, a largely agreed measure arising out of wartime consultations. It came before Parliament at the end of 1946, as the most comprehensive and far-reaching

effort that any gov. has made to deal with A. and the use of land for food production. The Act seeks to provide stability through guaranteed prices and assured markets. In this context Part I of the Act sets out the proposed machinery for promoting and maintaining the lasting basis for 'a stable and efficient agricultural industry capable of producing such part of the nation's food as in the national interest it is desirable to produce in the United Kingdom, and of producing it at minimum prices consistent with proper remuneration and living conditions for

estate management or bad husbandry, and such matters as directions served on owners to provide fixed equipment, consent to notices to quit, and the div. of farms. The decision of these tribunals is in all cases final. Another part of the Act deals with the provision of more small holdings by co. councils for men with previous agric. experience. All the legislation on land tenure was consolidated by a single Act, the Agricultural Holdings Act of 1948.

Organisation of agricultural education in Britain. Although in many ways Great

PICK-UP BALING

farmers and workers in agriculture, and adequate return on capital invested.' The products covered by guaranteed prices and assured markets include live-stock, milk, eggs, grain, potatoes, and sugar-beet, but not horticult. crops. As regards husbandry, the Act seeks to encourage the farmer who takes good care of his land while obtaining a full output. The tenant who improves his farm is assured fuller compensation when he leaves; and as a corollary the tenant whose farming is not up to standard gets shorter shrift. The Agric. Land Commission is responsible for the management of land taken over by the Ministry of A. The Co. Agric. Executive Committees are continued as the ministry's agents on the same basis as before; and there is also an Agric. Land Tribunal for each area of England and Wales, to which are referred questions of the dispossession of owners and occupiers on the grounds of bad

Britain is still behind such countries as the U.S.A., Germany, Denmark, and Sweden, considerable progress was made before the First World War in agric. education, upon which the future of A. so largely depends. The twofold system of univs. and colleges for higher education and the co. council courses for young persons, which now prevails, was merely the putting into execution of plans which were far advanced before the First World War, but stopped by that period of disturbance. These plans envisaged the replacement of the pre-existing and chaotic work of a large number of authorities of various kinds by an imitation of the Scottish system of agric. provs., with depts of the univs. at the head of each. Scotland has 3 such provs., under the univs. of Aberdeen, Glasgow, and Edinburgh. It was proposed to divide England and Wales into 12 provs., with a central institution at the head of each,

the institutions being Aberystwyth Univ. College, Bangor Univ. College, Bristol Univ. (with the associated Royal Agric. College), Cambridge Univ., Harper Adams College, Leeds Univ., Midland Agric. College, Armstrong College, Newcastle-on-Tyne, Reading Univ. College (now Univ.), Seale-Hayne College, Newton Abbot, Manchester Univ. (with the associated college at Holmes Chapel), and Wye College (part of London Univ.). This organisation has now been adopted, and 2 other institutions have been added, namely Oxford Univ. and Nottingham Univ., making 14 institutions in all where the higher teaching and research are to take place aided by experimental stations at Rothamsted, Woburn, and elsewhere. Closely correlated with, and looking for advice to, the central institution in each 'province' are the 'farm institutes' (as was proposed before the First World War), broadly similar to those which have for some time been estab. at Basing, Ridgmont, and Newton Rigg, and are well known in other countries. The site of these institutes has been fixed in accordance with the nature of local farming, and with due regard to convenience of access. The univs. and colleges provide courses of 2 to 4 years in duration, with diplomas or degrees. As advisory centres they employ specialists in chem., entomology, and the like, as contradistinguished from the general education given by technical instructors under the co. councils. These latter bodies provide short courses for boys and girls already on the land or intending to return to it. The farm institutes usually give a 6 months' winter course in practical A. to young persons of 16 years of age and upwards, and in summer courses in dairying and poultry farming. Some co. councils, however, have organised only a more economical and less efficient system of evening lectures and day classes, without the obvious advantage of facilities for actual practical training on neighbouring farms where various 'demonstrations' and 'experiments' of agric. importance are conducted. Under the Agricultural Land (Utilisation) Act, 1931, for promoting the better utilisation of agric. land in Great Britain and the settlement of unemployed persons on it, the Ministry of A. is empowered to acquire and hold land for use as demonstration farms. All this work is under the control of the Ministry of A., Fisheries, and Food, but the system is made complete by linking up certain activities of the Ministry of Education, especially the imparting of a 'rural bias' to rural elementary and secondary schools. This concentration on a 'rural bias' takes the form of giving lessons in geography with special reference to the physical characteristics of the dist., effect of climate, and the like, but compulsory further education would greatly promote the ends in view.

Agriculture, Fisheries, and Food, Ministry of (M.A.F.F.). Until they were amalgamated in 1955 the Agriculture and Fisheries and Food Ministries were quite distinct. Food control (q.v.) by a govt. dates from 1916, but the present constitution of the ministry probably allows for closer co-ordination of food and agric. policy than ever before. The Ministry of A. and Fisheries owes its origin to the Board of A. set up in 1793 by Pitt's govt. The prime mover in its formation and first president was Sir John Sinclair, and Arthur Young was the first secretary. Soon after Sinclair had retired Young went blind, and such was the influence of these two men that after they had gone the board receded in importance and was dissolved in 1822. It was re-instated in 1889, became the Board of A. and Fisheries in 1903, and was raised to ministry status in 1919. The M.A.F.F. is controlled by a minister having cabinet rank and of course he is appointed by the political party in power. The salary is £5000 per annum and that of the parli. secretary is £1500. The ministry has

responsibilities under sev. Acts, the most important being the Agriculture Act of 1947. It controls the agric. and horticult. interests of the country, having Co. Agric. Executive Committees (C.A.E.C.s), the National Agric. Advisory Service (N.A.A.S.), veterinary, pest control, and livestock improvement depts. In addition there is a fisheries dept and a forestry dept, the ministry being assisted in the latter by the Forestry Commission (q.v.). Also the running of the Fatstock Marketing Organisation is very important, having both agric. and food interests. The position and functions of the ministry, taking into consideration the recent amalgamation of the food and agric. sections, have been reviewed by a committee headed by Sir Arton Wilson and its findings have been pub. (Cmd 9732).

Agriculture, International Institute of, founded at Rome in 1905 by David Lubin. Its long and useful career was not seriously interrupted till the advent of the Second World War. In setting up the I. I. A. Lubin perceived the need for international action by govts. in certain classes of problems and a permanent international secretariat to sustain and inform that activity. Although its membership was large, one weakness was the lack of representation from the Amer. and Asian countries. However, much useful information was collected on all aspects of A. This was pub. in its international year-books of agric. statistics and legislation and also in monthly bulletins of science and practice, agric. economics, etc. One of its greatest achievements was to initiate and organise the first world agric. census in 1930; a second planned for 1940 was partially interrupted by the war. The I. I. A. must be regarded as one of the stepping stones leading to the Conference on Food and A. in 1943 at Hot Springs and the subsequent setting up in 1945 of the Food and A. Organisation (q.v.). See also AGRICULTURE. See Food and Agriculture Organisation, *So Bold an Aim*, 1955.

Agriculture in U.S.A. Practically every known kind of field crop is cultivated in the U.S.A., but maize, hay, wheat, oats, cotton, and soya beans represent over three-fourths of the total value of all Amer. crops. In America there are ample land and water resources, although the inherently fertile land is restricted to the 'corn belt' of the Mid-W. and the Mississippi delta. The land under crops and grass (excluding range, i.e. rough grazings) averages 2½ ac. per head of the pop. (compared with ½ ac. in this country). According to the 1950 census there are 5,382,100 farms in the U.S.A. and 20 per cent of the pop. is engaged in agriculture. The value of farm products sold ranges from \$2000 to over \$25,000 per farm per year, but on most is between \$2000 and \$10,000. A. was hard hit by the depression of 1921-4 and full recovery has only been attained in recent years.

After the Second World War most of the farmers' gains were devoted to meeting post-war conditions—a large market, lower prices, and less labour. A. in

America has developed rapidly along the lines of mechanisation, and thus a greater production has been obtained on a smaller crop acreage and with fewer workers. The future tendency of A. is towards larger farms and greater technical improvements both in farm machinery and in the scientific care of crops and livestock. The most stable and important of Amer. crops is maize, the yield in the years 1939, 1947, and 1950 being 2342, 2137, and 2760 million bushels respectively, which represents more than half the world's supply. The 6 most productive states of the 'corn belt' are Iowa, Illinois, Nebraska, Missouri, Indiana, and Ohio, but Indian corn is widespread over the whole of the U.S.A. The flourishing stock-breeding industry depends largely on the corn crop, of which about 85 per cent is fed to livestock, chiefly hogs. The forage crops, which are second in importance, include pasture, hay, clover, alfalfa, etc. The third most important crop, cotton, is dealt with under that head. The wheat crop, fourth in importance, covers about 61½ million ac., principally in the states of Kansas, N. Dakota, Minnesota, Nebraska, S. Dakota, Washington, Illinois, Oklahoma, Indiana, Ohio, and Missouri. Amer. and Canadian wheat is called winter wheat or spring wheat, according to the season of sowing. Winter wheat represents nearly three-quarters of the Amer. produce, and the yield of both kinds was 1019 million bushels in 1950. The U.S.A. is the largest wheat-growing country in the world, and in addition produces a quarter of the world's supply of oats, thereby equalling Russia. The average ann. oats crop is over 1200 million bushels, half of which is produced in Illinois, Iowa, Wisconsin, Minnesota, Nebraska, and Indiana. Other important Amer. crops with their average yield in millions of bushels are barley (304), sorghums (233), rice (86), linseed (40), and rye (21). In addition there are the legume crops, field beans, soy beans, and peas, while the white potato crop is 430 million bushels and the sweet potato crop 50 million bushels. Of the fruit production, apples and peaches form the largest share. In addition to field crops, the U.S.A. is the largest stock-breeding country in the world, the estimated figures for 1950 being 80 million cattle, 60 million swine, and 30 million sheep. Tobacco, in 1950, was harvested from 1,600,000 ac. producing 2030 million lb. It is grown in over a score of states, but chiefly in N. Carolina, Kentucky, Virginia, Tennessee, S. Carolina, Georgia, and Pennsylvania.

Agricultural education in the U.S.A. had its beginnings in the efforts of private individuals interested in the productivity of the land. Comparatively early in the last cent. vocational training in A., as indeed in other industries, was a feature of the manual labour schools in New York state. By the latter part of the 19th cent. co. agric. schools had become well established, and in the first decade of the present cent. over 50 agric. high schools were in

existence, while agric. courses were given in hundreds of ordinary high schools. The system now comprises agric. schools, dist. agric. schools, agric. depts of high schools, and ordinary schools giving instruction in elementary A. At the apex of the system of agric. education in the U.S.A. are the agric. colleges or state colleges and univs. in direct association with the U.S. Dept of A. These institutions are mainly concerned with research and experiment, this latter function being carried out at stations organised by the dept under the Hatch Act of 1887. See A. N. Duckham, *American Agriculture: Its Background and its Lessons*, 1952.

Agrirento: 1. Prov. of Italy, in SW. Sicily (q.v.). It is generally mountainous, and is broken up by fertile riv. valleys; the chief rivs. are the Magazzolo, Platani, and Sulso. There is an undulating coastal plain in the S. Cereals, fruit, olive-oil, sulphur, salt, and fish are produced. The prin. tns include A., Sciacca, Caltabellotta, and Canicattì (q.v.). Area 1173 sq. m.; pop. 484,000. See PELAGIAN ISLANDS.

2. (formerly **Girgenti**; Gk **Akragas**; Rom. **Agrium**). Tn in Sicily, cap. of the prov. of A., 57 m. SSE. of Palermo (q.v.). It is on a hill near the S. coast. A Gk colony from Gela (q.v.) founded in 582 bc, it became one of the richest and most splendid cities of the anc. world; it was destroyed by the Carthaginians in 405 bc and, though rebuilt by Timoleon (338), never regained its former greatness. It was the bp. of the philosopher Empedocles (q.v.). Chief among the magnificent buildings which adorned the S. slopes of A. were 5 great temples ranging in date from c. 510 to 210 bc. There were 3 dedicated to Zeus, Heracles, and Asclepius, remains of which may still be seen, and 2 others wrongly called 'of Hera' and 'of Concord'. A. became subject to Rome in 210 bc. Roger I (q.v.) took it from the Saracens (q.v.) in ad 1086 and founded a bishopric. It was severely damaged during the Second World War. A. has a cathedral (13th-15th cents.) and other fine buildings, but the tn is chiefly remarkable for its magnificent Gk and Rom. remains. There is a harbour SW. of the tn at Porto Empedocle. Pop. 40,600.

Agrimonia, genus of the Rosaceae, commonly known as *agrimony*. It has medicinal properties, and is used in herb teas. *A. odorata* and *A. eupatoria* are found in fields and under hedges.

Agrinion, **Vrachori**, or **Vrachochori**, tn of Acarnania and Aetolia, Greece, 18 m. N. of Missolonghi. A. is the centre of a tobacco- and currant-growing region. Pop. 21,750.

Agrippa, **Herod**, see **HEROD** (4).

Agrippa, **Marcus Vipsianus** (63-12 bc), Rom. general, naval commander, statesman, and builder, b. of humble family. He was studying with Octavian at Apollonia in 44 bc when news came of Caesar's murder. It was by A.'s advice and in his company that Octavian promptly set out for Italy, and the subsequent achievement of Augustus was largely due to A.'s energy and ability.

His meteoric career may be summarised as follows. 38 bc, quelled an Aquitanian rising and undertook a punitive expedition against Ger. tribes beyond the Rhine; 37, consul for the first time; 36, commanded the fleet against Sextus Pompeius, whom he defeated at Mylae and Naulochus; 33, as aedile, did much to beautify Rome, as well as to improve its drainage and water supply; 31, was largely responsible for Octavian's victory at Actium; 27, consul for the third time, when he built the Pantheon, now the church of San Stefano in Rotondo. From this time until his death he was employed in various commands in the E. (23-21) and Spain (19); in 18 he was given tribunician power for 5 years. A. was married 3 times. His first wife, Pomponia, daughter of T. Pomponius Atticus (q.v.), d. or was divorced before 28 bc, in which year he married Octavian's niece Marcella. He was obliged to divorce her in 21 and to marry the emperor's daughter Julia, by whom he was father of Agrippina, wife of Germanicus. A. is known to have written an autobiography and some geographical works; but his most important achievement in this field was the carrying out of the great survey planned by Julius Caesar.

Agrippa von Nettesheim, **Heinrich Cornelius** (1486-1535), Ger. philosopher and occultist, had a varied and troublous career as writer, soldier, physician, and lecturer. His prin. works are *De Incertitudine et Vanitate Scientiarum*, 1527, and *De Occulta Philosophia Libri Tres*, 1531. The former was trans. by James Sanford in 1569, and the latter probably by J. Freake in 1651 (ed. W. F. Whitehead, 1898). See life by H. Morley, 1856.

AGRIMONY

Agrippina the Elder (d. ad 33), daughter of M. Vipsianus Agrippa and Julia, daughter of Augustus, endeared herself to the Rom. populace by bravery displayed in the Ger. campaigns of her husband Germanicus. On the mysterious death

(AD 17) of the latter, believed by some historians to have been engineered by the jealous Tiberius, her popularity aroused the emperor's hatred, and she was banished to the isle of Pandataria, where she is supposed to have starved herself to death. She was the mother of the notorious A. the Younger and Caligula. See Tacitus, *Annals*; S. Baring-Gould, *Tragedy of the Caesars*, 1892; J. B. Bury, *Roman Empire*, 1895.

Agrippina the Younger (AD c. 15-59), daughter of Germanicus and Agrippina, b. Oppidum Ubiorum (afterwards Colonia Agrippina, modern Cologne); mother of Nero by her first husband, Gnaeus Domitius Ahenobarbus, (d. AD 40). Her second husband, Crispus Passienus, she was accused of poisoning. She married thrice her uncle, the Emperor Claudius, and induced him to set aside his own son, Britannicus, in favour of Nero. She then had him poisoned, and Nero became emperor under her regency. Tiring of her ascendancy, Nero had her slain. See Tacitus, *Annals*, xii-xiv.

Agropyron, family Gramineae, genus of tough, perennial herbs or grasses, of which *A. repens*, the quitch, scutch, twitch, or couch-grass, is often a troublesome weed; with persistent rhizomatous roots; *A. caninum* is Bearded Couch-grass, *A. donianum*, Don's Twitch of Scottish Mts, and *A. junceiforme*, Sand Couch-grass of dunes, all natives of Britain.

Agrostis, family Gramineae, genus of perennial grasses, of which *A. canina*, Brown Bent-grass, *A. tenuis*, Common Bent-grass, *A. gigantea*, *A. setacea*, and *A. stolonifera*, the Florin of pastures, are Brit., often used for lawn-making.

Agtelek, see AGTELEK.

Aguadilla, seaport in Puerto Rico, standing on a beautiful bay of the same name, 70 m. W. of San Juan. It has a large trade in coffee, sugar, tobacco, fruit, and cotton; it manufs. straw hats and cigars and there are sugar milling and fishing industries. It was founded in 1775. Pop. 18,276.

Aguardiente (burning water), coarse kind of Sp. brandy, made from the grape or molasses or from grain or potatoes.

Aguas Calientes, tn and state, Mexico, so called from hot springs in the vicinity. The tn, 364 m. NW. of Mexico city, has a considerable trade and industry and is noted for its beautiful fruit gardens and fine climate. Pop. (tn) 88,200; (state) 188,000.

Ague (O. F. *ague*, sharp), term applied to malarial fever, particularly to the variety in which a paroxysm of intense chill, causing shivering and chattering of the teeth, alternates with a hot stage, when the face is flushed and the skin hot to the touch. See MALARIA.

Aguesseau, Henri François d' (1668-1751), Fr. lawyer, b. Limoges, was in succession advocate-general (1690), procurator-general (1700), and chancellor of France. He lost the chancellorship in 1718, through his opposition to Law's system of finance, recovered it in 1720, lost it again in 1722, and assumed the

office for the last time in 1737. According to Voltaire, he was the most learned magistrate France ever had. He made many judicial reforms.

Aguilar, Grace (1816-47), novelist and historian, b. at Hackney of Jewish parents. Her chief works are *The Spirit of Judaism*, 1842, *The Jewish Faith*, 1845, *The Women of Israel*, 1845, and the novel *Home Influence*, 1847.

Aguilar de la Frontera, Sp. tn in the prov. of Córdoba. It has a Moorish castle, and produces oil and white wine. Pop. 16,000.

Aguilas, Sp. seaport in the prov. of Murcia, on the Mediterranean. It has large smelting works, and exports lead, iron ore, sulphur, esparto, and grain. Pop. 17,000.

Aguinado, Emilio (b. c. 1870), Filipino revolutionary leader. At the outbreak of the 1896 rising he was mayor of Cavité Viejo, but, in consequence of the part he took in the rebellion, consented to go into exile at Hong Kong. He returned in 1898 to aid the U.S.A. against Spain, but turned against them on their purchase and annexation of the Is., and attacked Manila in Feb. 1899. Fighting continued with varying success till Mar. 1901, when A. was captured by Gen. Funston at Palawan. He swore allegiance to the U.S.A. the next month, and retired into private life until 1935, when he was an unsuccessful candidate for the presidency. Accused in 1945 of collaboration with the Japanese during the Second World War, he was arrested, but never came to trial.

Agulhas, Cape (The Needles), most southerly point of Africa, so called by the Portuguese from its sharp-pointed rocks. It is dangerous to shipping, on account of fogs, rocks, and uncertain currents. The A. Bank, with an average breadth of 40 m., stretches for 150 m. from the cape to the Great Fish R. It was on the A. Bank that the *Birkenhead* (q.v.) was wrecked. A 100-ft lighthouse has been erected with a light of 12,000,000 c.p. visible at 18 m.

Agustina (d. 1857), the 'Maid of Saragossa.' A *vivandière* of the Sp. Army, she became famous for her bravery during the siege of Saragossa by the French, 1808-9. See Byron's *Childe Harold*.

Agyrium, see AGIRA.

Ahab, son of Omri and 6th King of Israel (874-853 BC), married Jezebel, the daughter of Ethbaal, King of Sidon, and through her influence introduced the worship of Baal. This and the subsequent persecution of the priests and prophets of Yahweh brought him into conflict with Elijah. Though lacking in moral courage, A. united considerable personal courage with a public spirit shown in the construction of fine buildings. He twice defeated the Syrians, but was finally killed in battle with them at Ramoth-Gilead. See 1 Kings xvi and xxii, and R. Kittel, *History of the Hebrews* (Eng. trans.), 1895-6.

Ahasuerus: 1. The traditional name of the Wandering Jew.

2. The biblical name of sev. Persian kings of whom the best known, the

husband of Esther, has been identified with Xerxes (485-464 BC). The name is probably a title.

Ahaz, 11th King of Judah (742-726 BC). He was attacked in 735 by the kings of Israel and Syria, and gravely imperilled his kingdom at a critical time. With little faith in Yahweh, he sought to placate the gods of his dangerous neighbours, and offered his son in sacrifice to Moloch; he summoned to his assistance Tiglath-Pileser, King of Assyria, who exacted from him heavy tribute. His full name, Jehoahaz, is given in an Assyrian tribute list. The prophets Isaiah and Micah lived in his day. See 2 Kings xvi; Isa. vii.

Ahaziah: 1. Son of Ahab and 8th King of Israel (853-852 BC), like his father an idolater, worshipped Baal and Astarte. When about to attempt to suppress the Moabites, who had revolted on his accession, he was fatally injured by a fall from a window (1 Kings xxii and 2 Kings i).

2. 6th King of Judah (841 BC), nephew of the foregoing, killed in the insurrection under Jehu (2 Kings viii; 2 Chron. xxii).

Ahimelech, Jewish high priest at Nob, fed David with the shewbread and gave him the sword of Goliath to help him escape from Saul (1 Sam. xxi. 1-10). He was put to death by Saul (1 Sam. xxii. 11-20).

Ahitophel, see ACHITOPHEL.

Ahlen, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 60 m. NE. of Düsseldorf (q.v.). It has textile and metal manufs. Pop. 33,000.

Ahlqvist, August Engelbrekt (1826-89), Finnish linguist. Prof. of Finnish in Helsingfors Univ. (1863-88). When 21 he was a co-founder of the national cultural magazine *Suometar*. In his extensive travels through Finland, Estonia, Livonia, Courland, E. Russia, and Siberia he studied numerous Ugro-Finnish languages. He has also written important works on the structure and phonetics of Finnish. Under pseudonym Oksanen he wrote romantic-patriotic poetry (*Säkeitä*, 1860 and 1868, etc.); some of his poems became national songs.

Ahmadabad, or **Ahmedabad**, city of Bombay state, India. On the Sabarmati R., 306 m. N. of Bombay, this former stronghold of the N. Jains (q.v.) was founded in 1411 by Sultan Ahmad I of Gujarat. It is notable for the extent and beauty of the many remains of its historical magnificence. It is now a main centre of the cotton trade and manuf. Pop. 788,310.

Ahmed I (1589-1617), Sultan of Turkey, succeeded his father, Mohammed III, in 1603. The most notable events of his reign are the conclusion of the Peace of Sitvatorök with Austria in 1606 and an unsuccessful war with Persia.

Ahmed II (1643-95), Sultan of Turkey, succeeded his brother Solymán II. His forces, under Kiuprili, were driven from Hungary after their crushing defeat at Slankamen, 1691.

Ahmed III (1673-1736), Sultan of Turkey, succeeded his brother Mustapha II in 1703. The most notable events of

his reign are the war with Russia, the recovery of Morea from Venice in 1715, and the two defeats by the Austrians, at Peterwardein, 1716, and Belgrade, 1717. He was deposed in 1730.

Ahmed Fuad, see FUAD I.

Ahmed Shah, first monarch of Afghanistan (1747-73), son of Sammaun Khan, chief of the Abdali tribe. After the murder of his master Nadir Shah he retired to Afghanistan, where he was elected ruler. He was a fine soldier and greatly extended the Afghan dominion.

Ahmednagar, or **Ahmadnagar**, tn of India, 120 m. E. of Bombay, now in Maharashtra state. A. was founded in 1494 by Ahmed Nizam Shah. It was captured from the Marhattas by Gen. Wellesley in 1803, but restored to them. It was finally ceded to the British in 1817 by the treaty of Poona. The Emperor Aurungzeb d. here in 1707. A. is a considerable centre for local trade and has for long been the home of large Christian missions, both Brit. and Amer. Pop. 54,000.

Ahmes, see AMARIS I.

Aho, Juhani (1861-1921), pseudonym of Johannes Brofeldt, Finnish writer and journalist, b. Lapinlahti. He visited Paris in 1889, and was much influenced by the Fr., Scandinavian, and Russian realist writers. His earliest sketches were written in Paris; in 1897 appeared *Panu*, a patriotic romantic story of Christianity and paganism in 17th-cent. Finland. A. produced a number of books of stories and novels, travel books, and memoirs, and 2 plays (*Panu*, 1903, and *Tuomio*, 1907).

Ahoms, see ASSAM.

Ahriman (Pahlavi for the Avestan *Angra Mainyu*, 'enemy spirit'), the god of evil and darkness, opposed to Ormazd (q.v.), the god of goodness and light, in Zoroastrianism and the religion of the Parsees (q.v.). The defeat of A. is assured but must be assisted by man, if man is to attain blessedness. See R. P. Sanjana, *Zarathushtra and Zarathushtrianism in the Avesta*, 1906, and C. Gore, *The Philosophy of the Good Life* (Everyman's Library), 1930.

Ahuachapán: 1. Dept in El Salvador, Central America. The fertile valleys of the Coast Range produce sugar, coffee, tobacco, cotton, and fruit. Area 804 sq. m.; pop. 94,750.

2. Cap. city of dept of same name, 47 m. NW. of San Salvador. Pop. 11,000.

Ahvaz, dist. and tn of Khuzistan, prov. of Persia. The tn is situated on the R. Karun. Pop. of tn 72,000.

Ahvenanmaa (**Åland**) Islands, the chief is. in an archipelago of the same name consisting of more than 6500 is., islets, and skerries, at the entrance to the Gulf of Bothnia, forming part of Finland. Only a few are inhabited. Taken from Sweden by Russia in 1809 and bombarded by the Allies in 1854, in 1921 A. I. were neutralised and demilitarised under a convention signed by Great Britain, France, Italy, and all the Baltic states except Russia, and the forts razed. A plebiscite taken in the same year was

favourable to self-gov., but the is. now form part of the rep. of Finland and enjoy a large measure of autonomy.

In 1939 an agreement was concluded between the Finnish and Swedish Govs. for the remilitarisation of the is., and approved by the signatories of the 1921 convention, but action was blocked by Soviet opposition. The is. are of the greatest strategic importance because they dominate the entrance to Finland and N. Sweden. Pop. 28,000.

Ahwaz, see AHVAZ.

Ai (Heb., 'heap'), Canaanite city, the modern Et-Tell, 1 m. E. of Bethel and about 15 m. from Jericho. Abraham pitched his tent between Bethel and Ai (Gen. xii and xiii), but the city is better known for its capture by Joshua in later times (Joshua vii and viii). Its ruins existed in the time of Eusebius and Jerome, but are now lost.

Ai (slith), see BRADYPUS.

Aicard, Jean François Victor (1848-1921), Fr. author, b. Toulon. His works, mainly poetical and dramatic, include *Poèmes de Provence*, 1873, and *La Chanson de l'enfant*, 1876, both crowned by the Fr. Academy; *Miette et Noré*, 1880; *Jésus*, 1896; *Maurin des Maures*, 1908, and *L'illustre Maurin*, 1909, both trans. by Alfred Allinson, 1910; *Le Témoin* (poems), 1916, and *Forbin de Sollires* (play), 1920. His best novels are *Roi de Camargue*, 1888, *L'Amé d'un enfant*, 1898; and *Tatas*, 1902.

Aidan, St (d. 651), monk of Iona, was in 635 sent by the abbot on the request of King Oswald of Northumbria to evangelise that country. This he achieved with remarkable success from Lindisfarne, where he ruled as bishop and abbot. His feast is on 31 Aug.

Aide-de-Camp (Fr., 'camp-assistant'), an officer attached to the personal staff of an admiral or general, with whom he is in confidential touch when on active service, assisting him in all the military routine and looking after his comfort. The sovereign may have any number of A.s., and this position is given as an honorary distinction. The usual abbreviation is A.D.C.

Aidin, see AYDIN.

Aidone, tn in Sicily (q.v.), on the Serra Orlando Mts., 14 m. SE. of Enna (q.v.). Near by are extensive remains of an unknown city. Pop. 8000.

Aids, under the feudal system, were payments due from vassal to lord under certain conditions.

Aids, Hearing, see DEAF AND DUMB. *Mechanical aids to hearing.*

Aigues-Chaudes, see EAUX-CHAUDES.

Aigues Mortes (Lat. *Aquae Mortuae*), Fr. tn in the dept of Gard. Now 3 m. from the Mediterranean, it was in the Middle Ages an important port, from which its founder, Louis IX (q.v.), twice sailed for the Crusades. Its anc't walls remain. Pop. 3300.

Aiken, Conrad Potter (1889-), Amer. poet and novelist, b. Savannah, Georgia. Son of a doctor, he was at Harvard with T. S. Eliot, and in 1914 pub. a vol. of verse, *Earth Triumphant*. In 1929 his

Selected Poems won the Pulitzer Prize and the Shelley Memorial Award. Later books of poetry were *The Soldier*, 1944, *The Kid*, 1947, and *Skylight One*, 1949; in 1953 his *Collected Poems* appeared, and in 1956 *A Letter from Li Po*. Subtle psychology is shown in his novels *Blue Voyage*, 1927, *Great Circle*, 1933, and *King Coffin*, 1935.

Aiken, co. seat of A. co., S. Carolina, U.S.A., 17 m. ENE. of Augusta, Georgia; it is a health resort and trade and industrial centre (lumber milling, kaolin shipping, printing). Pop. 7000.

Aikin, John (1747-1822), author, b. Kibworth, Leics. He studied medicine at Edinburgh and London, later taking the degree of M.D. at Leyden, 1870. Besides practising at Chester, Warrington, and London he wrote voluminously. Among his works are *Evenings at Home*, written in conjunction with his sister, Mrs Barbauld (q.v.), and his *General Biography*, 1799-1815.

Aikin, Lucy (1781-1864), authoress, daughter of John A. (q.v.), b. Warrington. She wrote a novel, *Lorimer*, 1814, but her reputation rests mainly on her series of court memoirs, of which *Memoirs of the Court of Elizabeth*, 1818, was the first, and on her life of Addison, 1843.

Ailanthus, or **Ailanto**, genus of deciduous tropical trees, family Simarubaceae. *A. altissima*, China, the tree of heaven, is cultivated in Britain; the leaves are like those of the ash. The wood is valuable to cabinet-makers.

Ailleboust, Louis de Coulonge (d. 1660), 3rd Governor-General of Canada (1648-1651). It is believed that he landed in Canada with the founders of Montreal in 1642. Be that as it may, he represented the Montreal dist. in 1647 in the new colony's council at Quebec prior to succeeding Montmagny as Governor-General in 1648. In his tenure occurred the destruction of the Huron nation by the Iroquois. A. belonged to the 'Compagnie de Montréal' formed in 1641.

Ailly, Pierre d' (1350-1420), Fr. theologian and prelate, was a famous leader of the Nominalists. He became chancellor of the univ. of Paris, Bishop of Compiègne, and papal legate in Germany. He took part in the Council of Constance.

Ailsa Craig, rocky islet of columnar basalt off the W. coast of Ayrshire, Scotland, in the form of a cone, rising abruptly from the sea to a height of 1114 ft. There is a lighthouse at the S. tip. Curling stones are quarried here.

Aimard, Gustave (1818-83), Fr. novelist, b. Paris. He spent 30 years of his life roving through Central America and Asia. He made use of the materials thus collected in writing novels of the Fenimore Cooper type, such as *Les Trappeurs de l'Arkansas*, 1858, and *Les Pirates de la prairie*, 1859. Many have been trans. into Eng. See *Indian Scout*, Everyman's Library.

Aimoin (d. 1008), Fr. Benedictine monk and historian, who wrote a hist. of the French up to 654, which gives an account of the manners and customs of the time.

Ain: 1. Fr. riv. rising in the Jura Mts, and flowing SW. through the depths of Jura and Ain, to join the Rhône 18 m. above Lyons. Length 118 m.

2. Dept on the E. frontier of France, bounded W. by the Saône, and S. by the Rhône. The plains of the N. and W. yield cereals and market-garden produce, and there is much breeding of livestock, including poultry. The S. is swampy, and only partially drained. There are vineyards in the valleys of the Jura Mts in the E. There are hydro-electric schemes, and a considerable plastics industry. The prin. tns are Bourg (the cap.), Belley, Gex, and Nantua (qq.v.). Area 2248 sq. m.; pop. 311,950.

Ain Tab, tn of Asiatic Turkey, 65 m. N. of Aleppo. It was once an important military post, and is now a flourishing centre of Amer. mission work. Trade, hides and leather. Pop. (Turkish, Armenian, and Gk) 45,000.

Ainaboli, see INEBOLI.

Ainger, Alfred (1837-1904), b. in London, graduated from Trinity College, Cambridge, in 1860. In 1866 he was appointed reader at the Temple Church, in 1877 canon of Bristol, in 1894 Master of the Temple. He is best known as the biographer and editor of Charles Lamb. His works include *Crabbe*, 1903, and *Lamb*, 1882 (revised 1888), in the English Men of Letters series, and various articles in the *Dictionary of National Biography*. See his *Life and Letters* by Edith Sichel, 1906.

Ainley, Henry Hinchliffe (1879-1945), actor, b. at Morley, Yorks, descended from mining stock. While working in a Sheffield bank he became an amateur actor, and later went to Frank Benson for training and experience. George Alexander, struck with his fine physique and voice, cast him, still unknown, to play Paolo in Stephen Phillips's tragedy *Paolo and Francesca* in 1902. As a romantic juvenile actor he conquered America as 'The Little Minister' in Barrie's play. Under Granville-Barker he obtained invaluable experience in styles as diverse as those of Gk tragedy and Shavian comedy, passing from the name-parts in Euripides' *Hippolytus* and *Orestes* to that of Valentine in *You Never Can Tell*. Meanwhile at Stratford he kept up his Shakespearian work, and in Granville-Barker's Shakespearian revivals (1912) at the Savoy he reached the highest point of his acting in his Leontes and Malvolio. He was also excellent as Joseph Surface and charming as Little Billie in *Tribby*. He had now perfected his vocal range, which made him the greatest verse speaker on the stage, while his majestic bearing enabled him to invest his parts with a physical quality denied to others. In 1913, under Barker, he reflected brilliantly the nervous realism of the shy artist Ilam Carve in Arnold Bennett's *The Great Adventure*; *Quinney's* at the Haymarket was another success. After serving as a gunner in the First World War he was associated with Gilbert Miller in management at St James's. During the next 10 years his most notable successes were in Milne's

The Dover Road, Irvine's *The First Mrs Fraser*, and James Bridle's portrait of an Edinburgh surgeon, *The Anatomist*. His last appearance on the stage was in 1932.

Ainmiller, or Ainmüller, Maximilian Emanuel (1807-70), b. Munich, where he was a glass-painter. Discovering various technical improvements, he extensively revived the art of glass-painting. His works include windows in St Paul's Cathedral, London, and in Glasgow Cathedral.

Ainsworth, William Francis (1807-1896), b. at Exeter, graduated in medicine at Edinburgh in 1827. He then conducted some geological researches in the Auvergne Mts and the Pyrenees, after which he travelled for some years in Asia, visiting Kurdistan. On his return, in 1838, he pub. *Researches in Assyria*, and later *The Claims of the Christian Aborigines in the East*, 1843, and *Travels in the Track of the Ten Thousand Greeks*, 1844.

Ainsworth, William Harrison (1805-1882), historical novelist, b. Manchester, where his father was a solicitor. He was to have followed the same profession, but he had little liking for it. He came to London to finish his studies and met there John Ebers, a publisher who was manager at that time of the Opera House; he thus met a great number of literary and musical people, and his charming manners found him many friends. His first successful novel, pub. in 1834, was *Rookwood*, the hero of which was Dick Turpin, and from that time to 1881 he pub. about 40 novels. Some of these appeared in *Bentley's Miscellany*, *Ainsworth's Magazine*, and the *New Monthly*, while he was editor of these papers between the years 1840 and 1854. Among his friends were Dickens, Thackeray, Talfourd, and Cruikshank, who illustrated sev. of his novels. His best-known novels are *Rookwood*, 1834, *Crichton*, 1837, *Jack Sheppard*, 1839, *The Tower of London*, 1840, *Old St Paul's*, 1841, *The Miser's Daughter*, 1842, *Windsor Castle*, 1843, *The Lancashire Witches*, 1849, and *The Flitch of Bacon*, 1854. See S. M. Ellis, *William Harrison Ainsworth and his Friends*, 1911.

Aintree, vil. and par. of Lances, England, 6 m. NNE. of Liverpool. At A. is the racecourse where the premier Eng. steeplechase, the Grand National, is run each Mar., and also a noted motor racing circuit. Pop. 4500.

Ainus, dying race now found chiefly in the is. of Hokkaido (Japan) and Sakhalin. They were probably one of the aborigines of Japan, and early Jap. hist. tells of fierce conflicts with them. They are now almost intermingled with the Japanese. The A. are tall, strong, and very hairy, though there is no ground for the tradition that their bodies are covered with hair. Their cheek-bones are high, their noses flat and broad, and their faces short. They are primarily hunters and fishers. Their prin. object of worship is the bear, though they pay no respect to the life of this animal, which they kill and skin without any fear, setting up its head in their vils. They believe, however, in a

Supreme Creator and also in the immortality of the soul. They have no written literature; recently, however, their epics and myths, handed down orally, have been recorded and studied by Dr K. Kindaichi and his school.

The A. differ in physique, language, and customs from the other Asiatic races, and are generally considered to have Caucasoid ancestry, being classified as Proto-Caucasoids (see RACE). See J. Batchelor, *The Ainu and their Folklore*, 1901, and *Ainu Life and Lore*, 1927; L. H. D. Buxton, *The Peoples of Asia*, 1925; G. P. Murdock, *Our Primitive Contemporaries*, 1934; G. Montandon, *La Civilisation ainoue*, 1937.

AINUS
Paul Popper

Air, or **Asben**, fertile but mountainous region of the Sahara, situated between lat. 17° and 20° N. and long. 7° and 10° E. The pop. consists mostly of Tuaregs (q.v.). Cereals and dates are extensively cultivated, and vegetation is luxuriant. An important caravan passes annually through the tn of Asben. A. is the most populous part of the Sahara. Chief tn Agades (q.v.).

Air, the atmosphere we breathe (see ATMOSPHERE); the characteristic or soprano part of a musical composition (see ARIA and MELODY); the bearing or manner of a person; in the plural, affected manners.

Up to the middle of the 18th cent. A. was thought to be a simple elementary substance, of which all other gases were modifications. Hence oxygen was first of all spoken of as 'dephlogisticated A.'

nitrogen as 'phlogisticated A.' hydrogen as 'inflammable A.' and carbon dioxide as 'fixed A.' The idea of modifications of the atmosphere is still preserved in the use of such terms as 'mountain A.', 'sea A.', etc.

A. is now known to be a mixture of gases, consisting approximately of 4 vols. of nitrogen to 1 of oxygen, with smaller quantities of carbon dioxide, water vapour, argon, helium, neon, krypton, xenon, ammonia, dust, sulphuric acid, etc. Carbon dioxide, though present in small proportion (0.03 per cent by vol.), is nevertheless of great importance, as it forms the chief food of green plants.

A. may be liquefied and even solidified by the application of great pressure combined with an extremely low temp. (see LIQUID GASES). Compressed A. is used as a curative agent (see AEROTHERAPEUTICS), as an explosive or propellant (see AIR-GUN), as a dielectric in a form of Leyden jar (q.v.), and as a motive power in various forms of machinery, such as the boring machines used in tunnelling through the Alps and elsewhere (see TUNNELLING).

Air-bath, oven heated by gas or steam, used in practical chem. for removing water from a substance.

Air-bed, bed consisting of an envelope of rubber fabric distended with air. It is used principally for bedridden patients who are apt to develop bedsores. The bed is usually divided into compartments, into each of which air is pumped through a valve. When deflated the bed can be folded up.

Air - bladder, or **Swimming - bladder**, structure in some fishes which is filled with gas and serves as an organ of flotation. It occurs in the position occupied in air-breathers by the lungs, but is in most instances developed dorsally from the fore-gut, whereas the lungs are a ventral outgrowth. It is usually connected with the pharynx or the gullet by a duct, and therefore probably performs the duties of an accessory respiratory organ. It has been found that in a perch asphyxiated in stagnant water, the oxygen of the A. has been entirely replaced by nitrogen and carbon dioxide, although the normal proportion of oxygen is from 20 to 25 per cent. In some fishes the pneumatic duct is atrophied, so that the A. becomes a closed sac whose function is entirely hydrostatic, i.e. it serves to keep the sp. gr. of the fish the same as that of the water. The gases in the bladder are compressed or rarefied as the fish is subjected to greater or less pressure by its varying position in relation to the surface, and the quantity of gas is regulated by absorption or secretion, so that the sp. gr. of the whole fish is properly adjusted. In some instances there is a connection between the A. and the auditory organ, probably giving the fish a consciousness of the variations of pressure.

Air-brake, see BRAKES.

Air-chambers, in plants, are cavities in the leaves or stems, or other parts, containing air. They are present in the

parenchymatous tissue at the angles of adjoining cells. They are easily seen in aquatic plants, e.g. water-lilies.

Air Conditioning, system used for controlling the internal climate of a building. This may be necessary for some industrial process (as in cotton mills), for laboratory work, or to maintain comfortable conditions in very hot or cold climates. An extreme instance is afforded by the pressurized cabin of the modern air-liner. Essentially an A. C. system is a forced ventilation system in which, instead of air being drawn in from outside the building, the inside air is recirculated, filtered, washed, heated or cooled, and its humidity adjusted. In cold weather this system results in a considerable economy in heat, especially if the shell of the building is designed to give a high level of insulation; double glazing may be installed, for example, as windows will not need to be opened to admit fresh air. A. C. is widely adopted in Amer. cities. Cooling systems, incorporating refrigeration plant, are much more costly. In the tropics it is feasible to provide them in only the most important buildings. See also VENTILATION.

Air Council, estab. by the Air Force (Constitution) Act, 1917, to administer the R.A.F., to organise the defence of the realm by air, and (initially) to control civil aviation. See AVIATION, CIVIL.

Air-engine, a form of heat-engine in which the working substance is air (see THERMODYNAMICS). A chamber is placed so that one end can be heated by a furnace and the other cooled by a refrigerator. When hot the air is allowed to expand to push a piston; when cooled it is compressed to its original vol. by pushing a piston back. The difference between the work done by the hot air pushing the piston and that done upon the engine by pushing the piston back is the net work done by the engine.

This principle was adopted by the Rev. R. Stirling, who invented in 1816 an A. in which a large plunger works in a cylinder, with a space at the top kept cool by a water-jacket, and a space at the bottom heated by a furnace. The distinctive feature of the engine is the 'regenerator,' a structure of thin metal plates or wire gauze, which connects the cold upper region with the hot lower region, so that the hot air in ascending may give out heat which may be taken in by the cold air in descending, thus supplementing the furnace and economising on fuel. When the plunger is raised the cold air is forced through the regenerator to the bottom of the engine, becoming heated, and exerting pressure which serves to raise a motor piston. The plunger then falls; the heated air is forced up to the cold region, the pressure diminishes, and the motor piston falls. The whole work done by the engine is the difference between the work done by the motor piston and that required to move the plunger. The theoretical efficiency of such an engine is high, but in practice it does not work out so satisfactorily. A double-acting engine of a somewhat

improved type, the result of the collaboration of Robert Stirling with his brother James, was installed in the factory of the Dundee Foundry Co., where it was used for about 3 years; but repeated difficulties connected with the heating vessels eventually caused its abandonment.

In 1853 an American, Capt. John Ericsson, fitted his ship, the *Caloric*, with an A. He used a regenerator, but experienced the same difficulties as his predecessors, and abandoned the attempt after 2 years' trial.

The more marked disadvantages of A.s on the Stirling model are the great bulk of air used in engines of quite small power and the difficulty of transmitting heat to it. The surface to be heated is too large, there is great waste of heat through the chimney, and there is constant oxidation of the metallic envelope, owing to its being at a high temp. in contact with free oxygen.

Modern A.s are usually of small power; they are, however, easy to work, and are especially suitable for pumping. Messrs Hayward and Tyler's 'Ilder' hot-air engine has 2 cylinders and a regenerator consisting of thin iron plates. Coke is employed as fuel, and if the engine is used for pumping the water may be utilised in the cooling-jacket. For a 1-h.p. engine the consumption of coke is about 9 lb. per hr. In the 'Bailey' engine there is 1 cylinder, in which both the motor piston and the plunger work. The engine is very simple in construction, and requires little attention in working. In a Fr. hot-air engine, the 'Bénier,' the air is first compressed by an air-pump and then driven through the incandescent fuel. A valve prevents the escape of the air during the ascent of the piston; it is then exhausted, a portion being blown into a small space surrounding the motor-cylinder, which tends to keep the cylinder and piston cool. This engine is made to give as much as 20 h.p.

Air Force, Royal (R.A.F.). This, the youngest of the 3 services, was constituted by Act of Parliament in 1917 by amalgamating the Royal Naval Air Service and the Royal Flying Corps. These bodies were organised respectively by the Admiralty and the War Office, and rendered effective service during the First World War, but as from 1918 the amalgamated force was organised and controlled by the Air Ministry. The R.A.F. consists of the Royal Air Force, the Air Force Reserve, the Royal Auxiliary Air Force, the Royal Air Force Regiment, the Royal Air Force Volunteer Reserve, the Women's Royal Air Force (W.R.A.F.) (earlier W.A.A.F.), Princess Mary's Royal Air Force Nursing Service, and the Air Training Corps. The Fleet Air Arm was transferred to the R.N. in 1937. The R.A.F. is divided into Commands as follows: Bomber Command (q.v.) (H.Q., High Wycombe); Fighter Command (H.Q., Stanmore); Coastal Command (H.Q., Northwood); Flying Training Command (H.Q., Reading); Technical Training Command (H.Q., Brampton); Maintenance Command (H.Q., Andover); Transport

Command (H.Q., Upavon); Home Command (H.Q., White Waltham); and N. 90 (Signals) Group. *Overseas:* Middle East Air Force (H.Q., Cyprus); H.Q. Brit. Forces, Aden; Air H.Q., Levant; Air H.Q., Malta; Far East Air Force (H.Q., Singapore); Air H.Q., Ceylon; Air H.Q., Hong Kong; 2nd Tactical Air Force, Germany; R.A.F., Gibraltar.

The R.A.F. had its beginnings in the estab. of the Royal Flying Corps on 13 May 1912, comprising naval and military wings, together with a Central Flying School and the Royal Aircraft Factory at Farnborough. In the next 2 years good progress was made and, when war broke out, 4 squadrons of the Royal Flying Corps with some 50 aeroplanes were sent overseas in time to play a part in the battle of Mons; while a detachment of the Royal Naval Air Service (R.N.A.S.) was sent to Belgium and estab. itself at Dunkirk—which remained, throughout the war, a centre of air operations. In Aug. 1914 there were less than 250 officers in the service: in Nov. 1918 there were 30,000. The total aeroplanes available for immediate use in 1914 were about 150; in Nov. 1918 there were more than 22,000. In addition to the W. front, squadrons operated in Italy, Palestine, Salonika, Mesopotamia, and E. Africa. At home an air defence organisation was formed to combat the airship and aeroplane attacks on Great Britain. The R.N.A.S. was primarily engaged in co-operating with the navy in countering the submarine menace to our sea lines of communication. Offensive action was mounted against enemy-occupied ports in Belgium, and naval aircraft from carriers played an important part in the operations against the Dardanelles and in the Mediterranean, the Aegean, and the E. Indies. With the development of the heavy bomber and efficient day bombers in 1917 came the employment of air power in an independent strategic role. In Jan. 1918 the Air Ministry and Air Staff were created for planning and directing such strategic air operations, and 3 months later—on 1 April—the R.A.F. came into being. In June of the same year an independent striking force was estab. in France for an assault on Germany's war industries. When the First World War ended, the R.A.F. was the most powerful in the world; the economies of peace reduced it rapidly to a fifth position amongst the nations.

A scheme for the permanent organisation of the R.A.F. prepared by Lord Trenchard was presented to Parliament by Winston Churchill, then Secretary of State for War and Air, in Dec. 1919. The object of this was to lay a foundation of a small but highly efficient force, capable of expansion without any drastic alteration. A cadet college was opened at Cranwell in 1920, followed in 1922 by an R.A.F. Staff College at Andover. A training scheme for aircraft apprentices was started at Halton. Another development was the formation, in 1925, of the Auxiliary A. F. In the 1920's the R.A.F.

played a leading role in surveying and pioneering air routes throughout the Commonwealth and made many famous flights, the more notable including those from Cairo to the Cape in 1926; a flying-boat cruise of 23,000 m. to the Far E. and Australia early in 1928; and in 1933 a flight from Cranwell to SW. Africa—a distance of 5340 m. in 57 hours. High-speed flying was not neglected and R.A.F. teams won the Schneider Trophy contests in 1927, 1929, and 1931, gaining the trophy outright for Britain and setting up new world speed records in the process. The aircraft used in these contests contributed greatly to the development of later fighter aircraft which won the Battle of Britain in 1940. Simultaneously the R.A.F. was engaged upon active operations. In 1919–20 detachments co-operated with our forces in N. and S. Russia; in 1920 with the Camel Corps in operations against the mullah in Somaliland. The Gov. decided that the control of certain mandated ters. should be taken over by the R.A.F., and in 1922 Sir John Salmond assumed command of the military and air forces in Iraq. For the next 10 years these forces were engaged intermittently in tribal incidents. In India the R.A.F. was involved in numerous actions in Waziristan and during the inter-tribal disorders in Afghanistan. During the rebellion of 1928–9, some 590 people of all nationalities were evacuated by air when the Brit. Legation at Kabul was cut off by rebel forces. In 1928 defence of the Aden Protectorate was also entrusted to the R.A.F. To meet the threat of the new Ger. A. F., the R.A.F. was expanded considerably in the mid 1930's, and by 3 Sept. 1939 its strength stood at 2600 operational aircraft, mostly modern all-metal monoplanes. In addition, it possessed a vitally important reporting system on the ground in the form of the Observer Corps (later Royal), combined with the newly constructed chain of 18 radar warning stations along the E. coast of England, each connected to the filter room at Fighter Command H.Q.

From 2600 operational aircraft and 174,000 officers and men in 1939, the R.A.F. grew to a strength of 9200 first-line aircraft and 1,079,835 R.A.F., Dominion, and allied officers and airmen—of whom some 193,000 were air crew—by May 1945. A major factor in this expansion was the Brit. Commonwealth Air Training Plan, centred in Canada, where no fewer than 360 schools produced, in the course of the war, 137,740 air crew for the R.A.F., the R.C.A.F., and the R.N.Z.A.F. To these were added air crew trained in the U.K., S. Rhodesia, and the U.S.A. Ground personnel, numbering 154,000 in 1935, reached a total of 887,000 by May 1945. Women also served—from a total of 1734 in 1939 the strength of the W.A.A.F. rose to a peak, in 1943, of 182,000 employed in more than 80 trades. The great test of the R.A.F. and its ground reporting organisation came in the Battle of Britain, July–Sept. 1940, when the Germans launched

some 4000 aircraft in attacks on England to pave the way for a planned invasion of Britain. The 600 Hurricanes and Spitfires of Fighter Command inflicted a total defeat upon this force. Their victory marked the turning point in the war and, although Brit. cities had to endure many later night attacks, the crisis had passed. Meanwhile Italy had allied herself with Germany, and the war had spread to the Middle E. Air H.Q., W. Desert, was created on 9 Oct. 1941, under the command of Air Vice-Marshal A. Coningham, from units which had been operating in Egypt and Cyrenaica since the summer of 1940. This force played a leading part in the battles which swayed to and fro across the W. Desert until the decisive battle of El Alamein in Nov. 1942. From then until the final surrender of the Ger. and It. armies in N. Africa in May 1943, the R.A.F. was the spearhead of the advancing Eighth Army, developing techniques of army support that were later adopted by all allied A. F.s. This force was then renamed the Desert A. F. and continued to work with the Eighth Army in the advance through Sicily and Italy.

Throughout the entire war a battle for survival was waged by Coastal Command and light naval forces against the U-boat menace in the Atlantic. With the development of radar search devices, the Leigh light, and the estab. of patrols by very long range aircraft, the counter attack steadily got the upper hand and 303 Ger. and It. U-boats were destroyed by aircraft at sea, 66 in harbour, 17 by air-laid mines, and a further 52 shared between air and surface craft—out of a total of 868 destroyed. In addition 914 enemy surface vessels were sunk by direct air action and another 770 by air-laid mines in N. European waters. In Dec. 1941 Japan joined the Axis powers and war spread immediately to the Far E. After a series of disasters involving the loss of Malaya, Singapore, and Burma, the allied strength was gradually built up until by 1944 it was possible to drive the enemy from Burma in a few months. These operations were made possible by using transport aircraft to supply all the needs of an army of more than 30,000 men. The primary role of the R.A.F. in the Second World War was that for which it was estab. in 1918—the strategic bombing of Germany. Bomber Command began its assault in May 1940 and dropped a total of 90,000 tons of bombs in 1940-2. In 1943 the total rose to 157,000 tons and in 1944 to 525,000 tons. With the development of radio navigational aids, increasing accuracy, and weight-carrying capacity of aircraft, large areas of the Ruhr and other industrial centres were laid waste. This compelled the Ger. A. F. to concentrate on home defence and, coupled with an all-out attack on Ger. fighter production, so reduced its striking power that air supremacy was estab. over N. Europe, and the allied landing in Normandy, in June 1944, was practically unopposed from the air. All commands played a leading role in the liberation of Europe,

and an R.A.F. bomber force was preparing to leave for the Far E. when Japan surrendered.

Post-war, the R.A.F.'s first task was to re-equip Fighter Command with jet-fighters, and it should be recorded that it was the only allied A. F. to use jets in action in the Second World War. Then it built up a large interim bomber force of Canberra jet-bombers whilst developing its formidable 'V' series of four-jet atom-bombers. Transport Command participated in the Berlin air lift of 1948-9. Coastal Command flying-boat squadrons, units of spotter planes and transport aircraft served in the Korean War; and R.A.F. jet-fighters and bombers took part in the Suez operations of 1956. Although much smaller than the Amer. or Soviet A. F.s, the R.A.F. was in 1957 technically and operationally still second to none.

See also AERIAL WARFARE; AEROPLANE; AIR RAIDS; BOMBER; FIGHTER.

Air Gap in a magnetic circuit, the air space between iron cores of adjoining components of the circuit. In electric machines the magnetic circuit consists of field and armature, one of which is rotating, and the A. G. has the effect of increasing the reluctance of the circuit, making the magnetic induction less sensitive to variations in the field excitation, i.e. the machine becomes more 'stiff' as regards regulation. See ELECTRIC MACHINES.

Air-gun, gun in which the bullet is propelled by the energy of compressed air. There are many forms, but usually there is an air reservoir communicating with the barrel, which should be of small bore. The air is compressed by means of a spring, the trigger operates the valve, and the bullet is thereupon propelled by the elasticity of the compressed air. Most A.s are capable of carrying a small bullet for a distance of about 60 to 80 yds. Modern Amer. A.s employ the 'Sparklet' compressed CO₂ as used in soda-water siphons. A.s are limited to .177 and .22 calibre. See also FIREARMS.

Air-lock, chamber connecting the region of compressed air of a caisson (q.v.) with the outer atmosphere. When the outer door is opened to admit men or materials the air is at atmospheric pressure. The outer door is then shut and air pumped into the lock until the pressure is equal to that of the caisson, when the inner door is opened.

Air Mail. A. M. is entirely a post-1918 development, apart from a temporary service between Hendon and Windsor, operated in 1911. A regular service between London and Paris was estab. in Nov. 1919, which was operated by Aircraft Transport and Travel, using an Aircro 'D. H.' type of plane. The initial rate of charge was 2s. 6d. per oz., but this was soon reduced to 2d. In 1920 the service was extended to Brussels and Amsterdam, and 2 years later the Paris service included parcel post. Then followed daily services to Paris, Brussels, Stockholm, and Basel in summer-time. Plans in preparation shortly before the Second World War covered every European cap. in the network of the Brit. A. M. services. A. M.

service between Egypt and Iraq was operated by the R.A.F. in 1921, but in 1927 this service was transferred to Imperial Airways Ltd. In Mar. 1929 the Egypt-Iraq service was included in the newly inaugurated London-Karachi route via Italy, Greece, Egypt, and Iraq. Soon afterwards the Indian service was continued from Karachi to Lahore and also to Bombay and Madras, and then across India via Delhi and Calcutta through Siam to Singapore. In 1933 a further extension was made through Java to Port Darwin (Australia), and thence to Perth, and also a transcontinental service was begun to Sydney and Brisbane. In the following year Imperial Airways announced the preparation of a 7-8-day service to Australia. The other long-distance Empire route, the 8000-m. route from London to Cape Town, was opened in 1932. A transatlantic A. M. service, connecting with the airway system of Canada, and a trans-Pacific service were then projected, and test flights were carried out in 1938 and 1939 between England and Port Botwood (Newfoundland). Between 1936 and the outbreak of war in 1939, Imperial Airways operated the Empire A. M. Scheme with their Short flying-boats, under which all first-class mail to any destination in the Brit. Empire was carried by air at a standard charge of only 1½d. per half-oz. As a result, between 1924 and 1939 the Brit. A. M. increased from 100,000 letters to many millions annually.

There has been no return to the Empire A. M. Scheme since the war; but the great post-war growth of civil aviation has been matched by a steady increase in the vol. of A. M. carried. Brit. airports alone now handle up to 1600 tons of mail each month. See AVIATION, CIVIL.

Information on A. M.s to countries abroad is given in the current A. M. leaflet, which may be obtained gratis at any post office or, by telephone, from the London Postal Inquiry Office.

Air Ministry, ministry formed to administer the R.A.F. (q.v.) through the Air Council (q.v.). It has depts under each of the prin. members of the Air Council. For purposes of recruiting and organisation there were in 1938 5 Area Commands under its control: the Northern, Midland, Southern, Western, and Scottish, with H.Q., respectively, at Catterick, Grantham, Stanmore, Gloucester, and Edinburgh. The enormous increase of the R.A.F. during the Second World War, coupled with the rapid completion of numbers of new aerodromes and the training of thousands of air personnel in Canada under the Air Training Scheme, entirely transformed the organisation of air commands in Britain. The A. M.'s depts include a meteorological office; scientific adviser's dept; directorates of signals, armaments, operations, navigation, accident prevention, intelligence (research, technical, etc.), plans, policy, operational training, equipment, engineering, technical training and radio; and personnel branches.

Air Pollution. Efforts to abate the smoke from the burning of coal date back to 1273, but quite recently other constituents of the general pollution of the air have also been given attention. Considerable research, new legislation, and other action have followed serious 'smog' disasters in the U.S.A. (Donora, 1948) and Britain (London, 1952). The latter led to the appointment of a new committee of inquiry (the Beaver Committee), the report of which in 1954 was followed by the Clean Air Act, 1956, which replaced earlier legislation.

Constituents. The visible constituents of A. P. are smoke, grit, and dust. Smoke is produced by the incomplete and uneconomic combustion of bituminous coal, when some of the volatile hydrocarbons escape unburned. Oil can also produce visible smoke if incompletely burned. In Britain annually about 2 million tons of smoke are emitted, and with accompanying combustible gases there is an ann. waste of up to 10 million tons of coal. Nearly one-half the smoke is from domestic fires. 800,000 tons of grit and dust are also discharged, mainly from industry. Invisible constituents include sulphur gases from the sulphur present in both coal and oil, carbon monoxide and other gases, and from road vehicles an increasing amount of hydrocarbons, aldehydes, and other contaminants. Certain industries also produce specific pollution, such as dust from cement and lime-burning kilns, dust and fumes from metallurgical plant, etc. The notorious 'smog' of Los Angeles, mainly derived from oil products, differs materially from the pollution found in Britain and the eastern U.S. cities.

Effects. A. P. affects health by diminution of natural light (up to one-half winter sunlight may be lost in large cities), by respiration of polluted air, especially when abnormally concentrated by fog, and by the psychological effects of life in a dirty, darkened environment. The London smog (i.e. smoke plus fog) disaster of 1952 caused 4000 deaths, mainly from respiratory and cardiac causes, and in 1956 a less severe episode is estimated to have caused 1000 deaths. Possibly more important is the chronic effect of the normal A. P. on the respiratory system, which will largely account for the excess of bronchitis in urban as compared with rural areas. Serious damage to plant life, stone-work, fabrics, metals, etc., is caused by smoke and the associated sulphur acid gases. Including the fuel losses, the ann. cost of A. P. was estimated by the Beaver Committee to be £300 millions.

Prevention. In principle smoke may be prevented by confining the use of bituminous coal to plant in which combustion can be correctly controlled, and for all other purposes (e.g. open domestic fires) using only the smokeless derivatives of coal. Modern industrial technique, by mechanical and underfeed stoking, good design and instrumentation, skilled attention, avoidance of overloading, etc., can ensure smoke prevention in

most plants. Electricity and gas are increasingly making difficult industrial processes smokeless, as in the Potteries. Grit and dust can be eliminated by electrostatic precipitators, cyclones, wet washing, etc. Elimination of sulphur gases is carried out at Battersea and Bankside power stations, London, but the process is expensive and is not feasible for small plants.

Domestic smoke is now recognised as a very equally serious problem. Efficient new stoves and grates have been developed which will burn any type of smokeless fuel (anthracite, gas and oven coke, and semi-cookes of the 'Coalite' type). Gas, electricity, and central heating are also making important contributions to smokeless housing. New housing estates exist where the use of smokeless methods is a condition of tenancy.

Pollution from road vehicles, and especially from Diesel engines, can be reduced by correct adjustment and maintenance, but cannot yet be satisfactorily prevented. Further research and development are required for this and for a number of other special problems.

Legislation and Control. The Clean Air Act, 1956, provides for strict control over dark smoke from industry, control over new plant, enforcement of measures for the minimisation of dust and grit, and for the progressive abolition of domestic smoke by means of smoke control areas. These are similar to the successful smokeless zones set up in a number of cities, in which all smoke is prohibited. The new Act unifies Eng. and Scottish law, provides for the setting up of an advisory Clean Air Council by the responsible minister, and contains sections relating to smoke from railways, shipping, and Crown premises. Except for the more difficult processes, which are the concern of the central Inspectorate of Alkali, etc., Works, the Act is administered by the local authorities. The programme for smoke abolition proposed by the Beaver Committee is for the setting up of smoke control areas, by stages, in the areas of heaviest pollution (the black areas) over a 10-15 year period. This would remove 80 per cent of the present pollution, but its success depends largely on the increased production of solid smokeless fuels to replace domestic coal.

Organisation. Reference has been made to the legal duties of the Alkali Inspectors and the local authorities. The latter also carry out systematic measurement of pollution under the supervision of the Fuel Research Station of the Dept of Scientific and Industrial Research. The National Smoke Abatement Society (N.S.A.S.) is the prin. information and propaganda body and publisher, with local authority, industrial, and individual membership. See A. Marsh, *Smoke: Problem of Coal and the Atmosphere*, 1947; H.M.S.O., *Report of Committee on Air Pollution*, 1954, and ann. reports on *Investigation of Atmospheric Pollution*; A. R. Meetham, *Atmospheric Pollution*, 1956; N.S.A.S., *Smokeless Air* (quarterly jour.), year-book, and ann. conference

proceedings. There is also a considerable amount of U.S. literature.

Air Pump, machine for diminishing or increasing the amount of air in a contained space. The term was originally applied to contrivances for producing a partial vacuum, but is now used without discrimination in connection with machines for producing a flow of air. The mechanism which provides a diver with a constant supply of air at a pressure proportionate to his depth in the water is called an A. P., and the term is also applied to machinery whose object is to provide a supply of compressed air.

The earliest device for exhausting air by means of a pump is associated with the name of Otto von Guericke. In 1650 he devised an apparatus for removing air from a vessel, called a receiver, which is connected with a barrel in which a piston works. Both the connecting pipe and the piston are fitted with valves opening away from the receiver. As the piston is pushed in, its valve opens and lets out the air contained between it and the valve at the bottom of the barrel. When the piston is withdrawn its own valve shuts, and the other valve opens to allow the air of the receiver to extend into the barrel. The air in the receiver thus becomes more rarefied at each stroke. A. P.s on the Guericke model do not reach a high level of efficiency. The difficulty of working increases as the difference of pressure within and without the receiver increases; there is usually constant leakage at the valves, and when the process of exhaustion has reached a certain point, the pressure of the air left in the receiver is not sufficient to open the valves. An improvement was instituted by Papin and Hawksbee, who used a pump with 2 barrels, thus shortening the process of exhaustion. In Hawksbee's A. P. each piston is worked by a rack and pinion, and owing to the fact that 1 piston works with the pressure of the atmosphere as the other works against it, the difficulty of working as exhaustion proceeds is not increased.

In Tate's A. P. there is a single barrel with a double action, the piston consisting of 2 disks joined together, forming essentially a piston just less than half the length of the cylinder. There is an outward-opening valve at each end of the cylinder, and the inlet is in the middle, so that air is expelled by both the forward and backward strokes of the piston.

A pressure gauge is usually attached to these pumps, consisting of a bent glass tube containing mercury, one end of which is closed, thus forming a kind of barometer. The closed portion, however, need not be 30 in. long, as it is seldom necessary to know the pressure inside the receiver until it is considerably less than that of the atmosphere.

The progress that has been made in modern electrical research and in its practical applications since about 1900 has been made possible only by an enormous improvement in the design and technique of A. P.s. The modern 'high-vacuum' pump is capable of producing a

pressure as low as one million-millionth of an atmosphere. The pressure in a wireless valve and the modern Coolidge X-ray bulb is about one thousand-millionth of an atmosphere. There are 3 main types of vacuum pumps: (1) the rotary oil pump, (2) diffusion pump, (3) the ionisation gauge acting as a pump.

Another type of pump works as follows: Inside a fixed cylinder there is mounted a concentric cylinder of a diameter only slightly less than the outer one. The latter cylinder can be rotated very rapidly about its axis by means of an electric motor. In the outer cylinder there are 2 outlets, one (A) communicating with the vessel to be evacuated, and the other (B) connected to a low-pressure chamber, i.e. one in which the pressure has been reduced to about one-thousandth of an atmosphere by means of an ordinary A. P. The movable cylinder rotates from A to B, and as its periphery is moving with a high velocity, comparable with that of the molecules, a one-way molecular traffic is set up in the direction from A to B, and the pressure in the vessel connected to A decreases very rapidly to a very low value.

In the common filter pump a stream of water rushes past an outlet and draws the air from the tube connected to the funnel containing the liquid to be filtered. The diffusion pump uses the same principle, but with this difference: the stream is a stream of mercury vapour from mercury boiled under reduced pressure, and it rushes past an outlet connected to the vessel to be evacuated, thus dragging molecules of the air along with it. See DIFFUSION PUMP.

Air-raid Precautions (A.R.P.), see CIVIL DEFENCE.

Air Raids. *First World War.* The inviolability of the shores of Great Britain guaranteed by the supremacy of the seas was to a limited extent disturbed in the First World War by enemy attacks from the air. A few attacks were made in 1914. In 1915 Ger. airships of the Zeppelin type raided Norfolk, Northumberland, Essex, Suffolk, Yorks, E. London, and the home cos. The attacks were repeated in 1916 and extended to the midland cos., Cheshire, and as far N. as Scotland. In 1917 and 1918 airship raids were very rare, and ceased altogether after April 1918, the losses sustained by the raiders rendering such mode of attack abortive. Some Ger. airships were brought down in flames in England, and in Oct. 1917 only 4 out of 11 returned safely to Germany, the other 7 being wrecked over France and the Mediterranean. The number of airship raids was approximately 50, and according to the best available estimates the casualties among civilians in killed were: 217 men, 171 women, 110 children; the injured numbered 587, 431, and 218 respectively; 58 sailors and soldiers were killed and 121 injured.

Ger. aeroplane raids began in Dec. 1914, over Dover and other parts of Kent. There were 4 raids over the E. cos. in 1915, 16 over E. and home cos. in 1916,

27 over E. and home cos. and London in 1917, 8 in 1918, mainly over Kent, Essex, and London, the last being in June over Kent. The total casualties from these A. R. were: among civilians, killed 282 men, 195 women, 142 children; injured 741, 585, and 324 respectively; military personnel 238 killed and 400 injured. No co. was more raided than Kent, though Essex suffered severely. No fewer than 213 civilians were killed and 615 injured in 2 raids over Margate, Essex, and London on 13 June and 7 July 1917. By 1918 the R.A.F. had estab. a definite superiority over raiders, and this fact, combined with the pressure on the W. front, which necessitated the retention of Ger. machines over the lines, caused these raids to cease altogether nearly 5 months before the end of hostilities. The last A. R. on London was on 19 May, 1918, this being the twenty-fifth raid on the cap., the prin. damage during the whole period being done in Bethnal Green, Peckham, Lewisham, Lower Sydenham, Kilburn, Hotherlitho, the City, and Poplar. In the City the most disastrous raid was that in which explosive bombs were dropped on the Central Telegraph Office. For the rest anti-aircraft guns and defensive planes kept the raiders too high to permit of damage to railway centres or points of military importance. Many bombs were dropped on Paris in the course of numerous raids, over 400 persons being killed and twice that number injured. In the first months of the First World War, the Allies only employed aircraft for reconnaissance work, for the direction of artillery fire, and for bombing the Zeppelin sheds of Düsseldorf or military positions. The Germans, however, initiated the policy of bombing open or undefended towns with the object of instilling terror into the inhab., but without any marked effect. By way of reprisal the Allies in the later stages of the war effected numerous raids into Germany, especially in the Rhine provs. Later the R.A.F. organised and carried out raids of increasing intensity as far as Frankfurt and Stuttgart, and a great raid on Berlin would have been attempted but for the signing of the armistice.

Air Raids over Britain in Second World War. Daily A. R. on Britain began on 18 June 1940. General night attacks, but on no large scale, were meant to probe defences, and to make pilots familiar with the area. At the beginning of July daylight raids increased in strength, particularly against ports and shipping, suggesting that temporarily the enemy's purpose was not so much the destruction of Brit. air power as the tightening of the blockade, for airports and industrial plants were no longer the main targets. Southampton and Portsmouth were savagely raided, but attacks also ranged from E. Scotland all round the coast to the Bristol Channel. By the end of July the raids were increasing in intensity, but the numbers of hostile aircraft were still comparatively small. On 8 Aug. there was begun a series of mass daylight

raids lasting a fortnight, the number of raiders rising ultimately to more than a thousand. These raids were still directed against ports and shipping, but attempts were also made to wreck airports and destroy defending planes. The battle of Britain (q.v.) showed, however, that the Germans had no hope of conquering the R.A.F. by mass daylight raids. Damage had been fairly extensive in certain localities of London, but basic resources were not seriously impaired. At the end of Aug. it was evident that the Germans

tiers above them, or in mixed formations of fighters and bombers which spread out in the hope of scattering the defending planes before converging from different points and at different altitudes. But they continued to pay a heavy price, and sometimes lost a third of their raiding force. Of the 40 heavier raids by daylight between 5 Sept. and 6 Oct. about a score were directed at the London area. On 15 Sept. the Germans made a supreme effort which proved to be the climax of their daylight raids, and the most triumphant

THE LONDON FIRE RAID OF 29 DEC. 1940

News Chronicle

had signally failed to crush the R.A.F. by direct assault on aerodromes and airports. Hence they were driven to indirect methods of attack, which Hitler pretended were in retaliation for the bombing of Berlin. The real motive for the mass assaults on London, which began on 7 Sept., was to paralyse a vital nerve centre by disrupting essential services. In the ensuing weeks London suffered a bombardment from the air more severe than that of Rotterdam or Warsaw. The vast system of the London docks lay almost in ruins. Shops, residences, and utility services were seriously damaged, but the city's vital services continued to function and the morale of the people remained unbroken. The success of the R.A.F. fighter-pilots against the daylight bombers forced the Luftwaffe to change their tactics. The bombers now approached in solid formations with fighter escorts in

day of all for the R.A.F. For losses at this time see P. Fleming, *Invasion 1940*, 1957. The Germans were now constrained to try to achieve their object by night raids, aided by parachute flares and incendiary bombs, and though they found it difficult to locate targets with any precision, their continuous bombing by mass assault wrought great havoc, especially in areas round the E. End docks. The defence now concentrated on a box barrage, aided by new methods of prediction and new combinations of searchlights and anti-aircraft fire. It still remained, however, to train fighter-pilots for night operations. But all these defences were still far short of giving immunity against the damaging effects of a protracted process of attrition. None the less the abandonment of *blitzkrieg* methods of air-raiding meant that all hope of an immediate victory over

Britain had gone, and the enemy now hoped by indiscriminate night-bombing to demoralise the civilian pop., besides progressively destroying London or paralysing its commercial life. Occasionally they still sent over daylight raiders, but when they did so their losses always rose, and sometimes they tried daylight raids by fighter-bombers under cloud cover—'nuisance' raids, whose purpose was to increase the strain both on civilian morale and on the fighter-pilots of the R.A.F.

But if the damage to vital objectives was still a matter of chance the damage to London property generally was mounting in severity and extent. In Oct. London was still the main objective, but by the middle of that month there were scattered raids on prov. cities which sometimes bore the brunt of an attack. The failure to conquer England by destroying London had compelled the enemy to turn his attention to the chief industrial areas, while periodically claiming that the raids were reprisals for R.A.F. raids. A full-scale attack on Britain being impracticable the Luftwaffe now tried the method of concentrating the maximum force on a single point of attack. Coventry was the victim of the first of these attacks. Some 500 planes bombed that city throughout the night of 14 Nov. with indiscriminate attacks, which destroyed the cathedral and the centre of the city, but left industrial plant relatively untouched. This 'terror' raid was soon followed by similar attacks on other tns, though not on the same scale. Birmingham, Southampton, Bristol, Liverpool, Plymouth, and other tns were in turn the objectives of such concentrated raids sev. times. Sheffield experienced the first of a series of raids on 12 Dec. Manchester was raided on 22 Dec. But public morale was not shaken, and on 29 Dec. the Gers. turned from high explosives to incendiarism. On that night thousands of incendiary bombs on the very heart of the City of London found its defenders unprepared, and many famous buildings were destroyed, the disaster being paralleled only by the Great Fire of 1666. It was, however, significant that the raids were now always on a limited scale, the inference being that the enemy was still unwilling to use more than a fraction of his force. Severe as the raids were, the real test in the air lay in the future. The direct damage by A. R. to Britain was not so much a matter of spectacular destruction as of gradual attrition, and perhaps the most extensive damage to an important area in this sense was that done in the Sept. raids on the E. End of London when great quantities of food imports were destroyed. But the percentage of destruction of industrial plants remained small, and not one of the services upon which the life of the great cities depended had broken down entirely. The 'nuisance' raids of Oct. were probably intended to retard production by compelling workers to resort to their shelters, though this was offset to some extent by employing roof-sitters. But

inevitably there was some loss of efficiency through the disturbances in the normal routine of civil life. The demolition of dwellings, particularly in Coventry, Plymouth, and the riverside bors. of E. London, also involved considerable inconvenience, especially as there was already a housing shortage. It was, therefore, true enough to say that the civilian, and particularly the London civilian, was in the front line. Air-raid wardens and the national fire-fighting services were repeatedly occupied in tasks of the most extreme danger, while the bulk of the pop. was exposed to perils which in past wars were experienced only by the people whose land was actually suffering invasion. But the prospect of A. R. was foreseen by the Gov. before the war began. Besides air-raid precautions and an auxiliary fire service, adequate preparations were made for the care of raid casualties. Yet insufficient preparation was made for the contingency of homeless persons. Thus, in Poplar, where more than half the houses were hit, the rest centres could not shelter, clothe, or feed the 'bombed out'; and no efficient billeting organisation existed, while responsibility for various functions was distributed among many different local bodies. But at this time the chief problem was the provision of sufficient shelters, for which no real plans had been made either by the Gov. or by the local authorities. With the accommodation in the few deep public shelters utterly inadequate, Londoners crowded into the tube stations to sleep in bunks on the platforms or on the stairs, while others sought refuge in warehouse basements. In these conditions the menace of disease was serious, especially as most shelters contained no heating installations. Some amelioration came with the provision of 'Anderson' shelters, and later of 'Morrison' indoor shelters; but Mr Herbert Morrison (q.v.) continued generally to rely on dispersal through a combination of evacuation to safer dists. and surface shelters, and this, in the circumstances, was no doubt the most effective remedy. Throughout these months of the greatest strain the patience of the mass of the pop. was beyond praise, and indeed the spirit of the Brit. people remained prepared to endure whatever burdens the war might inflict, confident always in ultimate victory.

There was a lull in A. R. over Britain for some 6 weeks between Jan. and the beginning of Mar. (1941) owing to the fact that Ger. air activity was now subordinate to the U-boat warfare. In this connection large-scale A. R. were resumed, in Mar. 1941, against the areas of Brit. ports in the hope of dislocating their functions as such. This time the long-range Ger. bombers struck as far N. as Glasgow and the Clyde-side, where the mass technique tried out at Coventry was combined with that of the incendiary attack on London. The effect of these raids was to some extent diminished by the fact that fire-watching had been made a compulsory duty, and that the

night-fighter defence and anti-aircraft technique had both been much improved. Considerable damage was, however, done to Plymouth, Southampton, Bristol, Cardiff, and Swansea, though none of these cities suffered the prolonged ordeal of London during the autumn of 1940, and in any case the Luftwaffe still lacked the resources to strike more than one major blow in a single night or on 2 successive nights. From April to June 1941 the Luftwaffe persistently attacked the chief seaports on the W. coast through which Amer. supplies must come, and sometimes they bombed E. coast tns, notably Newcastle and Hull. Some of the ports were heavily damaged, and made practically uninhabitable, though none was knocked out completely. The 3-day raiding of Plymouth on 21-3 April sent a great number of the inhab. out into the open countryside, and after sev. more raids before the end of April the state of Plymouth was even worse than that of Coventry. Portsmouth suffered a similar though less severe experience. Bristol's worst raid was on 11 April. Belfast was twice heavily raided in the same month. Liverpool was raided on 2 May, and for a week thereafter; yet despite widespread damage the port did not cease to function. The inland industrial cities were also intermittently attacked: Coventry again on 8 April, Birmingham on the succeeding night. London had one of its most savage attacks of all on 16 April, a dusk-to-dawn visitation which was only exceeded in ferocity by the raid on the night of 10 May when the roof of the House of Commons was demolished. Manchester and the Midlands suffered sporadic raids in June. But by way of set-off the improvement made in radio detection (see RADAR) soon made itself felt in an increasing number of enemy raiders being brought down by the Brit. night-fighters, especially on moonlit nights, and on 10 May the Germans lost 33 machines; while for the whole of May no fewer than 143 night-bombers were shot down, a substantial advance on any previous figures for night-time.

The extent and fierceness of this raid on London, following on the prolonged attack on Liverpool, and the increasing activity over the rest of the country, seemed to presage a full-scale Ger. air offensive by way of preliminary to an invasion, and the widespread attacks on Brit. air bases on 11 May seemed to confirm this impression; but in fact these raids were quickly followed by a lull—the lull before the Ger. invasion of Russia—though occasional savage raids were still made, and the 'hit-and-run' raids were continued. But generally speaking the practical cessation of Ger. A. R. over Britain was the corollary to the concentration of Ger. air-power on the Russian front, and the battered industrial cities and ports of Britain now enjoyed a valuable respite in which to remove the debris and return to an approximation of normal activity. Moreover it was now the turn of the Ger. cities to experience the nature of an all-out air attack, for

more bombs were dropped by the R.A.F. on Germany in June 1941 than had been dropped on Britain in April, the peak month of the Luftwaffe's effort, and the ensuing months showed that the Brit. attacks were on an ever mounting scale. Britain, in fact, had now secured relative immunity from large-scale A. R. There was a recrudescence on a minor scale in April 1942, the so-called 'Baedeker' raids on Brit. cathedral cities, such as York, Bath, Canterbury, and Exeter, alleged to be retaliatory raids for the bombing of Cologne, Rostock, and Lübeck. These 'Baedeker' raids involved over 900 civilian deaths against only 20 in the previous month, but comparison with the figure of 6000 fatalities in April 1941 shows how steeply the scale of Ger. A. R. had declined, and mostly less than 30 machines took part in these attacks. Enemy A. R. against Britain in 1943, described not inaptly as 'scalded cat' raids, were mostly carried out against fringe targets, and on no occasion were they on a heavy scale. On a number of occasions fast fighter-bombers were used, doubtless to keep down losses. There was little activity by day and most of the night raids were scattered.

A few days after the allied invasion of Normandy began (June 1944) the Germans opened an attack against London and S.E. England with jet-propelled flying bombs (V1). The attack was not on the scale the enemy had hoped because the launching ramps in the Pas-de-Calais and elsewhere and storage depots in France were subjected to persistent poundings from the air. When it was no longer possible to launch them from the ground the Germans used obsolescent bombers to release them while flying low over the North Sea. Later the V1 attacks, as they were called (see FLYING BOMB), were reinforced by rocket attacks (V2), mainly from Dutch bases. As these missiles (see ROCKET) are invulnerable during flight, the allied air forces, whenever possible, attacked them while they were in transit from the underground factories within the Reich to their launching sites. A great deal of damage was done by the flying bombs during an intensive period of some 80 days in June-Aug. 1944. Croydon was very heavily attacked, 3 out of every 4 houses being more or less damaged, and some 211 persons were killed—a low death roll owing to evacuation and good shelter accommodation. The 13 worst-hit bors. (in order of severity) were in the S.E.: Croydon, Wandsworth, Lewisham, Camberwell, Woolwich, Greenwich, Beckenham, Lambeth, Orpington, Coulsdon and Purley, West Ham, Chislehurst, and Mitcham. Wandsworth was only a degree less badly damaged than was Croydon. The old parish church of St Leonard's, Hastings, was completely demolished. The V2 rocket attacks began in the early autumn of 1944, and continued intermittently until stopped by the Canadian liberation of Holland. S. dists, especially suffered from this long-distance bombardment, by both V1 and

V2 attacks, which ceased on 27 Mar. 1945, when the 1505th and last rocket landed in Orpington. Throughout this period flying bombs, but in no great numbers, continued to come over. One of the worst incidents of the war was caused by a rocket which fell on Smithfield market buildings in Mar., killing 115 persons, and seriously injuring 122, while another rocket at Stepney in the last few days of the attacks killed 131 and injured 40. It is conceivable that the Germans, who were experimenting in Norway with 'heavy water,' might have developed attacks on Britain with atomic bombs, but they were utterly defeated before they could conclude their experiments. The total number of civilian casualties in the U.K. through enemy A. R. from the outbreak of war was 146,760. Of these 60,585 were killed and 86,175 injured and detained in hospital. The detailed figures were as follows: Killed (or missing, believed killed), men, 26,920; women, 25,392; children under 16, 7736; unclassified, 537. Injured and detained in hospital: men, 40,736; women, 37,816; children under 16, 7623. *See also under the names of individual cities.*

Chief Allied Raids on Germany, 1943-1944 (the 1940-2 bombing of Ger. tns is dealt with under **AERIAL WARFARE**, when policy was in the making and allied A. R. were not on a very large scale). Berlin was bombed 4 times by the R.A.F. in Jan. 1943—twice in daylight by Mosquito bombers. Heavy bombers of the R.A.F.—Lancasters, Halifaxes, and Stirlings—dropped 4000- and 8000-lb bombs or 'block-busters' (q.v.) on Berlin on 3 Mar. Munich was hit with 500 tons from R.A.F. bombers, 11 Mar. On 17 May daring low-level attacks were made by Lancasters on the Eder and Möhne dams in the Ruhr: the walls of the dams were blasted with 1500-lb. mines and great damage was done by flood waters down the Ruhr valley. A heavy blow to Ger. war industry was dealt by the R.A.F. raid, 11 June, on Düsseldorf, the administrative cap. of the Ruhr and notable for its iron and steel, heavy engineering, and armaments plants. Münster was also bombed almost simultaneously. Transcending all these raids was the raiding of Hamburg, which might well be named the battle of Hamburg. Probably the dominant motive for the tremendous destruction wrought there was to paralyse the submarine-building industry—a paramount consideration for the W. Allies. In the great raids between 24 July and 3 Aug., 9 sq. m. of Hamburg were utterly devastated, and more than 77 per cent of the city's 15 sq. m. of fully built-up areas wiped out. Eight shipbuilding yards were either destroyed or severely damaged; oil, non-ferrous metal, and chemical works were destroyed; most of the city's centre was demolished; and vast damage done in the dock areas. The total Brit. losses were 87 bombers, averaging no more than 14 a raid. On 4 Nov., by daylight, Amer. Flying Fortresses bombed Wilhelmshaven—also a submarine centre; while the R.A.F. made a night raid on

Düsseldorf. The Flying Fortresses did not always escape punishment. While on 7 Nov., in their attack on the non-ferrous metal centre, Düren, 25 m. S.E. of Cologne, accompanied by a Thunderbolt fighter escort, they lost no machines. In an earlier raid, on the ball-bearing plant of Schweinfurt, they lost no fewer than 60 aircraft; but they were then without long-distance fighter escort. Berlin was again bombed by the R.A.F. on the night of 26 Nov., while, in the day, a great force of Amer. heavy bombers attacked Bremen. The range of the heavy bombers was now being extended—thus on 3 Dec. the R.A.F. dropped 1500 tons on Leipzig. The year closed with more attacks on Berlin by the R.A.F., and these were continued in the early months of 1944.

Raids on Berlin. It may be said that the real air battle of Berlin began on 18 Nov. 1943, and there were 6 major attacks between that date and the end of 1943. The chief destruction was in the W. and central parts, including the Tiergarten and Charlottenburg dists. A number of factories in the Reinickendorf dist. and the Siemensstadt, together with administrative buildings in the Wilhelmstrasse, were either destroyed or greatly damaged. There were 9 more major raids in the air battle of Berlin up to 15 Feb. (1944), the culminating raid of 15 Feb. being carried out by 1000 bombers, chiefly Halifaxes and Lancasters, 2500 tons being dropped in half an hour for the loss of 43 machines. The damage by this date was officially estimated at 326 major war plants, 775 out of 1500 smaller plants, 7 gas works, 3 power stations, and the main offices of 21 gov. depts. Organised industrial activity virtually ceased in Berlin at the end of Nov. (1943), and had not been resumed late in Jan. 1944. But the 15 raids cost the R.A.F. 465 bombers and 3000 men. On 6 Mar. strong Amer. forces, escorted by long-distance fighters, attacked Berlin by daylight, this being the first heavy attack by the U.S. Strategic Force on the Ger. cap. They lost 68 bombers and 11 fighters, but themselves destroyed 120 Ger. aircraft. The U.S. Strategic Force made another attack on 8 Mar., losing 38 bombers and 16 fighters. Yet despite its continuous battering, the Allies considered that Berlin stillon tained much of military and industrial importance, and on 24 Mar. one of the heaviest attacks theretofore was made by the R.A.F., when 2500 tons were dropped. The Luftwaffe offered a spirited defence and the R.A.F. lost 73 aircraft. The effectiveness of allied bombing was much increased by its continuity—Amer. day raids followed or preceded by Brit. night raids either on the same target or on others in the Reich.

Wilhelmshaven, Leipzig, Brunswick, Stuttgart, Gotha, Frankfurt, and Osnabrücken attacked. Some 1100 Amer. bombers made a great attack on 3 Feb. on the port and naval base of Wilhelmshaven, the Flying Fortresses being escorted by fighters—Thunderbolts, Lightnings, and

Mustangs. The greatest daylight assault of the war up to that date took place on 20 Feb. when 2000 allied aircraft, including a large force of Amer. heavy bombers, following a night attack on Leipzig by 1000 Brit. bombers, also bombed Leipzig, together with many other targets, including Gotha, Bernberg, Brunswick, and Oschersleben. Stuttgart was also a much-sought target, on account of its aircraft factories and repair depots. There was a double attack on 22 Feb. by the R.A.F., who dropped 2000 tons at night, and by the Americans in a day attack with nearly 2000 aircraft; and another attack on 15 Mar., when the R.A.F. dropped 3000 tons, this being the city's sixth battering by the R.A.F. The mounting scale of Amer. attack is shown by the fact that between 20 Feb. and 9 Mar. (1944) the Amer. heavy bombers dropped 17,000 tons of bombs on Ger. plants and, together with Amer. fighters, destroyed 1023 Ger. planes in combat. Frankfurt was assaulted by over 2500 R.A.F. bombers on the night of 18 Mar., only a few hours after 1500 Amer. fighters and heavy bombers had returned from day attacks on industrial and other targets in S. Germany—aircraft factories and other war plants in Augsburg, Landsberg, and elsewhere. Frankfurt was an important war-production city and rail centre, and Amer. heavy bombers and the R.A.F. attacked it twice again in the same month. Brunswick, too, was subjected to many and severe attacks in the early months of 1944. Essen, which had been so severely hit in the battle of the Ruhr in 1943 and had not been raided for a year, was dealt its heaviest blow of the war by the R.A.F. on 26 Mar., the assumption being that much of the war plant had been since restored.

On 30 Mar. the R.A.F. suffered their heaviest loss—94 aircraft of a total force of nearly 1000 which attacked Germany, with Nuremberg as the main target—not a small price to pay even for a successful attack on an important war-production centre. The Luftwaffe, however, sent up the greater part of their entire night-fighter force to defend Nuremberg, and probably day-fighters as well, and the attackers were opposed by hundreds of twin-engined and single-engined fighters, as many as those encountered by the U.S. Air Force in their great daylight raids.

The first time that more than 1000 heavy bombers attacked Berlin was during the night of 21 Mar. 1944, when Lancasters and Halifaxes dropped more than 2500 tons of bombs; but on 21 June more than 1000 Flying Fortresses and Liberators, accompanied by 1200 Lightnings, Thunderbolts, and Mustangs, attacked targets in Berlin and at Basdorf on the outskirts of the cap.—the targets being K.W. 190 engine factories at Basdorf, and railway yards and factories in Berlin. This was the largest force of aircraft ever sent against Berlin targets: 43 bombers and 7 fighters were lost, but the enemy lost at least 50 planes. The appearance of Thunderbolt fighters over Berlin for

the first time showed that heavy Amer. fighters then had a sufficient range to enable them to do a 1200-m. round journey. On 12 May (1944) over 750 Amer. heavy bombers hit 4 synthetic oil plants near Leipzig and one in Czechoslovakia, this being the deepest penetration by U.S. bombers from Brit. bases. Fierce resistance was met, 150 Ger. aircraft being shot down for the loss of 42 Amer. bombers and 10 fighters.

But in the tremendous pounding of Germany's industrial areas by Anglo-Amer. heavy bombers, records were often established only to be broken again soon after, and in daylight on 16 Nov. 1944 R.A.F. bombers, operating in support of the Amer. armies, dropped the greatest load of bombs of all time—more than 5600 tons—to obliterate the Ger. centres of Dürren, Jülich, and Heinsberg. The heavy bombers' main targets towards the end of the year (1944) were railway marshalling yards and oil plants, particularly the great synthetic plant at Leuna. Early in 1945 the allied strategic bombers had matters all their own way over Germany. Their numbers were enormous, whether by day or night; thanks to radar (q.v.) they could hit targets which they could not see, and by means of a Brit. invention for dispersing fog they could go up and come down in almost any weather. By Mar. the R.A.F. were using bombs up to 10 tons in weight, the first of these being dropped in NW. Germany on 14 Mar. on a viaduct. 18 Mar. saw the biggest daylight air attack on Berlin when 1300 Liberators and Flying Fortresses sent down 30-ton salvos of bombs every 30 seconds on railway yards near the centre of the city, and vast armament plants in the industrial suburbs. The greatest previous raid on Berlin by daylight was that on 26 Feb. (1945) when 1200 aircraft took part. But by this time the allied bombers had more or less razed most of the larger Ger. cities, and although the Germans had planned a great fleet of fighter planes for defence, including very fast types using jet propulsion, the bombing nipped most of it in the bud, and left few defences against A. R. save flak. It may be noted here that in Feb. 1945 a tremendous air assault was opened against Ger. communications with Italy in preparation for the final land offensive which the Allies launched on 8 April. For air raids against Japan see PACIFIC CAMPAIGNS. See also AERIAL WARFARE and UNITED STATES AIR FORCE.

Air Records, see AERONAUTICS; ATLANTIC FLIGHTS; SCHNEIDER TROPHY.

Air-sacs, bladder-like chambers communicating with the lungs in birds. They are situated all over the body and make the aeration of the blood much more complete than in other vertebrates. In most cases they communicate with spaces in the bones, rendering them pneumatic, thus serving to lower the sp. gr. of the bird. A. are also found in the chameleon. These also are a complication of the lungs, and can be inflated, increasing the bulk of the animal.

Air Survey, see MAPS.

Air Transport, see AEROPLANE; AIR MAIL; AVIATION, CIVIL.

Air-valve, an arrangement to prevent the compression of air where there is a bend in line of water-pipes. When the pipes are filling with water the driving of the air to the upper part of the bend might cause sufficient compression to stop the flow if it were not allowed to escape. The valve is closed by a guided float if the water itself reaches to the top of the bend.

engages one of the arrester wires on the flight deck. The aircraft is thereby brought to a halt. Battleships and cruisers used to be equipped with a catapult for launching seaplanes used for reconnaissance, but this practice was dropped towards the end of the Second World War when sufficient A. C.s became available. The seaplanes landed on the water and were recovered by the ship's crane.

At the beginning of the Second World War in 1939 the Brit. Empire had 8 A. C.s

C.O.I. Crown Copyright Reserved

H.M.S. 'ARK ROYAL' IN THE MEDITERRANEAN

Jet aircraft being spotted ready for launching by catapult.

Air-vessel, chamber interposed between the pump and delivery pipes in single-acting pumps. The air in the chamber is compressed at each forward stroke of the pump, thus providing a pressure which serves to drive the water on during the backward stroke. As the water tends to absorb the air, the latter must be replenished from time to time.

Air Warfare, see AERIAL WARFARE.

Aircraft Carrier, large naval vessel designed to carry aircraft and provide facilities for air operations while at sea. The aircraft fly off from and land on the flight deck, which is a large expanse of open deck, occupying the whole of the length of the ship and most of the width. The ship's superstructure is on the starboard side of the flight deck. Aircraft are frequently launched from the carrier by catapult. When landing the pilot lowers a hook fitted in the fuselage, which

of a total displacement of 126,000 tons and 7 'building and authorised' of a total displacement of 138,000 tons. The totals for other powers were: France, 2 with a displacement of 32,000 tons and 2 under construction of 36,000 tons' total displacement; Germany, 2 under construction (39,000 tons' total displacement); Japan, 11 (147,000 tons) and 2 (25,000 tons); Russia, 1 (9000 tons) and 2 (24,000 tons); and U.S.A., 5 (120,000 tons) and 2 (35,000 tons). The famous *Ark Royal* was a vessel of 23,000 tons with 16 4.5-in. guns. She was torpedoed and sunk in the Mediterranean E. of Gibraltar in 1941 (see *ARK ROYAL*). The *Courageous* (22,500 tons) and the sister ship *Glorious* carried 16 4.7-in. guns. The *Courageous* was originally completed as a cruiser in 1917 but was converted between 1924 and 1928 and refitted in 1936. She also was torpedoed

and sunk, 17 Sept. 1939, 515 men being lost. The *Glorious* was sunk off Norway in June 1940. Other A. C.s are (1942) the *Hermes* (10,850 tons, 6 5.5-in. guns), sunk by the Japanese off Ceylon in April 1942; *Furious* (22,450 tons with 10 5.5-in. guns); *Eagle* (22,600 tons, 9 6-in. and 4 4-in. guns); and the *Argus*, a training A. C. of 14,450 tons with 4 3-pounders. The Brit. A. C. *Illustrious* (23,000 tons), completed after the outbreak of war, rendered great service on 11 Nov. 1940 at the victory of Taranto, which restored naval supremacy in the Mediterranean to the Brit. Fleet, for the striking forces were naval aircraft flown from the carrier. On 10 Jan. 1941 the *Illustrious*, while conveying ships to Greece, was heavily attacked in the central Mediterranean by 15 Junkers dive-bombers, and hit with a 1000-lb. bomb below the bridge, but, though shaken from stem to stern, she reached port safely. In the Guadalcanal campaign (Aug. 1942), the crucial campaign of the Pacific in the war against Japan, 3 A. C.s formed part of the 'task force' (independent tactical unit) which covered the Amer. landings, but were withdrawn as soon as possible owing to fear of a Jap. land-based air attack. There were, however, A. C. engagements off the E. Solomons (23-5 Aug.) and the Santa Cruz Is. (26 Oct.), in the latter of which the *Hornet* was sunk, leaving the damaged *Enterprise* the only allied A. C. in the Pacific, the *Wasp* having been sunk by submarine in Sept. But by Feb. 1943 the U.S.A. sent 5 more A. C.s to the Pacific. After the lessons of Guadalcanal the attrition tactics were replaced by the adoption of the principle of achieving decided command of the sea by building up much larger task forces, and in this strategy the A. C. played its part. Until the series of operations which began at Tarawa the A. C. had been used in small numbers, and regarded merely as a means of making planes available to surface ships as a protection for them when beyond easy reach of their own land-based aircraft. But the offensive successes of the Amer. A. C.s in Feb.-Mar. 1942, at the Marshalls, Rabaul, Wake, Lae, and Salamana, showed the Amer. Naval Command what were the real potentialities of the carrier, and the result was an accelerated and expanded programme which bore fruit towards the end of 1943. For once the Americans began to use carriers in large groups it became evident that their navy had incorporated within itself the only truly mobile air force of any size in the world, an air force in which both the aircraft and their floating bases were capable of rapid movement and of achieving surprise; while Amer. naval fighter-planes operating from A. C.s proved tactically superior to the best land-based planes which the Japanese could send against them. The popular doctrine that carrier-borne air forces should not be opposed to land-based air forces because the floating base could be sunk was largely overcome by the very fact of concentration, which gave the Amer. task fleets air forces large enough to repel

dangerous concentrations of enemy planes in the Okinawa campaign over a 2-month period 8 large carriers, 2 light carriers, and 3 escort carriers were damaged, most of them by the Jap. *kamikaze* (suicide planes), a salutary reminder to the Amer. Navy that tactical problems are never solved conclusively.

Since the Second World War, A. C.s have replaced battleships as the main naval fighting ships, and they have been developed to operate the fast, heavy jet aircraft of to-day. Recent improvements include the angled deck and the deck-landing mirror aid, which has replaced the 'batman.' Both inventions are Brit., and have reduced deck-landing accidents by over 50 per cent. Britain has built 5 A. C.s since Jan. 1950: *Eagle* and *Ark Royal* (36,800 tons), and *Albion*, *Centaur*, and *Bulwark* (22,000 tons). Six older Light Fleet carriers are used for non-flying training or are in reserve, but all R.N. A. C.s, which saw much service in the Second World War, have been scrapped, except the *Victorious*, which is being extensively refitted. In Jan. 1957 the Royal Canadian Navy had one A. C., the Royal Australian Navy 2, while it was recently announced that India had decided to buy a carrier from Great Britain. The U.S. Navy had 15 'attack' carriers, including 2 of the *Forrestal* Class (60,000 tons), the largest A. C.s in the world. France had 3 A. C.s and was building 2. The U.S.S.R. was the only major naval power with no A. C.s. See also AIRFIELD.

Aird, Thomas (1802-76), poet, b. Bowden, Roxburghshire, and educ. at Edinburgh Univ., was the friend of Carlyle and Hogg. His literary work, though praised by Carlyle, has never become popular. The best-known piece in his *Poems*, 1848, is 'The Devil's Dream.'

Airdrie, burgh of Lanarkshire, Scotland, 11 m. E. of Glasgow. Originally a centre of cotton weaving, A. now manufs. a large number of products ranging from paper to patent medicines. Pop. 30,660.

Aire, riv. of England, rising in the Pennine Hills in Lancs, but early in its course passing through the A. Gap into Yorks. It runs through the S. part of the co. to join the Ouse near Goole. Length 70 m. Airedale, through which it flows, is a picturesque valley lying between Malham Cove and Leeds. The A. and Calder Navigation is a system of rivs. and canals serving the larger Yorks towns. Its chief branches are from Goole to Leeds and from Castleford to Wakefield.

Aire-sur-Lys, Fr. tn in the dept of Pas-de-Calais, at the junction of 3 canals with the R. Lys. There are some fine old houses. The tn has a trade in agric. produce. Pop. 8200.

Aireborough, urb. dist. of the W. Riding of Yorks, England, 5 m. NE. of Bradford. Within the dist. is Yeadon Airport. Woollen milling is carried on. Pop. 27,570.

Airedale, breed of large, rough-haired terriers forming the link with the hound group, and said to be a hybrid between

the otterhound and the Welsh terrier or a local terrier of the Aire valley. It is the largest of the terriers and was first bred in 1853. It has a close, wiry coat of black and tan, short straight back and sloping shoulders, flat skull, forelegs

AIREDALE

T. Full

perfectly straight, and powerful jaws. A full-grown dog should weigh about 15 lb. It needs much open-air exercise on account of its strength and size, and is not suited for life in small houses in towns.

Airfield, alternatively **Aerodrome**, or, if supplied with customs and immigration facilities, **Airport**, a place at which aircraft land and take off. A.s vary in type from flat grass-covered surfaces allowing take-off runs of 600 yds or less to great open spaces crossed by concrete runways up to 5000 yds in length and 150 yds in width and surrounded by concrete tracks for taxi-ing. Most A.s have hangars for housing aircraft. Bigger types have buildings to house control organisation, administrative services, workshops, and offices of operating companies. Chief A. in London area is London Airport, between Hounslow and Staines. The layout finally chosen for this has 3 pairs of parallel runways, arranged in the form of 2 interlocking triangles, 2 of the runways being 3000 yds long, and the others 2000-2500 yds. These now allow 50 or more aircraft to be handled per hour in daylight. London is to have a secondary airport at Gatwick in Surrey, which will probably be used mainly for short-range services. Second inter-continental airport in Britain is at Prestwick, near Ayr, Scotland. There are some 160 A.s available to civil aircraft in the U.K.; many of these are owned and operated by the Ministry of Transport and Civil Aviation. Landing charges are made at every A. and are graduated according to loaded weight of aeroplane. Many smaller A.s have club-houses; bigger A.s have public waiting-rooms and refreshment-rooms for passengers and also public enclosures for spectators. Control organisation is responsible for regulating air traffic within the airport control zone. It is also responsible for

providing runway, boundary, and taxi-track lights, and for aids to landing in poor visibility. These include radio and radar beacons which indicate on instruments in the aircraft the approach path an aeroplane must follow to arrive at the end of the runway. Alternative system allows track of incoming aeroplane to be followed by radar and approach instructions to be given by radio to pilot. Control also instructs pilots what heights and courses to fly within control zone. Major A.s provide pilots with bearings, 'fixes,' and special meteorological information on request (see **AERIAL NAVIGATION**). One civil and 1 R.A.F. A. in Britain have fog dispersal apparatus installed on each side of 1 runway for use in emergency. Every A. in commercial use has a neon beacon which flashes the 2-letter call-sign of the A. at night. Most A.s are some miles from the cities they serve, and only 1 in the U.K. (Gatwick) has its own railway station. Communication is generally by road.

Aircraft carriers (q.v.) are floating A.s for aeroplanes and are important units of most of the navies of the world. They have a speed of over 30 knots and flying decks up to 1036 ft in length. Machines are transferred very speedily to the deck from the hangars below by hydraulic lifts. Catapults are provided to assist the aircraft into the air, and a system of wires across the deck is used to engage a hook carried by the aircraft, to bring it to a halt when it lands.

Airships, too, have acted as aerial A.s, and the ill-fated Amer. dirigible *Akron* was large enough to house 5 aeroplanes in a special compartment. The aeroplanes, suspended from trapezes, were lowered, detached themselves, and flew off, and at the end of their flight could attach themselves to the trapeze and be hoisted aboard the airship again.

The name aerodrome was also given by Prof. Samuel Pierpont Langley (q.v.) to his steam-powered tandem wing model aeroplanes, and to the full-sized petrol-engined version of 1903.

Airola, vil. of Switzerland, canton of Ticino, at the S. end of the St Gotthard railway tunnel. Elevation 3800 ft. A bloody battle was fought here between the French and the Russians in 1799. The vil. was twice almost destroyed by avalanches, in Dec. 1898 and Jan. 1951. Pop. 1700.

Airport, see **AIRFIELD**.

Airship, popular name for a lighter than air dirigible aircraft using either hydrogen, coal-gas, or helium as a lifting agent. As soon as balloons were invented in 1783 efforts were made to steer them, and it was quickly seen (a) that the envelope must be elongated and (b) that an engine working a propeller must be employed. Despite the brilliant but unrealisable designs of Mennier (1781), and ineffectual efforts to make balloons dirigible, the first successful A. was made by the Frenchman H. Giffard (1852), which was steam-powered; but it could only travel at about 5 m.p.h. In 1884 two

other Frenchmen, Renard and Krebs, made their *La France*, which was the first practical A. of hist.: it was electrically powered. After a further period of only mild activity A.s became increasingly popular. The practical light A. was pioneered by Santos-Dumont, 1898-1906, and the first Zeppelin flew in 1900. It was Zeppelins which between 1910 and 1914 pioneered air passenger travel on a large scale, and carried nearly 35,000 passengers, without a fatality, over some 170,000 m.

The major nations were producing numerous A.s of various types and sizes before the First World War, but Great Britain and the U.S.A. had done little compared with France, whose *Lebandy* was particularly successful, and Germany. In England a few non-rigid A.s had been constructed, such as *Nulli Secundus*, *Beta*, *Gamma*, until Gor. Progress alarmed the Brit. Gov., and the ill-fated *Maffly* was built. This was Britain's first rigid A., but it met with disaster on its trial flight. When the First World War broke out Germany was well in advance of any other country, a fact which was demonstrated very clearly in the early air raids over England, and which made the Brit. Gov. again turn its attention seriously to A.s. In 1915 a number of non-rigid A.s had been built for anti-submarine work. By a stroke of fortune the Ger. *L 33* was brought down in England in Sept. 1916, in such a condition that it was possible to copy her design successfully in the Brit. *R 33* and *R 34*, completed in 1919. Under the treaty of Versailles Germany was forbidden to maintain A.s of over 1,000,000 cub. ft. capacity. Consequently she disposed of these A.s in part payment of reparations to the Allies. In May 1926, however, the limitation was removed. Great Britain, after the First World War, constructed a few A.s, notably the *R 100* and *R 101*. The *R 34* successfully crossed the Atlantic both ways (see ATLANTIC FLIGHTS). The Imperial Conference decided that A. routes were to be prescribed between the various parts of the Brit. Empire.

Design and Construction. There are great differences in design between non-rigid, semi-rigid, and rigid types of A. A non-rigid A. is one in which the internal pressure maintains the designed shape of the envelope without the assistance of a rigid keel. A semi-rigid A. has a rigid keel to distribute the load and assist in keeping the designed shape of a non-rigid envelope. A rigid A. has a rigid framework to maintain the designed shape of the hull. **Non-rigid Airships:** As in the case of a kite balloon, the shape is maintained solely by the internal gas pressure. The type which survived others of simpler frame was designed by Torres in Spain and was manuf. in France. Although in outline the shape is only a streamlined balloon, the circular shape is distorted to form a trefoil section, having 3 equal lobes. In this way an internal system of triangular bracing is possible, and to this the dead weight of the car and engine are carried by ropes.

The car is slung immediately underneath the envelope, rather than to the front of the ship, provision being made for the engine at the rear of the car. A pressure airscrew is employed, or separate engine units may be installed. The ballonets in the lobes maintain the shape of the envelope when the internal pressure is varied. To assist the retention of the A.'s shape, ribs are generally fitted at the nose in radial directions and taken back behind the plane of the nose. The ship is equipped with relatively large rudder and elevator planes, to the rear of which the rudder and elevator are respectively attached. The basket is fitted with a power plant and a propeller. The non-rigid A. or 'dirigible' balloon is the smallest of the types of A., and with increase of size the balloon becomes unwieldy and loses its shape. **Semi-rigid Airships:** These were introduced in order to relieve the envelope of a non-rigid ship from some of the strain arising from the connection of cabins, power cars, etc., thereby permitting an envelope of circular cross-section to be employed. For this purpose a keel consisting of a braced structure, generally triangular or rectangular in section, is suspended immediately below the envelope, and to this the dead weights of the car and engine are transmitted. In modern designs—e.g. in the case of the *Norge*—the keel is practically enclosed in the envelope so as to produce a good streamlined shape of low head resistance. **Rigid Airships:** The much larger ships are all of this type, and it is the only type which is likely to have any practical use in the future. The rigid type was developed in Germany by Count Zeppelin, and consists of a framework of girders whose external form corresponds with the shape of the A., the covering being directly attached to the girders. The earlier rigids were made with a relatively long central parallel portion and with a short head and tail; the parallel part underwent successive shortening until the modern perfect streamline shape was evolved. In order to obtain minimum resistance, the actual lines of the hull were determined from a consideration of the rates of change of curvature. Structurally the framework consists of a series of transverse hoops or rings connected to a series of longitudinals; both the rings and longitudinals are similarly constructed, frequently being triangular in section. The rings are polygonal, having approximately 25 sides. Provision is made for efficient connection between rings and longitudinals, while the whole structure is made rigid by a system of wire bracing. The space between 2 rings is occupied by a ballonnet, and there may be as many as 20 ballonnets in all. About half the bags are fitted with a manoeuvring valve on top, but each is supplied with an automatic valve which maintains the pressure at some predetermined amount, usually opening when the A. has reached an altitude of 20,000 ft. The navigating car is suspended near the nose of the ship and is fitted with the usual controls and

instruments. There is also an aft car fitted out as an auxiliary control car in case of emergency. The engines are installed in the rear of these cars. The *Hindenburg* was the most modern rigid type of A., and made its first flight in 1926. Its length was 800 ft, maximum diameter 135 ft, gas capacity 6,700,000 cub. ft. The structure in its main conception was the same as has been successfully developed during the past 35 years. It had 15 main transverse frames, each of which was a 36-sided regular polygon. Its passenger accommodation was arranged on 2 decks inside the exterior envelope. A control car and 4 engine gondolas were mounted externally. The outer fabric was doped with cello, mixed with aluminium powder on the outside to increase the heat reflection; on the underside the fabric was porous to assist ventilation. On its preliminary trial the ship attained 178 m.p.h. The *Hindenburg* was destroyed by fire in May 1937, when about to land at Lakehurst, New York, at the end of her first voyage of the year, 33 persons being killed out of a total of 97 on board. After the First World War the U.S.A. suffered serious A. losses in those of the *Shenandoah* and the *Akron*. The first of these losses did not retard development, and the authorities, profiting by experience, built mooring-masts across America, it having been found that operating A.s from their sheds limited their use. But further loss came when the *Akron* (U.S. Navy A.) crashed off New Jersey on 4 April 1933, in an electrical storm, with the loss of 74 of her 77 officers and guests aboard, including Adm. Wm. Moffett, chief of the Bureau of Aeronautics. Her loss was in fact due to the same cause as that which destroyed the *Shenandoah*. The *Akron* was not so large as the *Hindenburg*—being 785 ft long, with a gas capacity of 6½ million cub. ft and diameter 132 ft. A sister ship, the *Macon*, was launched in 1933. Great Britain, France, Italy, and Japan, however, all decided to abandon A. construction; but Germany, in no way dismayed, kept the *Graf Zeppelin* on passenger transport service as late as 1938. Great Britain's worst disaster was the loss of the *R 101* on 5 Oct. 1930. The A. had started on an official flight to India, but came down at Beauvais in France, being totally destroyed by fire; 48 of the company of 54 were burned to death, including Lord Thomson, secretary of state for air, Air Marshal Sir Seton Brance, and Maj. Richmond, the designer. The court of inquiry found that the accident was caused by a substantial loss of gas in bumpy weather. Had helium been used instead of hydrogen, the loss of life would not have occurred, but hydrogen was used because of its greater lifting power.

See V. C. Richmond, *Some Modern Developments in Rigid Airship Construction*, 1928, and E. F. Spanner, *About Airships*, 1929.

Airstrip, see AIRFIELD.

Airy, Sir George Biddell (1801-92),

astronomer, b. Alnwick. He entered Trinity College, Cambridge, in 1819. In 1836 he was appointed Astronomer Royal at Greenwich Observatory, where he made important researches. He determined the mass of the earth by comparing the values of *g* (the acceleration due to gravity) as measured with a pendulum at the top and bottom of a coal-mine. Among his works are *Astronomical Observations, Tides and Waves*, 1842, *Ipswich Lectures on Astronomy*, 1851, and *Treatise on the Errors of Observation*, 1861. See his autobiography, 1896.

Aisle (Fr. *aile*, Lat. *ala*, a wing), any lateral div. of a church or other edifice. Generally in England there is only 1 aisle on each side of the nave, but on the Continent there are sometimes as many as 3 in large churches.

Aisne (Lat. *Axona*): 1. Riv. of France, rising in Argonne (q.v.), and flowing N.W. and then W. through the depts of Marne, Ardennes, Aisne, and Oise to join the R. Oise (q.v.) near Compiègne. Length 175 m.

2. Dept in the N. of France, formed of parts of the auct. provs. of Picardy and Ile-de-France. It is generally flat, wooded in the N. and undulating in the S. A. is an important agric. dept, and noted for cereals, potatoes, sugar-beet, vines, and livestock. It has extensive industries, including textile, sugar, chemical, and metallurgical manufs. The dept is watered by the Marne, Oise, and Aisne (qq.v.). The prin. tns are Laon (the cap.), Château-Thierry, St-Quentin, Soissons, and Vervins (qq.v.). Area 2866 sq. m.; pop. 453,000.

Aisne, Battles of the. The valley of this riv., extending as it does from Compiègne and the vicinity of Noyon, through Soissons and the dept. of the Meuse to the Argonne forest and to within 25 m. of Verdun, was bound to be the scene of bitter fighting in any war in which the Ger. armies should invade France from the N.E. There were 3 B. of the A., fought respectively in 1914, 1917, and 1918, but the Brit. armies were not especially involved in the second battle, which began a few days after the Brit. attack at Arras had closed.

First Battle of the Aisne. The advance to the A. began with the allied victory of the Marne on 6 Sept. 1914, and continued until 1 Oct. When conditions stabilised, the trench warfare, which was to endure for 4 years, began. So far as the Brit. Army was concerned this warfare was improvised, for the only heavy guns it had were a few batteries of old 6-in. howitzers; and engineering stores were meagre. The compilers of the Brit. official *History of the Great War* conclusively refute the assumption that entrenchments had already been prepared on the A. heights in anticipation of retreat. Indeed no one had foreseen the deadlock which was to ensue, or envisaged the implications of scientific progress in the art of modern warfare whereby the hope of outflanking a line which could seemingly be endlessly extended was finally dispelled; and the long

routine of dreary trench fighting without tangible results set in.

The actual battle began on 13 Sept., the Germans being then N. of the riv. with their guns concealed on the N. slopes. Despite the depth of the riv. Maunoury with the Sixth Army, attacking on the left from Compiègne, succeeded in getting sev. divs. across; the Brit. Army sustained the general attack from the point of junction with the French at Soissons for a distance of 15 m. On the 14th Maunoury captured Nouvron and attacked the heights, only to find, as did the British after capturing Troyon, that the enemy positions on the high ground were invulnerable. On the 15th the Germans, counter-attacking, drove the French from Nouvron and the British back to the riv. Marshal Joffre, who was then in supreme command, next began a change of strategy, lengthening his left by forming 2 new armies, but the only result of this collision of equally balanced forces was to force them out westward, and the same result ensued in the opposite direction when the Germans sought to outflank Gen. Sarrail on the Meuse.

Second Battle of the Aisne. This battle was begun on 16 April 1917 by Gen. Nivelle attacking the 'Hindenburg line' near Laon. His strategy was the antithesis of that of Joffre, whom he had succeeded, namely to deal a decisive blow rather than to wear down the enemy by attrition. He actually endeavoured to storm the A. heights in 1 supreme attack launched from 3 quarters simultaneously with the whole of his forces, the main offensive being in the vicinity of the lower ground before Laon. He captured the riv. banks from Soissons to Berry-aux-Bac, together with 20,000 prisoners and nearly 200 guns, but he found the road to Laon impregnable. His disastrous strategy caused a reaction to the Fabian tactics of Foch and Pétain, the latter being appointed generalissimo in his stead, and once more the allied armies settled down to a war of attrition, in which the side which should eventually receive heavy reserves at the decisive moment would of necessity win the day.

Third Battle of the Aisne. This battle was part of the Ger. offensive in Champagne, which extended between 27 May and 6 June 1918, the geographical limits, so far as the Brit. forces were concerned, being between the Chemin des Dames and the Montagne de Reims. E. of Verneuil. Ludendorff had recently held out hopes to Germany of a supreme and decisive effort before the Amer. armies could be thrown into the fray, inasmuch as he had driven a deep salient into the Brit. lines near Arras and the Ger. effectives still outnumbered those of the Allies. The offensive against the French was begun on the A. heights, this being the zone nearest to Paris and the Marne and the Paris-Châlons railroad. The Ger. preparations were made with dispatch and secrecy, and on 27 May the preliminary artillery bombardment began all along the line from Ailette to the environs of Reims. Before the day was over the

French had retreated from the heights N. of the riv. and the Ger. troops under Gen. von Boehn had crossed the riv. at Fismes, capturing numerous prisoners, guns, and other booty. Flushed with success, the Ger. command deepened its thrust from Fismes right to Château-Thierry on the Marne; but never for an instant did Marshal Foch allow his major strategy—the strengthening of his flank positions at Reims and Soissons—to be distracted, and before long the tide was destined to turn. *See also* MARNE, BATTLES OF THE.

Aissé, Mademoiselle (c. 1694–1733), Fr. letter-writer, b. Circassia. She was captured by Turks and sold in 1698 as a slave to the Comte de Ferriol, Fr. ambas. at Constantinople, who had her educ. in Paris. She attracted much attention by her beauty and romantic story. Her letters to Mme Calandrin, first pub. 1787, with notes by Voltaire, reveal her tenderness and fidelity. Other eds. appeared in 1846 by S. Ravenel, with an introduction by Sainte-Beuve, and in 1873 by E. Assé. *See also* her life by Courteault, 1900.

Aistulf, Astolf, or Astolphus (d. 756). King of the Lombards, succeeding his brother Rachis in 748. He captured Ravenna and the Pentapolis, 751–2, and marched against Rome. The Pope appealed for help to Pepin, King of the Franks, who defeated A. in 753. A. again besieged Rome in 756, and was forced by Pepin to give up the exarchate of Ravenna and the Pentapolis to the Pope.

Aithalia, see ELBA.

Aitutaki, one of the S. Cook Is. The main is. is volcanic whilst the lesser islets are of atoll formation. Total area 6 sq. m. A coral airstrip was built by Amer. forces during the Second World War. Tasman Empire Australian Line flying-boats regularly land on the lagoon to refuel. Pop. in 1954, 2555.

Aix, Fr. is. in the Bay of Biscay, opposite the mouth of the Charente, and in the dept of Charente-Maritime. The French defeated the British here in 1806, and there was an indecisive battle in 1809. Napoleon surrendered to the British here in 1815.

Aix-en-Provence (anc. *Aquæ Sextiæ*), Fr. city in the dept of Bouches-du-Rhône. It was founded in 123 BC and was known to the Romans as a spa. In the vicinity Marius (q.v.) defeated the Teutoni in 102 BC. From the 8th cent. until 1481 it was the most important city in Provence (q.v.). A. is a beautiful city, with an archiepiscopal cathedral (13th–15th cents.), other anc. churches, a baroque hall, fine 17th- and 18th-cent. houses, a univ. (founded 1409; the science and medical faculties are at Marseilles, q.v.), and an important art gallery. It is frequented as a resort and spa, has a trade in olives and almonds, and is noted for its nougat and its almond cakes (*calissons*). Cézanne, Mignot, Tournefort, and Vauvenargues (qq.v.) were b. here. Pop. 54,200.

Aix-la-Chapelle, see AACHEN.

Aix-les-Bains, Fr. spa in the dept of

Savoie. The Romans called it *Aquae Allobrogum*, and *Aquae Gratianae* or *Domitiana*; there are Rom. remains. It is in a picturesque valley. Pop. 14,600.

Ajaccio, prefecture and second city of the Fr. is. and dept. of Corsica (q.v.). It is on the W. coast of the is., at the N. side of the mt.-girt Gulf of A. The tn was the bp. of Napoleon I (q.v.); the house of the Bonaparte family, and the palace of Cardinal Fesch, Napoleon's uncle, are preserved as museums. There is a 16th-cent. cathedral, and there is a fine harbour. The chief industries are the anchovy and pearl fisheries. Olive oil and wine are exported. The tn is much frequented as a health and winter resort. Pop. 31,400.

Ajalon, modern **Yalo**, is mentioned in biblical hist. as the scene of Joshua's defeat of the Canaanites, when he is said to have made the sun and moon stand still till the victory was complete (Joshua x. 12-14). The miracle raises difficulties moral and theological, as well as cosmological. Various explanations have been given. One explains it as a misinterpretation of the poetical hyperbole uttered by Joshua, recorded in the book of Jashar, and at least 2 cents. later included in the book of Joshua with a prose comment. Others interpret it as a subjective experience. The place was given to the tribe of Dan.

Ajanta, vil. in Hyderabad state, India, where Sir Arthur Wellesley halted after the battle of Assaye (q.v.), 1803. Five m. to the N. are the world-famous caves of A. The 29 caves, which date between 200 bc and about ad 650 and were visited by Hiuen Tsang in ad 640, consist of chapels and monasteries. Many of them contain magnificent sculptures and exquisite frescoes, all strictly Buddhist in character. The frescoes, which have inspired a modern school of Indian art, have been expertly cleaned and good lighting arrangements have been made. They are one of the most remarkable sights in India.

Ajax, son of Oileus (the lesser A.), sailed against Troy with 10 ships. On his way home he was wrecked and escaped to a rock, but when he boasted that he would be saved in spite of the gods, Poseidon split the rock and A. perished (Homer, *Odyssey*, iv). Virgil says that he excited the anger of Athena (*Aeneid*, i).

Ajax, son of Telamon (A. the Great), a hero of the Trojan war. He fought Hector single-handed (*Iliad*, vii), defended the ships, and killed many Trojans (*Iliad*, xiii-xvii). When the armour of Achilles was awarded to Ulysses, A. in madness killed himself (Sophocles, *Ajax*; Ovid, *Metam.*).

Ajlun, dist. of East Jordan. It is almost entirely occupied by a settled pop. rather than Bedouin. In the mts of A., in biblical times, dwelt the tribe of Manasseh. On the foothills of these mts, 3 m. W. of Jerash, is a pleasant vil., Reimun, which has been identified with Ramoth-Gilead. Arx Ajlun was the crusaders' name for Qala'at al-Rabad -

surmounting the vil. of A.—the most important of the Saracen fortresses in Transjordan. The small agric. tn of A., 28 m. NNW. of Amman, has a pop. of about 2000.

Ajmer, or **Ajmere**, tn of central India, formerly cap. of Chief Commissioner's prov. of A.-Merwara, 220 m. SW. of Delhi. It is situated at the foot of Mt Taragarh (2855 ft) and enclosed by a stone wall. It was here that Emperor Jhangir received Sir Thomas Roe, ambas. of King James I. There is a tomb of a Muslim saint, Khwaja Muin-ud-Din Chishti (d. 1256), held in great reverence by Muslims. The Pushkar lake (7 m.) is reached through a spectacular pass and is, reputedly, the most sacred lake in India for Hindus.

Ajodhya, anct tn of Uttar Pradesh state, India, on r. b. of R. Gogra, 84 m. E. of Lucknow. A. is one of the great cities described in the Ramayana (q.v.) and one of the seven sacred Hindu shrines. It is now ruined, but the remaining temples are of great interest.

Akabah, see **Aqabah**.

Akbar (the 'great,' his proper name being Jalal-ed-din Mohammed) was b. in 1542 at Umarkot in Sind, W. Pakistan, when his father was fleeing to Persia from Delhi. He was probably the greatest of the Mogul emperors. In 1555 his father regained the throne, but d. in the same year. A. committed the care of the kingdom to a regent, Bahram Khan. At that time few of the provs. originally subject to the Mogul emperors were in submission, and Bahram reduced many of them. However, he was despotic and cruel, and in 1560 A. took the rule into his own hands. In 10 or 12 years he had conquered all India N. of the Deccan, and was able to devote himself to administration. His name as a ruler is inseparable from that of his minister, Abul Fazil, who later left an enduring record of the emperor's name in the *Akbar Nameh*. The pair ruled with wisdom and vigour, repressing vice with a firm hand. Roads were made, and commerce was encouraged in every way.

A.'s reign marked a departure from former Mogul rule in India, and is one of the most important periods in the religious and literary hist. of India. A. was not a fanatical or bigoted Muslim. He believed that the best in diverse religions could be synthesised, and called for Portuguese missionaries from Goa to explain Christianity to him. Ultimately he adopted an eclectic kind of Deism, while allowing religious liberty to his subjects. He encouraged literature and estab. schools throughout the country. See G. B. Malleson, *Akbar* ('Rulers of India' series), 1890.

Akenside, **Mark** (1721-70), poet, b. Newcastle. In 1739 he was sent to Edinburgh with the object of studying theology for the Presbyterian ministry. A year later he gave up this object for the study of medicine, and in 1744 took his degree of M.D. at Leyden. On his return he practised in Newcastle, Hampstead, and finally London. His haughty

and pedantic manner (satirised by Smollett in *Peregrine Pickle*) prevented him from gaining a large practice. His profession, indeed, would hardly have supported him had not his friend Dyson made him an allowance of £300 a year. He had pub. verses in the *Gentleman's Magazine* as early as 1737, but his literary reputation rests on his *Pleasures of the Imagination*, commenced in 1738 and pub. in 1744. Its didactic nature made it popular at the time; it was approved by Pope and tolerated by Gray. A. also wrote various medical treatises. See life by C. Bucke, 1832.

Akers, Elizabeth Chase (1832-1911), Amer. poetess, b. Maine. She was three times married. B. P. Akers, a sculptor, being her second husband. Her first vol. of poems, *Forest Buds from the Woods of Maine*, 1856, was so successful that she was able to go travelling on the proceeds. Other vols. were *The Silver Bridge*, 1886, and *The Sunset Song*, 1902. She is remembered best for her poem 'Rock me to Sleep.'

Akershus, co. surrounding Oslo (4908 sq. km.). Forestry and agriculture are carried on. Pop. 183,000.

Akhmim, tn of Upper Egypt, on Nile, 85 m. SE. of Assiut. A steamboat and mail station, and long famous for textile manufs. Pop. (1947) 34,229.

Akhmaton, Akhenaton, or Ikhmaton, Pharaoh of the 18th dynasty, succeeding his father Amenhotep (or Amenophis III) as Amenhotep IV. He was a religious fanatic, declaring that there was only one god, manifested in the visible sun's disk, Aton. This brought him into conflict with the priests of Amen, the supreme deity of Thebes. He therefore abandoned Thebes and founded a new cap. at Tell El Amarna, dedicated to Aton. He neglected other affairs, and his reign marks the end of Egyptian rule in Syria. Art in his reign was characterised by realism. He d. c. 1350 BC, after reigning about 17 years. See also EGYPT and TELL EL AMARNA. See A. E. P. Weigall, *Life and Times of Akhnaton*, 1910.

Akibah, Ben Joseph, see AQIBA, BEN JOSEPH.

Akka: 1. Pygmy negroid race inhabiting the African equatorial belt. The A. (Arab, *Tikki-Tikki*) are found along the upper course of the Aruimi and W. of Lake Albert, and were discovered by Schweinfurth about 1872. They are yellow-brown in colour, and about 4 ft 6 in. high, and live nomadically, apart from, though usually under the protection of, the taller races.

2. Vil. of the Sahara on the Moroccan border; one of the stations on the Morocco to Timbuktu caravan route.

Akkad, or Accad, N. of the 2 provs. into which anc. Babylonia (q.v.) was at one time divided, the S. being Sumer, possibly the biblical Shinar (Gen. x). The area took its name from the city of Agado which fl. under Sargon (q.v.). The language spoken was Semitic (old Akkadian) and the term Akkadian has since been applied generally to the

Assyrian-Babylonian languages. See also BABYLONIA.

Akkerman, see BELGOROD-DNESTROVSKYI.

Akmolinsk: 1. Oblast (prov.) of Kazakh S.S.R. in the Soviet Union. It lies between the Ishim and Irtysh rvs. Economy chiefly agric. (wheat, oats, millet), with semi-nomadic sheep-raising in W. Mineral resources in the course of exploitation include gold, antimony, coal, and bauxite. Pop. 56,000.

2. Cap. of the above prov., on R. Ishim, 300 m. SW. of Omsk. Pop. 100,000.

Akra Leuka, see ALICANTE.

Akras, see PALAZZOLO ACREIDE.

Akrai, see PALAZZOLO ACREIDE.

Akranes, tn on Faxaflói, Iceland, opposite Reykjavik, important trading and fishing centre. Pop. 3135.

Akri, see ACTIUM.

Akron, city, cap. of Summit co., Ohio, on Cuyahoga R., 30 m. S. of Cleveland. It manufs. rubber goods, machinery, chemicals, etc. Pop. 274,600.

Aksakov: 1. **Sergey Timofeyevich** (1791-1859), Russian writer. His *Family Chronicle* (trans. *Chronicles of a Russian Family*) and its continuation, *The Years of Childhood of Bagrov the Grandson*, draw a vivid picture of a Russian squire's family (A.'s own) in the 18th cent., and of conditions in Bashkiria, then being colonised.

2. **Konstantin Sergeyevich** (1817-60), son of the above, historian, literary critic, publicist, and playwright. He was the leader of the Slavophiles (q.v.) in the 1840's and 50's; he exposed the dark sides of the Russian reality, and advocated the emancipation of serfs with land and retention of the vil. com. (see MIR).

3. **Ivan Sergeyevich** (1823-86), brother of Konstantin and leader of the Slavophiles after his death, brilliant orator and publicist, publisher and editor of sev. newspapers which were in turn suppressed by the gov. He reached the height of his influence in 1876-8 when he was the mouthpiece of the general enthusiasm for the liberation of the Balkan Slavs.

Aksum, or **Axum**, anc. tn of Tigré, Ethiopia, 85 m. NW. of Antalo; now mostly in ruins, which include some very fine specimens of Gk architecture. It was formerly cap. of an Ethiopian kingdom, and, after the adoption of Christianity in the 4th cent., an eccl. centre. It is still regarded as a sacred city by the Ethiopians, and the anc. chronicles are kept in the church. The city surrendered to the invading It. forces under Gen. de Bono on 15 Oct. 1935. The possession of this traditional centre of Ethiopian life was of considerable importance to the Italians, the more so from the fact that it had been the centre of religious celebrations for the Ethiopian victory of 1896. But the Italians wished to avoid wounding the religious susceptibilities of the pop. by occupying by force of arms a holy city in which, according to tradition, there still rested the ark of the covenant which had been brought from Jerusalem by the son of King Solomon and the Queen of Sheba.

Hence the It. poem was conveniently solved by a deputation of priests, headed by their political and religious chief, the Nevrad, coming out and delivering the keys of the city to the It. commander. Pop. 10,000.

Aktyubinsk: 1. Oblast (prov.) of Kazakh S.S.R. of Soviet Union. Cultivation of cereals is growing but most of the area is devoted to livestock raising. There are chrome, nickel, and chemical deposits. Pop. 360,000.

2. Tn and cap. of the oblast. It has electro-technical and engineering works. Pop. 80,000.

Akureyri, tn of Iceland, on Eyjafjörður. It has a good harbour and is an important trading centre, and after Reykjavik has long been Iceland's greatest cultural centre; it has sev. schools of all grades and a flourishing printing and publishing trade, cloth mills, a boot factory, and a large dairy. Pop. 7518.

Akyab, dist. (area 5136 sq. m.) and tn in the Arakan div. of Burma. After the cession of Arakan in 1826 A. was made the seat of gov., and rapidly grew from a small fishing vil. into a leading port. Chief export rice, with sev. large rice mills. Pop. (dist.) 760,700; (tn) 38,000.

Al Beruni, see BERUNI.

Al-Farabi (c. 870-950), Arabic philosopher of Turkish origin. b. Farab in Transoxiana. He is best known as having introduced Aristotle to the Mohammedan world. A diligent commentator on the works of that philosopher from the Neo-Platonist standpoint, he applied the political theory of Plato to the problems of his day. He exercised considerable influence upon Avicenna and Averroes (qq.v.), and was known to the medieval schoolmen. His complete works (*Al-Farabi Opera Omnia*) were pub. at Paris in 1638. There are eds. of his philosophical treatises (*Al-Farabi's philosophische Abhandlungen*, 1892) and *Ideal State* (*Al-Farabi, Der Musterstaat*, 1900) by F. Dieterici. The *Book of Gems* with Ismail's commentary has been trans. by M. Horten, 1906. See I. Madkour, *La Place d'Al-Farabi dans l'école philosophique musulmane*, 1934.

Al-farghāni, see ALFRAGANIUS.

Al-Khwarizmi, Arabian mathematician, b. Khorassan, who fl. in the 9th cent. He studied and made important astronomical calculations at Bagdad. He wrote sev. books on mathematics, among which was one on Hindu arithmetic, containing dissertations on the quadratic equations, etc. The original name of the work was *Al-Jabr wa'l-muqabala*, which was corrupted into Algebra. This book was the basis on which all subsequent medieval works on algebra were founded.

Al-Kindi (fl. 9th cent. AD), Arabic philosopher, b. Bagdad. He was the first of the so-called Arabian school, and introduced into the Islamic world a system which combined Aristotelianism and neo-Platonism. His outlook was fundamentally religious, and he considered philosophy as the 'handmaid of revelation.' Of his numerous works, some moral treatises and an introduction to the

study of Aristotle have been pub. as follows: H. Ritter and R. Walzer, *Studi su Al-Kindi II*, 1938; M. Guidi and R. Walzer, *Studi su Al-Kindi I, Uno scritto introdotto allo studio di Aristotele*, 1940. See R. Walzer, 'The Rise of Islamic Philosophy,' in *Oriens*, 3, 1950.

Al-Mamun, or **Abdallah III** (c. 786-833), caliph of the Abbasid dynasty, the second son of Haroun al-Raschid (q.v.). After defeating his brother Amin he came to the throne in 813. He encouraged science and the arts, and was famous for his generosity and clemency, and for his own literary talent. He d. during a campaign against Emperor Theophilus.

Al-Mokanna ('the veiled'), so called because he used a veil of green silk to hide his ugliness or the effulgent radiance of his face. It is not certain what his name was, perhaps Hashim ibn Hakim. He was one of the many who revolted in central Asia against the caliphs and, like most of them, invoked the aid of religion, calling himself God. The movement lasted from about 780 to 786 when he perished in the flames of his fortress. He is the hero of Moore's *Lalla Rookh*.

Al Segno, It. musical term meaning 'to the sign.' It directs the musician to revert to the sign :S: and continue from there to the first double bar or to a place marked *fine* (end).

Al-Sirat (the path) is a bridge thinner than a hair and sharper than a sword over hell along which all must pass to reach paradise. This bridge is not mentioned in the Koran but is an accepted dogma of Islamic theology.

Alabama, the 'Cotton State,' one of the Gulf states of the U.S.A., bounded on the N. by Tennessee, on the E. by Georgia, on the S. by Florida and the Gulf of Mexico, on the W. by Mississippi, and having a gross area of 51,609 sq. m. In the extreme N. of the state is part of the fertile valley of the Tennessee; to the S. of this lies a hilly region containing parts of the Allegheny and Cumberland ranges, in which coal and iron are found. The centre of the state is occupied by the Cane-brake or Black Belt, one of the most fertile cotton countries in the world. To the extreme S. is a low-lying, sparsely populated dist., very heavily wooded. The country is well watered, and the A. and Tombigbee are navigable rivs. The leading industry of the state is still agriculture. A. ranks as one of the leading cotton-producing dists., and Indian corn, tobacco, rice, and wheat are widely grown. There are large coal, iron, and steel industries in the N., and cotton manuf. and the lumber trade are considerable. The climate is warm and equable and very healthy except in the low-lying land in riv. valleys.

A. takes its name from an Indian tribe, which formerly inhabited this region. The ter. now constituting A. was first explored in 1540 by the Spaniard, De Soto, who passed through it from Florida to the Mississippi. The first permanent settlement was made by the French on Mobile Bay in 1702, and was removed to the present site of Mobile in 1711.

Towards the close of the 17th cent. France asserted her title to this region, basing her claim on the discoveries of Marquette and Joliet, who descended the Mississippi to the Arkansas in 1673, and of La Salle, who sailed down the Mississippi to its mouth in 1682. England, too, claimed the region N. of the Gulf of Mexico, and the ter. now forming A. was included wholly or in part by the Carolina Charters of 1663 and 1665, and by the Georgia Charter, 1732. In 1763 the French, by the Peace of Paris, ceded A. to Great Britain; Florida, then a part of A., being also transferred to Great Britain by Spain. The treaties of Versailles and Paris led to complications over A. between the U.S.A., Spain, and England, but at the close of the 18th cent. all the present area of A., except that portion lying S. of the thirty-first parallel, was ceded by Great Britain to the U.S.A. The Floridas were transferred by Great Britain to Spain at the same time. In 1795 Spain relinquished her claims to the ter. N. of the thirty-first parallel. In 1819, after Spain had virtually given up all claims to any ter. in A., A. became a state with boundaries as at present, and was admitted to the Union.

Disaster befell A. in 1837 as a result of the corruption of the note-issuing state banks, and the state's public debt reached over 3½ million dols. Further trouble occurred over the slave-holding question, the 'Alabama Platform' definitely pronouncing against any infringement of slave-holding rights. A., in 1860, together with other cotton states, seceded from the Democratic National Convention, and as a Confederate state sent out the bulk of its male white pop. to fight against the N. After the war the Negro pop. gained the ascendancy and disfranchised the white voters, but financial disaster quickly followed, the state debt reaching 26 million dols. in 1874. In 1901 a new constitution greatly curtailing the Negro voting power was adopted. A. has 37 railways, 8 of them trunk lines. More than a third of the landowners are coloured; there are strict laws against the marriage of whites and Negroes. Pop. (1950) 3,061,743, of whom 67 per cent are white. The state cap. is Montgomery (pop. 106,500); the seaport is Mobile. Prin. tns, Birmingham, Gadsden, Tuscaloosa, Anniston.

'Alabama,' The, Confederate cruiser in the Amer. Civil War which, causing immense loss to the commerce of the Federal states, gave rise to the celebrated Alabama question, and led to strained relationship between the govs. of the U.S.A. and Great Britain. Britain accorded to the Confederates the status of belligerents, and was lax in the enforcement of strict neutrality. This very nearly precipitated a war between the 2 countries, which was only averted by arbitration. The A. was built in the yard of Messrs Laird & Sons, Birkenhead, and the vessel, before coming out in her true light by being named after one of the seceding states, was known as No. 290, i.e. her number in the builders' yard; on the pretext of making a trial trip, she

steamed down the Mersey and out to sea on 29 July 1862. She made for the Azores, where, under the direction of her commander, Capt. Semmes, she was equipped with arms and ammunition. Thus armed she sailed forth on 24 Aug. In all she captured some 68 vessels and inflicted direct damage to the extent of nearly £1,000,000. Finally, on 19 June 1864, the Federal warship *Kearsarge*, commanded by Capt. Winslow, caught the A. off Cherbourg, and after an hour's engagement, in which the latter vessel was reduced to a sinking condition, Capt. Semmes surrendered. The prolonged negotiations between this country and the U.S.A. eventuated in the treaty of Washington, 1871, by which it was agreed to refer the dispute to a court of 5 arbitrators, one each to be nominated by Britain, U.S.A., Italy, Switzerland, and Brazil. This court sat at Geneva in Dec. 1871, and awarded the U.S.A. \$13,500,000 in respect of damage done by the A. and 2 other vessels, the *Florida* and the *Shenandoah*. The question is discussed in most works on International Law. See G. W. Lowrey, *English Neutrality*, 1863; W. Dwinelle, *American Opinions*, 1870; M. Bernard, *Neutrality*, 1870.

Alabama River, 315 m. long, is formed by the confluence of the Goosa and the Tallapoosa near Montgomery, the cap. of A. A short distance above the Mobile it unites with the Tombigbee to form the Mobile and Tensaw Rs. With its tribs. it drains the greater part of the state of Alabama.

Alabaster, term applied to 2 different minerals. The A. of the ancients is said to have derived its name from the tn of Alabastron in Egypt. It is a hard, marble-like carbonate of lime formed by a stalagmitic process, and was in much demand for ornamental purposes. The 'alabaster box of very precious ointment,' mentioned in Matt. xxvi. 7, was made of this substance.

The A. of the present day is gypsum (q.v.), a hydrated sulphate of lime. It is a much softer mineral than the anct A. and slightly soluble in water, but it is used for making ornaments, statuettes, plaster, and plasterboard for building, etc.

Alacoque, Marguerite-Marie, St, see PARAY-LE-MONIAL.

Alagoas: 1. A state of NE. Brazil since 1889, bounded on N. and NW. by Pernambuco, of which it was originally part (until 1817), on SW. by Sergipe, and on the E. by the Atlantic. It has an area of 11,016 sq. m., and a pop. of about 1,173,000. The soil is fertile, and the country well watered, but agriculture is only sparingly carried on owing to the tropical climate. The chief products are sugar, tobacco, coffee, and cotton. Maceió is the cap.

2. Tn in state of same name, near the coast, on Lake Manguaba. Formerly the cap. of the prov. Now called Marechal Deodoro. Pop. 19,000.

Alais, see ALÈS.

Alajuela, cap. of prov. of same name, Costa Rica, 12 m. NW. of San José and

summer resort for the cap., being 3080 ft above sea level. The centre of an important coffee and sugar dist., A. is a cathedral city and commercial tn; prov. is agric. area with stock raising and lumbering in lowlands. Area 3700 sq. m.; pop. 15,297, (prov.) 148,850.

Alalakh, cap. of anct kingdom covering the Amq plain in Syria, mod. Tell Atshana or Acana, E. of Antaakya (Antioch) on R. Orontes. Fl. in 18th and 15-14th cents. BC. The site was excavated by Sir C. L. Woolley in 1937-9, 1946-50, and yielded inscriptions and the palace of its ruler Iarlimlim and his successors. Originally explored in the hope of tracing the relation of the E. Mediterranean, Hittite, and Mesopotamian civilisations, it furnished evidence of the Syrian and Hurrian culture of a period somewhat earlier than that at Ras Shamra (q.v.). See C. L. Woolley, *A Forgotten Kingdom*, 1953, and D. J. Wiseman, *The Alalakh Tablets*, 1953.

Alaleona, Domenico (1881-1928), It. musical composer, b. Piceno. He won a place among modern It. musicians as a national composer of marked originality. His *Canzoni italiane* and *Laudi italiane* are collections which revive the songs of his people and make an attempt to reconstruct a basis for the symphony and for modern instrumental music. A. also contributed some important studies of It. musical hist.; his book *Studi sulla storia dell'oratorio musicale in Italia*, 1908, 1945, contains much valuable research.

Alamanni, or Alamans, see ALEMANNI. **Alambagh**, fort in India about 4 m. from Lucknow, which during the Indian Mutiny in 1857 was used as a fortress by the rebels. It was taken by Havelock and Outram, and was later defended for a long period by the latter. Here is Havelock's tomb.

Alameda, residential city in A. co., California, 6 m. from San Francisco. Pop. 36,256.

Alamo, 'Thermopylae of America,' originally a Franciscan mission, but used at the end of the 18th cent. as a fort. In the Texan War of Independence (1836) a party of Texans and Americans numbering slightly over 180 held it against a large number of Mexicans under Gen. Santa Anna. Continued assaults were repulsed from 24 Feb. to 6 Mar., when the Mexicans, after storming the fort three times, obtained entrance. In the resultant hand-to-hand fighting all the defenders were killed. David Crockett (q.v.), James Bowie, and Wm B. Travis were among the dead.

Alanbrooke, Alan Francis Brooke, 1st Viscount (1883-), Brit. soldier, b. Bagneres de Bigorre, France, son of Sir Victor Brooke, of Co. Fermanagh, Ireland. Ednc. abroad and at the Royal Military College, Woolwich, passing out into the R.F.A., 1902. Went to France in 1914 with the Secunderabad Cavalry Brigade, 1915; Adjutant, 2nd Indian R.H.A. Brigade, 1915; G.S.O.I.R.A., First Army, 1918. Commandant, School of Artillery, 1929-1932; Army Instructor, Imperial Defence College, 1932-4; Commander, 8th Infantry Brigade, 1934-5; Inspector, R.A.,

1935-6; Director of Military Training, War Office, 1936-7; Commander of Mobile Div., 1937-8; G.O.C.-in-Chief, Anti-aircraft Command, 1939, G.O.C.-in-Chief, S. Command, 1939-40; Commander of Second Army Corps, B.E.F., 1939-40; Commander-in-Chief, Home Forces, 1940-1. Chief of the Imperial General Staff, 1941-6. Field Marshal, 1944. Master Gunner of St James's Park from 1946; Lord Lieutenant of co. of London from 1950; Constable of Tower of London, 1950-5. See Sir A. Bryant, *The Turn of the Tide*, 1957, based on A.'s diaries of the Second World War.

Aland Islands, see ÅHVENANMAA.

Alans, Iranian-speaking tribe which in the first cent. AD lived in the steppes between the Caucasus and the R. Don. They were routed by the Visigoths in the 5th cent.

Alaouites (Alawis), Territory of the, dist. of Syria created by France as mandatory when pre-war Syria was partitioned into sev. states. In 1921 the then newly formed state of the A., together with those of Damascus and Aleppo, was made into a Syrian federation, but from 1924 to 1930 the A. constituted a separate regime under a Fr. governor. Cap. Latakia. See also SYRIA.

Alaroón, Hernando de, Sp. navigator in the 16th cent. In 1540 he sailed from Acapulco to support the expedition under Vasquez de Coronado in search of the 7 cities of Cibola (Mexico). By exploring the Gulf of California he proved that California was not an is. He also ascended the Colorado R. A report of the expedition occurs in Hakluyt's *Voyages*, and the earliest known map of the region was made by Castillo, one of his pilots. See Herrera, *Decade VI*, Bk 9, and Hakluyt's *Voyages*.

Alaroón, Juan Ruiz de (c. 1581-1639), Sp. dramatist, b. Mexico, d. Madrid. He graduated in Mexico in 1606, and in 1622 went to Spain to fill a position under the council of the Indies. In 1628 his first vol. of 8 dramas was pub. at Madrid. The second vol. of 12 plays appeared at Barcelona in 1635. His work includes heroic drama, character-plays, and comedies of intrigue, and ranks very high in Sp. literature. His plays are carefully written in polished style, his masterpiece being *La Verdad sospechosa* (imitated by Corneille in *Le Menteur*). Others are *Las Paredes oyen*, *El Tejedor de Segovia*, and *Todo es ventura*. He received little contemporary appreciation; he was a hunchback, and cruelly pilloried for this defect. See P. Henriquez Ureña, *Don J. R. de Alarcón*, Mexico, 1914.

Alarcón, Pedro Antonio (1833-91), Sp. novelist and statesman, b. Guadix, d. Madrid. He was intended for the Church, but soon took up journalism, writing for the *Eco del Occidente* of Cadiz, and after the revolution of 1854 editing *El Látigo*. He accompanied the Morocco campaign of 1859 as a correspondent, publishing in 1860 an excellent diary of his experiences. In 1864 he entered the Cortes as Liberal member for Cadiz, and he later filled many important posts. His short stories,

poems, and essays were collected under various titles in 1871, 1875, and 1883. His later novels, many on religious subjects, were not so popular as his sketches and studies of rustic Spain. Among his works are *Diario de un testigo de la guerra de Africa*, 1860; *Fortas seriosas y humorísticas*, 1870; *El Sombrero de tres picos* (*The Three-cornered Hat*), 1874, and *Costas que fueron*, 1882.

Alarcos, see **CUBAD REAL**.

Alaric I (376-410), King of the Visigoths. In 394 he commanded the Gothic allies of Theodosius against Eugenius. On the death of Theodosius in 395 he led a Visigoth revolt against the Romans, and invaded Greece in 396. Arcadius made him governor of Illyricum and the Visigoths elected him their king. In 400 he invaded Italy, but was defeated by Stilicho at Pollentia and Verona in 403. After Stilicho's execution effective opposition to A. ceased. He ravaged N. Italy and eventually besieged Rome, and captured and sacked it in 410. He went on to invade S. Italy, but d. suddenly the same year at Cosentia.

Alaric II (d. 507), King of the Visigoths. He succeeded Euric in 485, and was a wise and tolerant ruler, ordering the compilation of the *Breviarium Alaricianum*, a selection from Rom. legal writers, for the use of his governors. His prosperity ultimately brought him into conflict with the Frankish king Clovis, who, on religious grounds (A. was an Arian), made war upon A., whom he defeated and killed at Vogladensis (modern Vouillé), near Poitiers. See also **GOTHs**.

Alarodian Languages, name which was applied by philologists to the Caucasian group of languages. The term is derived from the Alarodii of the classical geographers.

Ala-Shan, dist. of Inner Mongolia, occupying the S. part of the Gobi Desert. It is about 800 m. long and 480 m. wide, and is very sparsely inhabited by Oluts, the pop. being about 20,000. The dist. is an arid sandy plain, with occasional low hills and chalk downs. A little grazing is done where the absence of saline deposits permits. To the E. is the A.-S., or Khara-Narin, range, reaching 11,000 ft. The prov. was annexed by China in 1636.

Alaska, ter. of U.S.A., occupies the extreme NW. corner of N. America, with the adjacent is., being bounded on the N. by the Arctic Ocean, on the E. by the Yukon dist. of Canada and Brit. Columbia, on the S. by the Pacific Ocean, and on the W. by Bering Sea and Straits. It was formerly known as Russian America. It has an area of 590,884 sq. m., and a pop. of 128,600, of whom nearly 28,000 are whites and the remainder chiefly Indians, with a few hundred Japanese, Negroes, and Chinese. There is a floating pop. of 20,000 (excluded from the above) employed in the mines, on the railways, and in the canning industry. The country may be divided into 4 dists. The Pacific mt. belt, along the S. coast, contains 4 ranges, the Coast, the St Elias, the Aleutian, and the Alaskan, apparently a

continuation of the Coast Range of W. America. Sev. lofty peaks are found here, including Mt Sanford, 16,200 ft; Mt St Elias, 18,024 ft; Mt McKinley, 20,300 ft; and Mt Foraker, 17,000 ft. This dist. comprises the basins of the Copper and Susitna rivs. The coast is deeply indented and precipitous, and bordered by numerous is. The Central Plateau, at an average elevation of 3000-5000 ft, is a rolling upland with deep channels trenched by rivs., the chief of which are the Yukon and the Kuskokwim. The Rocky Mt system, which enters A. as a wide belt comprising sev. ranges, with peaks of 7000 and 8000 ft, merges into the Endicott Range, and dies away towards the Arctic Ocean. The Arctic slope, divided into the Anaktuvuk plateau and the featureless coastal plain, is as yet very little known. But in 1938 a Harvard Univ. expedition, led by Bradford Washburn, discovered, during aerial reconnaissance, a huge inland ice-field, which is now computed to be nearly 250 m. long and to be the source of the huge glaciers of A., such as the Bering glacier (30 m. wide) and the Malaspina (50 m. wide). The ice-field is hemmed in by a maritime mt. range, whose peaks range from 10,000 to nearly 20,000 ft above sea level. This range extends from the Copper R. valley above Cordova to the Alsek R. valley in the Yukon. The rivs. of A. are large, numerous, and navigable. The great system of the Yukon falls into the Bering Sea. The N. rivs. are comparatively unimportant. The chief industries of A. in the past have been fish and fur. The salmon fisheries are very fine. Whaling has lately fallen off considerably. The fur trade, comprising seal, sea-otter, and sev. varieties of fox, is also on the decrease. Reindeer have been brought in from Siberia, and there are now upwards of 600,000 head in the country, yielding an increasing tonnage of reindeer meat for export. The number of foxes is also increasing, and the value of fur-bearing animals exported reaches £175,000 a year. Salmon-fishing is an important activity, and there are adequate stringent laws for the protection of the fisheries. There are also valuable fur-seal herds on the Pribilof Is., the estimated number of animals being close to 2 million. Agriculture suffers from the shortness of the summer, but the soil appears to be rich, and experiments go to show that numerous hardy vegetables and sev. cereals may be grown in many parts of the country, while the abundance of grazing grasses offers possibilities of pastoral development. The timber resources are still untouched. The mineral wealth of A. has only lately been exploited. Gold was first found in 1850, and prospecting has gone on ever since, though as yet no veins of the richness of the Klondike deposits have been found. Gold is worked chiefly in SE. A., where a low-grade ore is found, on the Yukon R., and on the W. coast. The value of gold production in recent years has been more than \$25,000,000,000 per annum. Copper, silver, coal, lignite,

gypsum, and marble are also mined. A. trades almost exclusively with the U.S.A., and to the Amer. NW. states and Seattle the trade is an important one. The range of climate is considerable. A. has short, very hot summers and long, severe winters. The seat of gov. is at Juneau (6000); other important tns are Ketchikan, 5300; Anchorage, 11,300; Sitka, 2000; Fairbanks, 5800; and Nome, 1900. There are some 18 incorporated tns; most of them are equipped with all modern advantages, such as electric lighting, and some of them have up-to-date means of

George, Brit. Columbia, via the Rocky Mt Trench to an intersection with the Alaskan railroad SW. of Fairbanks. The gov. of A. is charged with the education of the whites, while education of the native elements is in the hands of the Alaskan div. of the U.S. Office of Education. There is an agric. college and school of mines at Fairbanks.

Boundary Commission, 1903. The dispute between the U.S.A. and Canada began with a treaty between Russia and Great Britain in 1825, which laid down a boundary line for that part of the deeply indented coast which runs up from the Portland Canal to Mt St Elias, embracing a narrow strip of coastline and the Alexander Archipelago; this line, which was to follow 'the tops of the mountains parallel to the coast, to meridian 141,' limited the strip to 10 marine leagues from the coast, following the windings of the coastline. In 1867 the U.S.A. purchased the Russian-Alaskan Co.'s ter., and then followed a period of disputes between Canada, the U.S.A., and Great Britain on the question whether the international line was to go across or round the indentations of the coast. An attempt to settle this dispute by a joint high commission in 1897 broke down, but in 1903 it was agreed to decide the question by a commission of 6 'impartial jurists' from Canada, U.S.A., and Great Britain. The commissioners were Lord Alverstone, Lord Chief Justice of England; Sir L. Jette and Mr A. B. Aylesworth of Canada, lawyers of repute; and Senator H. C. Lodge, Hon. Elihu Root, and Senator G. Turner of the U.S.A. The decision, not signed by the Canadian representatives, favoured the Amer. contentions, giving Canada no access to the inlets down to the Portland Canal, and only 2 of the is. claimed. In Canada much feeling was aroused against Lord Alverstone's vote as being dictated by Brit. policy in regard to the U.S.A., but the award has since come to be looked upon in Canada as a good workable compromise. See a series of articles in 1908-9 in the *University Magazine* of Montreal. At the end of 1938 the Brit. Columbia Legislature voted \$25,000 for a preliminary survey of a proposed highway connecting A. with the U.S.A. through Brit. Columbia. The President of the U.S.A., at the same time, appointed a commission to study routes and costs (see next section).

The Alaska Highway. The A. Highway was opened on 29 Oct. 1942. It is 1523 m. long, and runs from Dawson Creek, Brit. Columbia, following the general line of the airports which Canada had constructed at Fort Nelson, Watson Lake, and Whitehorse, and thence via Boundary and Big Delta to Fairbanks. The highway links A. and the U.S.A. There has been much joint effort between Canada and the U.S.A. for the development of A., particularly in relation to Brit. Columbia. On 23 Jan. 1943 the joint economic committees of the 2 countries undertook an international study of the vast region comprising A.,

S. & G.

THE OLD PIONEER ROAD

A section, later abandoned, of the Alaska Highway, near Champagne, Yukon.

water supply. The best harbour along the W. coast is at Teller on Port Clarence, near the W. tip of Seward Peninsula. A. was discovered by Vitus Bering (q.v.) in 1741. In 1867 it was purchased from Russia by the U.S.A. In 1906 A. received power to elect a delegate to the U.S. Congress. A law was passed by the Congress in 1912 conferring legislative power on A. and constituting Juneau the cap. of the ter.; it also created a railroad commission. The rail route from Seward to Fairbanks, projected in 1915, and completed in 1923, comprises altogether 500 m. of track and connects the terminus with the coal-fields at Matanuska. The U.S. Gov. has secured the consent of Canada for a railroad survey of a line connecting the Canadian National Railways with the Alaskan railroad. The route extends from the vicinity of Prince

the Yukon, and parts of the NW. Ters. and Brit. Columbia. This followed other co-operative action, particularly the setting up by President Roosevelt and Mr Mackenzie King of a joint defence board, and later various other joint boards were set up in the economic field. The major aspect of this great joint effort was the programme for the defence of A. and its use as a base for offensive action against Japan. The Defence Board recommended, and Canada constructed, a long line of air bases uniting the interior of the continent with the advanced posts in A. and N. Brit. Columbia. The construction of the airway to A. presented a problem of supply which could be effectively solved only by the building of a road, and the A. Highway was constructed by U.S. Army engineers and Canadian and Amer. contractors with remarkable speed. An offshoot from the A. Highway was plotted from Champagne to the deep-water landing at Haines on Lynn Canal, thereby greatly enhancing the usefulness of the highway as a channel of distribution. Canadian airmen, operating from Alaskan bases, attacked Jap. shipping and installations in the Aleutians. The last link in the highway from the NW. tip of the N. Amer. continent to the Panama Canal is under construction from the S. frontier of Mexico to Panama. The highway forms part of the Inter-Amer. Highway extending for 16,800 m. from A. to Argentina. Numerous countries are involved in the road, which runs from Fairbanks (A.) through Brit. Columbia to Seattle, and leaves the U.S.A. at Laredo (Texas). The A. Highway also formed a 'NW. passage' along which were transported vital supplies to Russia via the Bering Straits. See Benjamin H. Kizer, *The U.S.-Canadian Northwest*, Princeton, 1943.

Alauda (Lal., 'lark'), belonging to the family Alaudidae of the Passeriformes, is a gregarious bird. The wings are broad and long, the tail is short, the head feathers may form a crest. *A. arvensis* is the skylark, *Lullula arborea* the wood-lark.

Alausi, tn in Chimborazo prov., Ecuador, 70 m. E. of Guayaquil, situated on a plateau of the Andes at an altitude of 8553 ft. A. is on the Guayaquil-Quito railway (the A. loop is an engineering triumph). Pop. 4800.

Alava, Sp. prov., largest and most southerly of the Basque provs. (q.v.). It contains part of the Cantabrian Mts (q.v.), and is watered by tribs. of the Ebro (q.v.), including the Zadorra. The mts are well wooded and rich in minerals, and in the valleys cereals, flax, hemp, fruit, oil, and wine are produced. The cap. is Vitoria (q.v.). Area 1176 sq. m.; pop. 119,350.

Alawis, see ALAOUTIS.

Alb, liturgical vestment consisting of a white linen tunic with narrow sleeves and a hole for the head, ultimately derived from the *tunica alba* of Rom. citizens. Originally plain, in the 10th cent. embroidered bands were employed for borders and cuffs, and later 'apparels', i.e. square patches of ornamentation, 4 or

5 in number, were added. Lace is often used at the cuffs and on the skirt.

ALB

Alba (ancient **Alba Pompeia**), It. tn in Piedmont (q.v.), on the Tanaro. It has a 15th-cent. Gothic cathedral. Pop. 8000.

Alba, Duke of, see ALVA.

Alba Iulia, or **Alba Julia** (ancient **Apulum**; Ger. **Karlsburg**; Magyar **Gyulafehérvár**), tn of Rumania, near the Mureş (q.v.), 45 m. NE. by N. of Hunedoara. It is one of the oldest tns of Transylvania (q.v.), and is on the site of the Rom. settlement of *Apulum*. Its bishopric was founded in the 11th cent., and its cathedral (rebuilt 1443) belongs partly to that time, and contains the tomb of Janos Hunyadi (q.v.). The union of Transylvania with Rumania was proclaimed at A. in 1918. Pop. 15,000.

Alba Longa (Castel Gandolfo, q.v.), ancient tn of Latium, Italy, on a ridge overlooking the Alban Lake, 15 m. SE. of Rome. Said to have been founded by Ascanius, son of Aeneas. It was the legendary bp. of Romulus and Remus and centre of the Lat. League. Destroyed by Tullus Hostilius, third king of Rome, it was never rebuilt.

Alba Pompeia, see ALBA.

Alba Regia, see SZÉKESFEHÉRVÁR.

Albacete: 1. Sp. prov. in Murcia (q.v.). It is in general a tableland, hilly in places, and has fertile valleys and plains. The main industries are stock-raising and agriculture. Area 5739 sq. m.; pop. 403,000.

2. Sp. tn, cap. of the prov. of A. It has a fine 16th-cent. church, still unfinished, produces wine and saffron, has a cattle fair, and is famous for its knives. Pop. 73,850.

Albacore, name given to the long-finned tunnies, *Thunnus alalunga* and *T. germo*. The pectoral fins are very long and sabre-shaped. The A.s rarely exceed a length of 3 or 4 ft.

Alban, St., protomartyr of Britain. b. Verulamium (now St Albans) in the 3rd cent., and converted to Christianity late in life. He suffered martyrdom by the sword about 304. King Offa founded the famous monastery of St Albans on the site of his death in 795. His feast is on 22 June.

Alban Hills (It. **Monti Albani**), mt range in the Apennines (q.v.), SE. of Rome (q.v.). The Appian Way (see APPIA VIA) runs at its foot, and on Monte Cavo (3100 ft; auct. *Mons Albanus*) stood the temple of Jupiter Latiaris (see JUPITER). See CAMPAGNA DI ROMA and ALBANO, LAKE.

Albani, famous Rom. family, said to have come originally from Albania and to have settled at Urbino in the 16th cent. The fame of the house began with the accession of Giovanni Francesco A. to the papal throne in 1700 as Clement XI. Numerous other members of the family

In 1911 she pub. her reminiscences, *Forty Years of Song*, and at her farewell concert at the Albert Hall received a purse of gold. In 1925 she was given a Civil List pension, and created D.B.E. Sullivan's setting of the *Golden Legend* was inspired by her voice, and Gounod composed his *Mors et Vita* as a special tribute to her.

Albani, Francesco (1578-1660), It. painter of the Carracci school, b. Bologna and d. there. He painted numerous altar-pieces, but preferred mythological or pastoral subjects. His 12 beautiful children served as models for many of his

A MOSAIC PAVEMENT
in the Byzantine Baptistery at Ravenna

E.N.A.

were cardinals and other high Church officials. Cardinal Alessandro A. (1692-1779) was a determined enemy of the Stuarts. He also formed the famous art collection at the Villa A. at Rome. The family died out in the 19th cent.

Albani, Dame Emma (1847-1930), stage name of Marie Louise Emma Cécile Lajeunesse, Canadian singer, b. Chambly, near Montreal. Trained in music by her father, she first appeared in public at Albany, New York, in 1863. After studying in Paris and Milan she made her opera debut at Messina in 1870 as Amina in *La Sonnambula*. In 1872 she appeared in London with the Royal It. Opera, later visiting Paris (1872), the U.S.A. (1874), St Petersburg (1878), Berlin (1884), etc. In 1878 she married Ernest Gye, lessee of Covent Garden. She later left opera for oratorio, and sang at all the chief festivals and before many European monarchs. On the eve of her retirement

most famous paintings, now at Rome, Dresden, and in the Louvre. He opened a Rom. academy.

Albania, auct. name of N. Azerbaijan (see AZERBAIJAN).

Albania, independent Balkan state made up of parts of the old Turkish provs. of Scutari, Yanina, Kosovo, and Monastir. Prior to 1939 it was a monarchy which, before 1912, formed a part of the Turkish Empire. It consists of a very mountainous strip of land lying on the W. shore of the Balkan Peninsula, between Montenegro and the N. boundary of Greece. Until recently it was little explored. The mts of N. A. form the watershed between the Aegean and the Adriatic Seas; they consist of a high mass of rocky mts which spread through Montenegro to the Adriatic. The highlands of A. may be described as lying in the N. and S., the mts of central A. being of a more undulating character. Owing

to the character of the mts, the rivs. which flow from E. to W. are not navigable. The chief rivs. are the Boyana and the Drin. The mineral wealth of A. is probably great, but the country is almost entirely unexploited. It has splendid forests, and produces wine and olive oil. The chief means of subsistence are cattle-rearing in the plains, sheep- and goat-rearing in the mts. The pop. of A. is roughly estimated at about 1,200,000. The chief tns are Tirana, Scutari, and Durazzo (q.v.). As a race the Albanians are one of the most anct in the Balkan Peninsula; they are noted for their sturdy independence and for the tenacity with which they have clung to their customs and traditions. The majority of the Albanians are Muslims; the remaining portion of the pop., roughly two-fifths, belong either to the Gk or the Rom. Catholic Church. A number of interesting Rom. remains proves the existence of a Rom. influence in A. Three ports, the present Pollina (Rom. Apollonia), Durazzo (Rom. Dyrrachium), and Avlona (Rom. Aulon), on the Adriatic, must have been thriving tns during the days of Rom. authority. After a long period of disuse, the two latter are gradually returning to a position of importance.

History. During the 4th and 5th cents. A. was in the hands of the Goths; in the 6th cent. it became a part of the E. Empire under Justinian, and in the following cent. came under the rule of the Serbs, who held it, with a short break, until the 14th cent. In the 12th cent. for a short period the Normans, under Robert Guiscard, tried to form a kingdom there, and Michael Comnenus, after the setting up of the Lat. Empire, retired to A. and tried to build up an independent kingdom. During the latter half of the 13th and the beginning of the 14th cent. the Aukevin kings of Sicily ruled A. The Serbs, however, re-estab. their power and retained it until the death of Dushan in 1360. Between the downfall of Serb rule and the estab. of Turkish power, A. was ruled by native chieftains. During the 15th and 16th cents., however, in spite of prolonged resistance, A. gradually fell into the hands of the Turks, finally becoming a Turkish prov. in 1748. In the 18th and early 19th cents. attempts were made by individual Albanian chieftains to estab. their independence in A., but these had no lasting success. At the conclusion of the Balkan wars (q.v.) the treaty of London settled the independence of A., May 1913: a ruler was to be chosen by the powers, and Prince William of Wied was invited to take up the office. On 21 Feb. 1914 Prince William received at Neuwed an Albanian deputation, consisting of Essad Pasha (q.v.) and a number of Albanian chieftains, who offered him the crown on behalf of the Albanian people, which he accepted. His position was beset with many difficulties, not least among which was the question of N. Epirus, where a revolt took place on his arrival in A. He was known in A. by the title of *Mpret* (said to be a modification of *Imperator*). It was evident, on

the outbreak of the First World War, that there was no stability in this arrangement of a petty principality created by the influence of Germany with the object of furthering Austro-Hungarian policy in the Balkans. Prince William left A. when Austria declared war on Serbia, and Essad Pasha became self-appointed ruler of the country. In Dec. 1914 Italy dispatched an expedition to Avlona on the Albanian coast as a set-off to Austrian aggrandisement in Serbia. The Entente in 1915 promised A. to Italy as part of the price of It. support in the war. Unaware of this, the Dual Monarchy, in

E.N.A.

AN ALBANIAN BOY

The donkey is carrying water.

the endeavour to purchase It. neutrality, offered Italy sovereignty over Avlona and a free hand in A. Later in 1915, however, after the Montenegrin cap. had fallen, the Austrians marched southward into A., captured Scutari, and reached the heights of Tirana (Jan. 1916). Meanwhile Bulgarian troops had also crossed the frontier and occupied El Bassan. The Italians evacuated Durazzo, but continued to hold Avlona, and so dominated S. A. At the conference in San Remo, 1920, A. was mandated to Italy. Later a rep. was proclaimed with a constitution providing for a Parliament of 54 elected members and a Senate of 18 under a president (Ahmed Zogu or Zog, 1925). In 1928 the Constituent Assembly proclaimed A. a democratic monarchy, Ahmed Zogu assuming the title of Zog I, King of the Albanians. In 1939 Italy suddenly invaded A., after air-raids over the chief tns. Zog fled the country, and soon afterwards the country was proclaimed an It. protectorate. The Italian move was generally interpreted as part of the Axis policy of encircling Yugoslavia, and also designed to give Italy still greater influence in the Mediterranean. In the course of the It. invasion

of Greece in 1940 the Greeks captured various strategic points in A., and but for Ger. intervention would probably have driven the Italians out of the Balkans. In 1942 the premier of the Albanian 'puppet' gov. of A. announced a programme for complete 'fusion' of the Italo-Albanian union, indicating that A. would be entirely absorbed into the It. Empire. But Albanian patriot forces eventually entered the cap. on 20 Nov. 1944, and Durazzo was liberated the following day, A. thereby regaining her independence. In Nov. 1945 the provisional gov. of Enver Hoxha was recognised by the allied govts.; elections held in Dec. 1945 returned a Communist-controlled assembly. In Jan. 1946 A. was proclaimed a People's Rep. It has since followed a policy in line with Soviet Russia's. Efforts have been made to give the country new industries and better communications (the first railway was built in 1947), and new measures taken to improve health and education, after the Soviet pattern. See BALKAN WAR, THE; SCUTARI; SERBIA.

Language and Literature. Albanian is an Indo-European language with no obvious affinity to any other, though some scholars have found features in common with certain Caucasian languages. The Lat. alphabet is used, and much of the vocabulary is borrowed from Greek, Latin, or Slavonic. It is divided into 2 dialects (Geg, spoken in the N., and Tosk, spoken in the S.); but a unified literary language has now been formed. The earliest fragment in Albanian is a form of baptism printed in 1462, now preserved in Florence. Albanian literature has fl. since the 17th cent., much of it in the Turkish period being pub. abroad (Italy, Egypt, etc.). It is especially rich in poetry, and there is an extensive folk literature. See S. E. Mann, *A Short Albanian Grammar*, 1932; *An Historical Albanian-English Dictionary*, 1948; *Albanian Literature: An Outline*, 1955.

See also C. A. Chekrczi, *Albania Past and Present*, 1919; R. Matthews, *Sons of the Eagle: Wanderings in Albania*, 1937; Julian Amery, *Sons of the Eagle: A Study in Guerilla War*, 1948.

Albano, Lake, It. lake, in Lazio (q.v.), 12 m. SE. of Rome, beside the Appian Way (see APPIA VIA). It is in the Alban Hills (q.v.), and is formed in the basin of an extinct volcano. The tunnel by which it is drained is said to owe its existence to a pronouncement of the Delphic oracle (see DELPHI) that Veii (q.v.) would not fall until the waters of A. reached the sea. Circumference 6 m.

Albans, St., see ST ALBANS.

Albany, Count, assumed name of the 2 brothers. John Sobieski Stobierski Stuart (1797-1872) and Charles Edward Stuart (1799-1880), who claimed to be descendants of the Young Pretender. Both served on the Continent under Napoleon till his final defeat, and then settled successively in London, the Scottish Highlands, and Austria.

Albany, Dukes of, title created first in 1398 and bestowed on Robert Stewart,

Earl of Fife. The title has been revived at various periods in Brit. hist., being conferred on Darnley by Mary Queen of Scots in 1565, held by James I, Charles I, and James II, and again bestowed on the youngest brother of George I, on the younger brother of George III, and on the second son of George III. It was finally revived in 1881 by Queen Victoria for her youngest son Prince Leopold.

Albany, Leopold George Duncan Albert, Duke of (1853-84), youngest son of Queen Victoria. He was known as Prince Leopold until created Duke of A. in 1881, and he married Princess Hélène of Waldeck-Pyrmont, 1882. His daughter Alice married the future first Earl of Athlone in 1904. His son succeeded to the dukedom of Saxe-Coburg in 1900, fought for Germany in the First World War, and was deprived of his Brit. titles in 1919. A. was a liberal patron of literature and education.

Albany, Louise Maximilienne Caroline, Countess of (1752-1824), eldest daughter of Prince Gustavus Adolphus of Stolberg-Gedern, b. Mons. She was married to the Young Pretender in the days of his decline, but the marriage proved childless and most unhappy. In 1780 she fled from her husband and threw herself on the protection of Henry Stuart, her brother-in-law. She then lived quietly and happily, interesting herself in literature. In 1788 Charles d. and she is said by some to have married the poet Alfieri. See life by G. R. Preedy, 1945.

Albany, Canadian riv., rising in Lake St Joseph and flowing into James Bay; total length, 500 m. It is navigable up to Martin's Falls. Fort A. stands at its mouth.

Albany: 1. The co. tn of A. co. and cap. of the state of New York, U.S.A.; situated on the W. bank of the Hudson R. The first settlement was made here in 1614 by the Dutch, who called the place Fort Nassau. In 1664 it was occupied and named by the English. In 1754 there was held here the general conference of the states, in which plans for a closer union were mooted. It played an important part in the Amer. war of independence, and became the state cap. in 1797. It has a number of magnificent public buildings, among which may be mentioned the state capitol (1879), one of the costliest in the U.S.A., the city hall, the Federal Building, and the state museum of natural hist. The capitol was partially demolished by fire in Mar. 1911, and many valuable documents were destroyed. A. is an important railway and commercial centre. The chief industries are brewing, oil refining, printing, publishing, meat packing, and the manuf. of machinery, chemicals, paper and wood products, heaters, foundry products, textiles, clothing, and food-stuffs. Pop. 134,995.

2. The co. tn of Dougherty co., Georgia, U.S.A., at the mouth of the Kinchafoona Creek, on the Flint R. It was settled in 1836, and became a city in 1907. It is a major market and processing centre for pecans and peanuts, and manufs. thread.

sheeting, hosiery, lumber, fertiliser, candy, and farm machinery. Pop. 31,155.

3. Co. seat of Linn co., Oregon, on the Willamette R. It is a rail, trade, and shipping centre for a farm and orchard area, and manufs. lumber, leather goods, and furniture. Pop. 10,000.

Albany, port and municipality of W. Australia, on the Princess Royal Harbour, 245 m. SSE. of Perth, with a fine harbour. It was first settled as a penal colony in 1826. Pop. 4760.

Albategnius, or **Al-Battān** (850-929), properly Mohammed ben Gebir ben Sinan al Battani, his surname being taken from his native tn Battan in Mesopotamia, Arab chief and astronomer who, while following in general the Ptolemaic system, made sev. improvements thereon. He obtained more accurate values of the obliquity of the ecliptic and of the precession of the equinoxes than those previously determined, and produced improved tables of the positions of the sun and moon. His astronomical treatises were trans. into Lat. by Plato Tiburtinus early in the 12th cent., and printed at Nuremberg in 1537 and 1645.

Albatross, a species of large sea bird belonging to the family Diomedidae, which together with the petrels forms the order Procellariiformes. The external nostrils are more or less tubular.

The Diomedidae contain 14 species of A. found in the S. Ocean and in the tropical and N. Pacific oceans. The wandering A. (*Diomedea exulans*), which has a wing span of up to 14 ft., is the largest oceanic bird. It ranges between latitudes 30° and 60° S. A.s feed mainly on squids and fishes and nest on remote oceanic islands. A single white egg is laid.

Albedo, astronomical term applied to the ratio of the light reflected from the surface of a body to that which falls upon it, e.g. the A. of the moon (1/14) is the fraction of the sun's light falling upon it which is reflected. The following A.s of some of the bodies of the solar system are taken from *Earth, Moon, and Planets*, by Fred L. Whipple (q.v.), but opinions differ regarding the actual figures. Mercury, 0.07; Venus, 0.59; Earth, 0.5; Moon, 0.07; Mars, 0.15; Jupiter, 0.44; Saturn, 0.42; Uranus, 0.45; Neptune, 0.52; Pluto, small.

Albemarle, Dukes and Earls of, variant form of the Norman name Aumale. The first earldom was created by William the Conqueror, who gave his brother-in-law Odo of Aumale the lordship of the Isle of Holderness in Yorkshire. In 1180 William de Mandeville, son of the adventurer of Stephen's reign, succeeded to the title by marriage. During the century following it was held in conjunction with the earldom of Devonshire, and towards the end of the reign of Henry III it lapsed to the Crown. Revived subsequently by the royal prerogative, it was conferred on Richard Beauchamp, Earl of Warwick, in 1419, and in 1660 the earldom was raised to a duchy and conferred on Gen. Monck by Charles II. The newly created title became extinct in 1688, but was conferred

in 1696 again as an earldom on Van Keppel, a trusted follower of William III, and has been in the Keppel family ever since. The 9th earl (b. 1882) succeeded to the title in 1942. *See also* MONCK, GEORGE.

Albemarle Sound, a large inlet on the coast of N. Carolina, about 55 m. long and 5-15 m. wide. It is crossed by the Intracoastal Waterway. It received its name from the Duke of A. of Charles II's creation.

Albenga (anct **Albium Ingaunum**), It. seaport in Liguria (q.v.). It is on the Gulf of Genoa (q.v.) at the mouth of the Neva. There are Rom. remains, a 5th-cent. baptistery, and numerous medieval buildings, including a 13th-15th-cent. cathedral. It is known for its peaches and artichokes. Pop. 11,000.

Albeniz, Isaac (1860-1909), Sp. pianist and composer, b. Camprodon, Catalonia. A musical prodigy, he learned the piano as a child, appearing in public at the Teatro Romea, Barcelona, when only 4. He led a picturesque life for some years as a concert-giver in N. and S. America, and later went to the Brussels Conservatoire, where he studied under the auspices of King Alfonso XII. He failed as a musical comedy impresario, but throughout his vicissitudes, including heavy losses in financial speculation, he was fortunate in receiving, at crucial moments, the protection and influence of the best advisers, including the Conde de Morphy, the Sp. musicologist. In musical reform A. was an innovator of the 'new Spanish school,' and his name as a piano composer is known in all countries. As pianist he was specially famous for his rendering of Couperin, Scarlatti, Bach, Chopin, and Schubert. Eventually he gave up the piano to devote himself to composition. His operas include *Peppita Jimenez*, *Henry Clifford*, and *Merlin*; among his other works are the orchestral suite, *Catalonia*, and a great number of piano works, including the 12 magnificent pieces entitled *Iberia*.

Alberni, *see* PORT ALBERNI.

Alberoni, Giulio (1664-1752), It. bishop and Sp. politician, b. near Piacenza, Italy, where his father was a gardener. He took priest's orders and came to Rome, becoming secretary to the Duke of Vendôme, and accompanying him to Spain. He helped in the arranging of the Sp. king's marriage to Elizabeth Farnese of Parma, and was rapidly pushed forward by the queen. By 1715 he was prime minister of Spain and he was made a cardinal 2 years later. His internal policy included many salutary and much-needed reforms, but he met with much opposition from the nobility. He reorganised the army, and realised that the power of Spain depended very largely upon the size and state of her navy. He also reorganised finances, and threw open the trade with the Indies. By his invasion of Sardinia in 1718 he provoked the Quadruple Alliance (England, Holland, France, and the Holy Rom. Empire). This resulted in his downfall, and in 1719 he was forced to leave Spain.

Albert (1490-1568). Duke of Prussia, a cadet of the house of Hohenzollern, was, by the influence of the Emperor Maximilian, created grand master of the Teutonic Order of Prussia (1511). He subsequently became a Lutheran, secularised the estates of the Teutonic knights, and changed the mastership into a hereditary dukedom, becoming Duke of Prussia. This marked an important step forward in the foundation of the later Prussian state.

Albert, pseudonym of Alexandre Martin (1815-?), Fr. artisan who took a prominent part in the revolution of 1848. After this he was associated with Blanc (q.v.) in the provisional Gov. After a period in prison he was released, but reappeared in the Commune of 1871, following which his hist. is unknown.

Albert III (1414-86), elector of Brandenburg, surnamed Achilles, *b.* Tangermünde. Quite early in his life he distinguished himself as a warrior. On the death of his father he received the ter. of Ansbach and took his place as one of the leading Ger. princes. After a war against Nuremberg he was forced to recognise its independence. In 1470 he became elector of Brandenburg. In 1472 he finally brought Pomerania under his rule. He handed over his possessions in Brandenburg to his son in 1473 and retired to his Franconian possessions. He was one of the greatest and most ambitious of Ger. princes.

Albert I (1875-1934), King of the Belgians, son of Philip, count of Flanders. He succeeded his uncle, Leopold II, on 17 Dec. 1909. In 1900 he married Elizabeth (*b.* 1876), daughter of Duke Charles Theodore of Bavaria, by whom he had 3 children, Leopold (*b.* 1901), Charles Theodore (*b.* 1903), and Marie José (*b.* 1906). He was popular with his subjects and progressive in his policy. In the First World War he shared the hardships and vicissitudes of his armies during the Ger. invasion. When, in Oct. 1918, the Allies renewed their victorious advance on the W. front, his troops swept, within a fortnight, from Dixmude to the suburbs of Ghent, and on 13 Nov. he formally entered that city. Antwerp on the 19th, and Brussels on the 22nd. In Feb. 1931 he was killed in a mountaineering accident in the Meuse valley, 40 m. from Brussels.

Albert I (c. 1249-1308), son of Rudolf of Hapsburg, the founder of the Hapsburg dynasty. A. was not elected emperor on the death of his father, but was passed over by the electors, from motives of fear and jealousy, in favour of Adolf of Nassau. Adolf proved himself too weak to rule well, and was deposed and slain by the electors led by A. In 1298 A. was elected and crowned. During the 10 years that he reigned he followed an energetic and ambitious policy which resulted in the reduction of Germany to obedience; though he did not succeed in annexing Holland and Zeeland. He was murdered by his nephew John of Swabia.

Albert II (1397-1440), King of Hungary and Bohemia, succeeded Sigismund

as emperor in 1437. He d. as he was preparing to take the field against the Turks, who were ravaging Hungary.

Albert, Archbishop of Magdeburg (1490-1545), younger son of John Cicero, elector of Brandenburg. He became in 1513 Archbishop of Magdeburg, in 1514 Archbishop-Elector of Mainz, and in 1518 a cardinal. By the use of the services of Tetzels in the sale of indulgences, he may be said to have been directly involved in the events which touched off the Ger. Reformation.

Albert, Archduke of Austria (1559-1621), third son of the Emperor Maximilian II. Brought up in the Sp. court, he became cardinal-archbishop of Toledo, and later viceroy of Portugal (1594-61). In the latter year he succeeded the Archduke Ernest as governor of the Sp. Netherlands. His work in the Netherlands was chiefly directed against the power of France; in 1596 he captured Calais, thus inflicting a severe blow on the French; he failed, however, to retain Amiens and retired to the Netherlands. In 1598 he renounced his orders and married the Infanta Isabella, receiving the sovereignty of the Netherlands; in 1609 he concluded a truce with the Dutch.

Albert, Margrave of Brandenburg (c. 1100-70). A., usually known as A. the Bear, was Margrave of the N. Mark, situated between the N. courses of the Elbe and the Oder. Later he acquired Brandenburg, the nucleus of the later kingdom of Prussia. Sometimes in rivalry, sometimes in alliance, with Henry the Lion, he was an important factor in the civilisation of N.E. Germany.

Albert, Prince Consort (1819-61), husband of Queen Victoria of Great Britain and Ireland. Albert Francis Charles Augustus Emmanuel, the younger son of Ernest, Duke of Saxe-Coburg-Gotha, was *b.* at Schloss Rosenau, near Coburg, and married Victoria, his first cousin, in 1840. The marriage proved to be an ideally happy one. A.'s position, however, was one of great difficulty and needed the utmost tact, and at first Victoria herself would let him take no part in State affairs. He was made regent in 1840 in case of the queen's death; he soon came to help the queen with advice in all her political duties, though only after his death did the full value of his work become apparent. A.'s interest in science and the arts had been stimulated by a model educ.; he had a natural political flair and understanding for diplomacy, though his position meant that all his influence had to be exercised indirectly. In addition, he was keenly interested in social and economic progress, and it was through his suggestion that the Great Exhibition was held in 1851. His natural reserve and continental connections tended to act against his popularity in the country as a whole; the queen, however, never recovered from the shock of his premature death from typhoid, and remained in mourning for him for the rest of her life.

Albert, Prince of Bayreuth (1522 ?), surnamed the Warlike, or Alcibiades,

was a son of Casimir of Bayreuth and a member of the Hohenzollern family. In 1541 he received Bayreuth as his share of the family possessions, and is sometimes referred to as the margrave of Brandenburg-Kulmbach, after the name of the chief of its principality. He took part in many campaigns, sometimes for, sometimes against, the Emperor Charles V. He was noted throughout Europe for his bravery and deeds of valour. He was eventually put under the ban of the empire and fled to France, where he took service under Henry II, dying shortly afterwards.

Albert, Prince of Mecklenburg (d. 1412), King of Sweden, was called to the throne in 1365 by the nobility who had deposed Magnus II. After a long war peace was re-established. In Sweden in 1389, when A. retired to Mecklenburg, where he d. Margaret (q.v.) succeeded him, and united the 3 N. kingdoms under 1 ruler.

Albert, Eugène Francis Charles d' (1864-1932), Fr. pianist and composer, b. Glasgow. He received the foundation of his musical education under Sullivan at the National Training School of Music in London, and studied also under Ernst Pauer, Stainer, and Prout. He won the Mendelssohn scholarship at 17, entitling him to a period of study abroad, which he spent at Vienna, afterwards studying under Liszt. As a pianist he soon became known in all parts of the world, and was for a short time court conductor in Weimar. He wrote 2 piano concertos, a symphony, and piano pieces. He married 7 times, among his wives being Teresa Carreño, the pianist (1892-5), and the singer Hermine Finck (1895-1910). He also composed many operas, including *The Ituby*, 1893; *Glismonda*, 1895; *Gernot*, 1897; *Die Abreise*, a one-act comedy, 1898; *The Improviser*, 1900; *Tiefland*, his most successful work, and part of the stock repertory of most Ger. theatres, 1903; *Fausto Solo*, musical comedy, 1905; *Tragaldabas*, 1907; *Lore's Chains*, 1912; *Dead Eyes*, 1916; *The Bull of Oliveira*, 1918; *Scirocco*, 1921; and *Mareike von Nymwegen*, 1923.

Albert: 1. Fr. tn (formerly **Ancre**) in the dept of Somme, 17 m. N.E. of Amiens, on the R. Ancre. In the First World War it was captured by the Germans during the great offensive they launched on 21 Mar. 1918; it was almost completely destroyed by the Ger. artillery. Rebuilt, it was again the scene of heavy fighting in 1940 and 1944. Machine-tools are manuf. Pop. 8800.

2. Riv. of Australia, crossing N. Queensland and falling into the Gulf of Carpentaria.

Albert, Lake (formerly **Albert Nyanza**) (native name, Mwutan Nzige), large lake partly in the Belgian Congo and partly in Uganda, situated in the lower basin of a great rift valley; it has an area of 2061 sq. m. The White Nile issues from the N. end of this lake, near the place where, on the E., the Victoria Nile enters, bringing the overflow of Lake Victoria. It is connected with Lake Edward to the S. by the Semliki R.

Albert Canal, Belgium, completed in 1939, links the R. Meuse at Liège with Antwerp and the R. Scheldt. Length 70 m.

Albert Edward Nyanza, see EDWARD, LAKE.

Albert Hall, London, large circular hall situated S. of Kensington Gardens, and within the City of Westminster, used for public meetings, concerts, oratorios, etc. Its seating capacity is over 10,000. It is situated opposite the Albert Memorial (q.v.), and its building was completed in 1871. It has one of the largest organs in the world.

Albert Medal, decoration given for gallantry in saving life, instituted by Queen Victoria in 1866, in commemoration of her late consort.

Albert Memorial, London, monument erected (1863-72) in memory of Albert, the prince consort, husband of Queen Victoria, in Kensington Gardens. It was designed by Sir Gilbert Scott.

Albert Park, national park in the Belgian Congo, gorilla and game sanctuary; situated in the Lake Kivu dist. Area 1,000,000 ac. Most of the inhab. are of pygmy race.

Albert the Bold (1443-1500), Duke of Saxony, spent much of his early life at the court of the emperor. He attempted to obtain the crown of Bohemia in 1471 on the death of George. In 1464 he and his brother Ernest ruled jointly the possessions of their father, but in 1485, by the treaty of Leipzig, a division was made, and Albert founded the Albertine branch of the Wettin family. He was a skilful soldier, and took part in a number of campaigns. He was made hereditary governor of Friesland in 1498 by the emperor, but while making good his title he d. at Emden.

Alberta, prov. of W. Canada, estab. with its present boundaries by the Dominion Parliament in 1905. It covers an area of 255,285 sq. m., and has a pop. of 939,500. Its S. limit is the U.S. boundary; on the E. 110° W. long. separates it from Saskatchewan; on the N. it is cut off from the NW. Ter. by 60° N. lat.; while on the W. the Rocky Mts separate it from Brit. Columbia. Except in the S., where irrigation is necessary, the prov. is well watered. Its 2 great rivs., the Athabasca and the Peace R., flow N. and NE. respectively until they meet the Slave R. coming from Lake Athabasca. The Slave R. then flows into the Great Slave Lake, whence, as the Mackenzie R., it drains into the Arctic Ocean. The Saskatchewan (N. and S. branches), with its tribs., drains the S. of A. into Lake Winnipeg, and thence, under the name of the Nelson R., into Hudson Bay. There are many small lakes, but Lake Athabasca and the Lesser Slave Lake are the 2 most important.

In the N. and SE. the country is level and sparsely wooded, in the S. and SW. near the Rocky Mts it is broken, hilly, and more wooded. The centre is well watered and timbered, and is the chief agric. dist. Wheat, oats, and barley are especially cultivated here, and mixed

farming is prosecuted with success. The chief industries, however, are ranching, stock raising, carried on particularly in the N., and oil production. Sugar-beet is extensively cultivated and much fruit is grown. The climate is on the whole healthful and invigorating. Since the prov. extends over 11° of lat. it naturally varies considerably, and these variations are accentuated by the various levels of the land. In the N. the cold is severe, but is moderated by the Chinook, a wind blowing from the Rocky Mts which melts

for years yielded some gold; there are large salt deposits in the N., and immense beds of tar sands in the dist. E. of Athabasca R. The mineral output was valued at approximately 196,000,000 dols. in 1952 and 323,740,702 dols. in 1956.

36.7 per cent of the pop. are engaged in agriculture (1951). It is estimated that there are about 68,000,000 ac. (43 per cent of total land area) of agric. land in A., of which, in 1951, about 22,271,044 ac. were under field crops. All the usual cereals are produced in large quantities, and

Alberta Government Photo

WATERTON LAKES, ALBERTA

the snow in a few hours. It is a moisture-bearing wind, and its influence is not entirely beneficial.

The prov. is rich in minerals. Great veins of both bituminous and anthracite coal have been found in A., and it is believed that over 25,000 sq. m. are underlaid with this mineral. Some 85 per cent of the coal resources of Canada are in A., and 25 per cent of those of all N. and S. America. Coal production, which in 1937 amounted to about 5½ million tons, and in 1952 to over 7 million tons, has declined (1955) to about 4½ million tons. But the discovery after the Second World War of huge reserves of petroleum and natural gas in the area around Edmonton (*see* LEDUC; REDWATER) has made this one of the most important areas for the production of mineral fuels on the N. Amer. continent. Before these discoveries the most important source of petroleum in A. was Turner valley (q.v.). The sands of the N. Saskatchewan R. have

alfalfa is also extensively cultivated. There is a large dairying industry. Important irrigation enterprises, which water an area of 847,000 ac. (1955), are operating at Calgary, Lethbridge, Bassano, and Medicine Hat. Mixed farming and dairying are features of the central section of the prov. The raising of horses, beef cattle, and hogs is also a feature.

Lumbering is a large industry in N. A. Spruce, pine, poplar, birch, larch, and Douglas fir are the chief timbers. The great lakes of N. A. are stocked with fish, especially whitefish and pike. Trout and pickerel are also abundant. Fur trading is still an important industry, with Edmonton as the centre.

Secondary industries, which mainly supply local needs, include abattoirs and meat-packing plants at Calgary and Edmonton. Flour- and saw-mills, brick-yards and tile-works, iron-works, harness factories, and stone quarries are located at many points.

Railway development has been rapid since 1900. The lines of the Canadian Pacific Railway run from Medicine Hat and from the E. through the Crow's Nest and Kicking Horse passes over the Rockies. The mts. are also crossed by the Canadian National Railways via the Yellowhead Pass. The main line of the C.P.R. runs E. and W. through Calgary, and from there are branches to Edmonton, and Macleod, with offshoots starting at Larcombe and Wetaskiwin. Two through lines of the C.N.R. connect Edmonton with Winnipeg, Port Arthur, and other centres in the E., and with Vancouver and Prince Rupert in the W. Canadian National lines also extend to Calgary

architect, sculptor, painter, musician, and man of letters, *b.* Genoa. He was for some time pontifical secretary at Rome. His best work is generally held to be the church of San Francesco at Rimini. He also designed the church of Sant' Andrea, Mantua, and Santa Maria Novella (façade) in Florence, and the Palazzo Rucellai, Florence. He was one of the pioneers in reviving classic architecture. He wrote works on the theory of painting and statuary, but his great work is the *De re aedificatoria*, printed 1485. See biographies by Mancini, Florence, 1882; Landi, Florence, 1906; Ricci, Turin, 1917; Venturi, Rome, 1923; Semprini, Milan, 1927.

Alberta Government Photo

EROSION EFFECTS NEAR DRUMHELLER, ALBERTA

from E. and N., and there are also extensions westward into the coal-fields.

A., as other prairie provs., was severely hit by the economic depression of 1930-1932, and for years afterwards the people of the prov. were far from their previous degree of prosperity. This no doubt was partly due to over-cultivation of wheat and the impoverishment of the soil. See also ABERHART, WILLIAM.

The gov. is vested in a Lieutenant-governor, an Executive Council of 13 members, and a Legislative Assembly of 61 members elected for 5 years.

Cap. Edmonton; chief tns: Calgary, Lethbridge, Medicine Hat, Camrose, Athabasca, Drumheller, Peace River, Stettin, Wetaskiwin, Red Deer. See L. Thwaite, *The Province of Alberta*, 1912; A. D. MacRae, *History of Alberta*, 1912; J. Blue, *The Province of Alberta*, 1924; A. L. Burt, *The Romance of the Prairie Provinces*, 1930; and Bureau of Statistics (Dept of Industries and Labour), Gov. of Alberta, *Alberta—Facts and Figures*, 1954.

Alberti, Leone Battista (1404-72). It.

Albertinelli, Mariotto (1474-1515). It. painter, *b.* Florence. He was the pupil of Cosimo Rosselli, and fellow student with Fra Bartolommeo, with whom he collaborated in sev. works. Among his famous paintings may be named a 'Visitation' at the Uffizi in Florence and a 'Virgin and Child' in the Louvre.

Albertite, carbonaceous mineral found in Albert co., New Brunswick. It is soft, and a shiny jet-black in colour.

Albertus Magnus (1193 or perhaps 1206-80), one of the greatest scholastic philosophers of the Middle Ages, and known as *Doctor Universalis*. He studied science at Padua, entered the Dominican order about 1222, and taught theology at Ratisbon, Strasburg, Cologne, and Paris (1245). His works occupy 21 folio vols. in the ed. of Jammy (1651). St. Thomas Aquinas was his pupil. His erudition was so extraordinary for the time as to comprise a very considerable knowledge of Arabian and Rabbinical literature. In natural science he followed Aristotle and Avicenna, agreeing

with the latter over the impossibility of genuine metallic transmutation. See H. Wilms, *Albert the Great* (trans.), 1933.

Albertville: 1. Cap. of a dist. in the Belgian Congo at the end of the railway from Kabalo (Upper Congo); situated on the W. shore of Lake Tanganyika; connected with the E. coast by the railway Kigoma-Dar-es-Salaam. White pop. 953.

2. Fr. tn, cap. of an arron., in the dept of Savoie, on the Arly. It has saw-mills, and manufs. furniture and food-stuffs. Pop. 7100.

Alberus, Erasmus (1500-53), Ger. reformer and man of letters, b. Spremlingen near Frankfurt. He went to Wittenberg in order to study theology, and there met Luther, whose cause he soon espoused. His chief weapon in defence of Lutheranism was literary satire. He also wrote hymns, some of which are still to be found in the Ger. Protestant Hymnal, but his memory is preserved chiefly by his fables, *Buch von der Tugend und Weisheit*, 1550.

Albi (Lat. *Albiga*), Fr. tn, cap of the dept of Tarn, on the Tarn. It is the tn from which the Albigenes (q.v.) took their name. The seat of an archbishopric, it has a magnificent cathedral, the most noteworthy example of S. Gothic architecture, and also a splendid, fortified archiepiscopal palace, now a museum. It has textile, glass, cement, and machinery manufs., an agric. market, and is known for its *foie gras truffé*. Toulouse-Lautrec (q.v.) was b. here. Pop. 34,300.

Albica, see ALBI.

Albigenses, branch of the Cathari (q.v.) who multiplied in the S. of France in the 12th cent.; so named from Albi, the tn in Languedoc where a council condemned them in 1176. They were again condemned at the Lateran Council in 1179; but this and the pacific measures of Innocent III only increased their resistance, which led to the Albigensian Crusade. The latter, led by Simon de Montfort, virtually exterminated the heresy. See Daniel-Rops, *Cathedral and Crusade*, 1957.

Albinism, condition of the skin, hair, and eyes in which there is a congenital absence of pigment. Albino is the name given to a person suffering from this defect. A. may be partial, when there are irregularly shaped white patches on the skin or hair, or complete, when the entire surface is unpigmented, including the hair and the choroid coats and irises of the eyes. The irises appear pink because in the absence of pigment the transparency of the iris and retina allows the blood in the small veins of the eyeball to show through. This transparency of the iris constitutes a disability in sunlight, so that albinos usually pucker up their eyes and are often short-sighted or affected with mytaloopia (q.v.); at night, however, their sight is better than normal, owing to the greater amount of light reaching the retina. A. occurs in all races of human beings, but particularly among Negroes, whose race also shows a partial A. in which the black skin has white patches. It also occurs in

nearly all classes of the animal kingdom, particularly among mammals. In some cases the A. is periodic and is restricted to the winter months, so that it enables animals in snow-covered countries either to approach their prey or to escape detection by their enemies; notable examples are the arctic fox and arctic hare. A. is partially hereditary, and occurs periodically in accordance with a regular system, which has been investigated by Mendel and others. The phenomenon also occurs among plants.

Albinoni, Tommaso (1671-1750), It. composer, b. Venice. He was wealthy and never held a musical appointment, but was a fully trained musician. He wrote operas and instrumental music; three of his works were transcribed by Bach for clavier and for organ.

Albintimilium, see VENTIMIGLIA.

Albinus, Bernhard Siegfried (1697-1770), Ger. anatomist, b. Frankfurt-on-Oder. He qualified in medicine at Leyden (1719) and two years later was appointed prof. of anatomy there, a post he held for 50 years. His anatomical works are noted for their accuracy and beauty of illustration. A. was an incomparable lecturer and a master of the technique of anatomical injection. His chief works are *Historia musculorum hominis*, 1734, *De arteriis et venis intestinorum hominis*, 1736, *Tabuli selecti et musculorum corporis humani*, 1747, and *Tabuli ossium humanorum*, 1753. See T. J. Pettigrew, *Medical Portrait Gallery*, vol. i, 1840.

Albinus, Decimus Clodius (d. AD 197), Rom. soldier, b. Adrumetum in Africa. He entered the army at an early age, and served with distinction under Marcus Aurelius, especially during the rebellion of Avidius Cassius, AD 175. He was raised to the consulate in 176, and appointed to the governorship of Gaul and afterwards of Britain by the Emperor Commodus. On the death of Commodus and that of his successor, Pertinax, 193, Septimius Severus declared A. Caesar, in order to secure his neutrality, while he himself marched on Rome. Having there defeated his rival Pescennius Niger, he resolved to get rid of A. also. In a battle at Lugdunum (Lyons) A. was defeated and killed.

Albion, anct. name of Britain among Greeks and Romans. The name is perhaps of Celtic origin, but the Romans took it as connected with *albus* (white), referring to Dover cliffs.

Albion, New: 1. Name given by Sir Francis Drake to the dist. of Lower California, in N. America, which he visited in 1579. Later geographers, led by Humboldt, restricted the name to the dist. which Drake actually explored, between San Francisco Bay and the Columbia R.

2. Alleged royal grant of land to the Ploverden family, 1634. This ter. was the present New Jersey, with Long Island, and the region from New York to Virginia.

Albite, silicate of soda and aluminium belonging to the feldspar group. Its colour is pure white, whence its name

(Lat. *albus*), and thus it can be distinguished from true felspar, with which it often occurs. It forms a constituent of granite, and many crystalline rocks of primary or secondary origin. Several varieties of A. are distinguished, e.g. pericline.

Albium Ingaunum, see ALBENGA.

Alboin (d. probably 573). King of the Lombards, succeeded his father about the year AD 565. At this time the Lombards were living in Noricum and Pannonia. In alliance with the Avars, A. overcame the Gepidae, whose king he killed. He then married Rosamund, the daughter of the dead king. About 568 he invaded Italy, meeting with practically no resistance save at Pavia, which held out for about 3 years. During the siege he overran a great deal of N. Italy, ruling over the whole of Venetia, Lombardy, Tuscany, and Piedmont. In 572 or 573 he was murdered by his wife's lover Longinus, who was instigated to the crime by Rosamund, whom the king had insulted by forcing her to drink from the wine-cup made from her dead father's skull.

Alboni, Marietta (1826-94), celebrated lt. contralto opera-singer, b. Città di Castello. She was trained under Rossini. Her first appearance, in 1842, in Pacini's *Saffo* at Bologna, was followed by brilliant successes throughout Europe and the U.S.A.

Alborak (Arabic *al-burak*, connected with *barak*, lightning, for its brightness or its swiftness), animal like a mule which was the mount of the angel Gabriel; it was lent to Abraham to visit his son Ismael (Ishmael) in Mecca, and on it Mohammad ascended to heaven on the Night Journey. It is pictured with wings and a human head.

Albornoz, Gil Alvarez Carillo (1310-67), cardinal, b. Cuenca, nominated Archbishop of Toledo in 1337 by Alfonso XI. He fought against the Moors, but later went to Pope Clement VI at Avignon, some say in flight from Pedro the Cruel. In 1350 this pope made him a cardinal, and in 1353 Innocent VI sent him as legate into Italy to negotiate the restoration of the Church's temporal power. This he did, with the help of Rienzi (q.v.).

Albrechtsberger, Johann Georg (1736-1809), Austrian composer, theorist, and teacher, b. Klosterneuburg, near Vienna. Among his pupils was Beethoven, to whom he gave lessons in counterpoint.

Albret, Lebret, or Labrit, ancient lordship of France, in Gascony (q.v.). The château d'A. belonged to one of the most powerful Fr. medieval families, many members of which espoused the Eng. cause in the Hundred Years War (q.v.). The mother of Henry IV of France (q.v.) was a member of this family.

Albright (Albrecht), Jacob (1759-1808), Amer. clergyman, b. near Pottstown, Pennsylvania. Converted to Methodism in 1790, he preached that faith among the Pennsylvania Germans and was the founder of the Evangelical Church (q.v.).

Albright, William Foxwell (1891-), Amer. oriental archaeologist. From 1919 to 1936 he was Director of the Amer.

School of Oriental Research in Jerusalem, where he undertook many important archaeological expeditions into Palestine and the surrounding countries. Now Spence Prof. of Semitic Languages in the John Hopkins Univ. His important publs. include *Excavation of Tel Beit Mirsim*, 1932-43, *Archaeology of Palestine*, 1932 and later eds., and *From the Stone Age to Christianity*, 1940 and later eds.

Albrizzi, Isabel Theotoki, Countess of (1763-1836), b. Corfu, d. Venice. She was universally admired for her talent, wit, and beauty, which brought her into contact with the most famous literary men of her day; Byron called her the Mme de Staël of Venice. She is chiefly remembered for *Ritratti*, 1807, a series of portraits of famous lt. contemporaries, and for critical essays on plastic art.

Albucasis, see ABULCASIS.

Albuera, La, Sp. vil. in the prov. of Badajoz, 13 m. SE. of Badajoz tn. The French were defeated here in 1811 by a Brit., Sp., and Portuguese army (see PENINSULAR WAR). Pop. 2000.

Albuferra, Duc d', see SUCHET, LOUIS GABRIEL.

Albufera, La, large freshwater lake in the prov. of Valencia, Spain, separated from the sea by a pine forest. It abounds in wildfowl and fish, and its revenues were given to the Duke of Wellington. The English were defeated by Suchet (q.v.) near by in 1812.

Albula Pass, in the Grisons, Switzerland, connects the valleys of the Rhine and Inn. A railroad was completed across it in 1903, making the shortest route into the Upper Engadine. Highest point 7590 ft.

Album (Lat. *albus*, white), board (exposed in some public place such as the Forum), plastered or painted white, on which, in ancient Rome, were inscribed public edicts and announcements. The name was extended to include the *Annales* of the pontifex maximus, the list of decessions, of jurors, etc. In modern times the name is applied to a note-book in which verses, sketches, or autographs may be collected, or the larger books in which photographs are kept. In the Middle Ages any register or catalogue of saints, civil functionaries, etc., was called an A. On the Continent the term is now applied to the list of members of a univ.

Albumazar (Abu-Maaschar), Arab writer on astronomy or natural astrology, b. at Balkh c. AD 805, wrote *De Magnis Conjunctionibus*, *Introductorium in Astronomiam*, and *Flores Astrologiae*. He held that the world was created when the 7 planets were in conjunction in the first degree of Aries, and will end with a similar conjunction in the last degree of Pisces.

Albumen, in plants, is the nutritive tissue used by the developing embryo in a seed. It is not the same as animal A.; the name was applied only by analogy, and the botanical name for it is *endosperm* (q.v.). Plants are said to be *albuminous* (e.g. ash) or *exalbuminous* (e.g. pea).

Albumin, term applied to a group of organic bodies of very complex structure.

The chemical investigation and classification of these compounds is a matter of great difficulty, but there are certain important properties which are characteristic of the group generally. They contain 5 elements, the proportions of which do not greatly vary in the different members of the group: carbon, from 50 to 55 per cent; hydrogen, from 6.5 to 7.3 per cent; nitrogen, from 15 to 17.6 per cent; oxygen, from 19 to 24 per cent; sulphur, from 0.3 to 5 per cent.

A.s are colloidal substances, i.e. they do not pass through parchment paper, and advantage is taken of this property to separate them from salts in solution. The addition of alcohol to the aqueous solution precipitates the A., and boiling with water produces coagulation. Different A.s coagulate at different temps., and after coagulation all A.s are insoluble in water and can only be made to dissolve by being treated with caustic alkalis or mineral acids.

The A.s proper and the allied compounds are of great importance physiologically. With the exception of fats and mineral salts all the dry material of animal bodies is made up of albuminous substances, or proteins as they are sometimes called, according to the classification adopted. They are an essential part of every plant cell, and they form an indispensable constituent of human and animal food. The body can exist for a long time without fats or carbohydrates, but death is inevitable on the withdrawal of proteins from its nourishment. The chief proteins found in food substances are egg A. in white of egg, fibrinogen and haemoglobin in blood, myosin in meat, caseinogen in milk, casein in cheese, and gluten in flour. In the process of digestion (q.v.) proteins are split up into peptides, and these again into amino-acids. The products of digestion go mainly to the bloodstream for the building up or repair of the tissues.

Egg Albumin, or white of egg, is used as an antidote to poisoning by corrosive sublimate, sugar of lead, and copper sulphate, as it forms insoluble compounds with those substances. It is also used in the refining of sugar and for fixing light shades in the colour printing of textiles.

Albuminoids, term of doubtful application. It is sometimes used as a generic term to denote those substances which resemble egg albumin, such as myosin, casein, globulin, fibrin, and gluten. In histology the term has another use, denoting the substances composing the connective tissues, as collagen, keratin, fibroin, elastin, etc.

Albuminuria, presence of albumin in the urine. The immediate cause is the escape of the blood albumins from the blood-vessels into the renal tubules. There may be definite lesions of the kidney of an acute or chronic inflammatory nature. The most common of these is nephritis (q.v.). A. also occurs in toxæmia of pregnancy (see PREGNANCY). Accidental or spurious A. is due to the presence of blood or pus from hæmorrhage or disease of the ureters, bladder,

or urethra. Febrile A. is a condition accompanying many fevers and rarely lasts longer than the fever. Cyclic A. derives its name from the periodic appearance and absence of albumin in the urine. The albuminuric paroxysms are generally absent at night, and appear to be the result of the assumption of the upright posture. The simplest test is coagulation of the albumin by boiling. A test-tube is filled about two-thirds full of filtered urine, a little acetic acid added, and the upper part of the column of urine carefully heated. Any turbidity that appears can be at once detected by comparison with the lower part of the column, and may be due to albumin or phosphates. If it is due to albumin, adding nitric acid will increase the turbidity; if to phosphates, the liquid will be cleared at once. A peculiar protein, known as Bence Jones's protein, is found in the urine in certain affections of the bone marrow. If on heating urine a cloud appears well below boiling-point, disappears on further heating, and then reappears on cooling. Bence Jones's protein is present.

Albuquerque, Alfonso d., surnamed the Great (1453-1515), founder of the Portuguese power in the E., was b. near Lisbon and spent his youth at the court of Alfonso V. Being made viceroy of the Portuguese Indies, he took Goa, 1510, and then in rapid succession Malabar, Ceylon, Malacca, 1511, and later Ormuz, 1515. His rule was wise, firm, and humane. In 1515 Emmanuel recalled him, putting his personal enemy, Lopes Soares, in his place. He d. at Goa. See *Commentarios do Grande Afonso Dalboquerque* (Lisbon, 1557), written by his son; trans. pub. by Hakluyt Society, 1875-84.

Albuquerque: 1. Sp. tn in the prov. of Badajoz, near the Portuguese frontier. It has textile manufs. Pop. 10,500.

2. Co. seat of Bernalillo co., New Mexico, U.S.A., on the Rio Grande, and at the junction of the Atchison, Topeka & Santa Fe and Pacific railroads. The largest city in the state, it is a centre of an agric., livestock, and coal-mining region. Food processing, fruit canning, and lumber milling are important, and it manufs. metal appliances, wood fixtures, tiles, cement, and bricks. There is also Indian handicraft. A. is the seat of the univ. of New Mexico, the Catholic Teachers' College of New Mexico, the U.S. Indian School, and the United Pueblos Agency. Kirtland Air Force Base and Sardia Base (guided missiles station) are here. It is the H.Q. of Cibola National Forest. Pop. 96,815.

Alburnum, or **Sapwood**, youngest wood of a tree, lying immediately below the bark, in distinction to the heart-wood or *Duramen* (q.v.), which is the hardened older wood.

Albury, tn in New S. Wales, Australia, at the head of the navigation of the Murray R., from the mouth of which it is 1368 m. distant. It is 399 m. SW. of Sydney by rail. A. is the centre of an important rural dist. Pop. 17,100.

Alcaeus (late 7th-early 6th-cent. BC),

b. Mityleno. Of aristocratic birth, he was yet a fiery democrat, and vigorously opposed both the tyrant Myrsilus and the popular ruler Pittacus. He wrote odes in the Aeolic dialect, using the measure which bears his name. Fragments to be found in E. Lobel, *Alcaei fragmenta*, 1927. The Alcaic was a favourite metre with Horace, and has been imitated by Tennyson in 'O mighty-mouth'd inventor of harmonies. . .'. See C. M. Bowra, *Greek Lyric Poetry*, 1936.

Alcahest, or **Alkahest**, term introduced into alchemy by Paracelsus to denote the unknown 'quintessence' of creation, the one real elementary form of matter. He considered this to be the universal solvent that the alchemists sought.

Alcaide, or **Alcaide** (Arabic *al kayid*, the head, or leader), Sp. word formerly used to denote the governor of a fortress or a castle, a jailer or a warden.

Alcalá de Guadaira, Sp. tn in the prov. of Sevilla, on the Guadaira. It has a Moorish castle, and is known for its bread. Pop. 25,000.

Alcalá de Henares (Rom. *Complutum*), Sp. tn in the prov. of Madrid, on the Henares. Its famous univ., founded by Cardinal Ximenes (q.v.) in 1510, was removed to Madrid in 1836. Here was printed in 1517 the first polyglot (q.v.) Bible. Before 1836 A. had 38 churches, 21 convents, 27 other religious institutions, and 21 univ. colleges. Cervantes (q.v.) was b. here. Pop. 21,000.

Alcalá la Real, Sp. tn in the prov. of Jaén. The French defeated the Spaniards here in 1810, during the Peninsular War. There is a trade in cereals, fruit, and wine. Pop. 26,000.

Alcaide (Sp., from Arabic *al caidi*, the judge), general title for a judicial officer in Spain and parts of America settled by the Spaniards.

Alcámenes, famous Athenian sculptor of the end of the 5th cent. BC, possibly a pupil of Phidias. He is known by a 'Hephaestus' and an 'Aphrodite,' and it is likely that he worked on the Parthenon.

Alcamo, **Cielo D'**, see **CIELO**.

Alcamo, tn in Sicily (q.v.), at the foot of Mt Boniface, 24 m. ESE. of Trapani (q.v.). It has many relics of the Saracens (q.v.), who possessed the tn until 1233. There are mineral springs, and a trade in wine and fruit. Cielo Dalcamo (see **CIELO**) was b. here. Pop. 40,900.

Alcañiz, Sp. tn in the prov. of Teruel, on the Guadalupe. It has many ant. buildings, including a 12th-cent. Templars' castle. It is an important centre for bituminous coal. Pop. 10,000.

Alcántara, **Dom Pedro De**, see **PEDRO I and II**.

Alcántara, **Knights of**, founded as the order of St Julian, formed a military and monastic order for the defence of Spain against the Moors. The order was founded in 1156 and approved by Pope Alexander III in 1177. In 1835 it was changed from an eccles. to a court order.

Alcántara (Arabic 'the bridge'), Sp. tn in the prov. of Cáceres, on a rocky height above the Tagus. The ruins of the convent of the Knights of A. (q.v.) remain,

as do the ruins of the castle in which the order was founded. The magnificent six-arched Rom. bridge (870 ft long, 131 ft high), built in AD 105, has been much damaged, but the greater part is still intact. Pop. 4200.

Alcazar, Sp. tn in the prov. of Albacete, on the slopes of the A. mts. It has the remains of a Rom. aqueduct, and an ant. castle, and is in a copper and zinc mining area. Pop. 5800.

Alcarria, **La**, fertile dist. in the Sp. prov. of Guadalajara. Its mkt tn is Brihuega, which has ant. walls and fine churches and mansions.

Alcaudete, Sp. tn in the prov. of Jaén. Pop. 16,300.

Alcaide, see **ALCAIDE**.

Alcázar, name of sev. palaces of the Moors in Spain, the most important of which are the two A.s of Cordova—the 'A. viejo' built by the Arabs, and the 'A. nuevo' built by Alfonso XI. The A. of Segovia contained many art treasures, statues, and historical relics. It was, however, destroyed by fire in 1862. The A. of Seville was built by the Arabs in the 12th cent., and has been enlarged sev. times, presenting a mixture of oriental and Gothic architecture. It contains many valuable curios. Toledo had 5 A.s. of which the most beautiful was destroyed by fire in 1710, and that of Alfonso VIII has been converted into a monastery.

Alcázar de San Juan, Sp. tn in the prov. of Ciudad Real, in the plain of La Mancha (q.v.). It is believed to be the ant. tn of Alces, and has a large wine trade. Pop. 26,500.

Alcazar-kebir, city of Morocco, an important caravan centre. Here, in 1578, Sebastian of Portugal was defeated and slain by the Moors.

Alcedo, genus of kingfishers which belongs to the family Alcedinidae, and is allied to the hoopoes and hornbills. *A. althis* is the European species of kingfisher.

Alces, see **ALCAZAR DE SAN JUAN**.

Alcestis, daughter of Pelias and Anaxibia, and wife of Admetus, who won her by Apollo's aid. When her husband was about to die she offered her life for his, but was eventually brought back from the lower world by Heracles. See the *Alcestis* of Euripides.

Alchemilla, family Rosaceae, genus of about 200 perennial herbs of N. temperate regions and mts of tropical Africa. *A. vulgaris*, with broadly lobed leaves, and yellowish-green flowers in racemes, is Lady's Mantle; *A. alpina*, Alpine Lady's Mantle, and other species are found in Britain.

Alchemy, usually associated with the magic arts and with astrology, but in reality the beginning of our systematic chem. The origin of the word is variously given, being derived from the Gk and from the ant. Egyptian, via Arabic. The art probably had its origin in Egypt, since Egypt possessed a civilisation and culture far in advance of those of any contemporary nation. It is therefore not surprising to learn that the earliest mention of A. is to be found in the records of

the Egyptians. Legend after legend grew up and was perpetuated in some way or other by writings regarding the origin of this very mystical science. The origin is variously attributed to Hermes Trismegistus ('the thrice greatest'), to the fallen angels of the Book of Genesis (vi), and yet again by revelation to Moses and Aaron. The origin through Hermes is the one which was most generally accepted, and also the one which has affected chemical language down to the present day (cf. 'hermetically sealed'). He was the Egyptian ideal of personified strength, the great god Thoth, and his divine art of A. was a secret revealed only to a sacred school of the sons of kings. Astrology and magic were the accompanying sciences of A., and that whole science was based upon the transmutation of metals, which seems from the researches of Berthelot, in his study of the 3rd cent. AD Leyden papyrus (found in Thebes in the 19th cent.), to have undoubtedly originated in Egypt. During the 4th and 5th cents. the writings of the alchemists continued increasing until by the end of the 5th cent. we may say that speculative A. had reached its highest point in the Alexandrian schools. The results of the appearance of the Muslims in the civilised world did not at first promise to further the arts and sciences, but within a short time of their appearance the Muslim schools began to become famous, and the names of many Arabs and Persians are among the most notable of the alchemists. The most famous of these Muslim alchemists was Jabir ibn Hayyan, known to the W. of Europe as Geber. His name is bound up with the chemical knowledge of the time, but much that has been attributed to him has been found to be spurious, and many of his so-called writings are writings of a much later date. His own ideas were very similar to those of the old Alexandrian philosophers, and he believed even in the influence of the planets on metals.

The theory of transmutation, although modified to a certain extent by the later alchemists, can be traced quite easily in the writings of the Gk philosophers. All substances were ultimately composed of one elemental matter, and so the alchemist hoped to be able by the removal of all the foreign matter to obtain the *materia prima*. This theory of A. still existed amongst the alchemists of the Middle Ages; that they believed in it as firmly as did the ancients cannot perhaps be definitely stated. Men such as Albertus Magnus, Roger Bacon, Arnold of Ville-neuve (q.v.), and Vincent of Beauvais all held these beliefs. Roger Bacon, to quote only one example of this period, believed in the philosophers' stone, which was to turn the baser metals into gold, and also in the elixir of life. When it is remembered that numerous ideas of Roger Bacon were far beyond his time, it will be seen that the alchemistic ideas had a very strong hold indeed. Even down to almost modern times, certainly well into the 17th cent., these alchemistic ideas were still held, at any rate from the

academic point of view, by the chemists of the period. Among them may be mentioned (Glauber (1603-68), Robert Boyle (1627-91), and for some time Newton and Leibnitz, and even Dr Johnson, who was interested in chem. The science has been adhered to by some right down to the present cent., and recent alleged successful transmutations have been reported from Armenia and France. With the 20th cent. and the research into radio-activity, artificial transmutation of certain elements has been accomplished on a small scale. The views of the alchemist certainly do not receive support here, but the essential principle underlying all the experiments of A. seems to have received some little encouragement. See also ALBERTUS MAGNUS and TRANSMUTATION OF THE ELEMENTS. See A. E. Waite, *Lives of the Alchemists*, 1888; M. Berthelot, *La Chimie au moyen âge*, 1893; E. O. von Lippmann, *Die Entstehung und Ausbreitung der Alchemie*, 1919; E. J. Holmyard, *Makers of Chemistry*, 1931, and *Alchemy*, 1957; J. Read, *Prelude to Chemistry*, 1936, and *The Alchemist in Life, Literature, and Art*, 1948; K. K. Doberer, *The Goldmakers*, 1948.

Alchevsk, see VOROSHILOVSK.

Alciati, Andrea (1492-1550), It. jurist and poet, b. Milan, d. Pavia. He was prof. of civil law at Avignon, Pavia, and Ferrara. His refined legal criticisms make him founder of the 'elegant' school of law. He wrote commentaries on the Pandects and on the Justinian code. His criticisms of Rom. law were of a revolutionary nature. His collection of moral sayings in Lat. verse called *Emblems* (*Emblematum Libellus*) is famous.

Alcibiades (c. 450-404 BC), b. Athens and connected through his mother with the house of the Alcmaeonidae. He was left an orphan at a very early age, and this lack of proper control during his youth probably accounts for some of his later excesses. Socrates, who saved his life at Potidaea, and whose life he saved at Delium, obtained some influence over him and tried to eradicate his vices, but with very little effect. After the battle of Delium, 424 BC, he married Hipparche, and at this time he began to turn his attention to public affairs. He wished to ally himself with the Spartans, but on their choosing his rival Nicias to negotiate for them in 421 BC he immediately became their enemy. Instead of taking part in the Sicilian expedition of 415, he again joined them, escaping to their country because he was accused of the mutilation of the images of Hermes. He now became the enemy of the Athenians; but he soon forsook the cause of the Spartans and tried to get the Athenians to recall him, promising them an alliance with Tissaphernes, the Persian satrap. This plan was not successful, but he was eventually recalled to Athens by Thrasybulus. In 407 BC, on his return to that city, he was completely restored to his former position, but had his command taken from him the next year. He then chose exile as his only means of safety, and in 404 BC he went to take refuge with Pharnabazus, wishing to go thence to the court of

Artaxerxes. He was revolted from doing so, however, for he was there the house he was staying was set on fire. In trying to escape the flames he rushed out to fall pierced by arrows shot by emissaries of the Persians. See F. Taeger, *Alcibiades*, 1943.

Alcidae, the auks, belong to the Charadriiformes, and are all to sea-gulls. They have webbed feet and fly well. They live on rocks, lay single eggs, and feed on fish and crustaceans. *Pinguinus impennis*, the great auk, was extinct, had short, useless wings; *Alca* is the razor-bill; *Fratercula arctica* is the puffin.

Aloides, see HERCULES.

Aloinous, king of the Thracians, in the is. of Scheria, son of Ausithous and grandson of Poseidon. Books vi to xii of the *Odyssey* tell of his reception and entertainment of Ulysses, who an outcast on the shore of the is. was saved by A.'s daughter, Nausicaa. See also ARGONAUTS.

Alciphron (2nd-3rd cent.), Greek writer of prose epistles. These consist of four groups: letters from fishermen, farmers, parasites, and courtesans. The scenes are laid in 4th-cent. Athens; style is vivid and graceful, though somewhat artificial. See M. A. Schepers, *Alciphron's Iktoris Epistularum libri IV*, 1906; there is an Eng. trans. by F. A. Wrigth 1923.

Alcira, Sp. in the prov. Valencia, believed to be on the site of Rom. town of Saetabula. It has a 14th-cent. bridge, a Gothic church, and several old mansions. It is the centre of a rich orange-growing district. Pop. 25,250.

Alcloyd, see STRATHCLYDE.

Alomaeon, son of Amphias and Eriphyle, and brother of Amphius, fought with the Epigoni against Thebes. Amphiaras also participated at the cost of his life, having been induced to do so by Eriphyle against his promise of misfortune. To avenge his father's death Amphiaras enjoined his sons to kill his mother. A. did so on his return home and was pursued by the Furies in sequence. He was cured of his first madness by the King of Psophis, whose daughter Arsinoë he married, and of his second by the river-god Achelous, whose daughter Callirhoë he also married. His army was discovered by Arsinoë's father, whose sons murdered him.

Alomaeonidae, noble family Athens, who were driven out by Pylus Iessenia by the Dorians, and settled Athens. Owing to the way in which Mages, one of the family, treated the insurrection under Cylon (612 BC), they brought upon themselves the guilt of sacrilege and were exiled from Athens, c. 595. About 10 years they returned, but were again expelled by Pisistratus. In 548 they agreed to the Amphictyonic council to rebuild the temple of Delphi, and won great popularity throughout Greece by cutting the work in a style of grandeur much exceeding their obligations under the agreement. On the expulsion of the tyrants in 510 they were again restored to Athens. They now joined the popular party, and Clisthenes, who was then the head of the

family, gave a new constitution to Athens.

Aloman (7th cent. BC), Greek lyric poet; b. Messos, he made his home in Sparta. Fragments of his work survive, most of them from choral songs. See E. Diehl, *Anthologia Lyrica Graeca*, 1949; D. L. Page, *Alcman*, 1951.

Alcock, John (c. 1430-1500), English bishop. He was successively Bishop of Rochester, 1472; Worcester, 1476; Ely, 1486. He was the founder of Jesus College, Cambridge (1496).

Alcock, Sir John William (1892-1919), British airman who, with Sir Arthur Whitten-Brown, made the first direct transatlantic flight in 1919 (see ATLANTIC FLIGHTS), but subsequently lost his life on a flight to France.

Alcoforado, Mariana (1640-1723), nun of Beja in Portugal to whom has been erroneously attributed the authorship of the famous *Lettres portugaises*, 1669, a series of passionate love-letters written to a young French officer who was wrongly identified as Noël Bouton, afterwards Marquis de Chamilly and Marshal of France. The responsibility for this mystification rests with Barbin, the publisher, and Lavergne de Guilleragues, an impudently nobleman of small literary gifts. See F. C. Green, *Who was the Author of the 'Lettres Portugaises'?* (Modern Language Review), 1926, and Gonçalves Rodrigues, *Mariana Alcoforado*, 1935.

Alcofrabas Nasier, see LABELAIS.

Alcohol, term applied to a group of organic substances which may be regarded as derived from the hydrocarbons by the substitution of one or more univalent hydroxyl groups OH for the same number of atoms of hydrogen. The name A. is, however, usually applied to one member of that group, ethyl A., which is present in varying quantities in wine, beer, spirits, etc.

The aliphatic A. series contains methyl, ethyl, propyl, butyl, amyl, hexyl A.s, etc., and their isomerides. The lower A.s. from methyl A. to butyl A., are mobile liquids, the middle A.s. are oily liquids, and the upper A.s. are waxy solids. The lower A.s. have a characteristic spirituous smell which becomes disagreeable higher up in the series. The most important members are methyl A. and ethyl A.

Methyl alcohol or **methanol** (CH₃OH) is produced in the dry distillation of wood. The aqueous product of the distillation contains about 1 to 2 per cent of methyl A., which can be separated by fractional distillation after the removal of the acetic acid by hot milk of lime. Methyl A. is used in the preparation of aniline dyes and for the denaturation of ethyl A. It is now prepared synthetically, on a large scale, from carbon monoxide and hydrogen, which are made to react under pressure, at 450° C., in the presence of metallic oxides; the latter acts as catalysts.

Ethyl alcohol or **ethanol** (C₂H₅OH) has been known from the earliest times as produced in the fermentation of grape juice. When pure it is a mobile colourless liquid with a characteristic odour. It solidifies at about -130° C., hence its use in thermometers intended to register

low temps. It is miscible with water in all proportions, and burns with a pale blue non-luminous flame. In the laboratory it may be prepared by converting ethane into ethyl chloride and heating the latter with dilute alkalis under pressure. A. is always prepared for commercial purposes by making use of the process of fermentation (q.v.). Dextrose, or grape-sugar, decomposes in the presence of yeast-cells into A. and carbon dioxide, and the dextrose is obtained by making a pulp of any starchy material, such as potato, grain, rice, etc. By enzymes (see FERMENTATION) the starch is almost completely turned into maltose, which by combining with water is converted into dextrose. The weak solution of A. thus obtained is subjected to fractional distillation. The distillate or 'raw spirit' contains 'fusel oil,' which is contained in the higher boiling-point fractions. To eliminate the fusel oil, the raw spirit is diluted with water and filtered through charcoal, which absorbs some of the fusel oil. The filtrate is again distilled and collected in 3 fractions, that of the lowest boiling-point being fairly pure A. For most purposes it is unnecessary to get rid of the fusel oil; even beer and whisky contain a small quantity of this substance, which is supposed by some to improve the flavour; it is, however, undoubtedly injurious to health.

In the Brit. Isles a heavy excise duty is levied on 'spirits of wine,' but the Gov. allows certain exceptions in order not to hamper the various industries in which A. is used. Methylated spirit contains 10 per cent of partially purified wood-spirit and a small proportion of paraffin oil, which render it undrinkable. It is also coloured with an aniline dye. This spirit is sold duty free, and in cases where the paraffin oil would militate against certain manufacturing processes, the spirit may be supplied to manufacturers denatured with wood-spirit only. For laboratory purposes in univs. and colleges the sale of pure A. is allowed free of duty. Ethyl A. completely free from water and other impurities is known in chem. as 'absolute' A.

The great solvent powers of A. have made it of much importance in the preparation of lacquers, varnishes, and dyes. It is used also for the manuf. of chloroform, chloral, and iodoform, and as a fuel. Its solvent power also makes it valuable in the chemical laboratory, and it is used too for the preservation of anatomical specimens.

The most important fact in connection with A. is the part it plays in the preparation of alcoholic liquors. A vast mass of legislation and of administrative detail, great industries like brewing and distilling, and social and hygiene problems are all cognate to this subject. See BREWING; DISTILLING; DRUNKENNESS; EXCISE; LICENCE.

Alcoholic liquors may be divided into 2 classes: those which are distilled and therefore contain a large proportion of A., and those which are the result of

fermentation without distillation, and therefore depend their flavour mainly on the medium in which the fermentation takes place. One distilled liquor the chief are brandy (q.v.), distilled from wine; whisky (q.v.), from a fermented solution of malt; rum (q.v.), from a fermented solution of sugar; and gin (q.v.), from a fermented solution of malt, but flavoured with juniper. Those not distilled comprise (see under BREWING), which is fermented malt solution flavoured with hops, and wine (q.v.), which is fermented grape juice. Beer, with its modifications, but, porter, and the various kinds of ales, usually contains from 3 to 7 per cent of A., and wines from 8 to 17 per cent. Port, sherry, and Madeira (qq.v.) are what are called fortified wines; that is, they contain added A. beers that engendered by the fermentation. See also BURGUNDY WINES; CHAMPAGNE WINES; RHÔNE WINES; WINE-MADE.

The physiological effects of A. are well known. It is a powerful stimulant, increasing the flow of gastric juices when diluted, and more concentrated doses producing a longer and more rapid heart-beat. Its possible effects of its continual use: catarrh of the stomach, affections of the liver and kidneys, degeneration of the brain, and delirium tremens. Notwithstanding its therapeutic value, medical men are increasingly unwilling to advocate its use, owing to the bad physical effects and the worse moral degeneration consequent upon the A. habit which might possibly be established.

Alcoholism, addiction to alcohol. The term is also applied to the morbid results of prolonged excessive consumption of alcohol. It is difficult to treat, and, as with all addictions, a cure depends mainly on co-operation of the patient and his determination to succeed. There is no short-cut to victory. A drug called 'antabus' has been used with some success, notably in America, where addiction is a social problem. Alcohol, even in small quantities, taken in association with antabus causes the patient to feel acutely ill, so that he is frightened to try the experiment again. The drug is continued regularly till the craving for alcohol is lost. In some cases, however, the patient prefers to give up the antabus and not the alcohol, as the treatment fails without his will to succeed. A voluntary society, founded in the U.S.A., known as Alcoholics Anonymous, whose members have cured themselves of A. and are willing to help others to do the same, has already done some excellent work. As its name suggests, patients are helped anonymously in confidence. The causal connection between A. and crime has been established, and A. is a social problem in those countries where there is much addiction. For diseases associated with the consumption of A. see CIRRHOSIS; DELIRIUM TREMENS; EPILEPSY; INSANITY; NEURITIS. The general aspects of excessive drinking will be found under DRUNKENNESS.

Alcoholometry, determination of the

proportion of alcohol in a liquid. If the liquid is known to contain only alcohol and water, its sp. gr. as shown by a hydrometer would enable the relative proportions of water and alcohol to be known. In hydrometers used for this purpose the graduations are often marked in percentage of alcohol instead of sp. gr. In Sikes's hydrometer the graduations are arbitrary figures, from which the corresponding percentage of proof spirit may be found by the use of a book of tables issued under the authority of the Commissioners of H.M. Customs and Excise. Atkins's hydrometer is provided with a series of scales which enables the strength of any 'ort,' or beer in the making, to be determined.

Alcolhuas, see **ALHUAS**.

Alcoran, see **KOIN**.

Alcott, Amos Bronson (1799-1888), Amer. philosopher. b. Wolcott, Connecticut. He opened in 1834 a small school in Boston. His methods of education did not find favour there, and finally he went to Concord, where occasionally lectured to schools on philosophical subjects. He was the friend of Emerson, Thoreau, Hawthorne, and Carlyle. His theory was neo-Platonic. He was made dean of the Concord School of Philosophy in 1879. Of his writings the best known are *Concord Days*, 372, and *Table Talk*, 1877.

Alcott, Louisa May (1832-88), Amer. authoress, b. Genantown, Pennsylvania, daughter of Amos Bronson A. (q.v.). She spent most of her childhood in Boston and Concord, Massachusetts, where she was guided in her education by Thoreau and Emerson. After some years as a schoolteacher she was an army nurse in the Civil war. Her first novel, *Moods*, appeared in 184, but what made her famous was her story for children, *Little Women*, 1869, which was followed by *Good Wives*, 1871, *Life Men*, 1871, *Jo's Boys*, 1886, and many others. See lives by E. D. Cheney, 189; C. Meigs, 1933; J. B. Wagoner, 1943; M. Stern, 1952.

Alcoy, Sp. tn in the prov. of Alicante, on the Serpis. It has many old buildings, and a famous festival during which is staged a mock battle between Moors and Christians. Textiles, paper, and machinery are manuf. Pop. 42,800.

Alcuin (735-804), celebrated A.-S. scholar, b. York and educ. at the cathedral school there, of which he afterwards became headmaster. At Parma about the year 780 he met Charlemagne, who enlisted his services in the cause of education. A. founded and directed the *schola palatina*. In old age Charlemagne gave him the abbey of St. Martin at Tours which he reformed and governed until his death. A. was a prolific writer, mostly on theology and the liturgy. Some martyrologies describe him as *Beatus* (Blessed). See *Beati Patris Albini seu Alcuini Opera*, Ratisbon, 1771; A. F. West, *Alcuin and the Rise of the Christian Schools*, 1893; G. F. Brown, *Alcuin of York*, 1904; E. M. W. Buxton, *Alcuin*, 1922; W. H. Howell (trans.), *The Rhetoric of Alcuin and Charlemagne*, 1941.

Alcyonacea, sub-order of Alcyonaria, an order of marine coelenterates. They consist of a firm mesogloea mass, throughout which calcareous spicules are dispersed. The surface is studded with hydra-like polyps, with tentacles. They are found attached to rocks and seaweed. *Alcyonium digitatum* is popularly called dead men's fingers; *A. gelatinosum* is phosphorescent and inhabits deep water.

Alcyone, or **Halcyone**, daughter of Aeolus and wife of Ceyx. One legend says that she and her husband were changed into birds for calling themselves Zeus and Hera, and another that they were changed into kingfishers after Ceyx was shipwrecked and A. had thrown herself into the sea in her grief. 'Halcyon days' were supposed to be days of calm while the kingfisher (alcyon) was breeding in a floating nest.

Aldan. 1. Navigable right affluent of R. Lena, in E. Siberia. Its length is 1100 m.

2. (until 1939 *Nezametnyy*). Tn in S. Yakutia, economic centre of the A. gold-mining area, on the Amur-Yakutsk highway 405 m. from the Trans-Siberian Railway. It was founded in 1923, and became a tn in 1939.

Aldborough, vil. in the W. Riding of Yorks, England, on the R. Ure, on the site of the Rom. tn of Isurium. During the Rom. occupation it was the home of the consuls and governors of York, and remains of their villas may be seen. Pop. 400.

Aldebaran, Arabic name of a first-magnitude star (α) in the constellation Taurus, its exact magnitude being 1.1. It is of a light red colour, and is one of the group of 5 called the Hyades. It is sometimes called the Bull's Eye. The Romans knew it by the name of Palladium, because it set for the last time visibly when the feast of Palas, an old It. deity, was celebrated in the festival of the Palilia at Rome on 21 Apr.

Aldeburgh, tn in Suffolk, England. It used to send members to Parliament, but in 1832 this privilege was taken away. Its church, containing a statue of Crabbe the poet, who was b. at A., and its moot hall are worthy of note. A. was the first tn in England to elect a woman mayor, Mrs Garrett-Anderson in 1908. The A. Festival of Music and the Arts takes place annually in June. Pop. 2500.

Aldegonde, Philip van Marnix de Sainte, see **SAINTÉ ALDEGONDE**.

Aldehyde, name applied to a group of organic compounds prepared by oxidation of primary alcohols. The term is derived from alcohol *dehydrogenatum*—that is, dehydrogenated alcohol. When oxidised, the A.s give fatty acids; formaldehyde produces formic acid, acetaldehyde produces acetic acid, propionaldehyde produces propionic acid, and so on. Therefore the A.s may be looked upon as intermediary between the alcohols and the fatty acids.

The lower members of the group are colourless, mobile, neutral volatile liquids, usually with an irritating smell. The higher members are odourless solids.

The A.s may be prepared by oxidising

B. W. Allen, Alderburgh

ALDERBURGH

The town hall is on the right.

the primary alcohols, or from the fatty acids by dry distillation of their calcium salts with sodium formate. All the lower A.s form crystalline addition products when shaken with a concentrated aqueous solution of sodium hydrogen sulphite. In contact with an aqueous solution of hydrocyanic acid, *cyanohydrins* are formed, which may be converted into hydroxy-acids.

The chief members of the group are formaldehyde (q.v.) and acetaldehyde. *Acetaldehyde* (CH_3CHO) is formed by the oxidation of ethyl alcohol. Commercially acetaldehyde is obtained by causing acetylene (C_2H_2) to combine with water (H_2O) under the influence of a catalyst. It is a very volatile liquid with a penetrating odour, and on exposure to the air gradually oxidises to acetic acid. The term A., when used without qualification, often refers to this compound. Acetaldehyde is of importance in the chemical industry.

Aromatic A.s are generally liquids and may be prepared by oxidation of the corresponding alcohol and by other methods. They undergo a large number of reactions, many of which are of synthetic and industrial importance. The simplest member is *benzaldehyde* ($\text{C}_6\text{H}_5\text{CHO}$), which is contained in bitter almonds and in the kernels of many fruits. Owing to the pleasant aroma of aromatic A.s, many are used in the perfumery industry, e.g. anisaldehyde, vanillin, piperonal, and geraniol.

Alden, John (1599–187), one of the Pilgrim Fathers who sailed for America in the *Mayflower*. In *The courtship of Miles Standish* Longfellow tells the legendary story of his courtship of 'Risella Mullens'.

Alder, see ALNUS.

Alderman(men), title dating from A.-S. times, the word then being 'ealdorman.' In those times the title was held by various distinguished persons, and in the very earliest times the aldermen came next to the king. These ealdormen were nobles by birth, and their office was both civil and military. There were also special titles applicable to certain offices, such as 'aldermannus otius Angliæ,' 'aldermannus regis,' and others. They seem to have been at the height of their power during the time of Alfred the Great, and from then until his time of the Norman Conquest the nature of the office gradually changed, until the word was applied to men holding certain municipal offices.

In modern times A. are members of co., tn., and city corporations, and hold certain powers in local affairs. The Local Government Act, 1933, provides that one-half of the total number of the A. of a council must retire in every third year, being the year in which councillors are elected. In the City of London, which is divided into 26 wards, there are 26 A., and the lord mayor is elected from among the A. In America they have powers of legislation rather than judicature except in certain cases.

As each Amer. city is governed under the laws of its own special charter, and as the provisions of these charters vary greatly, such an official as an A. has vastly different powers in different places. For example, Chicago is governed by supervisors, Boston by an elected council, Washington by commissioners, and New York by a board of A. directly representative of the popular vote. Broadly, however, A. in America form legislative bodies, and, though they have the powers of magistrates in some cases, those powers are of a restricted nature, relating particularly to civic business, the control of the police, and similar functions. In New York or in other Amer. cities where the A. are the controlling body, the powers of these officials are far greater than are usually associated with the office in England; but the mayor, who is their chief and who is elected by the whole city, has also a large authority in the initiation and veto of measures. See COUNTY COUNCIL and LOCAL GOVERNMENT.

Alderney, one of the group known as the Channel Is., lying N. of Jersey and Guernsey. It is separated from the Fr. coast by a strait known as the Race of A.; to the NW. of the is. lie the Casquets, dangerous rocks which have been the scene of many shipwrecks. A. has an exceptionally bracing climate. The coast is mainly rocky, with bays on the N., and the cliff scenery is delightful. There are very few trees. The tn of St Anne stands in the centre of the is. where the soil is very fertile. A. is subject to the jurisdiction of Guernsey, though formerly it was independent. Unlike Sark, no dialect is spoken. A. was occupied in the Second World War by the Germans, who evacuated all the islanders and left it finally in ruins. Pop. 1320.

Aldersgate, ward and street of the City of London, the street running northwards from St Martin's-le-Grand to Goswell Road. The old gate is mentioned about AD 1000 as Ealdredesgate, and means 'the gate of one Ealdred'. John Day, the Elizabethan printer, is said to have lived in the gatehouse, together with John Foxe (see Taylor's *London*). The gate was restored after being burned in the fire of London, but eventually taken down in 1761. The dist. was much damaged by Ger. air raids in 1940-1.

Aldershot, tn in Hants, England, 35 m. from London. At first only a small vill., it grew in importance with the estab. of A. military camp in 1853-4 on the borders of Hants, Surrey, and Berks. A. remains to-day the largest permanent military camp in the U.K. The barracks and grounds in the immediate vicinity of the tn are roughly 4 sq. m. in area. At first there were only wooden huts, but brick buildings and permanent barracks have been added continuously. The bell in the tower of the Cambridge Hospital is made from guns captured at Sevastopol. There are training areas adjacent to the building complex, and during the summer months training schemes are carried out here. Originally the troops quartered at A. were termed the Division of A.; in 1870 they

and their station became the 'A. Dist.,' and in 1901 the 'First Army Corps (A. Dist.).' In 1902 the name was changed to the 'First Army Corps (A. Command),' and in 1904 it became the A. Command. It is estimated that about 3,000,000 men were stationed in the A. Command during the First World War, and it was from A. that most of the 'contemptible little army' went out to Flanders. The highest number stationed in the command at one period was 140,000. There were 60,000 troops on Laffan's plain for Queen Victoria's Jubilee review, and nearly 100,000, including detachments from every part of the empire, on the occasion of Queen Victoria's Diamond Jubilee review. In 1939 the majority of troops in A. again moved out to France. Later during the Second World War A. became a Dist. and part of S. Command, and this position remains to-day, although the Dist. is considerably larger in area than the old Command. Troops in A. are now mainly at depots and training schools and estabs. Between the wars the A. military searchlight tattoo became world famous; first held in the grounds of Gov. House, it later transferred to the Rushmore Arena (specially built for the purpose).

During recent years the bor. has developed to such an extent that it is almost completely built up. Since the Second World War a number of new industries have estab. themselves on a small trading estate in the bor. The tn has a large open-air bathing pool. Pop. 41,020.

Aldgate, ward and street of the City of London; the street connects Fenchurch Street with Whitechapel. The old gate, which was called Eastgate in the Saxon period and, later, Alegate, was the extreme E. gate of the City. Recent excavations establish that it was formerly the site of a Rom. gate. It was rebuilt in 1608 and finally demolished in 1761. Chaucer lived in the old gatehouse under lease from the corporation. The chief remaining old-time feature of A. is the pump.

Aldhelm, or **Ealdhelm** (c. 640-709), Saxon priest and scholar, educ. Canterbury. He became abbot of Malmesbury (676) and Bishop of Sherborne (705). The church of St Lawrence at Bradford, Wilts, alone remains of his buildings. He wrote treatises and verse in Latin and English, some of which survive.

Aldine Press, see ALDUS.

Aldington, Richard (1892-), poet and novelist, b. Hants. Educ. Dover College and London Univ., he started writing at a very early age. In 1913 he became literary editor of the *Egoist*, the Imagist periodical, and married Hilda Doolittle, a leading Imagist poetess. After serving in the First World War he worked as reviewer and translator and pub. sev. vols. of poetry, including *War and Love*, 1919, *A Fool in the Forest*, 1925, and *A Dream in the Luzemburg*, 1930. After living on the Continent for some time he turned to writing novels and produced *Death of a Hero*, 1929, and *The Colonel's Daughter*, 1931. At the beginning of the Second World War he went to America. His

biography *Wellington*, 1946, was awarded the Tait Black Memorial Prize, and his *Complete Poems* appeared in 1949. Later works were a critical study, *Esra Pound and T. S. Eliot*, 1954, and a life of Lawrence of Arabia, 1955.

Aldred, or Ealred (d. 1069), Eng. monk, became abbot of Tavistock about 1027; in 1044 he became Bishop of Worcester, and in 1060 Archbishop of York. He negotiated with the Emperor Henry III for the return to England of Edmund Ironside's son (1054). He probably crowned Harold II, and certainly crowned Wm the Conqueror.

Aldrich, Henry (1648–1710), ecclesiastic, educ. Westminster School and Christ Church, Oxford, where he succeeded Massey as dean in 1689. He wrote *A Compendium of Logic*, 1691, used at Oxford for a long time; he also composed church music. He designed Peckwater Quadrangle (Christ Church) and possibly All Saints' Church, both at Oxford.

Aldrich, Thomas Bailey (1836–1906), Amer. poet and editor, b. Portsmouth, New Hampshire. He worked as a clerk in New York, but had verses printed before he was 15, and in 1855 pub. a vol. of poems, *The Bells*. Moving to Boston, he became friendly with Hawthorne, Longfellow, Whittier, and Lowell. *The Story of a Bad Boy*, 1870, which is partly autobiographical, was followed by the novels *Prudence Palfrey*, 1874, *The Queen of Sheba*, 1877, and *The Stillwater Tragedy*, 1880. From 1881 to 1890, as editor of the *Atlantic Monthly*, he wielded a commanding influence over Amer. letters. His collected writings were pub. in 1907.

Aldrovandi, Ulisse (1522–1605), celebrated It. naturalist, b. Bologna. In 1553 he took his medical degree at Bologna, and occupied the botany and natural hist. chairs of that univ. He estab. the botanic gardens at Bologna in 1567, and also formed a natural hist. museum. He travelled in almost every part of Europe to collect information for his great work on natural hist., the first vol. of which was pub. in 1599. The complete work was not pub. until 1608. He was imprisoned as a heretic at Rome, but was afterwards released.

Aldstone, see ALSTON.

Aldus Manutius, or Manuzio Aldo (c. 1450–1515), It. printer and author, b. Bassiano, near Velletri, SE. of Rome. He spent some time in the study of the classics, subsequently becoming tutor to the princes of Carpi, whose family supplied him with money for starting his printing press, set up in Venice in 1490. His first book, Musæus's *Hero and Leander*, appeared 4 years later. A.'s first important work was a 5-vol. *Aristotle* in 1495–9. This he followed by eds. of Gk and Lat. classics. To make books as cheap as possible A. used Italic type. The first use of Italic was for a few words in an illustration of *Letters of St Catherine of Siena*, 1500, and the first Italic book, *Virgil*, came a year later. Among his famous eds. were *Se Aetna* by Cardinal Bembo, 1495, and the *Hyperbomachia Polifili*, 1499. The designs of the type used in these two

pubs. are in current use with the names Bembo and Poliphilus respectively. A. was the founder of the Aldine Press. See M. Ferrigni, *Aldo Manuzio*, 1925, and G. Fock, *Bibliotheca Aldina*, 1930.

Aldwych, London thoroughfare, constructed in 1900–5, forming a loop on the N. side of the Strand. The name was revived to commemorate a settlement of Danes in this area. Bush House fronts on A.; beside it is India House, and opposite the Waldorf Hotel. See also SAINT CLEMENT DANES.

Ale, originally malt liquor brewed without hops, but not generally a synonym for beer (see BREWING). The application of the term varies according to locality, but it is never used to denote stout. Mild A. is beer with a sweetish flavour and a fairly dark colour. Pale A., whether in cask (in which form it is usually termed bitter beer) or in bottle, is light in colour and has a pronounced hop flavour. The term A. often had a connection with the periodic or festive nature of brewing or drinking, as in Oct. A., Whitsun A., cuckoo A., harvest A., and bridal (originally bride-ale).

Ale-conner, or Ale-kenner, one who knows what good ale is. In ancient times in this country A.s or ale-tasters (called *gustatores cervisiae*) were appointed annually in the court-leet of each manor, in bors. and corporate tns, to see that the ale was good, and that it was sold at proper prices. In the City of London four were appointed every year, but the office is now a sinecure.

Aleardi, Aleardo (1812–78), It. poet and patriot, b. Verona. He studied first philosophy, then law. His poetry is full of passionate hopes for the liberation of Italy; twice he was imprisoned by the Austrians (1852 and 1859). His best-known political poems, received with the greatest enthusiasm by his contemporaries, are *Le città italiane marinare e commercianti*, 1856, *I tre fiumi*, 1857, *Il Monte Circello*, 1858, and in 1859, shortly before the outbreak of the war against the Austrians, *Triste dramma*. After his second imprisonment he returned to Italy, became a Member of Parliament, and in 1864 was appointed prof. of aesthetics in Florence. See *Canti scelti*, ed. L. Grilli, 1918, and G. Giuliano, *Aleardo Aleardi nella vita e nell'arte*, 1934.

Aleatory Contract (Dice-players' Contract), legal term used of an agreement involving risk of loss or the chance of gain and dependent on a hazardous event. Under this head are wagers and insurance.

Alecsandri, Vasile (1821–90), Rumanian poet. After studying in Paris he returned to Moldavia in 1839 and in 1840 was made one of the directors of the new Moldavian theatre in Jassy. After the ineffective movement of 1848 he continued, in exile, to support the cause of Rumanian nationalism with propaganda. After the union he was sent on a mission to Paris, London, and Turin to reassure the W. of Cuza's intentions. From 1861 he devoted himself exclusively to literature until 1885 when Carol I appointed him minister in

Paris. He was the first to collect Rumanian folk poetry. He founded a literary magazine. His writings include lyrics, epics on subjects from Rumanian history and legend, plays adapted and original, and autobiographical and critical articles. In 1878 he won the Félibrige Prize for a poem on the Lat. race. His influence extended beyond language and literature into the whole cultural life of Rumania.

Alecto, sister of Megaera and Tisiphone. These 3 sisters were known as the Erinyes or Furies, and pursued the guilty. The most famous victim of their vengeance was Orestes, pursued for the murder of his mother, Clytemnestra (q.v.).

Alcohol were houses where ale was sold. In 1496 an Act passed 'against vacabounds and beggars' (11 Hen. VII. c. 2) contained a clause regulating A., and from that time different Acts were passed for that purpose. In 1828 a general Act to regulate the granting of alchouse licences was passed (9 Geo. IV. c. 61), which repealed all former statutes on this subject. See LICENSING LAWS.

Alekhine, Alexander (1892-1946), chess-master, b. in Moscow, son of a Russian nobleman; studied law at the univ. of Paris, and became a naturalised Fr. citizen. He won the title of master at chess in 1909, when, at 16, he took the prize in the St Petersburg amateur tournament. From 1921 he dominated the chess world with a remarkable series of first prizes. Then, in 1927, he challenged the world champion, Capablanca, and won the title after a protracted match. As world champion he was even more successful than before. At his best period he was perhaps the greatest player the world has ever seen. The variations in the openings he discovered and popularised are many, and he was one of the best and most lucid annotators, as may be seen from his books, *My Best Games of Chess*, 1908 to 1923, and 1924 to 1937; *The New York Chess Tournament*, 1924; and *Nottingham*, 1936.

Aleksandropol, see LENINAKAN.

Aleksandrovsk, see ZAPOROZH'YE.

Aleksandrovskoye, vil. in the Irkutsk oblast of S. Siberia, 47 m. NW. of Irkutsk. It is known because of its hard labour prison, founded in 1873 (political prisoners since 1904); it was a concentration camp from 1919, and is now an isolator for important political prisoners.

Alekseyev, Mikhail Vasil'yevich (1857-1918), Russian general. In 1915 he was appointed Commander-in-Chief on the Russian W. front and soon afterwards Chief of Staff to the Supreme Commander-in-Chief (Nicholas II). In May-June 1917 he was Commander-in-Chief of all Russian armies, then again Chief of Staff under Supreme Commander-in-Chief Kerensky. He showed himself an able administrator and strategist. In 1918 he organised in the Kuban' region the first anti-Bolshevik volunteer army, but soon after d. of pneumonia.

Aleksinac, tn in Serbia, Yugoslavia, on the Morava. It is a coal-mining centre and mkt tn. Pop. 3100.

Alemán, Mateo (1547-c. 1613), Sp. novelist of Jewish descent, b. Seville, and d. Mexico. He was the author of the famous and popular novel entitled *Guzmán de Alfarache*, Madrid, 1599. This work, which was trans. into English, French, and Italian, is one of the many novels called *picarescas* describing the life and manners of rogues, vagabonds, and beggars. Le Sage's *Guzmán d'Alfarache* has no resemblance to the novel by A. In 1604 A. pub. a life of St Antonio de Padua, and in 1609, in Mexico, pub. *Ortografía castellana*. See F. Rodríguez Marín, *Vida de M. Alemán*, 1907, and E. Moreno Báez, *Lección y Sentido del Guzmán de Alfarache*, 1948.

Alemanni, Alamanni, or Alamans, confederacy of sev. Ger. tribes which was formed between the Danube, the Rhine, and the Main about the 2nd cent. AD, and from the 3rd to the 5th cent. was frequently at war with the Romans. They were not crushed until Clovis defeated them utterly in the battle of Tolbiac, 496. At one time they extended their dominions to the Vosges and to the Alps. It is from this people that the French derived the words *Allemagne* and *Aleman* for Germany and a German respectively.

Alembert, Jean le Rond d' (1717-83), Fr. writer and mathematician, one of the leading *philosophes* of the 18th cent., b. Paris. In 1741 he became a member of the Academy of Sciences, and in 1743 pub. his work, *Traité de dynamique*, explaining 'A.'s Principle. He helped Diderot to prepare his *Encyclopédie*, and wrote the *Discours préliminaire*, 1751. In 1754 he was admitted to the Fr. Academy. His mathematical treatises were collected in *Opuscules mathématiques*, 1761-80, and his collected works in *Oeuvres philosophiques, historiques et littéraires* (18 vols., 1805). See M. Müller, *Essai sur la philosophie de Jean d'Alembert*, 1926.

Alembic, apparatus, now obsolete, used by alchemists for distilling.

Alemtejo, see ALTO ALENTEJO and BAIXO ALENTEJO.

Alençon, Fr. tn in the dept of Orne, at the confluence of the Sarthe and the Briante. The church of Notre Dame has beautiful 16th-cent. stained-glass windows. There are printing and hardware works, and an agric. market. The making of the famous *point d'Alençon* lace has almost ceased. Pop. 19,700.

Alentejo, see ALTO ALENTEJO and BAIXO ALENTEJO.

Aleppo (native name *Halab*), cap. of the prov. of A. in Syria, situated on the R. Kuweik on the edge of the Syrian desert. The first known mention of A. is in documents from Boghazkoi of the 2nd millennium BC where it appears as Khallab or Khallav, since when it has had an unbroken existence. After the Muslim conquest it was a prov. cap. till 944, when it became independent and stayed so till about 1015; the crusaders tried in vain to capture it, and afterwards its hist. was confused till it became a part of the Ottoman empire in 1517. It was formerly the great trade centre between Europe and Asia, exporting silk, cotton, and woollen goods to the E. The discovery of the Cape route

to India damaged its trade; the earthquake of 1812, the plague of 1827, and the cholera of 1832 added to its ruin. But it recovered from its misfortunes, and before 1914 was still an important centre of trade. After the separation from Turkey in 1919 its trade suffered because Turkey would have no dealings with it and appropriated all the water of the Kuweik. A. is a centre of the tobacco and silk industries with many weavers; it is well known for its pistachio nuts. A. was united with Damascus to form Syria under a Fr. mandate which was ended in 1946, since when Syria has been independent with a troubled political hist. Independence was not won easily, for Damascus was shelled in 1945 and Lebanon, the traditional friend of France, was solidly on the side of Syria. The railway to Rayak, on the line from Beirut to Damascus, was opened in 1926 and A. is now on the line to Bagdad; it is also an airport. The Iraq oil pipeline has one terminus at A. Silk and cotton goods, leather, grain, carpets, tobacco, and wine are exported from Latakia, its port. The citadel is impressive and the gate tower one of the finest. The Halawiya college was formerly the cathedral and the bazaars are extensive and busy. Pop. (tn) 380,000, consisting of Muslims (Arabs and Turks), Greeks, Armenians, and Jews. The sanjak of Alexandretta was ceded in 1939 by France to Turkey.

See A. Russell, *Natural History of Aleppo*, 1794, and Ibn al-Adim in *Recueil des Historiens des Croisades*, vol. iii.

Alerion, see **ALERION**.

Alès (anc. **Alais**), Fr. tn, cap. of an arron., in the dept of Gard, on the Gardon. It was a stronghold of the Huguenots (q.v.), with whom Richelieu here concluded a treaty in 1629, granting them liberty of conscience but suppressing certain political privileges. It is in a rich coal-field, and manufs. silk, glass, and iron. Pop. 34,700.

Alesia, usually identified with Alise-Ste-Reine, was the scene of Caesar's victory over Vercingetorix in 52 BC, which completed his conquest of Gaul. Since the mid 19th cent. excavations have been made at Alise-Ste-Reine, and a statue of Vercingetorix stands near the tn.

Alesius, Alexander (1500-65), Scottish divine, b. Edinburgh and educ. at St. Andrews; was a strong supporter of the Reformation, settled in Wittenberg, became a friend of Luther and Melancthon, and signed the Augsburg Confession.

Alessandria: 1. Prov. of Italy, in SE. Piedmont (q.v.). It contains the W. end of the great N. plain of Italy, but has hills in the NW., and, in the S., ridges of the Ligurian Mts. (see **APENNINES**). It is watered by the Po (q.v.) and its trib. the Tanaro. The prin. tns include A., Acqui, and Novi (q.v.). Area 1405 sq. m.; pop. 480,000.

2. It. tn, cap. of the prov. of A., 45 m. ESE. of Turin (q.v.). It is on the Tanaro, and was an important fortress during the struggle between the papacy and the empire. There is a fine 19th-cent.

cathedral. A. is the centre of a corn and wine producing dist., is a railway junction, and has engineering, cotton, and hat manufs. Pop. (tn) 55,400; (com.) 83,000.

Alesund, see **ALESUND**.

Aletschhorn, one of the highest peaks in the Bernese Alps, being 13,721 ft. It was first ascended by Tuckett in 1859. The Aletsch, 12 m. long, is the largest glacier in Switzerland; at its E. extremity is the Mårjelen Lake.

Aleurone Grains, or proteid grains, are solid granules of proteid substance which act as reserve stores of food for the embryonic plant. They occur in the general protoplasm of the plant, but especially in the seeds. In shape they are round or oval, and they contain mineral matter in the form of a *globoid* of lime and magnesia or a crystal of calcium oxalate. In oily seeds, such as the brazil-nut, there is also a *proteid crystalloid*.

Aleutian Islands, chain of about 150 is., extending c. 1100 m. SW. from the peninsula of Alaska towards Kamchatka, the greater number of which belong to the U.S.A. They were first explored by Russians, in 1768, and Capt. Cook in 1778 made further explorations. The is. are mostly barren—attempts have been made at cultivation, but with little success. Many of the mt summits are volcanoes. The largest is. is Unimak, which contains 2 active volcanoes, and, excepting Attu, is the nearest to the mainland of Alaska. The only industries are fishing—whale and seal—and hunting. Unalaska is the chief is. for trade. It has a good harbour, a par. church, and trading estabs. The exports are fish and furs. The inhab. are of Eskimo origin, and they belong to the Gk Church. In June 1942 the Japanese made a descent on Attu, the westernmost is., under cover of a raid on the Amer. base at Dutch Harbour. At this time the A. I. (apart from Unalaska) were undeveloped, unfortified, and uninhabited for the most part, but they were of strategic importance, for Attu is the part of Amer. ter. nearest to Japan (1200 m), and the occupation by Japan put her within 1000 m. of the Alaskan Peninsula. The occupation of Attu was soon followed by an equally unopposed occupation of Kiska, which has a good harbour. But in Aug. the Americans, by rapid construction, estab. a defended air station on one of the Andreanof group, the next in the chain to Rat Is., of which Kiska is the chief. From this airfield the Amer. bombers frequently raided Kiska. Pop. 5500.

Alewite, the popular name of a fish belonging to the Clupeidae, probably so called from a fanciful resemblance to the stout hostess of an ale-house. It is 8-10 in. long, and is common in N. America. It is related to the herring and sprat, and is used for food.

Alexander (b. c. 100 BC), Jewish prince, son of Aristobulus II and grandson of Judaeus, was taken captive in Judaea by Cn. Pompey, 63 BC, but escaped. He was defeated near Jerusalem, 57 BC, by Marcus Antonius, who had been sent

against him by Gabinius, governor of Syria. A., however, conquered Judaea, put many Romans to death, and besieged the rest in Mt Gerizim. At last he was defeated by Gabinius, and beheaded by Metellus Scipio by the order of Pompey, 49 BC. See Josephus, *Antiquities of the Jews*, xiv-xvi passim.

Alexander I, King of Macedonia (c. 504-450 BC), was the son of Amyntas I. whom he succeeded. He had to submit to the Persians, and, though he secretly favoured the cause of the Greeks, he accompanied Xerxes in the invasion of Greece, 480 BC.

likely to be ousted from his position as heir to the throne of Macedon, that Phillip fell by the hand of an assassin in 336.

Recognised by the army, A. had no difficulty in obtaining his father's throne. Although the assassination caused some slight unrest and a tendency in the hill tribes towards revolt, he was in the same year recognised as generalissimo of the army of the Greeks against the Barbarians. Attacking the Barbarians of the N., and crushing a revolt in W. Macedonia, he was obliged by a revolt of the Thebans to strike a blow at Greece. There was no hesitation in the policy he

ALEUTIAN ISLANDS: UNALASKA VILLAGE AND DUTCH HARBOUR

Alexander II, 16th King of Macedonia (369-367 BC), was the son of Amyntas II, whom he succeeded. He reigned only 1 year and a few months.

Alexander III, or the Great (356-323 BC), was the son of Philip II of Macedon and his wife Olympias. He was b. at Pella, and received his education partly at the hands of Aristotle, who seems to have invested him with a deep and lasting love for Homer, and partly in the court of his father, where the numerous comings and goings of embassies must have given his education its practical side. Nor was his education in the art of war neglected, for at the early age of 16 he quelled a rising that had broken out at home in his father's absence. Quarrels occasioned by the repudiation of his mother and the marriage of a new wife by Philip II caused his withdrawal from the court; but later he was (at least openly) reconciled with his father, whom he accompanied at the battle of Chaeronea (338 BC). Whether A. was involved or not, it was during the period when he was under a cloud, and

adopted; Thebes had revolted, therefore Thebes must be crushed, and to all intents and purposes Thebes was wiped out of existence. The GK alliance against the Barbarians was then renewed, no hostility being openly shown.

Early in 334 A. crossed the Hellespont on the first stage of his expedition against Persia, and won his first great victory on the Granicus in Mysia. Having occupied Sardis and other important cities, he entered N. Syria, defeated Darius III at the battle of Issus (333), and subdued the whole of Syria and Phoenicia, notwithstanding an offer of negotiation by the Persian king. A. spent the winter of 332-331 in Egypt, where he was welcomed as a god and founded the city of Alexandria. Striking once again at Persia, he routed Darius before Gaugamela (20 Sept. 331), took Babylon, seized the Persian treasury at Susa, and rapidly subdued the mt tribes. In the following year the fugitive Darius was assassinated by Bessus, satrap of Bactria, who assumed his crown but was soon betrayed to A.

and executed (328). By this time, however, A.'s popularity had begun to wane. He was no longer the King of Macedon alone: he had conquered a great empire, he had worshipped at the Egyptian temples, he had worn the dress of a Persian; he was no longer the Greek captain-general, he was an oriental despot. The discontent showed itself in conspiracy, which was immediately put down by the execution of the ringleaders.

But the discontent of his Macedonian followers was still apparent, and showed itself in a number of gloomy incidents, amongst which can be numbered the murder of Clitus and the execution of Callisthenes, the nephew of Aristotle.

Glyptothek, Munich

ALEXANDER THE GREAT

By the end of 327 A. was preparing to invade India. Meeting with strong opposition from the hill tribes, he succeeded in reducing most of their fortresses and reaching the Indus. The riv. was bridged, and A. hurried on to the Hydaspes (Jhelum), where he defeated King Porus who attempted to dispute his passage. A. then moved eastwards, and had reached the Hyphasis (Sutlej) when his army mutinied. He therefore turned back and sailed downstream to the mouth of the Indus accompanied by some of his troops, the rest of whom marched along the banks in 2 divs. Nearchus (q.v.) was then ordered to sail with the fleet to the Persian Gulf, while A., at the head of the army, moved through Gedrosia to Susa, reaching that city early in 325. While the troops enjoyed a well-earned rest, A. undertook a number of administrative reforms, gave Asiatic wives to about eighty of his senior officers, and himself married Barsine, the eldest daughter of Darius. She was his second wife; in 327 he had married Roxana, daughter of the Bactrian Oxyartes and mother of his posthumous son Alexander

Aegus. From Susa A. moved to Babylon, which he intended to make the cap. of his empire. Here he was stricken with fever. The disease was not regarded seriously at first, but rapidly became worse, and 10 days later the Macedonian army were allowed one by one to pass through the chamber of the dying prince in order to bid him farewell. On the following day he d. (323). See L. V. Cummings, *Alexander the Great*, 1940; H. Lamb, *Alexander of Macedon: The Journey to the World's End*, 1947; W. W. Tarn, *Alexander the Great*, 1948.

Alexander I, King of Epirus (342-330 BC), was the son of Neoptolemus and brother of Olympias, the mother of A. the Great. In 332 he went to Italy to aid the Tarentines against the Lucanians and Brutii. He was defeated and slain in battle near Pandosia, on the banks of the Achéron in southern Italy.

Alexander II, King of Epirus, son of Pyrrhus and Lanassa, succeeded his father 272 BC.

Alexander I, King of Syria (150-146 BC), surnamed **Balas**. He pretended to be a son of Antiochus IV, Epiphanes, and usurped the throne of Syria from Demetrius I. Balas was, however, defeated and dethroned by the son of Demetrius, who came to the throne as Demetrius II.

Alexander II, King of Syria (128-122 BC), surnamed **Zabina** or **Zabinas**. At the instigation of Ptolemy Physcon he usurped the throne of Demetrius II; but 6 years later he was defeated and put to death by Antiochus Grypus.

Alexander, name of 8 popes: Alexander I (106-15), Alexander II (1061-1073), Alexander III (1159-81), Alexander IV (1254-61), Alexander V (1409-10), Alexander VI (1492-1503), Alexander VII (1655-67) (see CHIGI, FABIO), Alexander VIII (1689-91).

Alexander II (1061-73) was the nominee of Hildebrand, whose policy he carried out in preparation for the accession of Hildebrand himself (Gregory VII). He it was who sanctioned the Norman invasion of England and sent the sacred banner to William the Conqueror.

Alexander III (1159-81) succeeded Adrian IV; his appointment was opposed by Frederick Barbarossa. Held the third Lateran Council, 1179. Sanctioned Henry II's invasion of Ireland, and humbled the same king after the murder of Becket. Spent the latter part of his pontificate in exile, being driven from Rome by the rep.

Alexander VI (1492-1503) (Rodrigo Borgia), b. in 1431 in a little Sp. vil. near Valencia, was by the influence of his uncle, Calixtus III, rapidly advanced in the Church. He became successively bishop, cardinal, and vice-chancellor, and served in the Rom. court under 5 popes. During this period he acquired wealth, influence, and position. His 2 outstanding sins were his love for gold and women. His children by his mistresses seem to have formed the basis of his ambition, since for them he did all that he possibly could. By a system of judicious and gigantic

bribery he became pope on the death of Innocent VIII. At first his period of power was quiet and satisfactory, but he soon left no doubt as to his exact policy. A system of nepotism began, which even in an age of nepotism frightened his contemporaries by the lengths to which it went. To advance his son, to make a splendid marriage for his daughter, he was prepared to spend the wealth of the Church or to destroy the peace of Italy. The secularisation of the Church was carried to unheard-of lengths. The Church was to A. merely a means of carrying out his schemes for the advancement of his family. Even if all the stories of his poisonings and immoralities cannot be accepted, since our knowledge of his reign depends largely on the writings of his enemies, there still remains no doubt that he was guilty of much. He was a great patron of art, and during his pontificate many treasures of art were produced for him. He employed Raphael, Michelangelo, and Pinturicchio at one period or another. He *d.* on 18 Aug. 1503, having dragged down the papacy to the lowest depths to which even in the Renaissance days it had descended. His most famous, or infamous, children were Giovanni, Duke of Gandia (1474), Cesare (1476), and Lucrezia (1480). *See* BORGIA.

Alexander, name of 3 kings of Scotland:

Alexander I (the Fierce) (*d.* 1124), fourth son of Malcolm Canmore, succeeded his brother Eadgar in 1107. He ruled over Scotland N. of the firths of Forth and Clyde, Cumbria being given as an appanage to his younger brother David. He succeeded in establishing firmly the royal authority in the N. He married Sybille, a natural daughter of Henry I, and *d.* childless.

Alexander II (*d.* 1249), son of William the Lion, succeeded to the Scottish throne in 1214. From the time of his accession he was in communication with the still disaffected Eng. barons, and, despite the stipulations in Magna Carta on behalf of the Scots, he joined forces with the barons when hostilities again commenced. He retreated before the army sent against him by John, an army which successfully laid waste the border cos. of Scotland. This border war continued until 1217. In 1216 A. paid homage for his Eng. possessions to Louis of France. He married the sister of Henry III of England (Joanna) in 1221, and during his reign the definite boundaries of the 2 kingdoms seem to have been fixed, though no formal frontier was drawn. A. consolidated the royal authority in Scotland, and was a generous patron of the Church. He married secondly (1239) Marie de Coucy, by whom he had a son, Alexander III.

Alexander III (1241-86) succeeded to the throne in 1249. He was successful in bringing the W. Is. under his power in 1263. The later period of his reign was devoted to administrative reforms, which limited the power of the barons and brought Scotland a period of peace and prosperity. He was killed in 1286 by falling over the cliffs near Kinghorn, and

left as his heiress his two-year-old granddaughter, the Maid of Norway.

Alexander (1461-1506), King of Poland and Grand Duke of Lithuania. He became Grand Duke of Lithuania in 1492 and King of Poland in 1501.

Alexander, name of three Russian emperors:

Alexander I (1777-1825), son of Paul I. He was well educ. under the supervision of Catherine II (his tutor was a Swiss republican, a follower of Rousseau). He succeeded to the throne in 1801. The first half of his reign was marked by several reforms and improvements: the abolition of torture, the estab. of ministries and of the Council of State, and the foundation of sev. univs. and of an extensive state school system; the liberation of serfs (without land) in the Baltic Provs. and the granting of permission to squires elsewhere to free their serfs with land; and the grant of a constitution to Poland. Later, however, A. became mystical and reactionary, and undid much of the good previously done. In foreign affairs he allied himself alternately with England and Napoleon, acquired for Russia Finland, Bessarabia, and a large part of the Caucasus, and was the inspirer of the Holy Alliance (q.v.). The main event of his reign was the patriotic war in 1812 against Napoleon, which profoundly influenced the future development of Russia. *See also* ARAKCHEYEV; CZARTORYSKI; DECEMBRISTS; KUTUZOV; SPERANSKIY.

Alexander II (1818-81), called Tsar-Liberator for the emancipation of the serfs in Russia (1861) and the liberation of Bulgaria from the Turks (1878). The son of Nicholas I, he received a good education under the poet Zhukovskiy, and succeeded to the throne in 1855. His reign was a period of Great Reforms (q.v.) in Russia which completely transformed and modernised her social and political life. In foreign affairs he adhered to the principle of non-interference, except in the case of Turkey, where the massacres of the Bulgarians aroused universal indignation in Russia. The Polish uprising in 1863, the final conquest of N. Caucasus (*see* SHAMIL) and Turkestan, and the development of the underground revolutionary activities by Populists (*see* POPULISM), culminating in terror against leading representatives of the state, were other important events of A.'s reign. Sev. attempts were made by the terrorists on his life, and eventually he was killed by a bomb on the very day that he had signed a decree approving the plan of a constitution for Russia. *See also* GORCHAKOV and LORIS-MELIKOV.

Alexander III (1845-94), second son of A. II. He became heir apparent in 1865 on the death of his older brother, and succeeded to the throne in 1881. His policy in internal affairs, influenced by Pobedonostsev (q.v.), was one of consistent reaction and resulted in undoing much of what his father had achieved, in Russification measures towards national minorities and progressive discrimination against the Jews. At the same time a

protectionist economic policy facilitated the rapid industrial development of the country, which resulted in a great increase of the number of industrial workers and the spread of Marxist and Social Democratic ideas. In foreign affairs A. III strictly followed the policy of peace and non-interference; towards the end of his reign the Franco-Russian *rapprochement* took place.

Alexander I (1857-93), Prince of Bulgaria (Prince A. of Battenberg). A nephew of the Tsar A. II of Russia, he was, on the proposal of Russia, elected first sovereign Prince of Bulgaria (1879). Once elected, however, A. pursued a policy which ran counter to Russian interests. As a result, Russian pressure compelled him to abdicate in Sept. 1886. He *d.* in Austria.

Alexander (1888-1934), King of Yugoslavia; *b.* at Cetinje; second son of Prince Peter Karageorgevich (Karageorgević). A's mother was a daughter of Nicholas, reigning Prince of Montenegro. His early days were spent at Geneva, where his father lived in exile. A. was sent to St Petersburg in 1899 to be educ. In 1909 he rejoined his father in Serbia, where the latter was now king. A's elder brother George having been forced to renounce his claim to the succession, A. was recognised as heir. He distinguished himself in the Balkan wars of 1912 and 1913; and during the First World War he was made Commander-in-Chief of the Serbian Army. He was with the army in its retreat before the central powers; then headed the Serbian Gov. in exile at Corfu, and visited the W. Allies' camps. When his father *d.* in 1921, A. was proclaimed King of Yugoslavia. He married, 1922, Marie, daughter of Ferdinand of Rumania. In 1929 he suspended the constitution, and created a dictatorship, in a drastic attempt to settle the country's racial and political problems by attempting to unite all sections of the pop. under his personal rule. But the Croat and Slovene sections of the pop. remained restive and convinced that the Serb element was being favoured at their expense. A. was assassinated in Marseilles on 10 Oct. 1934 by a Croat subject a few moments after he had disembarked there. M. Barthou, Fr. foreign minister, who was in the same motor-car, was also killed.

Alexander (1893-1920), King of the Hellenes, second son of King Constantine, on whose dethronement he ascended the throne of Greece, 1917. His gov., with Venizelos as Premier, enjoyed the confidence of the W. powers. During his reign the boundaries of Greece were much extended. He *d.* of blood-poisoning, 25 Oct. 1920, as a result of a monkey bite.

Alexander, Bishop of Lincoln (*d.* 1148), nephew of Roger, Bishop of Salisbury. He became archdeacon of Sarum, and Bishop of Lincoln in 1123. He took the side of Stephen in the civil war, although he had sworn allegiance to Maud. Suspected of disloyalty, he was arrested, imprisoned, and dispossessed of his castles. He probably crowned Stephen in 1146.

Alexander, Archibald (1772-1851), Amer. Presbyterian divine, *b.* Virginia. In 1791, after being licensed to preach, he became known as a great and eloquent revivalist preacher. He afterwards became prof. in the newly created Princeton Theological Seminary, where he remained until his death. Amongst his theological works may be mentioned *The Outlines of Moral Science*, 1852, and *A History of the Israelitish Nation*, 1853.

Alexander, Boyd (1873-1910), noted as an explorer, *b.* Cranbrook, Kent. He took part in the famous A.-Gosling expedition (1904-7), which crossed Africa from the Niger to the Nile. It was during this expedition that his brother, Claud A., and his fellow explorer Gosling both lost their lives as a result of the hardships which they had to endure. In 1909 A. began his last ill-fated journey. After passing Lake Chad in safety at Wadai, just on the borders of the Brit. sphere of influence in the Sudan, he was attacked by natives and killed.

Alexander, Cecil Frances (c. 1820-95), see ALEXANDER, WILLIAM.

Alexander, Sir George (1858-1918), actor and theatrical manager, *b.* Reading. He was educ. for a City life, but his enthusiasm as an amateur actor soon led him to the stage. He started at the Theatre Royal at Nottingham at the age of 21, and 2 years later joined Sir Henry Irving at the Lyceum. He became a manager in 1890 at the Avenue Theatre, and in the following year opened at St James's. His long tenancy of that theatre was one of the most distinguished in the annals of the Eng. stage. On the stage he could play the lover to perfection, avoiding both bathos and mawkishness.

Alexander, Sir James Edward (1803-1885), Brit. soldier and traveller. He joined the E. India Co.'s army in 1820. In 1825 he became an officer in the Brit. Army, and he later took part in the Kafir, Crimean, and Maori wars. Amongst other things, to him is largely due the transfer to England of Cleopatra's Needle, 1877.

Alexander, John White (1856-1915), Amer. artist, *b.* Allegheny, Pennsylvania. Among his works are 'Miss Dorothy Roosevelt,' 'Pandora,' 'Rodin,' 'Walt Whitman,' 'The Quiet Hour,' and 'A Ray of Sunlight.'

Alexander, Samuel (1859-1938), philosopher; *b.* Sydney, N.S.W. Educ. Wesley College, Melbourne; univ. of Melbourne; and Balliol College, Oxford. First class in classical and in mathematical moderations, 1879; first class Lit. Hum., 1881. Scholar of Balliol, 1878. Fellow of Lincoln College, 1882-1893. Gifford lecturer, Glasgow, 1916-18. M.A., Hon. LL.D., St Andrews and Birmingham; Hon. D.Litt., Durham and Liverpool. His philosophy attaches great importance to Awareness; which, though different in kind from its objects, is derived from them—paralleling the results of chemical reactions. A. thus arrives at Emergent Evolution: the emergence of totally new things from combinations of the old. Space-time, the original matrix,

gave birth to matter in varying forms; which in turn gave birth to mind. From mind, God is expected to emerge. (See his *Space, Time, and Deity*, vol. ii, especially p. 399.) Publications include *Moral Order and Progress*, 1889, *Locke*, 1908, *Space, Time, and Deity*, 1920, *Spinoza and Time*, 1921, and *Beauty and other Forms of Value*, 1933. He received the Order of Merit on the king's birthday, 1930.

Alexander, William (1824–1911), Archbishop of Armagh and Primate of all Ireland, *b.* Londonderry, educ. at Tonbridge Grammar School and Brasenose College, Oxford. He held a number of livings in the N. of Ireland before being made Bishop of Derry and Raphoe in 1867. He became Primate of All Ireland in 1896. A. was the author of a number of theological works, and was also distinguished as the writer of *St Augustine's Holiday and other Poems*, 1886. His wife, Cecil Frances Alexander, is famous as the author of the hymn 'There is a green hill far away,' and of numerous other well-known hymns.

Alexander, William, Earl of Stirling (1567–1640), statesman and poet, *b.* Alva, Clackmannanshire. Educ. at Glasgow Univ. and Leyden, he became a courtier, followed James VI to England, and received from him the grant of a vast tract of land in what is now Canada, but this was rendered null by the Fr. conquests. In 1626 he was appointed secretary of state for Scotland and in 1633 was made an earl. Besides *Aurora*, 1604, and *Recreations with the Muses*, 1637, he wrote a long epic on *Doomsday*, 1614–37, and 4 'monarchic tragedies, *Darius*, 1603, *Croesus*, 1604, *The Alexandrian Tragedy*, 1605, and *Julius Caesar*, 1607.

Alexander, William Lindsay (1808–1884), Scottish theologian. He became recognised as a master of classical erudition. He ed. in 1861 the 3rd ed. of Kitto's *Biblical Encyclopaedia*. From 1877 he was principal of Edinburgh Theological Hall.

Alexander Archipelago, congeries of is., over a thousand in number, off coast S. of Juneau, Alaska, U.S.A. The chief is. are Ketchikan, on Revillagigedo Is., and Sitka, on Baranof. The industries are lumbering, fishing, fur farming, and gold mining.

Alexander Land, dist. in the Antarctic, lat. 68° 43', long. 70–5°, discovered by Bellingshausen, 1821.

Alexander Nevsky (1220–63), Grand Prince of Vladimir in medieval Russia. He received an excellent educ. In 1240, as Prince of Novgorod, he routed the Swedes on the R. Neva (hence Nevsky), and in 1242 inflicted decisive defeat on the Teutonic Knights in the famous battle on the ice of Lake Peipus. He defended Russia equally successfully against the Lithuanians, and in 1252 was appointed Grand Prince by the Khan of the Golden Horde. A. N. spent the rest of his life in endeavouring to ameliorate the lot of the Russians and relieve the distress occasioned by the Tatar invasion, and was canonised by the Orthodox

Church. Peter the Great founded a monastery in St Petersburg dedicated to him, and instituted an order called after him which was abolished in 1917 but revived in 1942 as a military decoration.

Alexander Obrenović (1876–1903), King of Serbia. He was proclaimed king under a regent on the abdication of his father Milan I in 1889, and took the gov. into his own hands in 1893. He aroused great opposition by his marriage to Draga Mashin in 1900, and by his arbitrary rule. A. and his wife were brutally murdered by military conspirators in 1903, the Karageorgević family thereby gaining the Serbian throne.

Alexander of Aegae, Peripatetic philosopher of Rome in the 1st cent. AD, who was tutor to the Emperor Nero.

Alexander of Aphrodisias in Caria lived at the end of the 2nd cent. and the beginning of the 3rd cent. AD, was a celebrated Peripatetic philosopher, and the greatest of the early commentators on Aristotle.

Alexander of Hales (c. 1175–1245), theologian, surnamed *Doctor Irrefragabilis*, *b.* Glos. He studied at the univ. of Paris, and about 1231 joined the order of Friars Minor. As *magister regens* of the Franciscan chair of theology at Paris he numbered among his pupils St Bonaventura and Roger Bacon. His prin. work is *Universae Theologiae Summa*, of which the only reliable ed. is that by the Franciscans of Quaracchi (1924 ff).

Alexander of Hillsborough, Albert Victor, 1st Viscount (1885–), politician, *b.* Weston-super-Mare, son of an engineer, ed. at St George Technical classes. A. was Labour-Co-operative M.P. for the Hillsborough div. of Sheffield, 1922–31 and 1935–50. He was First Lord of the Admiralty, 1929–31, in Ramsay MacDonald's first gov., and, again, in 1940, in the National Gov. of Winston Churchill, and in the Labour Gov. in 1945; Minister of Defence, 1947–50. In 1950 he was made a viscount. He was chancellor of the Duchy of Lancaster 1950–1.

Alexander of Tunis, Field Marshal Harold Rupert Leofric George A. 1st Earl (1891–), soldier, son of 4th Earl of Caledon, and educ. at Harrow and Sandhurst. In First World War he held a commission in the Irish Guards and was in the Mons retreat. Five times mentioned in dispatches. While still in his twenties he was put in command of the Baltic Landeswehr, a force of some 2000 men of Ger. stock, mainly Baltic barons and retainers, who were left behind in Riga after the Ger. evacuation. In 1934 he was given the command of a brigade in India, and served in 2 campaigns on the NW. Frontier. His name first came to be known in his own country when he was appointed to the command of the 1st Div. (1938). Two years later it was his task to control the final stages of the Dunkirk evacuation (1940), which he did with conspicuous gallantry and success. After holding the S. Command for a time he was appointed to command the army in Burma, where his skill contributed to

staying off any further Jap. advance in that country (1942). In Aug. 1942 he succeeded Gen. Auchinleck as Commander-in-Chief, Middle E. Here his presence was quickly felt, for very soon his strategy had its reward in the great victory of the Eighth Army under Gen. Montgomery at El Alamein, which completely reversed the position in Egypt and Libya; and this was followed by a series of victories on a smaller scale which took the Eighth Army into Tunisia, where A. had for some time been in command of the 18th Army Group. In May 1943 the entire Axis army under Gen. von Arnim was destroyed or taken prisoner. A. commanded the allied armies which defeated the It. and Ger. armies in Italy in 1944-5. C.S.I., 1936; K.C.B., 1942. Promoted general, 1942. Field Marshal, 1944. Raised to the peerage as Viscount of Tunis, 1946, became an earl, 1952. Governor-General and Commander-in-Chief Canada, 1946-52. Minister of Defence, 1952-4. *See also* AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN, and ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON.

Alexander Polyhistor, auct. Gk writer and philosopher of the 1st cent. BC.

Alexander Severus, *see* SEVERUS, MARCUS AURELIUS ALEXANDER.

Alexander the Aetolian, Gk poet who lived at Alexandria in the reign of Ptolemy Philadelphus (285-246 BC).

Alexandra Caroline Marie Charlotte Louise Julie (1844-1925), Queen of Great Britain and Ireland, wife of Edward VII. She was *b.* at Copenhagen, the eldest daughter of Christian IX of Denmark. She was married 10 Mar. 1863, and thence until the death of Queen Victoria in 1901 she was Princess of Wales. There were 5 children of the marriage, 2 boys and 3 girls. The eldest son, Albert Victor, Duke of Clarence, *d.* 1892, and his brother reigned as George V. A. was extremely popular in England; she had great charm, and showed a deep interest in charitable work of all kinds. She *d.* Sandringham. The bulk of the £230,000 raised in her memory was used to develop dist. nursing, and to provide pensions for queen's nurses. *See* Sir G. C. A. Arthur, *Queen Alexandra*, 1934.

Alexandra Feodorovna (1872-1918) (Alix Victoria Helen Louise Beatrice), last Empress of Russia, *b.* Darmstadt, daughter of Louis (IV), Grand Duke of Hesse. Her mother (Alicé, daughter of Queen Victoria) dying when she was 6, A. F. was brought up partly in England. She married Tsar Nicholas II, 1894. In 1904 an heir was *b.* Alexis, whose delicate health (haemophilia) occasioned the subjection of A. F. to Rasputin (q.v.). During the First World War she influenced Nicholas's policy for the worse, and was widely suspected of Ger. sympathies. When the empire fell she shared her husband's captivity. She was executed with him by the Bolsheviks at Yekaterinburg (Sverdlovsk) on 17 July 1918.

Alexandra Land, *see* NORTHERN TERRITORY.

Alexandra Park, place of recreation in the bor. of Wood Green, Middx, England, near the N. border of the co. of London. The park and a racecourse adjoining were opened in 1863. Alexandra Palace, a counterpart in N. London to the Crystal Palace at Sydenham, was opened on the grounds in 1873, burned down in the same year, and rebuilt (1875). It has been put to various uses, including the housing of internecine and gov. offices in the First World War, and latterly of the B.B.C. television studios (now transferred to Lime Grove, Shepherd's Bush) and their television transmitter.

Alexandre, Aaron (c. 1766-1850), noted Bavarian chess-player. He visited nearly all the European caps, and was the author of an *Encyclopaedia of Chess* and a book of *Chess Problems*.

Alexandrescu, Grigore (1810?-85), Rumanian poet. At school he had fallen under the spell of Fr. literature, and his work was particularly influenced by Boileau, Lafontaine, and Lamartine. His fables, epistles, and meditative poems were an important contribution to the development of Rumanian literature. He was a keen nationalist—he was imprisoned for his support of the nationalist opposition in Wallachia—and after the union he held sev. ministerial posts. All his activities were cut short by disease in 1860.

Alexandretta, or Iskanderun, tn of Asiatic Turkey. The sanjak of A. was formerly included in the dist. of Aleppo, N. Syria, but is now the vilayet of The Hatay. It owes its importance to its proximity to the Beilan Pass. It is the main port for the region, and has an extensive trade in tobacco, silk, cereals, liquorice, and textiles. Its climate is insalubrious owing to the marshy ground and the absence of purifying winds. Towards the end of the First World War it was occupied by Brit. and Fr. troops. After the war the sanjak of A., in recognition of the special interests of the large proportion of Turks in its pop., was accorded a special administrative regime. On 23 June 1939 France agreed to the complete cession of the sanjak to Turkey in consideration of the conclusion of a Franco-Turkish pact of assistance. Pop. 20,000.

Alexandria: 1. Chief seaport of Egypt. It was founded in 332 BC by Alexander the Great, and was for over 1000 years the cap. of the country. It is situated on a strip of land separating the Mediterranean from Lake Mareotis.

The Capital City. Originally the tn was built upon a mole called Heptastadium, which joined the isle of Pharos to the mainland. Since then sedimentary deposits have added considerably to the width of the mole. The buildings in the Brucheion (Gk) quarter included the royal palaces of the Ptolemies, the Great Theatre, afterwards utilised as a fortress by Caesar during the siege after the battle of Pharsalus, the Poseidonion, or temple to the god of the sea, the Timonium built by Antony, the Emporium or Exchange, the temple Caesareum, now lying underneath the new sea-wall, the Gymnasium,

the Palaestra, the mausoleum of Alexander, and the museum and library. The Necropolis lay to the W. A feature of the tn was the number of subterranean cisterns running along the spaces under the houses and capable of holding a supply of water sufficient to last the whole pop. a year. At the height of its prosperity it contained, according to Diodorus, approximately 300,000 free citizens, while it is probable that a still larger number represents the number of slaves. Placed as it was between the E. and W., it became a centre of commerce on that account. In 30 BC, on the death of Cleopatra, the last of the Ptolemies, it fell into the possession of the Romans. It was now at the zenith of its glory. A great centre of Hellenism, at the same time commercially prosperous to an extraordinary degree, and also the fountain of culture and intellect, A. can be said to have held at this time a position of unique and glorious splendour. For a long time it remained in an enviable position as the world's first port. But during the reign of Caracalla it sank considerably in its commercial greatness, and the rise of Constantinople only served to hasten its fall. Meanwhile Christianity had been introduced, and had quickly made headway. The subsequent struggle between Christianity and heathenism saw many bloody affrays, and in 389 the Serapeum, the last seat of heathenism, was captured and used thenceforth as a Christian church. Cairo was chosen by the Egyptian caliphs to be the cap. of Egypt; the passage round the Cape of Good Hope was discovered, as also was the continent of America: such significant events as these proved factors of deleterious influence upon A. Its decay seemed imminent. In 1517 it fell into the hands of the Turks, and presented but a shadow of its former beauty.

Signs of progress, however, were presently visible under Mehmet Ali. Much of its lost ground was recovered, so that to-day it is once more recognised as one of the most significant of Mediterranean ports. In 1882 Arabi Pasha incurred Brit. displeasure by his maltreatment of the Europeans during his rising, and a Brit. fleet was dispatched. The bombardment of A. followed, and of the few remaining emblems of antiquity most were utterly destroyed. This was not all. A few days later the tn was sacked and a disastrous fire ravaged a large portion of it. Among the scanty objects of antiquity that remain are Pompey's Pillar (so called in error) and 2 obelisks called Cleopatra's Needles, one of which is on the Thames Embankment, while the other is in New York.

The Modern City is built partly upon the isthmus which developed from the original mole by means of silt deposits, and partly upon a T-shaped peninsula. The Mahmudiya Canal, connecting A. with the Nile, runs at the S. of the tn, and by a series of locks enters the harbour. A.'s climate differs from that of the surrounding country. An almost incessant rain is experienced during the winter,

while the summer is rendered temperate by sea breezes. The chief exports are cotton, grain, beans, rice, etc. The prin. relics of antiquity are the so-called Pompey's Pillar, 88 ft high, the catacombs of Kom esh-Shuqafa, and the contents of the Museum of Graeco-Rom. Antiquities. A. suffered damage in frequent It. and Ger. air-raids in the Second World War. Pop. 925,081.

2. Tn of Dumbartonshire, Scotland, in Bonhill (q.v.) par., owing its existence to the cotton-bleaching and printing industries there.

3. Port and city of Virginia, U.S.A. It is accessible to the largest vessels, for the riv., which forms its harbour, though 100 m. from the mouth of the Potomac, is fully a m. wide. A. has railroad shops, freight yards, and naval ordnance plant, and manufs. chemicals, fertilisers, and metal products. Pop. 61,787.

4. City of Rapides par., Louisiana, U.S.A. Pop. 35,000.

Alexandrian Library, said to have been founded about 284 bc in consequence of the suggestions of Demetrius Phalerus, who had seen the public libraries at Athens. It was based on a collection of books formed by Ptolemy Soter, the first king of Egypt, probably the largest collection made before the invention of printing. Demetrius was appointed superintendent of the new estab., and he set about collecting the literature of all nations. Eusebius says that at the death of Ptolemy Philadelphus there were 100,000 vols. in the library. Together with the museum where the scholars lived and studied under royal patronage, it was situated in the Brucheion, the Gk quarter of Alexandria, while a smaller 'daughter' library was estab. in the Serapeum (q.v.). Successive librarians after Demetrius who encouraged the study of literature, philosophy, and the sciences were Zenodotus, Callimachus (q.v.), Eratosthenes, Apollonius, and Aristophanes of Byzantium.

In the siege of Alexandria by Julius Caesar a large part of the library was burnt, but it was re-estab. with the great library of MS. rolls from Pergamum, given to Cleopatra by Mark Antony, and continued to increase in size and reputation until it was dispersed in AD 390 at the destruction of the Serapeum by Theophilus, patriarch of Alexandria. Phoenix-like, the library rose again, according to the latest authorities, and Alexandria continued to flourish as one of the chief seats of literature, until conquered by the Muslims in AD 642, when the library was burnt by the order of Caliph Omar (see OMAR). See E. A. Parsons, *The Alexandrian Library*, 1952.

Alexandrian Liturgy, oriental liturgy of St Mark, which he is said to have arranged for the Christians of Egypt. See also LITURGY and RITE.

Alexandrian School and **Alexandrian Philosophy**. *Alexandrian School*. The loss of political independence by the Greeks resulted in the decline of their intellectual pre-eminence. Alexandria became instead the centre of literature,

science, and philosophy, a position which the city held for nearly a thousand years. This period may be divided into two—the first period extending from 323 to 30 BC, and the second from 30 BC to AD 640. The first period of intellectual supremacy was characterised by literature and science; the second by the speculative philosophy of the neo-Platonists and the religious philosophy of the Gnostics and early Christian Fathers: so that there were 2 A. S.s—the A. S. of Literature and Science and the A. S. of Philosophy.

The School of Literature and Science. Ptolemy Soter, who reigned in Egypt 323–285 BC, was a great patron of literature and science, and many Greeks of literary eminence gathered around him. With the help of Demetrius Phalereus, an Athenian orator, philosopher, statesman, and poet, he founded the Alexandrian library. Ptolemy also built the famous museum, where scholars lived, studied, and taught, and which was conducted on the lines of a modern univ. Every facility was given these learned men for their researches. Ptolemy Philadelphus (285–247 BC) extended the library by the addition of Aristotle's works and certain Jewish and Egyptian writings; and it is very probable that during his reign the O.T. was trans. into Greek. Ptolemy Evergetes (247–222 BC) added works from the archives of Athens to the library. The style of the A. S. differed widely from that of the anct Gk authors, whose writings gave evidence of that perfect freedom which they enjoyed. The members of the A. S. devoted their time to research and criticism, studying grammar, prosody, metre, mythology, antiquities, astronomy, and medicine. The result was that they wrote long epic poems on educational and other subjects. The *Argonautica* of Apollonius Rhodius (q.v.) and the *Alexandra* or *Cassandra* of Lycophron are some of the chief examples of the mythical works. Of the didactic epics the chief are Callimachus's *Heate*, fragments of which are extant; Nicander of Colophon's 2 medical works, entitled *Theriaca* and *Alexipharmaca*; and the *Phaenomena* of Aratus, a work on astronomy. Other epic poets were Dionysius, Euphorion, Rhianus, Dicaearchus, and Oppian. Of the elegiac poets Philetas of Cos, the tutor of Ptolemy Philadelphus, was the earliest; and Callimachus, of whose works only a few hymns, epigrams, and elegies remain, was the greatest. Among the lyric poets were Phanocles, Hermesianax, Alexander of Aetolia, and Lycophron. Epigrams were also written by the Alexandrians, and Timon the philosopher was the author of 3 books of lampoons. Tragedy, too, played an important part, but none of the works of the 7 great dramatists who were known as the Alexandrian Pleiades has been preserved. Theocritus was a celebrated bucolic poet, and his *Idylls*, which are pictures of the country life of the ordinary people, greatly influenced Rom. poets, especially Virgil. Besides the poets there were the critics and grammarians of the A. S., who gave to the world the anct Gk writings in

a form perfectly intelligible, for they devoted their time to criticism, the explanation of words, and the arrangement of the texts. Amongst these great critics were Zenodotus of Ephesus, Aristophanes of Byzantium, Aristarchus of Samothrace, Alexander of Aetolia, Lycophron, Callimachus and Eratosthenes. Mathematics, astronomy, geography, and medicine were also treated by the A. S. Of the mathematical school Euclid was the founder; and his pupils included Archimedes, whose inventions and discoveries were very important; Apollonius of Perga, the author of a work on conic sections; Hipparchus, the celebrated astronomer, whose catalogue of the stars is preserved by Ptolemy; and Eratosthenes, who wrote on astronomy, geometry, geography, and history.

The School of Philosophy. The members of this school brought together the philosophies of the E. and the W., and the Jewish notions of religion were very much influenced by Gk ideas. On this subject the reader is advised to consult Philo Judaeus. The founder of this neo-Platonic system (see NEO-PLATONISTS) was Plotinus, who was born about AD 203, and whose writings his disciple Porphyry rendered in their present form. Another celebrated teacher of this system was Proclus, sev. of whose works are still extant. The Gnostics (q.v.) were a sect who endeavoured to unite Christian and E. ideas. Clement of Alexandria and Origen showed leanings towards that heresy. Philo Judaeus made attempts to reconcile the Jewish scriptures with the doctrines of the Platonic philosophy and sev. of his works have been handed down to us.

Alexandrina, Lake, shallow lake (area 220 sq. m.) in S. Australia, at the mouth of the Murray R.

Alexandrine Verse, species of verse much employed by Fr. poets, especially in poetry of the heroic or epic order. Each line in the A. consists of 12 syllables, and strictly speaking, and following the Fr. model, it should be divided into 2 hemistichs, the sixth syllable ending a word. The name A. would appear to be derived from an old Fr. poem about Alexander the Great, written in this metre towards the end of the 12th cent. It is used in English as the concluding line of the Spenserian stanza, and also as a variant in poems written in the 10-syllabled heroic couplet. Pope railed against it in his well-known couplet:

'A needless Alexandrine ends the song,
That, like a wounded snake, drags its
slow length along.'

But for all that he employed it not infrequently. Two long Eng. poems written wholly in A.s are Drayton's *Polyolbion* and Browning's *Fifine at the Fair*.

Alexandrinus, Codex, MS. of the O.T. and N.T., in Gk, now in the Brit. Museum. The MS. is in 4 vols., large quarto, the N.T. being the last vol. It is written on vellum, in double columns, in uncial or cap. letters, without spaces between the words, accents, or marks of

aspiration. The letters are round and well formed, a few words are abbreviated, and the MS. is in fairly good condition. Its date is probably about 450. In 1628 it was sent by Cyrillus Lucaris, patriarch of Alexandria and of Constantinople, to Charles I. and placed in the Royal Library. In 1753 it was transferred with this library to the Brit. Museum. A facsimile of the O.T. was pub. by the Rev. H. Baber of the Brit. Museum (1816-28), and of the N.T. by Dr Woide (1786), and a second ed. by Spohn.

FROM THE CODEX ALEXANDRINUS

Alexandropol. *see* LENINAKAN.

Alexandropolis, formerly **Dedeagach**, Gk port, cap. of Evros nome, W. Thrace, on the Aegean Sea, 65 m. SW. of Edirne and near the border with Turkey. Once a small fishing vil., A. grew in importance after the completion of the Salonika-Istanbul railways (1896). It became a part of Greece after the First World War, and was renamed A. Pop. 19,400.

Alexandrovsk, *see* ZAPOROZH'YE.

Alexiad, *see* ANNA COMNENA.

Alexis (Russian **Alexey**) **Mikhailovich** (1629-76), Tsar of Muscovy (from 1645), second of the house of Romanov, father of Peter the Great. He was good-natured (nicknamed 'the Silent') and pious. During his reign a code of laws was compiled which remained in force until the 18th cent.; prayer books were revised by Patriarch Nikon, leading to a schism in the Russian Church; attempts were made to reorganise the army on W. European lines, and to estab. a regular postal service; the Ukraine was re-

united with Muscovy; Russian possessions in Siberia were enlarged; successful wars were waged against Poland. There were sev. rebellions during A. M.'s reign, including the great uprising led by Stenka Razin (q.v.).

Alexis (Russian **Alexey**) **Petrovich** (1690-1718), son of Peter the Great. He was hostile to the reforms introduced by his father, fled from Russia but returned; he was sentenced to death and *d.* in prison before execution as a result of torture, possibly by his father, during interrogation.

Alexis, Willibald, pseudonym of the Ger. novelist Georg Wilhelm Häring (1798–1871), b. Breslau. The work that brought him into prominence was an historical romance entitled *Walladmor* (1823), pub. as being a trans. of Sir Walter Scott. De Quincy trans. the novel into English, and Scott himself approved of it. Two more romances were pub. under the same pretence, *Die Geächteten* and *Schloss Avalon*, 1827. His other noted works are *Cabanis*, 1832, *Der Falsche Woldeemar*, 1842, and *Hans Jürgen* and *Hans Jochem*, 1846–8. His best novels are those dealing with the history of Brandenburg. He wrote also 2 comedies, *Prinz von Pisa*, 1828, and *Annen von Tharau*, 1829.

Alexius I, Comnenus (1048–1118), Byzantine emperor, succeeded 1081 after a military revolt. His military and diplomatic skill did much to delay the break-up of the E. Empire. He allied with Venice to curb the Normans in Albania, and in 1116 won a great victory over the Seljuk Turks in the E.

Alexius Angelus, name of Alexius III (1195-1203) and Alexius IV (1203-4), Byzantine emperors. Under Alexius IV Constantinople was taken by the Venetian and Fr. crusaders.

Alfa, see ESPARTO GRASS.

Alfadir, 'all-father,' appellation of Odin in Scandinavian mythology.

Alfalfa, the Amer. name for *Medicago sativa*, or lucerne as it is called in England. The plant has a wide distribution in the Old World, but was not introduced to America till the 18th cent. A. is now grown as a forage crop on a worldwide scale, with the U.S.A. and Argentine as its greatest cultivators. However, it is becoming increasingly important in Great Britain. It has trifoliate leaves and small purple flowers similar to those of many other legumes.

Alfano, Franco (1876-1954). Italian composer, b. Naples. He studied the piano and at Leipzig. Among his works are ballets, 2 symphonies, and other orchestral music, chamber music, and songs, but he was best known by his 12 operas, including *Risurrezione* (after Tolstoy), *L'ombra di Don Giovanni*, *La Leggenda di Sacralata* (after Kalidasa), and *Cyramo di Bergerac* (after Rostand), and better still by the completion of Puccini's *Turandot* entrusted to him by Toscanini.

Alfieri, Vittorio (1749-1803), eminent It. dramatist, *b.* Piedmont. He studied at the Accademia in Turin. Succeeding to a great fortune, he travelled extensively and had numerous love-affairs, the most

important being with the wife of Charles Edward Stuart, the Young Pretender. He wrote his first tragedy, *Cleopatra*, at the age of 25, and thereafter devoted himself to drama, mainly inspired by the fight for political freedom. His fame rests chiefly on his tragedies, among them *Abele*, *Filippo*, *Maria Stuarda*, and *Saul*. He wrote also a number of comedies (*L'Uno, I Pochi, I Troppi*), satires, and sonnets, and a masterly autobiography.

Alföld, great plain of Hungary, lying between the Danube and the Carpathians (q.v.). Parts of it were taken from Hungary by the treaty of Trianon (q.v.) and now belong to W. Rumania and N. Yugoslavia (see BANAT). The land, called *pusztá*, is traditionally barren, but extensive irrigation schemes are now in operation, particularly that stemming from the damming of the Tisza (q.v.) at Tiszalök. Cereals, vines, tobacco, hemp, and flax are produced, and live-stock is reared.

Alfonsine Tables, see ALPHONSINE TABLES.

Alfonso, name of 5 kings of Aragon (q.v.). Those mentioned below are the most important.

Alfonso I (1104-34), married to the widow of Raymond of Burgundy (q.v.) in order to unite the 2 great Christian states against the Moors. His violent quarrels with her led to civil war. He gained the title of the Battler from his great battles with the Moors.

Alfonso II (1162-96), christened Ramon, adopted this name in order to please the Aragonese. He was ruler of Aragon and ter. in SE. France.

Alfonso V, the Magnanimous (1416-1458), King of Aragon, Sicily, and Naples. A patron of men of letters and one of the conspicuous figures in the Renaissance.

Alfonso, name of 11 kings of Leon and Castile. Of the first 5 kings of this name very little is known, much of the information about them that exists being based on later legends. The most important later kings of this name are noted briefly below.

Alfonso VI (1065-1109), the Brave, a leader of organised resistance to the Moors. He was, however, defeated by the Almoravides at Zalaca in 1086.

Alfonso VII (1126-57), 'the king of the men of two religions.' He strove for unity of his realms and protected the Moors. He was killed trying to check a Moorish rising.

Alfonso VIII (1158-1214), King of Castile and leader of the Christian coalition that broke the power of the Moors. He married a daughter of Henry II of England.

Alfonso X (1252-84), 'El Sabio' (the Learned), gave great encouragement to the study of astronomy, and was a patron of the arts. His rule was lax, however, and the nobles gained a good deal of power at the expense of the crown during his reign.

Alfonso XI (1312-50), the Avenger, is noted chiefly for the ruthless manner in which he repressed his rebellious nobles, and for the defeat of the last Moorish invasion from Africa.

Alfonso, name of 6 kings of Portugal:

Alfonso I (1139-85) succeeded in establishing the independence of Portugal, which up to this time was a dependency of Leon. A great warrior and a man of gigantic stature, he distinguished himself in many battles against the Moors.

Alfonso II (1211-23), noted chiefly for his endeavours to weaken the power of the clergy, in the course of which he was excommunicated, and for the code of law which he introduced.

Alfonso III (1248-79). His reign was taken up principally in fighting the Moors.

Alfonso IV (1325-57). Wars with Castile and the Moors occupied most of his reign. Civil war broke out between himself and his son Pedro as a result of the barbarous murder of Inez de Castro (Pedro's wife).

Alfonso V (1438-81), usually called 'Africano,' a name which he gained for himself by invading the territories of the Moors in Africa.

Alfonso VI (1656-67). Forced on account of his vices to abdicate in 1667, he retired to Terceira, where he d. in 1675.

Alfonso XII, King of Spain (1875-1885), son of Isabella II. In 1868 he accompanied his mother into exile, and in 1870 she abdicated in his favour. While continuing his education at Sandhurst in 1874 he issued a manifesto proclaiming himself the only representative of the Sp. monarchy. In the following year he entered Spain, being received with enthusiasm, and in 1876 suppressed a Carlist rebellion.

Alfonso XIII (1886-1941), King of Spain, son of A. XII, b. posthumously. His mother, Queen Maria Christina, formerly an Austrian archduchess, acted as regent until 1906. In 1906 he married Princess Victoria Eugenie of Battenberg, niece of Edward VII, and narrowly escaped assassination on the day of his marriage. During A.'s minority, Spain lost her colonial empire as a result of war with the U.S.A. Notable features of policy in Spain during his reign were her neutrality during the First World War, and her campaign in Morocco—which created trouble at home that led to the suspension of the constitution in 1923. His assassination was attempted sev. times. In 1930-1, following the death of the dictator, Primo de Rivera (whom A. had supported), the Republican party rapidly gained in political influence until, in April 1931, they carried the day at the polls. To avert the danger of civil war A. left the country, though he did not renounce his monarchical rights until a few weeks before his death, when he named his third son, Don Juan, as his successor to the Sp. crown 'when Spain judges it opportune.' See S. Erskine, *Twenty-nine Years: the Reign of King Alfonso XIII of Spain*, 1931, and a life by R. Seneourt, 1942.

Alford, Henry (1810-71). Eng. divine and scholar. He showed early promise of extraordinary abilities, for at the age of 10 he had written sev. Lat. odes and a hist. of the Jews. He entered Cambridge in 1829. Shortly afterwards he issued his first vol., entitled *Poems and Poetical*

Fragments. The School of the Heart, and other Poems followed. His great work, his critical ed. of the *Greek Testament* in 4 vols., was pub. between 1849 and 1861. In 1835 he became vicar of Wymeswold in Leics. His scholarly and erudite *Chapters on the Greek Poets* now appeared. In 1857 he was appointed Dean of Canterbury.

Alford, vil. in Aberdeenshire, Scotland, where the Covenanters were defeated by Montrose, 1645. Pop. 1248.

Alford, mkt. tn. of Lincs, England, 22 m. N.E. of Boston. Pop. 2500.

Alfort, see MAISONS-ALFORT.

Alfraganus, or **Al-farghāni**, Arabian astronomer who fl. in the early part of the 9th cent. He was the first among the Arabian astronomers to enumerate the small stellar groups, and he wrote a treatise on the elements of astronomy.

Alfred Ernest Albert (1844-1900), Duke of Saxe-Coburg and Gotha and Duke of Edinburgh, second son of Queen Victoria. On the deposition of Otto he was unanimously invited by the Greeks to become their king, but political difficulties of long standing rendered it impossible. He was created Duke of Edinburgh in 1865; rear-admiral in 1878; and Commander-in-Chief at Devonport (1890-3). He succeeded to the Duchy of Saxe-Coburg and Gotha in 1893, surrendering his privileges as an Eng. peer.

Alfred of Beverley, see ALURED.

Alfred the Great (c. 849-99), Eng. king, b. Wantage, son of Ethelwulf, King of Wessex. In 853 and in 855 he was taken on pilgrimage to Rome. Even before his accession to the throne he was in conflict with the Danes, and he assisted his brother Ethelred right down to Ethelred's death. He was the youngest son of Ethelwulf, and succeeded on the death of his elder brother (871). The first years of his reign were constantly occupied in fighting the Danes under Guthrum. For 7 years A. fought, bargained, and treated with the Danes in a vain endeavour to give his kingdom respite from the constant war and bloodshed which it had endured. In 878 A. was driven into the woods and swamps of Somerset, and remained in hiding at Athelney until he felt strong enough to attack the Danes again. At Edington in Wilts in 878 he utterly defeated the Dan. invaders after a stubborn struggle, driving them back to their fortifications at Chippenham. After 2 weeks' siege the Danes agreed to terms, generally known as the treaty of Wedmore. Guthrum was baptised, the country was divided up; N. and E. of a line drawn roughly from Chester to London became the Danelaw (q.v.). S. and W. remained Wessex. The decisive victory at Edington arrested the flowing tide of Dan. conquest and brought nearer a united Eng. kingdom. For the greater part of the rest of his reign A. was able to attend to the pressing domestic affairs of his kingdom. The army was reorganised, a navy recognised as an absolute necessity, justice was reformed, education received attention. By means of his navy A. was

able to attack the Danes on the sea and in their strongholds, but this policy of a strong navy was neglected by his successors. To his court A. invited learned men from all parts of Europe. Chief amongst these were Asser, Werth, and Plegmund. From his reign dates the beginning of Eng. prose literature, and the hist. of Orosius, the *Consolation* of Boethius, the *Pastoral Care* of Gregory, and Bede's *Ecclesiastical History* are all trans. by A. himself. The *Anglo-Saxon Chronicle* was probably begun in its final form under his influence. He issued also a code of laws, compiled on the lines of the code of Ine and Offa. In 884 A. again defeated the Danes. In 892 a Dan. army under Hasting attacked Wessex, and although A. inflicted sev. defeats on the Danes desultory fighting continued up to A.'s death. These inconclusive later wars should not obscure the fact that A.'s earlier victories had undoubtedly saved Eng. learning and culture from extinction. A. combined the qualities of a military leader and great administrator with a sincere piety and love of learning. He has been called the most effective W. European ruler since Charlemagne. See *Anglo-Saxon Chronicle*; C. Plummer, *Life and Times of Alfred the Great*, 1902; F. C. Hayward, *Alfred the Great*, 1936; F. M. Stenton, *Anglo-Saxon England*, 1943.

Alfreton, tn in Derbyshire, England, 14 m. from Derby, noted as a market centre. Coal-mining is the chief industry, and there are hosiery and textile factories and engineering works. Pop. 23,300.

Alifuras, or **Harafuras**, aboriginals of Celebes, but inhab. also of Buru, Ceram, and New Guinea, and said to be of Malayan or Indonesian extraction.

Algae (Lat. *alga*, seaweed), with the fungi, form the div. of the vegetable kingdom known as the Thallophyta, but differ in possessing chlorophyll, though sometimes masked by other colours. A. enter into symbiotic partnership with fungi to form lichens. A., like fungi, have as their body a *thallus*, which is a relatively simple structure. This may consist of a single cell, a row of cells, a plate of cells, one cell thick, or a body sev. cells thick with structures like stems and branches, as in seaweeds (q.v.). A. are divided into Chlorophyceae or green A., Cyanophyceae or blue-green A., Phaeophyceae or brown A., Rhodophyceae, red A., and Diatomaceae, usually yellowish brown. A. reproduce by sexual or asexual spores; in the former, gametes sometimes unite in isogamous conjugation, i.e. with similar gametes; but also in heterogamous conjugation, when a male unites with a female gamete; in the latter often by means of ciliated spores able to move in water.

The *Pleurococcus* is a unicellular green alga that appears on tree trunks, multiplying by cell div. to form a green powdery growth, and reproducing by biciliate spores and isogamy. *Spirogyra* forms slimy masses in ponds and lakes, each alga consisting of sev. cells united to form a filament; each cell is complete in

itself and the filament has no attachment and no distinction of base and apex. *Spirogyra* is isogamous; 2 adjoining filaments send out processes from their cells which fuse on meeting, forming a tube through which the gamete of one cell can pass to another cell and there unite with a similar gamete. *Oedogonium* is also a filamentous green alga, growing attached to stones in ponds; it may reproduce by multiciliate spores, attaching themselves to stones and forming new filaments, or sexually, by forming sexual organs on the same or separate filaments, consisting of the male antheridium, formed by cell div. and producing 2 spermatozooids with large

GROUP OF DIATOMS

nuclei and many cilia; and the female oogonium, a rounded protoplasmic ovum. The spermatozoid swims down a passage to the ovum, uniting in an oöspore which usually gives rise to 4 zoöspores with cilia, that break free, swim about, and finally form new plants. Thus the green A. vary greatly in structure and reproductive processes. There is similar variation in other A.

A. are found in damp places, such as damp tree trunks, surface of moist soils, damp rock, etc., as well as in pools and streams. *Chlorophyceae*, *Phaeophyceae*, and *Rhodophyceae* are marine A., the last 2 comprising most of the seaweeds (q.v.). *Cyanophyceae* are found in fresh and sea water, reproducing chiefly by spores or by div. of a filament at a cell called a *heterocyst*—a large cell containing food material. Diatoms are highly important constituents of *plankton*, the life of surface waters, and consist of single-cell organisms encased in delicate skeletons of silica, often beautifully ornamented and in 2 halves, fitting together like the lid on a pill-box. See F. Wille, *Freshwater Algae*, 1887; C. S. West, *Freshwater British Algae*, revised by F. E. Fritsch, 1932; F. E. Fritsch,

Structure and Reproduction of the Algae (2 vols.), 1935-45; D. H. Scott and F. T. Brooks, *Structural Botany*, vol. II, 1948.

Algardi, Alessandro (1602-54). It. sculptor and architect, b. Bologna. He was a pupil of Giulio Cesare Conventi. He first worked in Mantua, but afterwards went to Rome, where he executed 2 statues in stucco for the Capella Rondini in the church of San Silvestro. His prin. works are the colossal group in marble, representing the decapitation of St Paul, for the church of the Barnabite Fathers at Bologna; the monument of Leo XI, and 'Attila checked by St Leo,' in St Peter's; and the bronze statue of Innocent X.

Algaroba, or **Algarroba** (from Arabic *al*, the, and *kharroub*, carob-tree, or from *Algarrobo*, a tree in Andalusia), carob-tree, *Ceratonia siliqua* (q.v.), and bean; also S. Amer. species *Prosopis juliflora* (family Leguminosae), known as the mesquite-tree.

Algarotti, Francesco, Count (1712-64), It. philosopher and writer on art. He was educ. at Rome and Bologna. He became acquainted with Voltaire in Paris, and thus formed a long friendship. He produced in Paris *Newtonianismo per le dame*, a work on optics. In 1740 he was made a count of Prussia by Frederick the Great and lived in Berlin for some time. His chief work on art was his vol. of 'Essays.'

Algarve, most southerly prov. of Portugal, co-extensive with Faro dist. (q.v.). It is bordered on the E. by Spain, and on the W. and S. by the Atlantic. Parts of the prov. were successively in the hands of the Phoenicians, Romans, and Visigoths (q.v.). In 1140 it became a Moorish kingdom, and it was the last stronghold of the Moors (q.v.) in Portugal. It was taken by Alfonso III (q.v.) in 1249. Fruit and wine are produced, and there is fishing and salt-making; the inhab. have a long seafaring tradition. The prin. tn is Faro. Area 1958 sq. m.; pop. 326,000.

Algebra, system of mathematical calculations where quantities are designated by symbols, usually letters of the alphabet. In ordinary A. the same operations are carried on as in arithmetic, but the symbols being capable of a more generalised and extended meaning than the figures used in arithmetic, it facilitates calculation where the numerical values are not known, or are inconveniently large or small, or where it is desirable to keep them in an analysed form. Addition is denoted by + and subtraction by -; $a+b$ and $a-b$ thus represent the addition to a and the subtraction from a of the quantity b , respectively. The results may enter into subsequent calculations as $(a+b)$ and $(a-b)$. Multiplication is denoted by \times , or by putting the symbols together, thus $a \times b = ab$; div. is denoted by \div or the use of the fractional form, thus $a \div b = \frac{a}{b}$ or frequently

a/b . Involution, or the multiplication of the same quantity, is shown by the use of

small numbers, or indices; thus $aaaa = a^4$.

Therefore $a^4 \times a^3 = a^7$; $a^5 \div a^2 = \frac{1}{a^3}$ or a^{-3} .

Evolution is denoted by the use of radical signs or of fractional indices; thus the seventh root of $a = \sqrt[7]{a}$ or $a^{\frac{1}{7}}$.

Negative quantities commonly enter into algebraic calculation. Thus if the value of a symbol be represented by the distance in a given direction of a point from a fixed point, the corresponding negative symbol represents an equal extension in the opposite direction. Imaginary quantities, such as the square root of a negative number, can also be symbolised and used in A.

A. was probably known in a rudimentary form to the anc. Egyptians, but the earliest W. work on the subject was written by Diophantus of Alexandria about AD 350. The Hindus had developed A., however, to a point far beyond the achievements of Diophantus. From them the Arabs brought the system to the W., and Al-Khwarizmi (q.v.), c. AD 820, wrote a work entitled *Al-jabr wa'lmuqabala*, from which the word 'algebra' has been derived. In 1202 an It. merchant, Leonardo di Pisa, reintroduced the study of A. into Europe, where it had declined since the fall of the Rom. Empire. The solution of cubic equations and biquadratic equations was accomplished by the 16th cent., and in the 17th Franciscus Vieta used symbols for known quantities as well as unknown, and introduced such terms as *affirmative*, *negative*, and *co-efficient*. Descartes, the famous Fr. philosopher, connected A. with geometry in 1637, and did much to extend the theory of equations. The discovery of logarithms by Napier and of the calculus by Newton and Leibnitz, and the development of differential equations by Gauss and Riemann, prepared the way for Einstein's theory of relativity, and for a modern higher A. which has proved to be the tool and to some extent the inspiration of recent research in the fields of atomic energy and radio.

Algeciras, Sp. tn in the prov. of Cádiz, on the Bay of Gibraltar. In 1906 a conference of European powers was held here to settle Moroccan affairs (see MOROCCO, *History*), and France and Spain were entrusted with the task of preserving order in Morocco. The 'Agadir incident' (see AGADIR) in 1911 arose from a presumed Ger. breach of this agreement. During the Civil war of 1936-9 the tn was bombarded by republican warships (1936). A. has ferry services to Tangier, Ceuta, and Gibraltar, and is a popular resort. Leather and charcoal are produced. Pop. 45,000.

Alger, Russell Alexander (1836-1907), Amer. soldier and politician, b. Medina co., Ohio. At the outbreak of the Civil war he enlisted in a cavalry regiment,

distinguishing himself in the Gettysburg campaign. He was secretary of war under McKinley, and was criticised for extravagance; he replied in his book, *The Spanish-American War*, 1901. He was elected senator in 1902.

Algeria, Fr. ter. of N. Africa, bounded on the W. by Morocco, on the E. by Tunisia and Libya, on the S. by Fr. W. Africa. A. has a Mediterranean littoral of 625 sq. m. The area of A. is 851,299 sq. m. divided into 2 regions, N. A. (80,938 sq. m.) and the S. ters., which include the Algerian parts of the Sahara Desert (770,361 sq. m.). N. A. is a mountainous mass divided into 3 zones by the 3 ranges of the Atlas Mts: the Tell Atlas, the High Plateaux, and the Saharan Atlas. This area is in the temperate zone. A. forms a group of Fr. *départements*, and as such is administered as an integral part of the metropolitan country. The pop. (Jan. 1957) was officially stated to be 1,200,000 Europeans, mostly of Fr. origin, and 8,300,000 Muslims, consisting of Berbers (i.e. Kabyles, Tuaregs, Mozabites, Aurasiens) and Arabs who are now freely intermingled with the Berbers. There is also a large Jewish pop. In May 1846 full citizenship was granted to all Algerian Muslims. In Sept. 1847 the full rights pertaining to the status of a Fr. citizen were guaranteed to all the inhab., and an Algerian Assembly was created possessing a considerable degree of legislative autonomy. The Assembly consists of 120 members who are elected by 2 colleges. To the first college belong all citizens of Fr. status and Muslims who have acquired such a status by certain military, academic, or other analogous qualifications. The second college is composed of all other Muslim citizens. Members of the Assembly are elected for 6 years, and the 2 colleges each elect 60 members. In the National Assembly A. is represented by 30 seats; 14 in the Council of the Rep.; and 18 in the Assembly of the Fr. Union. These seats are divided equally between the electoral colleges. A. belongs to a customs union with metropolitan France, and the exchange of agric. and mineral products for industrial equipment and food products constitutes the main item of trade. The trade deficit in 1954 was 78,000 million francs, attributed largely to the heavy increase of capital goods required for industrial development and the general increase in living standards. Direct grants and loans from France alone totalled 33,000 million francs in 1954, and in 1955 were estimated at 46,000 million francs. The main exports are wine, iron ore, citrus fruit, cereals, spring vegetables, and phosphates; and in 1954 the total value of exports was 140,000 million francs (imports 218,000 million francs).

A. may well become an immensely rich country following the discovery since 1952 of immense deposits of oil at Hassi Messaoud near Ouazgla, estimated at between 200 million and 1000 million tons. A pipeline to either the Tunisian

or Algerian coast will cost about £35 million (1956 estimate). Until the pipeline is laid the oil will be taken 100 m. by lorry to Touggourt, and thence by rail to Philippeville on the coast. Oil has also been found close to the Libyan border. Great deposits of natural gas have also been discovered S. of In Salah, a particularly barren part of the Sahara. S.E. of Tindouf the deposits of iron ore are said to rank among the world's 5 largest; it is easy to mine and has an average consistency of 54 per cent, which is equal to second grade Swedish ore. Again transport presents a great difficulty and will require large capital and the perpetual goodwill of Morocco, through whose territory a railway would have to run. In Mauretania, at Fort Gouraud, even higher quality ore has been found. In all these projects international interest has been encouraged by France. However, given that the exploitation of A.'s mineral deposits is economically feasible, and no serious suggestions are made to the contrary, A. in the meanwhile can only be regarded as a poor country, but with rich potentialities. Its present natural resources barely sustain its pop., which has increased from 2,000,000 in 1830 to 8,300,000 in 1957 (Muslims). It is estimated that the net natural increase of the pop. in 1954 was 240,000. European landowners, who numbered 22,037 in 1956, held 2,726,666 hectares, and 632,000 Muslim landowners 7,349,166 hectares, of which 6,000,000 are cultivated. Much of the best land is owned by the Europeans, and this is justified by the French on the grounds that most of this represents land which was reclaimed from swamps and never in beneficial occupation. (According to Muslim law previously uncultivated land which has been developed normally belongs to those who cultivate it.) Soil conservation and irrigation schemes carried out since 1937 include the construction of 12 major dams and nearly 2000 m. of canals. In agriculture and in industry, as well as in public works, France has invested vast sums of money.

Communications. In 1955 there were 15,534 m. of all-weather roads; 29,576 m. of other roads and tracks; and a further 3976 m. under construction. Railway lines totalled 2776 m. of track, and in 1954 ran 784,371.089 ton goods m. and 541,000,000 passenger m. A. is served by 4 international airports at Algiers, Oran, Bone, and Aoulouf. There are in addition 34 other aerodromes, 14 of which are classified as secondary.

Education. One-sixth of the ann. budget is set aside for education, in 1955 estimated at 16,800 million francs in addition to 5700 million francs for building and equipping schools. Nevertheless in 1956 only 523,000 children were attending schools, of whom 350,000 were Muslims. It is estimated that another 80,000 million francs is required to provide the accommodation for all children of school age. Secondary education is given in 49 *lycées* which were attended in 1954 by 35,000 pupils of

whom 4101 reached matriculation standard. There are 3 technical institutes and 11 technical depts attached to high schools. The Univ. of Algiers ranks third among Fr. univs. and is attended by some 5000 students. A commercial training school is attached to the univ.

Health. Typhus, which was a major scourge, appears to have been eliminated. Malaria is no longer common, but tuberculosis is widespread. In 1954, 3,364,560 persons were examined for tuberculosis. Trachoma is also common, especially in the S. Mobile ophthalmological units are extensively used to combat the disease. In 1956 there were 148 hospitals with a total of 30,000 beds. The Public Health Dept employed 200 doctors, and another 1800 doctors were in private practice or serving in the army. Military hospitals and infirmaries are available to the public in remote areas or in an emergency. The general budget is responsible for the cost of free medical assistance, a reform which took place in July 1956. The average yearly expenditure per person on health services is 1034 francs. The infant mortality rate is 8.5 per cent as against an estimated 50 per cent a century ago.

History. The Phoenicians founded trading settlements on the coast, and Carthage estab. her rule over the E. region. The Romans superseded the Phoenicians, conquering the ter. They penetrated into what is now desert, and allegedly Rom. remains are to be found as far S. as In Salah. The Berbers had more or less embraced the Christian faith by the 5th cent., and in the 6th cent. the Vandals invaded and partially occupied A. This era was followed by the Byzantine re-conquest; but during the 7th cent. the Arabs incorporated the coastal regions into the Muslim world, and the inhab. turned to Islam. Until the 11th cent. A. enjoyed comparative prosperity. It came to an end with the invasion of the Nomad Hilals from Egypt, who seriously disrupted the Berber kingdoms which were by this time well estab. Early in the 16th cent. the tn and harbour of Algiers were held by the Turks, becoming the cap. of a state under suzerainty of Stambul. Algiers became the notorious H.Q. of the Corsairs (pirates), of whom Horuk Barbarossa was the best known. Various expeditions by the maritime powers—England, Holland, France, Spain, and later America—failed to keep the pirates in check. Eventually, in 1830, Algiers was bombarded into submission by the Fr. fleet under the command of Gen. Clausel. It was 53 years before the whole of A. was finally subdued and general tranquillity estab.

Dissatisfaction with Fr. racial policy and the tardiness of necessary reforms led to general disaffection and to the estab. of a militant revolutionary movement, the 'Étoile Nord-Africaine' (N. African Star), under the leadership of Messali Hadj, formerly a member of the Communist party. The N. African Star became a branch of the 'Secours Rouge

International' in Mar. 1926. The objective of the organisation was to launch by all possible means, including violence, a social and political rebellion. Rapidly local conditions influenced the organisation and both nationalism and religious fanaticism began to get out of hand. For the first 10 years of its existence the N. African Star movement was apparently confined to Algerians living in France; in 1937 it became the 'Parti Populaire Algérien' (Algerian People's Party), which was banned in 1939 because of its Communist associations.

Until the liberation of France in 1944, the Free Fr. H.Q. was in A. On 8 Nov. 1942 a great Anglo-Amer. expeditionary force under the supreme command of Gen. Eisenhower landed at various ports in A. and Fr. Morocco. After 3 days Adm. Darlan surrendered; he was assassinated soon afterwards.

In the year of the Fr. liberation, political activity again sprang up in A. In Aug. 1944 another group was created under the leadership of Ferhat Abbas and named 'Les Amis du Manifeste Algérien' (Friends of the Algerian Manifesto). The Algerian People's Party, which had gone underground after being banned, reappeared in 1946 as the 'Mouvement pour le Triomphe des Libertés Démocratiques' or M.T.L.D. (Movement for the Triumph of Democratic Freedoms). The Friends of the Algerian Manifesto now became virtually an appendage of the M.T.L.D. and took an active part in the subsequent uprisings. (Between 1 Nov. 1954 and 31 Dec. 1956 5344 civilians were murdered, of whom 4149 were Muslims.)

Active training in sabotage and terrorism by the rebels was carried out with a strong admixture of the ideals of nationalism or communism, according to the politics of the rival organisations, of which there were several in 1946. For instance, the 'Front de Libération Nationale,' or F.L.N. (National Liberation Front), with H.Q. in Cairo, claimed to have cut the throats of 18 Muslims, members of the M.N.A. (National Algerian Movement). The mutual antagonism of various anti-gov. parties is one of the major phenomena of the Algerian insurrection. In 1957 there were probably 6 or 7 separate but active quasi-military parties. According to official Fr. sources only the M.N.A. appears to be an exclusively Algerian movement; the others are all in some way supported by Egypt, other Arab countries, or international communism.

The active participation and encouragement of Egypt have been proved on many occasions. For instance, on 16 Oct. 1956 the 400-ton yacht *Athos*, formerly *Il Briavels*, was seized on its way from Alexandria to the Bay of Boufades in A. The crew were armed and the ship's papers not in order. The cargo consisted of nearly 100 tons of arms intended for the rebel leaders of the Turenne underground group. Much of the material was manuf. in India after 1953. Egyptian complicity is no longer covert, and

assistance has taken the form of the actual training of terrorists, incessant propaganda by every modern method, and the supply of arms and financial aid. Both Morocco and Tunisia afford active assistance to the rebels.

At the end of 1956 there were said to be 400,000 troops engaged in an effort to restore law and order in A. Nevertheless, during the 6 months from Nov. 1955 to May 1956, large numbers of schools, bridges, gov. buildings in forest areas,

E.N.A.

AN ARAB CAID, ALGERIA

medical and social centres, railway depots, and buildings occupied by post offices were destroyed. Since then there has been a large increase in destruction. In addition sev. hundred farms have had their farm buildings destroyed, and much damage has been caused to crops, forests, and vineyards. The French have offered to carry out democratic elections and invite foreign observers to attend the elections, and to do away with the 2-college system within a reasonable time after the cessation of the insurrection. Other reforms have been promised. The restoration of political stability is obviously necessary if France and A. are to benefit fully from the recent discoveries of oil, natural gas, and minerals. The joint Brit. and Fr. action in respect of the Suez Canal (q.v.) against Egypt (q.v.) cannot be associated with Egypt's participation in the Algerian rebellion.

The chief tns of A., with pops., are Algiers (361,000, including suburbs), Oran (590,000), Constantine (150,000),

Bone (150,000), Sidi-bel-Abbès (150,000), Tlemcen (80,000), and Philippeville (75,000).

There are few works in English on A., but *The Algerian Problem*, pub. as a booklet by the Service de Presse et d'Information in Feb. 1957, and available at any Fr. Embassy, contains a comprehensive survey, historical, political, and economic, of A. Also various handbooks and pamphlets are available gratis from the same source. Otherwise see W. Sloane, *Greater France in Africa*, 1924, and W. B. Worsfold, *France in Tunis and Algeria*, 1930. *The Times*

Sheltered from every wind, it is a favourite winter resort. In 1954 the pop. was 361,285, comprising a medley of all nationalities, the Europeans numbering approximately 200,000.

Algoa Bay, in the SW. angle of which is situated Port Elizabeth, second city and port of Cape Prov., S. Africa. A. B. was so named by Bartholomew Diaz (q.v.). 1486. In 1820 5000 Brit. settlers landed in A. B. Port Elizabeth was named after Elizabeth, wife of Sir Rufane Donkin, acting governor of the Cape. Pop.: Whites, 83,181; Bantu, 78,953; Coloureds, 46,113; Asiatics, 4276 (1951).

E.N.A.

ALGIERS, FROM THE MARINA

index should also be consulted, especially for Mar. 1957.

Alghero, seaport in Sardinia (q.v.), on the W. coast, 17 m. SW. of Sassari (q.v.). It has a 12th-cent. cathedral. There is fishing for coral and lobsters, and a trade in wine. Pop. 21,200.

Algiers (Fr. *Alger*), cap. of Algeria. The name is derived from *Al-Jezair*, an Arabic word meaning islands. To form a harbour, which after heavy expense provides good accommodation, 4 is. were joined together. A. is situated on the slopes of a hill at the summit of which is a fortress called the Kasbah, which belonged in former days to the beys. The city consists of 2 parts, one of which is old, while the other is a marked contrast by reason of its modernity. The modern tn possesses many splendid streets, and the general air is European. The tn was founded in the 10th cent., and from 1530, when the Turkish pirate Khair-ed-Din expelled the Spaniards, until its conquest by France in 1830 it was a nest of piracy, exacting tribute from all the maritime nations. It is third in importance among Fr. seaports and a coaling station, and distributes the grain, esparto grass, wines, oil, etc., of central Algeria.

Algol, or **Beta Persei**, star of second magnitude. It is the best-known variable star, changing from magnitude 2.3 to 3.5 during a period of 68 hrs 49 min. owing to being eclipsed by a dark companion star. Vogel estimated that A.'s diameter is 1.2 that of the sun, and its dark companion about the same size as the sun, and concluded that the distance between their 2 centres is 3,200,000 m. A. has a helium spectrum, and though Al-Sufi classified it as a red star in the 10th cent., it is now a brilliant white.

Algoa, extensive dist. in the prov. of Ontario in the dominion of Canada, on the N. shore of Lake Huron. The ter. has great mineral wealth, being rich in silver and copper. The Canadian Pacific Railway passes through the dist.

Algonkian System, geological term used to denote a series of rocks of pre-Cambrian age which are younger than certain old pre-Cambrian gneisses but which are in turn followed by early Palaeozoic rocks. The term should not be used outside Canada where it was originally defined. In the region of Lake Superior these rocks, consisting of quartz, limestone, sandstone, etc., contain very valuable iron and copper deposits.

Algonkin, N. Amer. Indian tribe of the Algonquian language family. In the 17th cent. they were driven out of the St Lawrence region by the Iroquois. Today there are about 1500 in reserves in E. Ontario and W. Quebec.

Algonquian, div. of Amer. Indian languages, embracing a large number of tribes along the Atlantic coast from Quebec to Carolina, in the Upper Mississippi region, and W. into the plains of the Saskatchewan and Upper Missouri. They are polysynthetic in structure and also inflective.

Alguazil, Sp. title conferred upon judges in former times. The pure function of it has been lost, however, and any officer connected with the execution of justice now bears the name.

Alhakim I (d. 822), emir of Cordova, drove the Franks beyond the Pyrenees. *A. II*, caliph of Cordova (961-76), won many victories over the Christians, and extended the influence of Mohammedanism.

Alhama de Granada, Sp. tn in the prov. of Granada, on the Marchan. It has thermal springs, used since Rom. times. A ballad describing the fall of the tn, entitled *Ay de mí, Alhama*, was trans. by Byron. Pop. 6000.

Alhambra, tn in Los Angeles co., California, U.S.A. It stands at the entrance to the San Gabriel valley and is a residential suburb of Los Angeles. Near its tn limits are the remains of the famous San Gabriel Mission founded in 1771. Pop. 51,350.

Alhambra (*Ka't al-ahamra*, the red castle), anct royal palace and fortress in Spain, one of the most splendid examples of Moorish art in the world, standing on a hill overlooking the city of Granada (q.v.). It dates from the 11th cent., but the finer parts belong to the 13th and subsequent cents. Among its celebrated enclosures are the wonderful Court of the Lions, with its fountain, pavilions, and delicate filigree arches; the Court of the Myrtles, in which the columns are of alabaster and jasper; the Hall of the Ambassadors, with its cedarwood ceiling; the richly decorated Hall of the Two Sisters; and the whispering gallery called the Hall of Secrets. Beside the A. stands the Renaissance style Palace of Charles V, begun in 1526 but never finished. See ARCHITECTURE, Mohammedan; and see A. F. Calvert, *Granada and the Alhambra*, 1907.

Alhassan Ibn, see LEO AFRICANUS.

Alhazen, Arabian mathematician of the 11th cent. (not the Alhazen who trans. Ptolemy's *Almagest* in the 10th cent.), b. at Bassora (or Busra) and d. in Cairo in 1038. He professed to be able to construct a machine which could regulate the inundation of the Nile, but when the caliph Hakim gave him the opportunity A. saw that his scheme was impracticable and feigned madness till the caliph died. He had a reputation as an authority on optics and wrote 2 books, *Treatise on Twilight* and *Thesaurus Optice*.

Ali—son of Abu Talib—(c. 600-61), cousin and son-in-law of Mohammed

(q.v.). Pious legend has made him a great warrior and a learned man, but he took a fair share in the fighting during Mohammed's lifetime. When Mohammed d., A. was not chosen as his successor, and it was not till the third caliph was murdered that some Muslims chose him in 656. The important prov. of Syria did not recognise him and leading men in Arabia, egged on by Aisha (q.v.), whom A. had insulted, opposed him, so he retired to Iraq where he defeated his foes from Arabia. He proved an incompetent ruler, was outmanœuvred by the governor of Syria, and was murdered after a troubled 4 years, in which he could hardly be said to rule, in 661. His claim to be the heir of Mohammed was the start of a legitimist movement which gathered strength from other motives.

Ali, Hyder, see HYDER ALI.

Ali Pasha (1741-1822), Lion of Janina, b. Albania. The Turks made him pasha of Trikala, 1787, and pasha of Janina, 1788. He helped the Turks during the Austro-Russian war, and sided first with the Fr. and then with the Brit. during the Napoleonic wars. A career of cool impudence, deliberate betrayal, and high daring ended in his being put to death by Mahmud II. Though merciless and unscrupulous he did much to free Albania from bandit terrorism and treated the Christians under his jurisdiction with unusual fairness.

Alias, name given to a second writ when the previous one has been impossible to deliver or failed in effect. The term, however, has been corrupted, and applies now to false names used by criminals.

Alibi (Lat. *alibi*, elsewhere), plea of a person who, charged with a crime, alleges that he was elsewhere when the crime was committed, and thus could not be guilty.

Alicante: 1. Sp. prov., in Valencia (q.v.), with a coastline on the Mediterranean. The surface is very diversified, and the climate is temperate. Cereals, olives, fruit, and vines are grown, and silk-worms are reared. Area 2238 sq. m.; pop. 640,900.

2. (anct *Akra Leuka*; Rom. *Lucentum*) Sp. tn, cap. of the prov. of A., in a bay on the Mediterranean. It is a modern tn with fine buildings. The hill above the tn is crowned with a ruined fortress. Its port is busy, principally with ships for the Balearic and Canary Is., and it is a popular resort. Pop. 106,200.

Alicata, see LICATA.

Alice, Princess, Countess of Athlone, see ATHLONE, EARL OF.

Alice Maud Mary, Grand Duchess of Hesse (1843-78), second daughter of Queen Victoria, b. Buckingham Palace. In 1862 she married Prince Louis of Hesse, who succeeded his father as Grand Duke in 1877. During the short illness of her father the princess nursed him with the greatest care, and d. of diphtheria, caught nursing her husband and children. Her letters, ed. by Dr Sell, give a delightful impression of her as mother, daughter, and wife.

Alice Springs, tn in the Macdonnell Ranges of the N. Ter., Australia, approximately 1000 m. from Adelaide. Linked by air and rail to Adelaide, and to Darwin by air and by the 954-m.-long Stuart Highway, it is the centre of the thriving central Australian pastoral industry, and is becoming increasingly popular as a tourist centre. It is second to Darwin in size and importance in the N. Ter.; non-aboriginal pop., just over 3000.

Alliudi, see LIPARI ISLANDS.

Alien (Lat. *alienus*, foreign), one who, resident in one state, is by birth or naturalisation the subject of another. The privileges and disabilities of A.s in England have long been the subject of numerous statutes, from the reign of Edward III onwards. To-day an A. residing in Great Britain may be a property-holder, but is not enfranchised, may not hold public office, or own a Brit. ship or aircraft. The Rep. of I. was declared (Republic of Ireland Act, 1949) not to be a foreign country, and references in Acts of Parliament to A.s, foreigners, or foreign countries do not refer to it or its citizens.

Entry of Aliens into the United Kingdom. The control of the admission of A.s into the U.K. is exercised through Orders in Council made under the Aliens Restriction Acts, 1914 and 1919, as extended annually by the Expiring Laws Continuance Acts. The latest Orders in Council are the Aliens Order, 1953, and the Aliens Order, 1957; the former consolidated and revoked all previous Orders.

An A. wishing to enter the U.K. must apply for leave to land to an immigration officer at the port of his arrival. If the immigration officer decides to grant leave to land, he is empowered to attach to it conditions governing the length of the A.'s stay and his freedom to take employment, etc. An immigration officer is required to refuse an A. leave to land in certain specified circumstances, e.g. if he is not in a position to support himself and his dependants (if any) in the U.K., if he has been sentenced in a foreign country for any extradition crime within the meaning of the Extradition Acts, 1870-1935, if he is a person of unsound mind or mentally defective person, or if he proposes to enter the employment of a particular employer in the U.K., but cannot produce a written permit issued by the Ministry of Labour and National Service. The secretary of state has power to make a Deportation Order against an A. in cases where a court has recommended that one should be made, or where he deems it to be conducive to the public good that one should be made.

Generally speaking, an A. must register with the police after 3 months in the U.K. The total number of A.s registered with the police at 31 Dec. 1956 was 378,870.

Nationality and Naturalisation. An A. is defined in Section 32(1) of the British Nationality Act, 1948, as a person who is not a Brit. subject, a Brit. protected person, or a citizen of the Irish Rep.

Since the Act came into operation on

1 Jan. 1949, Brit. nationality has depended upon the possession of citizenship of the U.K. and colonies or of one of the other self-governing countries forming the Brit. Commonwealth of Nations (although there are persons who were Brit. subjects before the Act took effect, and who have retained that status without having become citizens of a particular Commonwealth country). The British Protectorates, Protected States and Protected Persons Order, 1949, sets out those persons who are Brit. protected persons by virtue of their connection with a protectorate, protected state, mandated or trust ter.

Each of the self-governing Commonwealth countries has or will enact laws setting out the persons who are its citizens. The British Nationality Act, 1948, defines those persons who are citizens of the U.K. and colonies. Subject to certain limitations, citizenship is acquired by birth in the U.K. or a colony. It can also be acquired by registration, naturalisation, or the incorporation of ter., or, subject in some cases to the fulfilment of certain conditions, by descent from a father who is a citizen at the time of the birth.

An A. of 21 years and over who fulfils the requirements of the Second Schedule to the British Nationality Act, 1948, may apply for naturalisation as a citizen of the U.K. and colonies. Among the qualifications is a total of 5 years' residence within the 8 years immediately preceding the application (12 months of this residence must have been completed in a continuous period immediately before the application). The grant of naturalisation is at the discretion of the secretary of state. A.s below the age of 21 years are not eligible for naturalisation, but the secretary of state has power to register any minor as a citizen.

A woman citizen does not lose her citizenship upon marriage to an A. An A. woman who has been married to a citizen of the U.K. and colonies does not acquire citizenship by virtue of the marriage; but, provided she has not previously renounced or been deprived of citizenship of the U.K. and colonies, she is entitled, on application, to be registered as a citizen.

United States Immigration. An aspect of the A. question which has for many years been of political importance is the attempt of countries peopled by European stocks to keep out yellow and other coloured persons. The immigration of contract labour, formerly prohibited in the U.S.A., has been permitted since 1952 under strict regulation as in Australia and Canada. Under various Acts the admission of A. immigrants into those countries, and into S. Africa, has been in fixed ratios of British to S. European persons. The present basic law of the U.S.A. is the Immigration and Nationality (McCarran-Walter) Act of 1952, which imposes various fixed ann. quotas for the admission of A.s, ranging from 100 to 65,000, from 85 different areas of the world. The quotas favour the

countries of N. Europe which were the source of the older immigration but include Asiatic countries formerly subject to exclusion. Only the consular officials of the State Dept have power to issue the essential visas. The status of A.s in the U.S.A. is determined principally by state laws, though these have to conform to international treaties. An A. does not possess political rights and is not subject to the political duties of a citizen, yet may be required to serve in the militia of the state. The laws of the states relative to ownership of real estate by A.s vary, but in most cases an A. may buy, sell, and devise real property. A friendly A. may contract, sue, and be sued in the state and Federal courts while allowed to remain in the country, but may be expelled and deported on good cause being shown, with rights of administrative and judicial appeal.

Alienation, in law, a term used to denote the voluntary transfer of estates from one person to another by conveyance and not by inheritance.

Aligarh, city in Uttar Pradesh state, India. The old part of A. consists of the town of Koli, a place of historical and strategic importance, mentioned by Ibn Bajuta in AD 1342. The fort was captured from the Mahratas in 1803 by Gen. Lake. The new city is best known for the A. Univ., now undenominational, but founded in 1875 by Sir Saiyad Ahmad Khan for Muslim students and raised in 1920 to the status of the Muslim Univ. Pop. 137,224.

Alignment, archaeological term now generally replaced by 'megalithic row' or 'avenue,' used to denote single and double lines of standing stones. Many, as on Dartmoor and in Wales, are found associated with burial cists and cairns, while others, such as the famous Callanish on the is. of Lewis in Scotland, are certainly associated with stone circles. Megalithic rows and avenues, in Britain, date from the Bronze Age. See also MEGALITHIC CULTURE.

Alima, trib. of the Lower Congo.

Aliment, **Alimentary Allowance**. In Scots law A. means the maintenance which one person may legally claim from another on account of relationship by marriage or otherwise. A. may be claimed by a parent from a child or vice versa. A husband is bound to A. his wife, and a wife who is able to do so may be required to A. her indigent husband. A wife is entitled to A. after a decree of separation, but alimony (q.v.) is not payable on divorce in Scotland: a divorced wife has no claim for A., and a wife who has divorced her husband has a claim not for A. but for her legal rights of terce and *jus relictæ* (q.v.) as if her husband were dead. This does not apply to divorce for insanity which has no effect on property rights. A wife who has custody of the children of the marriage may claim A. from her divorced husband to be expended on their maintenance and education.

Alimentary Canal, name given to the whole digestive tract from the mouth to

the anus. It includes the mouth, oesophagus, stomach, intestines with the caecum, rectum, and anus. See separate headings.

Alimentus, **Lucius Cincius** (3rd cent. BC), Rom. annalist. Very little is known of his life beyond the fact that he was praetor in Sicily in 209 BC, took part in the Second Punic War of which he wrote a valuable account, and was taken prisoner by Hannibal. Only fragments of his work survive.

Alimony, sum of money ordered by the court to be paid by either the husband or wife in a divorce case or judicial separation towards the maintenance of the other party. It must be proved that the person against whom the order is made has the means to pay. The amount may be agreed between the parties, otherwise one-fifth of the joint incomes is generally allowed. An order for permanent A. may be obtained by a wife who has obtained a final decree of judicial separation.

Alin, N. Wales, see ALLEN.

Alington, **Cyril Argentine** (1872-1956), Eng. cleric and schoolmaster, headmaster of Shrewsbury, 1908, Eton, 1916, Dean of Durham, 1933. He wrote a number of books on Eton, including 3 collections of *Eton Fables*, 1921, 1927, and 1933; readers' guides to the O.T. and N.T., and sev. detective novels.

Aliphatic Compounds form one of the great divs. of organic compounds. They are so called on account of the fact that the fats are among the most typical members of this div. (Gk *aleiphar*, fat). A. C. are characterised by the open-chain skeleton of carbon atoms in their molecules, as contrasted with the closed-ring skeleton found in aromatic and heterocyclic compounds. All A. C. may be regarded as ultimately derived from methane or marsh-gas, CH₄, by processes of replacement. Among the prin. members of the group are the *paraffins* (including methane, ethane, pentane, petrol, paraffin oil, lubricating oil, vaseline, and paraffin wax), the *olefines* (e.g. ethylene, C₂H₄), *acetylene* (C₂H₂), the *alcohols* (q.v.), *ether*, *chloroform*, *acetic* and other acids, *esters* (e.g. ethyl acetate or acetic ether), certain classes of *amines* (q.v.), the *carbohydrates*, such as starch, sugar, and cellulose, and of course the *fats* themselves. In general properties A. C. are distinguished from aromatic compounds in numerous ways, particularly in their behaviour with nitric acid and sulphuric acid.

Alicans, medieval cemetery near Arles that gave the name to a *chanson de geste* of the Carolingian epic cycle (middle of 12th cent.). The most important episodes are the 2 battles at Alyscamps (Elysii Campi) near Arles. In the first battle Wm 'Court Nez' is beaten by the Saracens, but in the second he takes his revenge.

Alishan, **Leon** (1820-1901), Armenian poet and historian, b. Constantinople. He occupied a chair in the Raphael College at Venice, where he was a member of the Mekhitarian Congregation on the is. of St Lazarus, an Armenian cultural

centre. His works include *Popular Songs of the Armenians*, historical monographs, and trans. of Eng., Ger., and Fr. poetry. His knowledge of hist. was extensive, and he wrote a *History and Geography of Armenia*.

Alison, Archibald (1757-1839), philosopher, b. Edinburgh. Educ. at Glasgow Univ. and Oxford. He was ordained in 1874 and became an Episcopal minister in Edinburgh. His once famous *Essay on the Nature and Principles of Taste*, 1790, embodied the theory that objects appear beautiful because of the associations they conjure up.

Alison, Sir Archibald (1792-1867), younger son of the Rev. Archibald A., b. Shropshire, studied at Edinburgh Univ. He was called to the Scottish Bar in 1814, made an advocate-deputy for Scotland in 1822, and became prominent as an authority on politics and law. Pub. *The Principles of Criminal Law of Scotland*, 1832-3. Created baronet in 1832.

Aliwal North, tn and dist. of S. Africa, on the Orange R., a trading and agric. centre for the N.E. part of Cape Prov. and the adjacent regions of Basutoland and Orange Free State. Hot sulphur springs similar to those at Aix-la-Chapelle (Aachen) lie 2 m. from the tn, where well-equipped baths have been built. Pop.: Whites, 2767; Bantu, 5384; Coloureds, 1544.

Aliwal South, see MOSSEL BAY.

Alizarin ($C_{14}H_8O_2(OH)_2$), or 1:2-dihydroxyanthraquinone, a derivative from anthraquinone, known to the ancients as extracted from madder-root, and used by them for dyeing. It is now prepared synthetically from anthracene. A. crystallises in dark red prisms and sublimes in orange-coloured needles, melting at 290° C. It is almost insoluble in water, but dissolves in alcohol. It yields with metallic oxides magnificently coloured insoluble compounds called 'lakes,' to which it owes its great value for dyeing purposes. Ferric oxide with A. gives a violet-black compound, chromium oxide a claret, calcium oxide a blue, and aluminium and tin give different shades of red. See DYE.

Aljubarrota, vil. of Portugal, in Leiria dist., 14 m. SSW. of Leiria (q.v.). In 1385 John I (q.v.) of Portugal, supported by the Eng., defeated John I of Castile here, and secured his country's independence. Pop. 700.

Alk. resin obtained from the turpentine tree (*Pistacia terebinthus*), which grows chiefly in the region of the Mediterranean. A yellow to green liquid Chian or Chio turpentine is distilled from it, leaving colophony (q.v.) as residue.

Alkahest, see ALCANEST.

Alkali, name applied to a group of metals comprising lithium, sodium, potassium, rubidium, and caesium. These metals form hydroxides which are soapy to the touch and are easily distinguished from acids and neutral bodies by their action on litmus, turmeric, methyl-orange, and other indicators. The term is sometimes applied to the hydroxides only, but in the important A. manuf. it

includes the carbonates, and is particularly associated with carbonate of soda.

The hydroxide and carbonate of the radical ammonium (NH_4) are included among the A.s.

The word A. is derived from the Arabic *al-qali*, ashes, from the fact that soda and potash were derived from the ashes of plants; in fact, for cents, this was the only known method of manufacturing soda. In 1793 the Fr. Gov. were faced with the necessity of finding some method of soda manuf., as, owing to the effect of the revolution on commerce, France was cut off from the chief sources of the world's supply. In response to the gov.'s appeal, Nicolas Leblanc elaborated a process which has now become obsolete (having been replaced by the ammonia-soda process, for which see below), but was very largely employed for over a cent. It consisted in heating salt with sulphuric acid, and subjecting the sodium sulphate so obtained, mixed with coal and limestone, to a high temp. in a reverberatory furnace. The sodium carbonate was then dissolved out of the residual mass, and the solution evaporated, when crystals of washing-soda or sodium carbonate decahydrate, $Na_2CO_3 \cdot 10H_2O$, were obtained. The Leblanc process would have been given up long before it actually expired but for the fact that 2 important by-products, viz. hydrochloric acid and sulphur, were obtained from it.

Ammonia-Soda Process. In this process brine is saturated with ammonia and filtered. The filtrate is then treated with carbon dioxide in a carbonating tower, consisting of a series of cylindrical compartments through which the brine slowly percolates. The carbon dioxide is blown in at the bottom of the tower, so that the following reaction takes place: $NH_3 + NaCl + H_2O + CO_2 = NaHCO_3 + NH_4Cl$.

The liquid sludge that flows out at the bottom of the tower is filtered in vacuum filters, and the residue of sodium bicarbonate left in the filters is then heated, when it splits up into sodium carbonate, steam and carbon dioxide: $2NaHCO_3 = Na_2CO_3 + H_2O + CO_2$.

The main advantages of the ammonia-soda process (sometimes known as the Solvay process, after its inventor, a Belgian chemist) are (i) it yields a very pure product, (ii) it requires much less labour, (iii) there are no noxious by-products.

Caustic soda, or sodium hydroxide ($NaOH$), is obtained by heating sodium carbonate solution with slaked lime: $Na_2CO_3 + Ca(OH)_2 = CaCO_3 \downarrow + 2NaOH$, and by the electrolysis of brine; chlorine is given off during the electrolysis, and this also is a valuable chemical product. Sodium and potassium hydroxides are white, deliquescent, crystalline solids easily soluble in water. Like all A.s. they neutralise acids to form salts.

In medicine the term A. is restricted to the hydroxides, which are used as caustics and for the neutralisation of acids. Ammonia is particularly valuable

for counteracting the poison in the stings of insects, immediate application generally having the result of neutralising the acid. A poisoning is treated by giving the patient dilute acid, such as vinegar. As an antidote to acid poisoning, the carbonates should be used; powdered chalk or, in an emergency, whiting scraped from the wall or ceiling is suitable.

Netherlands National
Tourist Office

CHEESE MARKET, ALKMAAR

Alkali Lands are regions where the soil contains quantities of alkali salts, e.g. in Nebraska, Montana, and New Mexico. Such soil requires very little moisture, and to prevent damage to the estates caused by abundant rainfall the lands are carefully drained and treated with gypsum.

Alkaline Earths, a name given to the group of metals comprising *magnesium, beryllium, calcium, strontium, barium, and radium*. Formerly the known oxides of these metals were considered to be elementary substances, and were known as earths. The oxides possess an alkaline reaction and neutralise acids.

Alkaloids, organic substances of complex composition and basic character found in plants of certain families. The A. were so named because they are like alkalis in some respects, particularly as regards basic properties. They are generally colourless crystalline compounds with a bitter taste, but a few are liquids. Usually they are insoluble in water but are soluble in organic solvents. Some of them are excessively poisonous, the general antidote being strong tea. They

are obtained by cutting up the plants and macerating the mass with acidified water in a conical vat, where a layer of lint receives the percolated liquid. If a volatile alkaloid, it is separated with steam after making the mixture alkaline; if an insoluble alkaloid, it may be obtained by filtration, after which it may be purified by crystallisation. The more important A. are atropine, cocaine, colchicine (which is found in colchicum), conine, morphine, narcotine, nicotine, and strychnine. Reference to these can be found under the appropriate headings.

Alkan, real name **Charles Henri Valentin Morhange** (1813-88), Fr. pianist and composer, b. Paris. He is best known for his numerous pianoforte studies, which are extremely difficult and which added materially to the technical resources of piano composition.

Alkanet, see PENTAGLOSSIS.

Alkmaar, anct mkt tn in the prov. of N. Holland, Netherlands, 20 m. NNW. of Amsterdam. It is situated on the N. Holland Canal, and is itself intersected by a network of canals. The tn is famous for its cheese market, held every Friday morning from May until Oct. The St Lawrence Church, a large Gothic building constructed between 1470 and 1512, has one of the oldest baroque organs in Europe. The Gothic tn hall (Stadhuis), built in the early 16th cent., contains the municipal museum. Pop. (1954) 41,090.

Alkora, see KORAN.

Alkyl, chemical term denoting radicals of the formula C_nH_{2n+1} ; the chief members are *methyl* (CH_3), *ethyl* (C_2H_5), *propyl* (C_3H_7), and *amyl* (C_5H_{11}). These radicals are not stable in the free state (see RADICAL) but are the radicals of a large number of types of organic compounds such as alcohols, esters, aldehydes, ketones, and halides.

Alkyl Oxides, see ETHERS.

All Fools' Day, 1 April. The custom of sending one upon a pointless errand is supposed to have been a burlesque of the sending hither and thither of Christ from Annas to Caiaphas, and from Pilate to Herod.

All Hallows, **All Hallowmas**, or simply **Hallowmas**, the O.E. name for All Saints' Day, 1 Nov. See ALL SAINTS' DAY.

All Hallows Barking, church near Tower Hill, London, sometimes called A. H. by the Tower, and in former times A. H. Barkingchurch. There is no record of its foundation, which took place in Saxon times, possibly as early as the 7th cent. Its affix of Barking suggests an original or early connection with Barking Abbey, Essex, which later owned it over various periods for some 250 years. A Norman church which replaced the original structure was rebuilt in the 13th cent. A mortuary crypt discovered in 1926 dates probably from the mid 14th cent. There were later additions, including a 17th-cent. tower from which Pepys watched the Fire of London. Except for the tower and crypt the church was destroyed in an air-raid in 1941, but it has been restored.

The church is noted for its brasses, the earliest dating from 1389. Wm Penn was baptised and J. Q. Adams, 7th president of the United States, was married here. It is the guild church of the Toc H movement (q.v.).

All Saints' Bay, on which stands São Salvador or Bala, is situated on the E. or Atlantic coast of Brazil. It is 25 m. long and 20 m. wide, and is supposed to be large enough to afford anchorage for the navies of the whole world.

All Saints' Day (1 Nov.), called in O.E. All Hallows, All Hallowmas, or simply Hallowmas, is a feast in honour of all the saints, i.e. of the whole Church triumphant, instituted in 835. The evening preceding All Hallows is called Hallowe'en, and on this night ceremonies of Druidical origin—bonfires, bell-rings, and domestic merrymakings, in which lamb's-wool (ale or wine mixed with the pulp of roasted apples) was the prin. beverage—were once held. In England, Scotland, and Ireland fireside ceremonies were held, and the future was supposed to be made known. An account of these ceremonies is given in the poem of Burns entitled *Hallowe'en*.

All Saints' Islands, see WEST INDIES.

All Souls College, Oxford, founded in 1438 by Archbishop Henry Chichele with Henry VI as co-founder. It forms a memorial to those who fell in the Fr. wars of their time. Alone of the older colleges it has no undergraduates, its members being all fellows, and always including some of the greatest authorities in law, hist., and the social sciences. Its library, the Codrington, is the most important in Oxford after the Bodleian.

All Souls' Day, Rom. Catholic festival held on 2 Nov., which was first instituted by Odilo in the monastery of Cluny, 998, the observance soon becoming general in all Rom. Catholic countries. On this day prayers and offerings are made for the dead. The festival is recognised also by the Anglican Church.

All the Talents, ministry organised by Grenville in 1806, on the death of Wm Pitt, and so named in derision by the opposition party.

'All the Year Round', see DICKENS, CHARLES.

Alla Breve, It. musical term which, placed at the beginning of a movement or indicated by the sign C , signifies that although there are four crotchets to the bar, the time is halved to a speed fast enough to be counted at two beats to the bar.

Allah (Arabic), name used by Muslims to denote the Supreme Being. Apparently it is a contraction of *al-ilah*, the god. The same root occurs in Hebrew, Aramaic, and old S. Arabian, but not this contraction.

Allahabad, one of the largest cities in Uttar Pradesh state, India. It is situated on the l. b. of the R. Jumna, close to its junction with the R. Ganges. There was an auct city on this site, Prayag or Prag, most sacred to Hindus, and the holy Akshat Bat, or undying banyan tree, is a great resort for pilgrims.

Here also is the famous Asoka Pillar on which are inscribed the edicts of Asoka, issued in 242 bc. The present fort and city were founded by Akbar in AD 1583. A. is the seat of a high court (1866) and a premier univ. (1887). The first Indian National Congress was held here in 1885. There is a Mela, or fair, of great antiquity held every year at the confluence of the Jumna and Ganges which attracts vast numbers of pilgrims. Pop. 333,362.

Allamanda, genus of tropical evergreen climbers, family Apocynaceae. *A. cathartica*, a climbing plant with yellow flowers, from the W. Indies, has emetic and purgative properties, and is used as a cathartic.

Allan, David (1744-96), Scottish historical painter, b. Alloa. He studied at Glasgow in Foulis's Academy, and later at Rome. He secured the gold medal of St Luke for his 'Origin of Painting,' Pictures such as his 'Highland Dance' and 'Scotch Wedding' caused him to be nicknamed 'the Scottish Hogarth.' He d. at Edinburgh.

Allan, Sir Hugh (1810-82), founder of the A. Steamship Line (q.v.), b. Saltcoats, Ayrshire. He emigrated to Canada, and was one of the promoters of the Canadian Pacific Railway. He was knighted in 1871, and d. at Edinburgh.

Allan, Sir William (1782-1850), painter of historical scenes and studies of Russian life, b. Edinburgh and educ. at High School there. He studied art at the Trustees' Academy with Wilkie, and at Royal Academy schools. Among his famous paintings are 'Peter the Great teaching his Subjects Shipbuilding' and 'Knox admonishing Mary Queen of Scots.' In 1805 he went to Russia, but returned to Edinburgh, 1814, and later travelled widely. He was made R.A. in 1835, P.R.S.A., 1838, knighted, 1842.

Allan Line, steamship company founded in 1853 by Sir Hugh Allan (q.v.). The line was amalgamated with the Canadian Pacific Steamship Co. in 1916.

Allantoin ($\text{C}_4\text{H}_8\text{O}_2\text{N}_2$), organic substance found in the allantoin fluids of many animals and in many plants. It is also formed in the oxidation of uric acid.

Allantois, foetal membrane derived from the mesoblastic and hypoblastic layers, characteristically developed in birds, reptiles, and mammals. In birds and reptiles it is developed from the lower end of the digestive tube, and has first the form of a small ovoid sac, but increases rapidly in size and makes its way into a space between the amnion and the serous membrane. It finally encloses the whole embryo and yolk-sac together with the remains of the albumin, which by this time has been largely absorbed. The A. serves as a respiratory organ, exchange of gases readily taking place through the porous shell; its cavity serves as a urinary bladder, excrement being discharged into it from the kidneys. In many mammals a connection is often estab. between the A. and the uterine wall, by which nourishment is conveyed to the embryo. At birth this

connection becomes part of the umbilical cord and is cast off, whilst the part that remains within the body develops into the urinary bladder.

Aillard, Jean François (1785-1839). Fr. general who first served under Napoleon. In 1815 he left France and went to Lahore in 1820, where he entered the service of Ranjit Singh. He organised the army according to the Fr. model, and was made generalissimo of the forces.

Allatius, Leo (1586-1669), Gk scholar and theologian, b. in the is. of Chios. He settled at Rome, where he taught his native language at the Gk College, and devoted his spare time to studying the anc. classics and theology. Entrusted by Gregory XV with the removal of the *Bibliothec. Palatina* from Heidelberg to Rome, he was afterwards (1661) appointed Vatican librarian, and held that post until his death. Besides editing MSS. and translating Gk authors, A. wrote a number of original works, including the treatise *De Ecclesiæ Occidentalis et Orientalis perpetua Consensione*.

Allbutt, Sir Thomas Clifford (1836-1925), physician, b. Dewsbury, Yorks, and educ. York, Cambridge, St George's Hospital, and Paris. He graduated in 1860 and settled in Leeds as a consultant. In 1866 he invented the short clinical thermometer. He moved to London in 1899, but 3 years later was appointed regius prof. of physic at Cambridge Univ., where he soon exerted an influence on medicine reaching far beyond the bounds of the univ. He ed. the famous *System of Medicine* (8 vols.), 1886-9 (2nd ed., 11 vols., 1906-11). He was elected physician to Addenbrooke's Hospital in 1900, and at the age of 80 was president of the British Medical Association (1916-21). He was K.C.B. in 1907 and a privy counsellor in 1920. A. was a man of great erudition, scholarly in his tastes, courtly and aristocratic in his manner, and a master of Eng. prose. It is considered that the character of Dr Lydgate in George Eliot's *Middlemarch* was drawn from him. A. made valuable contributions to medicine and was well versed in its hist.; his writings include *Disease of Arteries*, including *Angina Pectoris*, 1915, *Science and Medical Thought*, 1901, and *Greek Medicine in Rome*, 1921. See biography by Sir H. D. Rolleston, 1929.

Allegheny Mountains, see APPALACHIAN MOUNTAINS.

Allegheny River, Pennsylvania and New York, U.S.A., 325 m. long, joins Monongahela R. at Pittsburgh to form Ohio R.

Allegiance was defined by Coke as 'the highest and greatest obligation of duty and obedience' of a subject, and a violation of A. constitutes the highest legal offence, namely treason (q.v.). Every natural-born subject, every naturalised citizen, and every alien while within the kingdom owes this duty to the king, his liege lord. Most public officials and many professional men are required to take the *Oath of A.* when entering on their career. The claim of the popes of Rome to temporal power, particularly in the matter of releasing Catholics from A. to

heretical sovereigns, was for about 2 centuries the cause of great difficulty in this country. The Oath of A., drafted in the reign of James I, required Catholics to reject this claim, and was considered by them to be unnecessarily offensive to their faith, but after long controversy and not a little persecution the objectionable clauses were removed in 1778.

Allegory, Gk word signifying the description of one thing under the image of another, derived from *allos*, other, and *agoreuein*, to harangue. In literature, a figurative discourse in which the writer or speaker conveys to the mind a parallel idea by its resemblance in its properties and circumstances to the subject of his ostensible discourse. In this respect it resembles metaphor, and A. has often been described as 'extended metaphor.' This is the most usual signification of the word, but it is also used for other forms of art, and may be applied to painting, sculpture, or the histrionic art. In painting, one may mention the famous picture of Proudhon, 'Justice and Vengeance pursuing Crime,' and the many allegorical pictures of the great Eng. painter, G. F. Watts. The well-known picture of Holman Hunt, 'The Light of the World,' hung in St Paul's Cathedral, is a good example of pictorial A. Reynolds-Stephens's group, representing Queen Elizabeth and Philip of Spain playing on a chess-board with ships as pieces, depicts in sculptural A. the struggle for sea supremacy between 2 nations. Returning to literature, in all branches of which one finds the use of A., it is important to realise the difference between A. and the fable. The fable has for its object the conveying of some moral precept or enforces some lesson for daily life, but an A. is by no means so limited in its scope. A further differentiation may be made that while, on the one hand, the merit of a fable lies in, and its lesson is emphasised by, its improbability, as, for example, Aesop's fable of the *File and the Piper*, where inarticulate objects speak, on the other hand, the A. depends for its excellence on its fidelity and its detailed correspondence to actual existence. A. has always been used for the personification of abstract ideas, and for its value in this direction has been much employed to assist the mind in grasping abstract principles. This teaching of the abstract by the concrete was often employed by Christ and other biblical characters in the form of a parable, or short A., to bring home to their auditors in a more facile manner religious truths. But this personification of the abstract is not the whole function of A., and it has been employed to represent persons and countries. Thus, Edmund Spenser, in his *Faerie Queene*, depicts the Earl of Leicester, Sir Philip Sidney, and other Elizabethans, including the queen herself. Sir Thomas More, in his *Utopia*, sets forth by an A. about an imaginary country his opinion as to how a country should be governed, and Dean Swift, 2 cents. later, in his well-known A.s, *The Battle of the Books* and *A Tale of a Tub*, satirises the shams and

folies of his time. It is a fact not to be lost sight of that the indirect attack of abuses by means of the A. was often the only method open to the would-be reformer. The use of A. dates from the earliest ages, and was especially popular among the peoples of the E. It follows from the utility of A. for conveying more easily abstract ideas to the mind that philosophers should use it in the instruction of their pupils. Among those to employ this method of instruction one of the earliest was Plato, and nowhere does he employ it more effectively than in his famous A. of the 'Cave,' which is to be found in his *Republic*. By means of an allegorical story of men in a cave believing that their shadows, thrown by a fire behind them on to the wall, are realities, he seeks to show the difference—a commonplace in all philosophical discourse—between the permanent 'idea' and the ever-changing phenomenal world of 'appearance.' The term to allegorise, i.e. to interpret the literal significance of a narrative, giving it an esoteric or more spiritual meaning, is the converse of the above. Among those to apply this method to the Scriptures were Philo the Jew of Alexandria, who in the time of Christ so interpreted the O.T., and his method was followed by the early Christian sect of the same city, notably by Origen (AD 185-254). The latter had the hardihood to explain, what is of course universally conceded to-day, that the story of the Garden of Eden and the Fall was an A. The neo-Platonists similarly sought to arrest the decay of Gk mythology at about the same time and by the same methods. A. passed into the Middle Ages, and took its place in the 'miracle' plays of the time, and in the 'moralities' of the 15th and 16th cents. Among the best known of these 'moralities' is that called *Everyman*, an A. in which all men are personified in Everyman, who is called upon by God to give an account of his life. As was to be expected, the A. has played a large part in the development of poetry, and it was employed to such good purpose by Geoffrey Chaucer, the father of Eng. poetry, that he influenced for nearly 200 years the poets who followed him. Chaucer's contemporary, Langland, produced in 1362 a remarkable A., *The Vision of Piers Plowman*, in which he satirised the customs of his time. With Edmund Spenser's *Faerie Queene* (1590) A. again rises to great heights in poetry, but perhaps the best known of all A.s in the Eng. tongue is the *Pilgrim's Progress* of John Bunyan (1678). This story of the journey of Christian from 'this world to the next,' and the story of the siege of 'Mansoul,' told in his book *The Holy War*, are written in the purest English. Another well-written A. is Addison's *Vision of Mirza*, which appeared in the *Spectator*. Of modern A.s one may mention Olive Schreiner's *Dreams*, Jack London's *White Fang*, and Anatole France's *Ile des pingouins* in prose; and Maeterlinck's *Blue Bird* and Edmund Rostand's *Chantecler* in drama. See C. S. Lewis, *The Allegory of Love* (3rd ed.), 1948.

Allegretto (It. dimin. of *allegro*), musical term—a movement or time not so quick as *allegro*, but quicker than *andante*.

Allegri, Antonio, see CORREGGIO.

Allegri, Gregorio (1582-1652), musical composer, b. Rome. He will always be remembered as being the composer of the famous *Miserere* written for 9 voices, and still sung in Holy Week in the Sistine Chapel.

Allegro (Lat. *alacer*, joyful, brisk), musical term originally denoting a brisk, sprightly movement, but now signifying simply an animated pace.

Alleluia, see HALLELUJAH.

Allemande, Fr. musical term (O.E. equivalents were *almand* and *almain*) designating a dance, generally in a moderately paced 4-4 time. With the courante, sarabande, and gigue it is one of the obligatory movements in the old suite form.

Allen, Charles Grant Blairfindie (1848-1899), Brit. author, b. Kingston, Ontario. Educ. King Edward's School, Birmingham, and Oxford, he was a schoolmaster in Jamaica 1873-7, but later settled in England and devoted himself to writing scientific works and novels. The former include *Physiological Aesthetics*, 1877, *The Evolutionist at Large*, 1881, and *The Evolution of the Idea of God*, 1897; best known of the latter are *The Devil's Die*, 1888, *The Great Taboo*, 1890, and *The Woman Who Did*, 1895, an unconventional book which provoked much discussion.

Allen, Henry T. (1859-1930), Amer. soldier, b. Sharpsburg, Kentucky, U.S.A.; graduated U.S. Military Academy 1882; served with the Mexican punitive expedition in 1916. He went to France as commander of the 90th Div. of the Amer. Expeditionary Force in 1917, and was Commander-in-Chief of the Amer. army of occupation in the Rhineland, July 1919. He wrote *Cavalry Notes*, 1911, *My Rhineland Journal*, 1924, and *The Rhineland Occupation*, 1927.

Allen, Horatio (1802-89), Amer. civil engineer, b. Schenectady, New York. He made the first railway trip in America, operating the Stourbridge Lion in 1829 at Honesdale, Pennsylvania. He was chief engineer of the S. Carolina railway and later the Erie railway, of which he was also president. He was consulting engineer to the Panama railway and president of the Amer. Society of Civil Engineers.

Allen, Sir Hugh Percy (1869-1946), Brit. prof. of music, b. Reading; he began his musical career at Chichester Cathedral as assistant organist. In 1897-8 he was organist at St Asaph Cathedral. He was conductor of the Bach Choir, London, 1901-20; prof. of music, Oxford Univ., from 1918; and director of the Royal College of Music, London, until 1937. As prof. of music at Oxford A. did valuable work in widening the scope and practicality of the courses there; while as a choral conductor he was always highly successful.

Allen, Ira (1751-1814), politician of Vermont; b. Cornwall, Connecticut; removed to Vermont, 1772, where he served

as lieutenant under his brother Ethan, who captured the fort of Ticonderoga from the Eng. in 1775. As a member of the legislature he was zealous in asserting the independence of Vermont. He took an active part in the negotiation re the 'New Hampshire Grants.' In 1795 he visited Europe to buy arms, and was arrested at Ostend and brought to England, where he was charged with supplying arms to the Irish rebels. He was acquitted after litigation lasting 8 years.

Allen, Ralph (1894-1764), the Man of Bath, Eng. philanthropist and postal reformer. He was acquainted with Pope and Fielding and he appears as Squire Allworthy in *Tom Jones*. His benevolence became proverbial.

Allen, William (1532-94), cardinal, b. Rossall, and educ. at Oriel College, Oxford. He became principal of St Mary's Hall in 1556, but left England in 1561 since his Catholicism conflicted with Elizabeth's eccles. policy. He lived in hiding in England, 1562-5, and then returned to the Continent, where he was ordained priest. A. founded the Catholic seminary at Douai in 1568 (later transferred to Rheims) and arranged for the foundation of an Eng. Jesuit college in Rome (1579). The trans. of the Douai Bible was begun by A.

A. lived in Rome from 1585, and from this time onwards his efforts for the re-conversion of England to Catholicism became more political in character. In 1587 he was created a cardinal. Had the Armada (q.v.) succeeded in conquering England, A. was to have been made Archbishop of Canterbury. See life by Martin Hailie, 1914.

Allen, William Hervey (1889-1949), Amer. novelist, b. Pittsburgh. Educ. Pittsburgh Univ., he served as lieutenant in the army in the First World War and afterwards taught for a time at Vassar. During a five years' stay in Bermuda he wrote *Anthony Adverse*, 1933, which was a great success and set the fashion for mammoth novels of sev. hundred thousand words. Later novels were *Action at Aquila*, 1938, *The Front and the Fort*, 1943; *Bedford Village*, 1945, and *The City in the Dawn*, 1947. He also wrote a life of Poe and sev. vols. of poetry.

Allen, Alin, or Alyn, trib. of the Dee, N. Wales. It rises in Denbighshire and flows through Flintshire into the Dee.

Allen, Bog of, covers much of the central plain of Ireland, stretching from Kildare westwards through Offaly to the Shannon. It is the chief source of Ireland's peat fuel production.

Allen, Lough, see LEITRIM and SHANNON.

Allenby, Field Marshal Sir Edmund Henry Hynman, Viscount of Megiddo and of Felixstowe (1861-1936), Brit. soldier, educ. Haileybury and Sandhurst. Entered the army, 1882, in the Inniskilling Dragoons. Gained distinction as a column commander in the S. African War 1899-1902. Became inspector-general of cavalry, which post he held till 1914. In the First World War he won a brilliant reputation first as a cavalry leader, then as an army commander in France, and

finally as the Commander-in-Chief of the Egyptian Expeditionary Force. In France in 1914 he was conspicuous at Mons and in the Great Retreat, leading a cavalry div. with consummate skill, putting up a notable resistance at Holbeke in the Ypres battle of Oct. 1914. He was then promoted successively to corps commander and army commander (3rd Army), and rendered valuable services at the battle of Arras (1917). In Egypt he took over the chief command from Sir Archibald Murray, who had, with painstaking preparation, succeeded in advancing as far as the N. edge of the Sinai Desert. The task which confronted A. was the capture of Gaza, a naturally strong position and artificially reinforced by cunning field-engineering work. To the accomplishment of this task he brought administrative ability of a high order, and a patient study of the vast problems of supply and transport, the difficulty of which was enhanced by desert conditions. His strategy and tactics were masterly. Beersheba was captured and within 6 weeks of the commencement of his advance Jerusalem surrendered to the Brit. Army. Many of his troops were then transferred to France to repair losses, and he had perforce to spend much time in reorganising his army with less trained men, among whom were Indian troops. But again his organising capacity proved equal to his next task, which was the final overthrow of the whole Turkish Army, which he effected by executing one of the greatest campaigns of movement in the hist. of warfare, his army sweeping resistlessly forward beyond the Jordan valley to Damascus and Aleppo, after a crushing victory in the battles of Megiddo (18 Sept. to 31 Oct.), 1918. For these services he was given a viscounty and Parliament voted him a grant of £50,000. In 1919 he was appointed to the post of high commissioner in Egypt, where the rise of the Nationalist party and the aspirations of Egypt to sovereign independence demanded the utmost tact, as well as great administrative capacity, to the end that a settlement might be effected which should safeguard Brit. interests without forfeiting the confidence of the Egyptian people. He returned to England in 1922, in which year Egypt was declared an independent kingdom. Named after him was A. Bridge (built in 1927) which crosses the Jordan, 1200 ft below sea level, on the road between Jerusalem and Amman (name subsequently changed, 1957). See also EGYPT. See Earl Wavell: *Allenby: Soldier and Statesman—A Study in Greatness*, 1940; *Allenby in Egypt*, 1943.

Allende, see SAN MIGUEL DE ALLENDE.

Altenstein, see OLSZTYN.

Allentown, co. tn of Lehigh co., Pennsylvania, on the Lehigh R. It is an important manufacturing centre, producing steel products, automobiles, cement, machinery, electrical appliances, textiles, and clothing. The tn was settled first in 1752, and owes its name to John Allen, son of the chief justice of the prov. It is the

seat of Muhlenberg College and Cedar Crest College. Pop. 106,756.

Allergy, exaggerated reaction by the body to various foreign substances or physical agents that are harmless in similar amounts to normal people. One who is affected by A. is said to be allergic. The reaction is referred to as an allergic reaction. A substance which causes an allergic reaction is called an allergen. The reaction is of similar type in the same individual for each substance, and it is quite different from any toxic action the substance might have in a large dose. As a rule only a minute dose of allergen is necessary to produce a reaction in people who are allergic to it. The type of allergic reaction is usually constant in any person. Thus the reaction of one may be in the form of spasm of the bronchial tubes (see **ASTHMA**); that of another may be in the form of nettle rash or urticaria (q.v.); and yet another may be in the form of hay-fever (q.v.). Certain types of allergen tend to cause certain types of reaction. Thus foods usually cause urticaria or eczema (q.v.); pollens, hay-fever; dusts and animal danders, asthma. The exact nature of the allergic reaction is not completely known, but the so-called histamine theory fits most of the evidence and undoubtedly explains the greater part of the mechanism of A. According to this theory a chemical substance, histamine, is liberated from the cells of the particular tissue in which the reaction occurs. We have seen elsewhere how in the reaction of immunity (see **BACTERIA, Immunity**) antibodies, known as antigens, are formed in the blood stream to neutralise invading foreign proteins, by uniting with them. The same thing happens with allergens; antibodies are formed against them. But the allergen-antibody union takes place in or on the tissue cells and not in the blood stream as it does in the other forms of immune reaction. In the course of the allergen-antibody union histamine is liberated, and it is this histamine, it is believed, which causes the actual manifestations of the allergic reaction. The liberation of histamine has 2 important physiological actions: first, it causes the small blood vessels to leak so that fluid is poured out into the tissues; secondly, it causes spasm of smooth muscle. Observation of the symptoms of urticaria, hay-fever, and asthma show that these actions do indeed take place. Furthermore certain drugs of a group known as anti-histamine drugs—because they are antagonists to histamine—are effective in relieving many allergic symptoms. They are not so effective in asthma, however, but this may be because in this form of reaction the histamine is produced from outside the tissue cells.

Nobody knows why some people should suffer from A. and not others. Heredity is a predisposing cause: 50 to 70 per cent of allergic patients have an allergic family history. Predisposing causes in asthma are whooping cough, pneumonia, or other severe respiratory diseases. The precipitating cause of an allergic reaction may be extrinsic or intrinsic, but it is usually both.

The extrinsic factors, or specific allergens, may be inhalants (dust, feathers, grass pollens), ingestants (egg, cheese, milk, fish), injectants (serums and other foreign proteins), and contactants (primula leaves, geranium leaves, tomato leaves, rubber, cosmetic powders, etc.). The intrinsic, non-specific factors may be psychological, climatic, physical, chemical, and mechanical.

The treatment of A. depends, first, upon prevention by the avoidance, so far as is practical, of contact with the allergens which cause a reaction. Desensitisation may be possible by means of a course of injections of minute doses of the specific allergen, the size of the dose being gradually increased until the patient becomes immune. This form of treatment is more successful in hay-fever than in other types of A., but it needs a very long course of injections. The antihistamine drugs are valuable in treating reactions and bring relief to most cases of urticaria, eczema, and hay-fever. Asthma is the most resistant to treatment of all the A.s, partly because intrinsic psychological factors often play a large part in its causation. Injections of adrenaline (q.v.) relieve the spasm of severe attacks, but it is not curative. It was in 1906 that von Pirquet coined the word A. to indicate 'an altered capacity to react.' Clinicians took it up enthusiastically and for a time the diagnosis of A. was given to nearly every disease for which there was no specific cause known. The pendulum then swung the other way, but to-day, 50 years later, the proper place of A. in the aetiology of disease is becoming more precisely defined.

Allerion, or **Alerion**, heraldic device, consisting of an eagle with outspread wings, but without beak or feet, as in the arms of Montmorency.

Allestree, or **Allestrey**, Richard (1619-1681), divine, b. Uppington, Shropshire. Educ. at Christ Church, Oxford. A. served in the Royalist army; when the parl. forces sacked the Oxford colleges, A. at great risk saved many Christ Church treasures. He was expelled from the univ. for refusing to submit to the authority of Parliament. At the Restoration he was made canon of Christ Church, and regius prof. of divinity in 1663.

Alleyn, Edward (1566-1626), actor, and founder of Dulwich College (q.v.), b. near Bishopsgate, London. Married Henslowe's stepdaughter in 1582. In 1600 built, with Henslowe, the Fortune Theatre, London. In 1604 became master of the royal games of bears, bulls, and mastiffs. Retired from the stage, 1604.

Alliaceus Plants are those which belong to the *Allium* genus, and include chives, garlic, leeks, onion, romances, ransomes, and shallots. The inflorescence is umbellate, and the various species have tunicated bulbs, or swollen underground buds, which are cultivated for culinary purposes.

Alliance, city in Ohio, U.S.A., on Mahoning R., 20 m. NE. of Canton. It is a coal-mining, industrial, and distribution centre. Mt Union College is here. Pop. 26,200.

Alliance, union between nations or govts.

formed by treaty, league, or agreement. A definite aim, clearly stated in the agreement, has generally been the cause of an A. Thus in 1688 the Triple A. between Great Britain, Sweden, and the Netherlands had as its object the diminution of the power of Louis XIV. The Grand A. of 1689 was formed for the same object. The Quadruple A. of 1814 between Great Britain, Austria, Russia, and Prussia was directed against Napoleon and his dynasty, and towards keeping back France within her boundaries. The object of the Triple A. of 1882 between Germany, Austria, and Italy was the preservation of European peace against any possible aggressive action of Russia or France. This led to the Dual A. of France and Russia, having as its object mutual help in case of any hostile action on the part of the aforementioned powers. Sev. attempts have been made to generalise the character of A. For example, the Holy A. of 1815 was an attempt to find in the teaching of the Gospels a common basis of a general league of the European govts., having as its object the preservation of peace. One of the most important A.s of modern times was the offensive and defensive A. effected between Great Britain and Japan in 1902 and modified in 1905. The terms of this A. were pub. to the world. It terminated in 1921 as a result of the Washington Conference. On the outbreak of the First World War the Triple A. broke up owing to the refusal of Italy to act with Germany and Austria-Hungary.

The Triple Entente, or informal A., before the First World War embraced Great Britain, France, and Russia, and was concluded in 1907. Although at this time a formal A. existed between France and Russia, there was no binding agreement between the 3 powers to take a common course should one be engaged in war. In order to strengthen this bond and to have a clear understanding on the matter, the 3 powers signed the Pact of London in 1914, each declaring that it would not conclude a separate peace or demand terms at the eventual peace conference without consulting the others. Japan signed the pact soon after. The Bolsheviks concluded a separate peace with the central powers in 1918 and broke up the Triple Entente. Great Britain's A. with Portugal provides for mutual assistance if either of the 2 countries were attacked; but it involved no obligation for Portugal to fight in the Second World War, and she remained neutral. In view of the menace of Germany's policy of European domination, Great Britain, in conjunction with France, in 1939, made pacts with Rumania, Greece, and Poland, guaranteeing their integrity, her policy being to form a peace bloc which should serve as a substitute for the collective security it was, at one time, hoped to procure under the League of Nations (q.v.). In the result the guarantees brought a Brit. declaration of war against Germany on the latter's invasion of Poland. An Anglo-Fr.-Turkish pact of assistance was signed in 1939, valid for 15 years, which provided, *inter alia*, that

Turkey was to aid Britain and France in the event of aggression by a European power leading to war in the Mediterranean, and if Britain had to fulfil her guarantees to Greece, but these undertakings were not, in fact, fulfilled. See also EUROPE, *History of Europe during the Second World War (1939-45)*, and LOARNO TREATIES.

Alliance, Holy, see HOLY ALLIANCE.
Alliaria petiolata (synonyms *A. officinalis*, *Erysimum alliaria*, *Sisymbrium alliaria*), commonly called Garlic Mustard, Jack-by-the-Hedge, Hedge Garlic, Sauce-alone, is a biennial herb, family Cruciferae, indigenous to Great Britain and many parts of the N. hemisphere.

Allibone, Samuel Austin (1816-89), Amer. author, b. Philadelphia, Pennsylvania. He became librarian of the Lenox Library, New York City, in 1879. He is best known for his critical dictionary of Eng. literature (3 vols., 1858-71, with supplement by J. Foster Kirk, 1891), which is still of service.

Alliote, see SHAD.

Allier: 1. Fr. riv., rising in the Margeride Mts in the dept of Lozère, and flowing NNW. to join the Loire. It is the boundary between the depts of Cher and Nièvre. Length 250 m.

2. Dept of central France, formed of part of the anct prov. of Bourbonnais. Its surface features are diverse: in the W. is the plateau of Combrailles, and in the centre the low spurs of the Auvergne Mts, fertile and rich in minerals; the region of the Sologne in the NE. is covered with forests and small lakes. Cattle and poultry are raised, and cereals, vines, beet, and vegetables are produced. Coal, iron, and antimony are mined. There are metallurgical, glass, textile, porcelain, and leather industries, and there are several spas. The prin. tns are Moulins (the cap.), Montluçon, and Vichy (qq.v.). Area 2848 sq. m.; pop. 372,700.

Allies, Thomas William (1813-1903), Eng. historical writer, b. near Bristol. Became a fellow of Wadham College, Oxford, in 1833. In 1850 became a Rom. Catholic, after resigning the living of Taunton. Secretary of Catholic Poor Schools Committee and lecturer on hist. in the Catholic Univ. of Ireland. His chief literary work was *The Fountain of Christendom* (8 vols.), 1861-95.

Alligator (Sp. *el lagarto*, the lizard), of family Crocodylidae and order Crocodylia, is a reptile of which there are only 2 living species: *A. lucius*, in the Mississippi and other large rvs. of America, and *A. sinensis*, in the Yangtsekiang. It differs from the caiman (q.v.) by having a bony septum between its nostrils, and its ventral scutes are thinly, if at all, ossified; it differs from the crocodile (q.v.) by having a broad head, depressed and obtuse muzzle, unequal teeth, the fourth from the front on each side of the lower jaw being elongated and fitting into a cavity in the upper jaw when the mouth is closed, the hinder limbs lack a fringe of acute scales, and the toes are only slightly webbed. It is a carnivorous and piscivorous animal, and will devour dogs or pigs, but seldom attacks man unless

molested. The strong tail by its lashing movement assists it in swimming, during which exercise it emits a loud bellowing. The eggs are deposited in layers in sand, and incubation covers a period of about 3 months. The female A. is a tender mother, providing food for her young and guarding them from their many foes, such as large fish and turtles. The skin

ALLIGATOR

Mirrorpic

of the A. is a valuable object of commerce, used in the manuf. of purses, cigarette-cases, and other articles, and the teeth are sold for ivory. From the Upper Cretaceous to the Pliocene period these animals ranged N. Europe.

Alligator Apple, or **Corkwood**, *Annona glabra*, family Annonaceae, a swamp tree, which bears an inedible cone-shaped fruit.

Alligator Lizard, or **Swift**, names applied to sev. species of *Sceloporus*, family Iguanidae of the Lacertilia. They are viviparous and are found in N. and central America.

Alligator Pear, see AVOCADO PEAR.

Allin, **Sir Thomas** (1612-85), a naval commander, b. at Lowestoft. A. took a prominent part in the Royalist struggles. He was sent as Commander-in-Chief to the Mediterranean, where he captured sev. Dutch men-of-war. He brought the Barbary States to subjection in 1669. In 1670 he was controller of the navy, and in 1678 was Commander-in-Chief in the Channel. His life throughout was one of stirring sea adventure.

Allingham, **Margery** (1904-), writer of detective stories, b. London. She was trained to write by her father, who was also a writer, and in 1927 married P. Y. Carter, editor of the *Taller*. Albert Campion, the detective in her stories, is human and attractive, among the best known of his exploits being *Mystery Mile*, 1930, *Flowers for the Judge*, 1936, and *More Work for the Undertaker*, 1949. *Mr Campion and Others*, 1939, is a vol. of short stories. *The Tiger in the Smoke*, 1952, was filmed in 1956. Best-known of her other books is a commentary written during the war, *The Oaken Heart*, 1941. See also DETECTIVE STORY.

Allingham, **William** (1824-89), poet, b. Ballyshannon. Donegal. Entering the customs service, he worked in various places in England and Ireland till 1870, when he retired and became sub-editor of *Fraser's Magazine*. He became the friend of Tennyson, Leigh Hunt, Carlyle, and Rossetti, who figure in his *Diary*, ed. in 1907 by his wife, who was formerly Helen Paterson, the water-colourist. His books of verse include *Poems*, 1850, *Laurence Bloomfield in Ireland*, 1864, and *Irish Songs and Poems*, 1887.

Alliteration (Lat. *ad*, to; *litera*, letter), sometimes called head-rhyme, is the repetition of the same letter or sound in a series of words, usually at the beginning, as in Coleridge's lines:

'The fair breeze blew, the white foam flew,
The furrow followed free.'

In Eng. poetry, and to some extent in Eng. prose, it is used as an embellishment which enriches the musical effect of the rhythm. Its excessive use is sometimes seen in such poets as Swinburne, and 'hunting the letter' has been ridiculed at different periods, from 'The preylful princess pierced and pricked a pretty pleasing pricklet' of Shakespeare's *Holofernes*, to Charles Churchill's ironic 'Apt alliteration's artful aid.'

A. is traditional in Eng. literature, the earliest Eng. poetry being alliterative without rhyme. The usual metrical device was to have in each line 3 (or 4) stressed syllables beginning with the same consonant, 2 being in the first half of the line, and 1 (or 2) in the second. The last noteworthy Eng. exponent of purely alliterative verse was Wm Langland (c. 1332-c. 1400), whose *Vision Concerning Piers the Plowman* begins with the lines:

'In a somer seson, when soft was
the sonne,
I shope me in shroudes, as I a shepe
were.'

With the introduction of rhyme the use of A. receded. See also FIGURE OF SPEECH.

Allium, genus of bulbous plants, about 280 species, family Liliaceae. See ONION.

Allmers, **Hermann** (1821-1902), Ger. poet and artist, b. Rechtenfleth, near Bremen. His first pub. was *Marschenbuch*, a study of Frisian peasant life. His best work is perhaps his tragedy *Elektra*. Others are *Dichtungen* and *Römische Schlendertage*.

Alloa, burgh and co. tn of Clackmannanshire, Scotland, on the Forth, 6 m. E. of Stirling; has breweries, distilleries, glass-works, woollen manufs., engineering works, etc. Pop. 13,436.

Allobarbitone, see BARBITURATES.

Allobroges, anct Gallic tribe, occupying the land between the Rhône and Isère, now Savoy and Dauphiné. Their chief cities were Vienna (Vienne), Genava (Geneva), and Cularo (Grenoble). They were subdued by the Romans, 121 BC.

Allucation (Lat. *alucatio*, a speaking to), term denoting the formal address given by the Pope to the College of

Cardinals on any matter of eccles. or political moment, and affixed to the door of St Peter's.

Allodium, or **Allodial Tenure**, legal term used to signify land which is the absolute property of its owner, free from any feudal tenure or obligation to a superior. Since the Norman Conquest there had been no allodial land in England, for the laws declare all land to be the property of the sovereign. Before the Conquest the right was held to a certain extent, and it was common throughout the rest of N. Europe. In Scots law the term is applied to all movable property and to crown lands, and land bought under the Scots Lands Clauses Consolidation Act. The term is also applied to the udal land in the Orkney and Shetland Is.

Allogamy (Gk *allos*, other; *gamos*, marriage), or cross fertilisation, the transference of the pollen of one flower to the pistil of another. There are 2 types—(1) Geitonogamy, in which the fertilised flower is on the same plant; (2) Xenogamy, in which it is on another plant.

Allopathy, usually applied to the orthodox method of therapeutics as opposed to homoeopathy (q.v.). Hahnemann, the inventor of the term and the promulgator of homoeopathy, designated as A. that method of the treatment of disease consisting in the use of medicines the action of which upon the body in health produces morbid phenomena different from those of the disease treated. Homoeopathy, on the other hand, consisted in the use of medicines which, by experiment on persons in a state of health, are known to produce morbid phenomena similar to those of the disease treated.

Allophane (Gk *allos*, other; *phainein*, to appear), hydrous aluminium silicate of blue, green, or brown colour, found in Saalfeld and Schneeberg (Germany).

Allori, Cristofano (1577–1621), Florentine painter, son of the painter Alessandro Allori (1535–1607) (q.v.). He studied under Paganini, who followed the Venetians in colour. His most celebrated work is 'Judith with the Head of Holofernes' in the Pitti Palace, Florence. His works are distinguished by delicacy, rich colouring, and technical accuracy.

Allotments. An allotment in England and Wales is defined by statute as a piece of land, not more than 5 ac. in extent, which is cultivated as a farm or garden, or, in other words, it is a small agric. holding. 'A time there was ere England's griefs began, When every rood of ground maintained its man,' wrote the poet Goldsmith; but that time began to decline in the 15th cent., and continued till at the present day the great mass of the people are divorced from the land, and even those still engaged in agric. were only in the position of hirelings of large landowners. In the spacious days before the rise of modern industrialism, and before the numerous inclosure Acts of the 17th, 18th, and 19th cents., each cottager had his own small parcel of land which he cultivated, and in addition he had the right of turning

his cattle, swine, and geese out to graze on the common land. The Georgian parliaments, consisting mainly of the representatives of the landed class, passed Inclosure Act after Inclosure Act, enclosing as much as 7,000,000 ac. of common land between 1760 and 1867. To compensate the cottagers for their lost grazing rights many of these Acts provided that garden A. should be reserved for them. This benevolent intention seems to have failed in the working, for while between 1845 and 1867 nearly half a million ac. of land were enclosed, only 2119 ac. were set aside for the poor. Alarmed by the rapid decline in the agric. pop. due to the lure of the tns, with their greater opportunities, higher wages, and less monotonous existence, the policy of the 19th cent. was to check the flow towards the tns by giving the agric. labourer some inducement to remain in the country, so that Acts for the provision of A. and small holdings were almost as numerous as Inclosure Acts in the previous cent. Incidentally it was also discovered that the parcelling of land into small holdings was a profitable thing for the landlord, the fork and spade husbandry of the allotment being much more effective than the plough. In 1819 and 1831 the first Acts making provision for A. were passed, and the series of Acts which followed were consolidated in the Small Holdings and Allotments Act, 1908. Most of these Acts aimed at giving compulsory powers to local authorities, and in some cases laid on them the duty, to provide A. The Parish Councils Act, 1894, gave a stimulus to this matter, and during the first 4 years of its working nearly 15,000 ac. were allotted by the councils to 32,000 tenants. An allotment does not generally exceed in size a quarter of an ac., the underlying idea being that its size should not exceed that which can be cultivated during the spare time of the labourer; but a small holding is the term applied to an agric. holding of from 1 to 50 ac. Additional powers have been conferred on local authorities by various Acts passed since the First World War. Under the Allotments Act of 1919 a co. council may acquire land for leasing to a par. council of A., but the allotment may be let only to residents or to persons working on a co-operative system, or let to A. associations. Statutory powers are also given to local authorities to acquire land compulsorily for A., or, with the consent of the Ministry of Agriculture, land held by them for other purposes may be appropriated to A. Under the Act of 1925, the Public Works Loans Commissioners may lend to any 'approved society' (i.e. a society registered under the Industrial and Provident Societies Acts or under the Friendly Societies Acts) money to purchase land for A. Compensation for improvements is provided for by the Allotments Act of 1922, and, in this context, an 'allotment' means any piece of land, whether attached to a cottage or not, of not more than 2 ac., held by a tenant and cultivated as a farm or a garden or as both. For the purposes of

the Act of 1925 an 'allotment' includes any piece of land of not more than 5 ac. Every local authority preparing a town-planning scheme must consider what provision ought to be made for reserving land for A. (including allotment gardens, i.e. A. not exceeding 40 poles and wholly or mainly under crops or vegetables for consumption by the cultivator or his family) and must at least once a year consider whether any and if so what lands within the area of the scheme are needed for A. (Act of 1925). By the Act of 1925 a bor. or an urb. dist. council may acquire land for future A. with the approval of the Ministry of Agriculture.

Allotropy, the property which some chemical elements possess of existing in different modifications under different circumstances. Sulphur may exist as

important decomposition product of uric acid. It is obtained by oxidising the uric acid with nitric acid. On treatment with alkalis it takes up 2 molecules of water, producing urea and mesoxalic acid.

Alloxantin, substance formed by the reduction of alloxan by dialuric acid, or directly from uric acid by evaporating to dryness with nitric acid. Treated with ammonia, it forms a purplish-red dye, *murexide*, a test for uric acid being thus provided.

Alloy, substance formed by the union of 2 or more metals. There are 3 ways of bringing about this union. The first is by powder metallurgy (see METALLURGY). It is also possible to bring about the deposition of an A. by the electrolysis of a solution of a mixture of 2 metallic salts (see ELECTRO-METALLURGY). The

NICKEL-COPPER PHASE
DIAGRAM

EUTECTIC TYPE OF PHASE
DIAGRAM

octahedral or prismatic crystals, or as an amorphous powder, or yet again in a plastic form. Carbon may exist in any of the 3 forms, diamond, graphite, and amorphous charcoal or lampblack. Phosphorus may exist in white and red crystalline modifications. Oxygen is found as the ordinary constituent of air or as the ozone which is produced in the neighbourhood of an electric discharge. In this case, however, it is known that the combination of atoms in the molecule is different, as ozone is one and a half times as dense as oxygen; that is, the formula for oxygen is O_2 and that of ozone O_3 . A. is not confined to non-metals; thus tin, silver, antimony, arsenic, and other metallic or metalloid elements exist in allotropic forms. A. is explicable on the assumption that the molecules of the different forms are of dissimilar structure.

Alloway, vil. on the banks of Doon, Ayrshire, Scotland, since 1935 part of the royal burgh of Ayr and 2½ m. from its centre, bp. of Robert Burns. The cottage in which the poet was b. has now been converted into a museum. Here also is the 'kirk' which he celebrates in *Tam o' Shanter* as the scene of the witches' dance, and the 'Auld Brig' over which *Tam o' Shanter* escaped.

Alloxan ($C_4H_2O_4N_2$), or mesoxalylurea,

third method, that of the greatest commercial importance, is the fusion of the metals at a temp. high enough to form a uniform liquid. The temp. of the liquid must not be above that required to melt the constituent with the highest melting point, since the melting-point of an A. is often lower than that of the pure constituents. Usually the metal constituting the major proportion of the A. is melted first and the other alloying elements dissolved in the liquid to form a homogeneous molten A.

Metallic crystals are usually of 3 types: body-centred cubic, face-centred cubic, and hexagonal close packed (see METALS). If the atoms of one metal are added to atoms of another to form an A., the second metal will generally form a solid solution (analogous to a liquid solution) with the first and the structure will be of the same type as that of the first if only a few atoms are added. As more atoms of the second metal are added a point may arrive when a second phase with a different crystal structure is formed and later, as still more atoms are added, a third and fourth phase may be present. Solid solution phases are, as a rule, very ductile and are therefore required for A.s which have to be cold-formed, e.g. cartridge brass for deep-drawing into cartridge

cases. Such A.s, however, have not the high strength required for structural purposes, and a composition is chosen which provides a sufficient proportion of a second, more rigid phase; a less ductile solid solution, or, better still, an inter-metallic compound. The latter are hard and brittle and provide the A. with stiffness while the solid solution supplies the ductility which prevents it from breaking under shock. Steel is a good example of this where the compound iron carbide stiffens the soft iron. Research has revealed some of the laws which govern the crystal structure of the various phases which occur in an A. It has been found that these depend upon such factors as the relative sizes of the atoms concerned, the system in which each crystallises, their relative positions in the electromotive series, and the ratio of electrons to atoms.

Phase diagrams are diagrams in which the various phases in an A. are represented when the percentage composition is plotted against temp. The simplest is exemplified by A.s of copper and nickel in which a single solid solution is present over the whole range from 100 per cent copper to 100 per cent nickel. It will be noticed that although the pure metals solidify at fixed temps. the A.s have a 'mushy' range in which both solid and liquid are present together. In another very common type of diagram there are two phases present, the α and the β solid solutions. Suppose an A. consists of 70 per cent of metal A and 30 per cent of metal B. As this A. cools, the α -solid solution begins to crystallise at point L; at point S the remaining liquid solidifies and consists of both the α and the β solid solutions together in the ratio given by point E. E is called the eutectic. Under the microscope a eutectic has a very characteristic appearance, showing most commonly layers of one solid solution alternating with layers of the other, or dots of one in a background of the other.

Allspice, the dried berries of A. tree, *Pimenta officinalis*. See PIMENTO.

Allston, Francis, see CHANNING, 1st BARON.

Allston, Washington (1779-1843), Amer. painter and author. b. at his father's plantation at Waccamaw, S. Carolina. In 1800 he graduated at Harvard, after which he visited London, Paris, and Rome to study art. He was a friend of Benjamin West, was admired by Coleridge, and is akin in romantic imagination to John Martin (q.v.). In 1818 he finally returned to America. His pictures are numerous, the best known being 'The Dead Man Revived,' 'St Peter liberated by the Angel,' and his unfinished 'Belshazzar's Feast.' He pub. a poem, *The Sylphs of the Season*, 1813; a novel, *Monaldi*, 1841; and *Lectures on Art*, 1850.

See J. B. Flagg, *Life and Letters of Washington Allston*, New York, 1892.

Alluvium (Lat. *alluvio*, washing against), legal term for land gradually formed by deposit from the sea or some other water. The process must be gradual. A. becomes the property of the owner of the land to which it is attached.

Alluvium (Lat. *ad*, towards; *luere*, to wash), or **Alluvial Deposits**, name given to those accumulations of sand, earth, and loose stones or gravel brought down by streams and rivs. and spread out over lower lands, which are called *alluvial lands*. The term is sometimes also applied to the deposits at the mouth of a riv. entering the sea, when they are known as *marine alluvia* to distinguish them from the *fresh-water alluvia*.

Allyl, unsaturated organic radical corresponding to the formula $\text{CH}_2:\text{CH}:\text{CH}_2$. The chief compounds are: A. *alcohol*, with the general properties of a primary alcohol; A. *iodide*, a colourless liquid with an odour of garlic; A. *bromide*, a heavy liquid obtained by treating A. alcohol with phosphorus tribromide; A. *sulphide*, or 'oil of garlic,' obtained by macerating garlic; and A. *isothiocyanate*, or 'oil of mustard,' occurring in black mustard seeds.

Al'ma, small riv. in W. Crimea. On its banks the combined armies of Britain, France, and Turkey defeated the Russians on 20 Sept. 1854.

Alma-Ata: 1. Cap. of Kazakh S.S.R. of the Soviet Union. Founded in 1854 as Russian fortress of Vernyy, it became the cap. in 1929. It has a heavy machine-building industry, fruit-preserving and meat packing plants, a univ., and an academy of sciences. Pop. 320,000.

2. Oblast of Kazakh S.S.R., extending along the Ili R. from Lake Balkhash to the Chinese border. The economy is entirely agric. Pop. 520,000.

Alma Mater (Lat. 'nourishing mother'), the name given to a univ. to express its relation to those educ. at it—its *alumni* or foster-children.

Alma-Tadema, Sir Laurence, O.M. (1836-1912), artist of Dutch extraction, b. Dronryp, Friesland. He studied painting first at the Antwerp academy, and later under Baron Leys. He followed Leys in devoting himself to the reconstruction of the past, painting chiefly classical subjects. About 1870 he settled in London and became a naturalised Englishman. In 1879 he was made a member of the Royal Academy, and he received a knighthood in 1899. His work is remarkable for its archaeological accuracy, though its sentiment was late-Victorian. Some of his works are 'The Education of the Children of Clovis,' 1861, 'Pyrrhic Dance,' 1869, 'The Vintage Festival,' 1876, 'The Seasons,' 1877, and 'Roses of Heliogabalus,' 1888. He had the distinction of being one of the artists selected for the Order of Merit. See H. Zimmern, *L. Alma-Tadema, his Life and Work*, London, 1886, and G. Ebers, *L. Alma-Tadema*, trans. New York, 1886.

Almacantar, see ALMUCANTAR.

Almack's, see CLUBS.

Almada, tn of Portugal, in Setúbal dist., 16 m. NW. of Setúbal (q.v.). It is on the S. bank of the Tagus (q.v.) estuary, opposite Lisbon. There are cork and food-preserving industries. Pop. 5800.

Almaden (anct. *Sisapon*), Sp. tn in the prov. of Ciudad Real, in the Sierra

Morena (q.v.), containing the most ancient mercury mines in the world. In the 16th cent. the mines were worked by the Fugger (q.v.) family. Pop. 13,000.

Almagest, name of an important astronomical and mathematical work of Claudius Ptolemaeus, or Ptolemy, one of the most celebrated savants of the Alexandrian school. This work was probably written between AD 140 and 150, in the reign of the Rom. Emperor Antoninus Pius, and was divided into 13 sections or 'books.' To distinguish it from other important works of the same author, it received the Gk appellation *megiste*, 'the greatest,' from which its modern name, with the addition of the Arabic definite article *al*, 'the,' is derived. In it is set forth the theory of the solar system, designated the Ptolemaic system, which held the unchallenged sway in the realm of astronomical science during the Middle Ages that the works of Aristotle did in other branches of knowledge. For an account of this system see **PTOLEMAIC SYSTEM**.

Almagra (Arabic), species of ochre of a dark red colour formerly used as a skin paint and general dye (q.v.).

Almagro, Diego d' (c. 1475-1538). Sp. soldier and explorer, b. Aldea del Rey. In 1524 he joined Pizarro in a scheme for the conquest of Peru. Ultimately the two quarrelled over the div. of terr., and in 1538, after a battle near Cuzco in which Pizarro was victorious, A. was put to death.

Almanac, book or table containing a calendar of the days, weeks, and months of the year, with the addition of notices of astronomical phenomena, of eccles. feasts, and similar useful information. Authoritative A.s are pub. by the govts. in most countries, and from these the smaller ones are compiled. Such are the *Nautical A.* in Great Britain, the *American Ephemeris and Nautical A.* in the U.S.A., and the *Almanach de Gotha*, pub. in Germany and France; the Berlin *Astronomisches Jahrbuch* and the Fr. *Connaissance des temps* contain additional astronomical information. These works are pub. some years in advance, and contain tables of the predicted positions of sun, moon, and planets, and of all the fixed stars used in navigation. Statistics of various kinds are also given. The *Almanach de Gotha* contains lists of the statistics of politics, pop., sovereigns, army, etc., for every state. More popular works are *Whitaker's Almanack* in England, containing much information, *Oliver and Boyd's New Edinburgh A.* in Scotland, and *Thom's Irish A.* for Ireland.

The hist. of the A. in the E. goes far back. Its use is known of from the 13th cent. onward in England. The first printed A. was that of Purbach, 1450-61, and this was soon followed by the more important work of Regiomontanus, which covered the years from 1475 to 1531. The early A.s generally took the name of 'Prognostications,' and these prophetic A.s had a huge circulation among the unlearned. In the reign of James I the

monopoly for their production was granted to the 2 univs. and the Stationers' Company. Of this type of pub. are *Old Moore's* and, in America, *Poor Richard's A.* The sale of such works of fiction is now considerably restricted. Partridge, the A. maker of the Stationers' Company, has been immortalised by Dean Swift in the famous *Bickerstaff Papers*, 1708. See **CALENDAR** and **CHRONOLOGY**.

Almandite, or **Almandine**, variety of garnet, composed of silica, alumina, and protoxide of iron, and either deep red in colour and transparent, brownish and translucent, or black (melanite). It includes the one popular carbuncle (q.v.). According to Pliny, it was named after Alabanda, a city of Caria where the mineral was cut and polished.

Almansa, Sp. tn in the prov. of Albacete, at the foot of a hill on which stands a ruined Moorish castle. Near by the Duke of Berwick (q.v.) defeated the English and Spanish in 1707. Textiles and leather goods are manuf. Pop. 15,800.

Almansur (Arabic 'the Victorious'), **Abu Jaffar Abdallah** (c. 712-75), second caliph of the Abbasid dynasty, succeeded his brother in 754. During his reign he lost Spain and Africa, and persecuted the Syrian and Egyptian Christians. He founded Bagdad.

Alme, **Aimel**, or **Al-mal**, i.e. 'the learned,' is the name given by the modern Egyptians and Arabs to the Egyptian singing girls (not to be confused with the ghawāzi or dancing girls) who attend festivals, marriages, funerals, and other ceremonies. They are also found in Syria and other parts of the Ottoman empire.

Almeida, tn of Portugal, in Guarda dist., 25 m. NE. of Guarda (q.v.), near the Sp. frontier. It was once an important fortress, and was taken by Spain in 1762. During the Peninsular War (q.v.) it was captured by the French in 1810, but was recovered by the British and Portuguese in 1811. There is a trade in agric. produce and olive oil. Pop. 3000.

Almeida-Garrett, João Baptista de (1799-1854), Portuguese poet and politician, leader of the Portuguese Romantic movement, b. Oporto. He took an active part in the political movements of his country. Of his romantic plays *Frei Luis de Sousa*, built on the pattern of the classical Gk tragedy, is considered the best national drama of Portugal. His other works include an epic poem called *Dona Branca*, *Romanceiro*, a collection of Portuguese folk-tales, and *Folhas caídas*, a vol. of lyrics.

Almeirim, tn of Portugal, in Santarém dist., 4 m. SE. of Santarém (q.v.). It was an ancient residence of the kings of Portugal, and is the centre of a fruit- and wine-producing region. Pop. 6800.

Almelo, tn in the prov. of Overijssel, Netherlands, 28 m. SE. of Zwolle. It is situated on the Overijssel Canal, and has weaving and spinning mills. Pop. (1954) 46,225.

Almería: 1. Sp. prov. in Andalucía (q.v.) with a coastline on the Mediterranean. It was once part of the ancient

kingdom of Granada (q.v.). It is hilly except in the coastal regions, and has rich deposits of copper, iron, silver, lead, and mercury. Cereals and fruit are grown, and wine is produced. Area 3389 sq. m.; pop. 356,850.

2. Sp. port, cap. of the prov. of A., in the Gulf of A. on the Mediterranean. During the time of the Moors it was, after Granada (q.v.), the richest tn in the kingdom, and was the arsenal for the fleet. It is still Moorish in appearance, and is dominated by a great Moorish fort. It has a fine 16th-cent. cathedral, and exports oranges, grapes, and esparto. Pop. 75,750.

Almodovar del Campo, Sp tn in the prov. of Ciudad Real, the centre of an agric. dist. It was once a Moorish fortress. Pop. 7000.

Almogia, Sp. tn in the prov. of Málaga, with a trade in fruit and wine. Pop. 4000.

Almohades, Berber dynasty that ruled N. Africa and the Muslim half of Spain during the 12th and 13th cents. The founder of the dynasty and the cult (the name, lit. *Al-muwah-hidun*, means Unitarians—those laying particular stress on the unity of God, as opposed to the current anthropomorphism) was Mohammed ibn Tumart. He, with his lieutenant and successor, Abd-el-Mumin, dethroned the Almoravide dynasty (q.v.) and conquered N. Africa. The dynasty was fanatical and purely military, yet it retained its power intact until 1212, when its decline began in the defeat of Navas de Tolosa. The line ended in 1269.

Almon, John (1737–1805), bookseller and pamphleteer, friend of John Wilkes, b. Liverpool. His business premises were in Piccadilly. Among his pubs. were the *Parliamentary Register*, 1774, and the *General Advertiser*, 1784. In 1786 the Crown moved to try him for publishing the pamphlet *Juries and Libels*, but the prosecution failed. For selling a copy of the *London Museum* containing Junius's 'Letter to the King' he was fined and bound over, 1770. He pub. Wilkes's correspondence, with a memoir, 1805.

Almon, name of an affluent of the Tiber in anct Latium, where the votaries of Cybele purified themselves, and where every year the image of the goddess was bathed.

Almond, trib. of the Tay, flowing into that riv. 2 m. above Perth.

Almond is a name applied to sev. plants. The common A. is *Prunus communis*; the Bitter A., its variety *amara*; it is grown in England for its pink flowers. It yields an oil, and the seeds are eaten as dessert. See PRUNUS.

Almondbury, see HUNDERSFIELD.

Almonds, Oil of, fixed oil obtained from the dried ripe kernel of both sweet and bitter almond trees, but more usually from the latter as the residual cake is of more value. It has a yellowish colour and slight characteristic odour; it consists mainly of glyceryl oleate and is used in cosmetics and medicine. Oil of bitter A. is obtained by maceration and

distillation from bitter almond cake. It is a volatile almost colourless oil, and has a characteristic odour. The odour is due to benzaldehyde, which constitutes about 90 per cent of the whole and is formed together with benzaldehyde-cyanhydrin, hydrocyanic acid, and a glucoside gentiobiose, by the action of the enzyme emulsion (syntapase) on amygdalin during maceration. Benzaldehyde is often called 'oil of bitter almonds' and is used for flavouring purposes and in perfumery and dyestuffs.

Almoner (O.F. *almosnier*; Lat. *elemosynarius*), originally the officer of a religious house appointed to distribute to the poor the alms of the house, one-tenth of the revenue. Bishops and sovereigns also had A.s. In England the lord high A., usually a bishop, distributes, twice a year, the sovereign's bounty.

Hospital Almoners were introduced into hospitals (q.v.) to prevent abuse by persons able to pay for treatment and to assess the contributions of those able to pay part of its cost. They first joined the Royal Free Hospital (q.v.) about 1895, and other hospitals appointed A.s during the next decade. Gradually other duties were added concerning the social services and after-care. Since the introduction of the National Health Service (q.v.) in 1948, A.s are no longer concerned with the financial position of the hospital but solely with the patient, and they link up the hospital services with the general-practitioner and local-authority services. Their social service activities include the after-care, resettlement, and rehabilitation of the patient. Over 1000 A.s are now employed in hospitals in Britain. The Institute of Almoners, Tavistock House North, Tavistock Square, London, W.C.1, is concerned with the selection, training, and certification of A.s. See I. F. Beck, *The Almoner*, 1948, and *Ten Patients and an Almoner*, 1956.

Almonte, tn in the prov. of Ontario, Canada, and a centre for the manuf. of woollen goods. Pop. 2595.

Almoravides, Berber dynasty which ruled over Morocco and part of Spain during the 11th and 12th cents. The line was founded by Abdallah ibn Yaseen, who about 1050 preached a holy war. Aided by his brother Abu Bakr, he conquered most of Morocco. On his death he was succeeded by Yusuf ibn Tashfin, who completed the conquest of Morocco and extended his power into Spain in 1086. He defeated the Christians at Sacralias, but was then obliged to return to Africa. In 1090, however, he returned and took the complete control of Mohammedan Spain. The dynasty was supplanted in 1147 by the Almohades (q.v.).

Almqvist, Carl Jonas Ludvig (1793–1866), Swedish author, b. Stockholm. After being in turn civil servant, farmer, schoolteacher, cleric, and journalist, his true literary career began in 1832 with the first of his series of romances, called *Törnrosens bok*. His succeeding pubs., lyrics, dramas, philosophical, aesthetic, moral, and educational works, show

remarkable versatility. In 1839 he published his famous story *Det gdr an*, attacking the 'marriage of convenience.' His art evolves from a metaphysically inclined Romanticism towards Realism. In 1851 he fled to America, convicted of forgery and charged with murder. Later he returned to Bremen, where he lived under the name of C. Westermann till his death. See A. Werin, C. J. L. *Almqvist*, 1923; R. C. Berg, C. J. L. *Almqvist i landsflykten*; H. Olsson, C. J. L. *Almqvist till 1836*, 1937.

Almshouse, house built and endowed for the support of those disabled from work by age or poverty. The most ancient example is the hospital of St Cross, Winchester. The name 'hospital' is also used for A.s in Scotland. In 1853 charity commissioners were appointed to put down the many abuses of the system. See J. M. Hobson, *Houses of Pity*, 1926.

Almucantar, small circle of the celestial sphere that is parallel with the horizon of the observer, in other words, a parallel of altitude. The term is also applied to a telescope which is mounted in such a way that in its rotation about a vertical axis it sweeps out small circles in the heavens. The instrument is chiefly employed to determine the exact position of the observer's zenith, from which his latitude is found. The telescope is borne on a float in a tank of mercury.

Almufecar, Sp. tn in the prov. of Granada, on the Mediterranean. It has Rom. remains, including an aqueduct, and a Moorish castle. There are fine bathing beaches, and a trade in agric. produce and wine. Pop. 12,150.

Aln, riv. of Northumberland, England, rising 12 m. W. of Alnwick in the Cheviot Hills and flowing E. for 16 m. to enter the N. Sea at Alnmouth.

Alnus, genus of shrubs or trees, family Betulaceae, which grow in a temperate climate. *A. glutinosa* is the common or black alder, so called from the very dark hue of its bark. It inhabits swamps and meadows of Europe; the N. of Africa, Asia, and America; and is common in Britain. It grows from 30 to 90 ft high. The leaves are a rough oval, with toothed edges, and the flowers form small female catkins resembling cones and pendulous male catkins. The bark is valuable for tanning, while the young shoots dye various colours, particularly red and brown. The tree furnishes an excellent charcoal, second only to that of the black dogwood. The wood is extremely useful, being capable of enduring long immersion in water. Cabinet-makers employ it in the manuf. of what is known as Scottish mahogany.

Other species of A. are *A. incana*, the grey alder, which is found in Europe and N. America, and is noted for its non-glutinous leaves; *A. cordata*, the heart-leaved alder, which is a native of Naples; and *A. viridis*, the green alder, a European shrub.

Alnwick, cap. of the co. of Northumberland, England, 33 m. NW. of Newcastle, on the R. Aln. A. is a well-built tn, and interesting historical features include

remains of the old tn wall and of various abbeys. Pop. 7370.

Aloe, family Liliaceae, genus of succulent stemless and stemmed plants, chiefly S. African, or S. Arabia to India, of which cultivation goes back to early times. In gardens, A.s are chiefly grown for their decorative foliage; *A. variegata*, Partridge-breasted A., *A. cristata*, often bearing a raceme of reddish-yellow flowers, and *A. ciliaris*, with red flowers, are grown in greenhouses. *A. succotrina*, the first A. to be grown in Europe is an esteemed source of the bitter drug, Aloe (q.v.).

Aloes, known as Curacao, Socotrine, or Zanzibar A., drug prepared from the sap excreted by the cut leaves of various species of *Aloe* (q.v.), evaporated dry. Chief constituents are aloin and emodin; and the action that of a powerful cathartic, emmenagogue, and antelmintic.

Aloes Wood, also known as Agila Wood, Agallochum, Eagle Wood, Paradise Wood, and Calambac, is the heartwood of *Aquilaria ovata* and *Aquilaria agallocha*, found in tropical Asia. The innermost wood of these trees yields a fragrant resinous substance which is used in the E. as a perfume and as a medicine. It retains its fragrance for years, and was once more valuable than gold. It is thought to be the aloes mentioned in the Bible.

Aloidæ, Otus and Ephialtes, twin sons of Poseidon and Iphimedia, wife of Aloeus. They made war upon the gods, and to force an entrance to heaven piled Mt Pelion on Ossa. They were defeated by the immortals, and their doom was a warning to insolent mortals.

Along, Bay of, see HA-LONG, BAY OF.

Alonso, see ALFONSO.

Alopea (Gk *alôpēkia*, fox-mange), baldness. *A. areata*, patches of baldness appearing in an otherwise normal growth of hair. Often attacks young persons. The cause of *A. areata* is not known but it is not due to any serious constitutional disorder. It sometimes seems to be associated with eye-strain and also with dental sepsis. Again, nervous tension may play a part. Uncleanliness is not a cause, nor is A. infectious or contagious. It must be distinguished from ringworm (q.v.). The hair usually grows again in time, but sometimes in a different colour, perhaps white.

Alopecurus, family Gramineae, genus of ann. or perennial grasses known as Foxtail. *A. pratensis*, Meadow Foxtail, *A. geniculatus*, Marsh Foxtail, *A. bulbosus*, Tuberous Foxtail, *A. alpinus*, Alpine Foxtail, are perennial; and *A. myosuroides*, Black Twitch, is ann.; and all native of Britain.

Alora, Sp. tn in the prov. of Malaga. It has ant walls and towers, and a ruined castle. The dist is renowned for its fruit. Pop. 15,300.

Alost, see SHAD.

Alost (Elen. Aalst), tn in the prov. of E. Flanders, Belgium, on the R. Dender, here made into a canal. It contains the church of St Martin dating from 1498; manufs. lace and textiles. Pop. (1955) 43,500.

Aloysia, see LIPPIA.

Aloysius Gonzaga (Luigi Gonzaga), St. (1568-91), b. Castiglione. In 1585 he joined the Society of Jesus, despite parental opposition, and d. of the plague while ministering to the sick. Canonised in 1726, his feast is on 21 June.

Alp Arslan (Valiant Lion) (c. 1029-72), Mohammed ibn Daoud, second Persian sultan of the Seljuk dynasty. He came to the Persian throne in 1063, and pursued a career of conquest. He reduced Armenia and Georgia, and later won a great victory over the Gk emperor, Romanus Diogenes, whom he took prisoner, but released on payment of a large ransom. The sultan was assassinated by a prisoner whom he had condemned to death.

Alpaca, domesticated breed of cameloid mammals, supposedly derived from the wild guanaco. It is smaller than the llama, and is not, like that animal, used as a beast of burden. A.s are kept in large flocks in the Peruvian Andes, and their wool is shorn annually. The wool varies in colour from black to dark yellow, and is lustrous, silky, and fine. It has been used by the Indians for cloth from time immemorial, but it was not properly introduced into England till 1836. The name of Sir Titus Salt is historic in its connection with the estab. of A. factories.

Alpenhorn (Ger.), or **Alphorn** (Eng.), musical instrument used chiefly by the Swiss mountaineers to convey signals. It consists of a curved wooden horn with cup-shaped mouthpiece. The notes are the natural harmonics of the open tube.

Alpes, Basses-, dept. of SE. France, formed of part of Provence (q.v.). It is bordered on the E. by Italy, and consists of 4 arrons.: Digne, Barcelonnette, Castellane, and Forcalquier. The prov. is entirely in the Alps (q.v.), and has high mts in the N. and E.; the scenery in many places is very beautiful. The chief rivs. are the Durance (q.v.) and the Verdon. Stock-raising and forestry are the main occupations in the mts, and the growing of vines, fruit, potatoes, and olives in the valleys. The cap. is Digne (q.v.). Area 2697 sq. m.; pop. 84,400.

Alpes, Hautes-, dept. of SE. France, formed of part of the Dauphiné and part of Provence (qq.v.). It is bordered on the E. by Italy, and consists of 2 arrons.: Gap and Briançon (qq.v.). The prov. is entirely in the Alps (q.v.); in the E. are the slopes of the Cottian Alps. The chief riv. is the Durance (q.v.). There is much stock-raising, and some vines, fruit, and vegetables are grown. The cap. is Gap. Area 2178 sq. m.; pop. 85,100.

Alpes-Maritimes, maritime dept. of SE. France, bordered on the E. and NE. by Italy. It has a coastline on the Ligurian Sea in the S., and encloses Monaco (qq.v.). The dept. is formed of the old co. of Nice, and of part of Provence (q.v.); it consists of 2 arrons.: Nice and Grasse (qq.v.). The N. boundary is formed by the Maritime Alps (q.v.), from which sev. spurs run S. The coast, the Côte d'Azur, is the most westerly part of the Riviera (q.v.), and contains such resorts as Nice, the

cap., Antibes, Menton, and Cannes (qq.v.), in addition to Monaco. The chief riv. is the Var (q.v.). There are many mineral springs. Flowers, fruit, and early vegetables are grown, and there are olive-oil, perfume, and metallurgical industries. On the coast there is fishing for tunny and sardines. Area 1444 sq. m.; pop. 515,500.

Alpha and Omega (α and ω), first and last letters of the Gk alphabet, descriptive of God as being the beginning and end of all things.

Alpha Boötis, see ARCTURUS.

Alpha Particles, nuclei of helium atoms, emitted by certain radioactive substances at velocities about one-twentieth of the velocity of light. Rutherford, 1899, distinguished 2 types of radiation from a uranium compound, one of which is stopped by about 0.002 cm. of aluminium, and the other by about one hundred times this thickness. The former he called alpha-rays, now known as A. P., and the latter beta-rays (q.v.). Rutherford and his co-workers first showed, 1903, that the A. P. are positively charged and have a charge-to-mass ratio almost exactly one-half that of the proton (q.v.). In 1908 they found that each alpha particle carries 2 units of charge, and therefore must have approximately 4 times the mass of the proton, i.e. they are helium nuclei.

In this work Rutherford and Geiger used an electrical device for counting A. P. An improved form of this is the Geiger-Mueller (GM) counter (q.v.) which depends for its action on the ionisation produced in a gas by moving charged particles. The earliest detectors were zinc sulphide screens which produce minute scintillations when bombarded by A. P. Photographic plates which are blackened by A. P. were also used (see NUCLEAR EMULSIONS and WILSON CLOUD CHAMBER).

Geiger and Nuttall found that naturally produced A. P. have discreet energies, bearing an important relation to the half-life (T) of the emitting nucleus (see RADIOACTIVITY), $\log(1/T) = A \log E + B$, where E is the energy and A and B are constants. More searching investigations showed that A. P. of slightly different energies are emitted by the same nucleus and are accompanied by gamma-rays (q.v.).

The discovery of an unexpectedly large number of A. P. scattered through angles greater than 90 degrees by very thin films of gold led to Rutherford's famous theory of the nuclear atom (see NUCLEUS).

Alpha-Rays, see ALPHA PARTICLES.

Alphabet, from *alpha* and *beta*, the names of the first 2 letters of the Gk A. The A. is the last, the most highly developed, the most convenient, and the most easily adaptable system of writing (see WRITING). It is a collection of a small number (generally between 20 and 30) of symbols called letters, intended to represent the various sounds used by the human voice in speech. Perfection has not yet been reached by any A., although this end does not perhaps seem very difficult of achievement. Perfection in an A. implies the accurate rendering of speech-sounds; each sound must be

represented by a single constant symbol, and not more than one sound by the same symbol. As it is, all A.s omit symbols for some sounds, representing these, when necessary, by combinations of other symbols, by the addition of diacritical points or other marks, and so forth, while, on the other hand, most of the A.s contain redundant letters. An interesting instance in this connection is the representation of the sounds *sh* and *ch* (as in 'church') in various languages; while the Russian A. has a single symbol for the combination *sh-ch*, Czech (another Slavonic language) would use for it the combination *šč*, Polish (again a Slavonic speech) represents it by 4 consonants (*szcz*)—and so does English (the 4 consonants are *sch*, as in 'Aschchurch')—and German would need as many as 7 consonants for the transliteration of this combination, that is *schtch*. English has no single symbols to represent the sounds *ch*, *sh*, *th*, and so forth. On the other hand, some letters are used for two or more distinct sounds; in English, for instance, the letter *c* is sounded hard (*-k*) as in 'cross' and 'cursive', and soft (*-s*) as in 'precise' and 'cell', in addition to entering into the combination *ch*, and replacing the *k* in *ck*. Again, *q* and *x* are redundant; *q* only appears in the combination *qu*, which can always be represented by *kw*; and *x* can always be represented by *ks*.

Alphabetic writing is now universally employed by civilised peoples, and no other system of writing has had so extensive, so intricate, and so interesting a hist. The story of the A. from the end of the second millennium BC until to-day is, on the whole, not very hard to trace, though many details, and the origin of some individual A.s, are still uncertain. It is the pre- and proto-hist. of the A. that is still wrapped in obscurity, and the prin. problem—that of its origin—is still unsolved. Since classical times this problem has been a matter of serious study. The Greeks and Romans held 5 conflicting opinions as to who were the inventors of the A.: the Phoenicians, the Egyptians, the Assyrians, the Cretans, or the Hebrews. In modern times various theories, some not very different in part from those of ant. days, have been current. Some theories need not be seriously treated (such as that of the Nazi pseudo-scholars), as they are influenced by political considerations. The earliest modern view was that Egypt was the starting-place of the A. The Egyptian theory has been subdivided into three theories—the hieroglyphic, the hieratic, and the demotic. The Egyptian view was revived in 1916 by Dr (now Sir) Alan Gardiner and Prof. Sethe, dealing with the Early Sinaitic inscriptions (q.v.). Many scholars hold the opinion that in the Sinaitic inscriptions we have to do with a stage of writing intermediate between Egyptian hieroglyphics and the Semitic A. This theory cannot be upheld, although it may be agreed that we have in these inscriptions one of the earliest known attempts at alphabet writing.

The attempts made to show that the cuneiform (q.v.) scripts, either the Sumerian or the Babylonian, or the Assyrian; or else the syllabary of Cyprus (q.v.), or the Hittite (q.v.) hieroglyphics, are the true parents of the A. may be regarded as even less successful. The Cretan theory, suggested by Sir Arthur Evans, had recently many adherents. It is certainly true that many alphabetic signs have a resemblance to Cretan linear characters, but the similarity is only external. The same may be said about the theory, developed by Sir W. M. Flinders Petrie, that the A. descended from the geometric prehistoric marks employed throughout the Mediterranean area from the earliest times. Most unlikely also is Sir John Evans's suggestion that the letters were once pictures used as ideograms.

The solution of the problem may come from Palestine, where, since 1929, various late Bronze Age inscriptions (18th to 13th cents. BC) have been discovered, mainly at Lachish (q.v.). According to many eminent scholars the writing of these inscriptions, termed Early Canaanite (q.v.), constitutes an important missing link in the hist. of our A., representing the long-sought intermediate stage between the Early Sinaitic and the earliest known N. Semitic forms. It is, however, possible that the Early Canaanite script represents another effort of the second millennium BC to introduce an alphabetic writing. Similar efforts were probably the cuneiform A. of Ras Shamra, the ant. Ugarit; the pseudo-hieroglyphic syllabary of Byblos (q.v.), partly deciphered by the Fr. scholar Dhorme; and the scripts of a few enigmatic inscriptions of N. Egypt, of Balua' (Moab, Transjordan), and of the so-called proto-Arabic inscriptions found at Ur (Mesopotamia).

The prototype of the A. was not very different from that of the earliest N. Semitic inscriptions now extant, belonging to the last cents. of the second millennium BC. These inscriptions have been discovered since 1923 at Byblos and other places in Syria; the Gezer (q.v.) 'calendar,' belonging to the 11th cent. BC, and the Stone of Mesha (q.v.) or the Moabite Stone, belonging to the 9th cent. BC, are written in the same character.

It is usually believed by scholars that practically all existing A.s have a common origin, being descended from a Semitic one, probably from the N. Semitic A. The known facts about this original N. Semitic A. may be summarised thus: it was used by the Syro-Palestinian Semitic peoples in the last cents. of the second millennium BC and during the first millennium. It consisted of 22 letters, which correspond roughly to the first 22 letters of the Gk. A., but all the Semitic letters expressed consonants only, and the method of writing was uniformly from right to left. The order, the names, and the phonetic values of the early Semitic letters are preserved in the modern Heb. A. At the end of the second millennium BC or at the beginning of the first millennium, with the definite

or temporary decay of the great nations of the Bronze Age (the Egyptians, the Babylonians, the Assyrians, the Hittites, the Cretans), we enter a new historical world, in which Israel, Phoenicia, Aram, the Greeks, and the S. Arabians played an increasingly important part. These conditions favoured the development of 4 main branches of the A.: the Canaanite, the Aramaic, the S. Semitic, and the Greek.

The Canaanite main branch may be subdivided into the two following branches: (1) Pre-exilic or Early Heb. (employed by auct Israel in the first half of the first millennium BC), with its three secondary branches, the Moabite, the Edomite, and the Ammonite, and its two offshoots, the Samaritan and the script of the Jewish coins; (2) Phoenician, which can be distinguished into Early Phoenician, Phoenician proper, and Colonial Phoenician, out of which latter Punic or Carthaginian, neo-Punic, and probably also the Libyan and Iberian scripts, developed. All the alphabetic scripts W. of Syria seem to have derived, directly or indirectly, from the Canaanite branch, whereas nearly all the hundreds of alphabets of the E. apparently sprang from the Aramaic branch. The Aramaic A. probably originated in the 10th cent. BC, but the earliest Aramaic inscriptions belong to the 9th to 7th cents. BC. In the second half of the first millennium BC Aramaic became by far the most important and widespread script of the whole Near E. The direct and indirect descendants of the Aramaic A. can be divided into two groups: (1) the scripts employed for Semitic languages, of which six separate centres of development may be discerned: Hebrew, Nabataean-Sinaitic-Arabic, Palmyrene, Syriac-Nestorian, Mandaean, and Manichaean; the most important of them being Hebrew, in which the holy scriptures of the Jews are printed and the scrolls of the law are inscribed, and the Arabic A., which is after our own the most generally used in the world to-day; (2) the scripts adapted to non-Semitic tongues of central, S., and SE. Asia, which can be divided into eight main groups: Kharoshthi, Persian or Iranian (including the Avesta A.), Sogdian, Kōk Turkic and Early Hungarian, Uighur, Mongolian (including Kalmuck, Buriat, and the allied Manchu A.), Armenian-Georgian-Alban, as well as Brahmi, the mother-A. of the Indian and Further Indian main branches. Indian writing and its origin constitute a story in themselves, and so do other branches, such as Iranian or Pahlavi, Mongolian, and especially Armenian, Georgian, and Alban. The S. Semitic group of A.s remained mainly confined within Arabia, although a secondary branch spread westwards, and became the progenitor of the Ethiopic A., which through its offshoot, the Amharic script, is the only S. Semitic script still in use, and the only one in which a literature has been produced.

The earliest existing Gk records in alphabetic writing go back to the 8th cent. BC, but the introduction of the A. into Greece was doubtless much older

than this. Between the 2 extreme views, that which assigns the invention of the Gk A. to the 15th cent. BC, and that which places it in the 7th or 8th cent. BC, each cent. has its own advocates. Until recently the date usually preferred was the 9th cent.; nowadays an earlier date, such as the 10th or even the 11th cent., is more favoured. The Greeks had many local A.s; many little states had each its own variant, and it was long before anything like uniformity was introduced. Indeed, only by the middle of the 4th cent. BC had all the local A.s disappeared in favour of the Ionic, which thus became the common, classical Gk A. of 24 letters. The Greeks made a few important changes, the most remarkable of them being: (1) the introduction of vowel representation, consisting in the allocation of certain Semitic consonants to Gk vowel sounds; (2) the addition of certain letters for the representation of sounds not expressed by any of the Semitic letters, such as *ph*, *ps*, *kh*, and *x*; and (3) the different arrangements of the sibilants. Like the Semitic A.s, the earliest Gk A. was written from right to left, a style which was later superseded by the *boustrophedon* direction of writing, that is alternately from right to left and from left to right, as the ox draws the plough, but c. 500 BC the method of writing from left to right was generally adopted. In the course of its long hist. the Gk A. produced the following offshoots: the Asiatic A.s (Lycian, Phrygian, Pamphylian, Lydian, and Carian), the Coptic A., with its Nubian derivative, the Messapian A. (in S. Italy), the Gothic A., invented in the 4th cent. by the Gothic bishop Wulfila, the two early Slavonic A.s (Cyrillic and Glagolitic), with their descendants (Russian, Bulgarian, Serbian, Ukrainian, White Russian, and Old Rumanian), later adapted to numerous non-Slavonic languages, and the 3 Albanian A.s, which had very little, and only local, importance. However, the main significance of the Gk A. lies in the fact that through its chief (direct or indirect) descendants, the Etruscan and Lat. A.s, and the aforementioned Cyrillic A., it has become the prototype of all the European A.s.

It is commonly believed that the Rom. character was directly derived from the Greek; this theory is unlikely: the Etruscan A. seems to have been the link between the Greek and the Latin. The Etruscans, a people of uncertain origin and ethnic and linguistic affinities, were the leading power in Italy in the first half of the first millennium BC. They gave their name to Tuscany and the Tyrrhenian Sea (the Romans called them *Etrusci*, and the Greeks knew them as *Tyrsenoi* or *Tyrrhenoi*). The probable date of the introduction of the A. into Etruria is the 8th cent. BC, but only c. 400 BC did the classical Etruscan A. take its final form, having 20 letters, that is 4 vowels and 16 consonants. The following were the main offshoots of the Etruscan A.: the Picenian A. (on the It. Adriatic coast); the Venetic A. (in the modern Venetian region), the

The first column contains the Modern Hebrew script, which phonetically corresponds with the Early Semitic alphabets (columns 2-3). These and the alphabets of the next three columns contain a few letters which have not passed to the other alphabetic systems or have changed their phonetic values. These letters are drawn in smaller type in the upper part of the square in their alphabetical order.

Russian.—The following Russian letters have no exact equivalent in the Roman alphabet or they are placed in different alphabetic position. В, meaning V (between B and G, which in the Russian alphabetic order takes the place of C), Ёж, Ъ, and Ы, variants of I or V, Ц, Ч, Ш, Щ, Ъ, Ь, Э, Ю, Я, Ё, Ъ, Ы.

Modern Hebrew.—The Hebrew letters, K, M, N, P, and S have also final forms, drawn on the left.

N. Etruscan or Alpine A.s. and various Italic A.s. (Oscan, Umbrian, Siculan, Faliscan, and especially Lat.). The origin of the Runes, the 'national' writing of the Teutons, especially of the N. Germanic peoples, offers many difficult problems. The most probable theory is that recently suggested and already accepted by many eminent scholars, that the Runes were derived from a N. Etruscan A., and were invented in the 2nd or 1st cent. BC. There were many local and chronological varieties, the following being the most important: Early or Common Teutonic or Primitive Norse (used mainly from the 3rd to 8th cents. AD), the A.-S. or Anglian Runes (employed in England for about 5 cents.), and the Nordic or Scandinavian varieties (from about AD 800). The gradual displacement of the Runes by the Rom. character coincided with the introduction of Christianity and its increasing influence, but in some parts of Scandinavia the Runic scripts lingered on (in limited use, for charms, for instance) as late as the 16th cent. or even the 17th cent. The origin of the Ogham A.—employed by the Celtic pop. of the Brit. Isles, particularly in S. Ireland and Wales, Isle of Man, and Scotland—is still obscure. It seems to have been invented in the 4th cent. AD, and mainly used as a cryptic script. The variety which was employed in W. Scotland is now known as Pictish Oghams.

The oldest existing records written in the Lat. or Rom. A. date from the 7th cent. BC, but on the whole the Lat. inscriptions belonging to the 7th to 2nd cents. BC are relatively few in number. The earliest inscriptions run from right to left, or vertically in *boustrophedon* style. Only from the 1st cent. BC onwards do they become so numerous all over the world that they cannot be counted. The Romans adopted 21 of the original 26 Etruscan letters, and at the same time varied the symbols a little. Their early A., therefore, ran thus: A B C (having the sound *g* or *k*) D E F Z H I K L M N O P Q R S T V X. At a later time Z was dropped, but a new letter was invented (consisting in the addition of a bar to the lower end of C, thus converting it into G) to denote the voiced sound *g*, and was placed in the position previously occupied by *zeta*. In the 1st cent. BC the Gk letters Y and Z were adopted (for the transliteration of Gk sounds) and placed at the end of the A. Thus the classical Lat. A. became one of 23 letters. The only permanent additions of the Middle Ages were the signs J U W. J is *i* used as a consonant; U is a variant of V which has secured separate recognition, U being used for the vowel-sound *u* to distinguish it from the consonantal *v*, for which V is employed; and W is *oo*, or double *u* (UU—VV).

The Eng. A. is, strictly speaking, the adaptation of the Lat. A. to the A.-S. form of speech. (Also the other modern European A.s. with a few exceptions, are adaptations of the Lat. A. to Romance, Teutonic, Slavonic, and Finno-Ugric languages.) To the A.-S. A., however, 3 new letters were added, one of which,

for the sound *th*, was borrowed from the Runes. Later the influence of the Normans caused these to be discarded. The vowels of the Eng. A. are like those of the Lat. A., but the sounds which they represent are very different (see SPELLING). The 'Gothic' A., known as 'black letter,' a medieval variant of the Lat. A., employed in NW. Europe, including England, until the 16th cent., is still used in Germany. The modern Irish A. (known also as Gaelic or Celtic), consisting of 18 letters, 5 vowels and 13 consonants, is a development of the Insular hand of the Lat. A., which according to some scholars was already used in Ireland in the 6th cent.

The evolution of the A. and of some specimens of modern A.s. is illustrated in the diagram opposite.

Alphege, St (954–1012), Eng. Benedictine monk and prelate. He joined the order at Deerhurst in Glos, and was afterwards abbot of a monastery near Bath. Bishop of Winchester, 985; Archbishop of Canterbury 1006. Martyred at Greenwich by the Danes, he was buried in Canterbury Cathedral. His feast is on 19 April.

Alpheus, see RUPHEA.

Alphonsine Tables, astronomical work compiled by a body of celebrated Arabian, Christian, and Jewish astronomers, working at Toledo in the reign of Alfonso X, the Wise, of Castile. They were completed in 1252, and first printed in 1483.

Alphonso, see ALFONSO.

Alphonsus, St, see LIGUORI.

Alphorn, see ALPENHORN.

Alpine Club, society of experienced climbers formed in 1857–8 to foster mountaineering, not only in the Alps, but throughout the world. It has been followed by many similar clubs in various countries. It laid the foundations of Alpine literature in 1859 with the pub. of *Peaks, Passes, and Glaciers*. In 1863 it began to pub. the *Alpine Journal* which now has an international reputation (No. 295 appeared in the centenary year, 1957). In consort with the Royal Geographical Society the A. C. has sponsored 9 Everest expeditions.

Alpine Orogeny, cycle of geological events which led to the formation of the Alps (q.v.) and of the other mt chains formed at the same time. The A. O., or Alpine period of mt building, reached its climax in the Miocene but may be said to have begun in late Mesozoic times, while it has not entirely ended at the present day. During the A. O. earth movements took

place which caused long strips of the crust of the earth to be folded and uplifted to form the mt chains of the Alps, the Apennines, the Carpathians, parts of the Atlas range in N. Africa and the prin. ranges of the Near and Middle E. which, together with the Himalaya, form the Asiatic continuation of the European Alps. Further E., movements of the same period are recorded in the mts of Burma, Malaya, and of Indonesia. The very existence of the Indonesian ls. arcs is in fact the result of Alpine uplift of the ocean bed. Alpine movements occurred also in New Zealand. The European and Asiatic parts of the Alpine chain follow to a large extent the basin of the Tethys Sea, a sea which during Mesozoic times was being filled with sediments. This sequence of marine sediments was subsequently elevated to form a large part of the Alpine mt chain. See also MOUNTAIN BUILDING PERIOD and GEOLOGY.

Alpine Plants are those which grow in high altitudes, as on mts which at a greater level bear perpetual snow. They are xerophytic plants, their conditions giving them a low degree of transpiration, and they exhibit most of the characteristics of Arctic plants. The flowers are more brightly coloured than those growing in lower regions, the roots are large, and the leaves frequently hairy, and often exist for long periods covered with snow; in themselves the plants are small and tufted. Most of the flowers are self-pollinated, owing to the scarcity of insects, though moths and butterflies are found at some high levels, e.g. the Alps, and vegetative reproduction is common. A. P. are generally shrubs and herbaceous plants. The most numerous of these are the various saxifrages, the edelweiss, rhododendron, campions, lady's mantle, violas, and primulas. There is naturally considerable variety among the flowers, as they live on damp or on rocky soil, and on damp soil such lower plants as mosses and liverworts abound. See H. S. Thompson, *Alpine Plants of Europe*, 1911; R. Farrer, *The English Rock Garden*, 1937; Sampson Clay, *The Present Day Rock Garden*, 1937.

Alpini, Prospero (Prosper Alpino) (1553-1616). Venetian botanist. b. Marostica. He studied at Padua, and became prof. of botany there. He did much valuable botanical research in Egypt. His chief works are *De Plantis Aegypti*, *De Medicina Aegyptiorum*, and *De Medicina Methodica*.

Alpinia is a subtropical genus of Zingiberaceae found in S. and E. Asia. *A. officinarum* yields Rhizomatis galangae, used as a medicine, and, in the E., in the place of ginger.

Alps (possibly derived from a Celtic word meaning 'high,' or connected with Lat. *altus*, white), massive mt range covering an area of over 80,000 sq. m., extending from the Mediterranean to the Danube, a distance of some 600 m. The width of the ranges varies from 80 to 150 m. It is the most extensive mt system in Europe, forming, in fact, its backbone. Its length is cut up by valleys in all directions, and many of its component

ranges run parallel, as in the Central A., or obliquely, as in the W. From very ancient times the div. of the A. has been threefold: the W. A., extending northward from the Mediterranean to Mont Blanc; the Central A., from Mont Blanc to the Brenner Pass; the E. A., from the Brenner Pass to the Hungarian plains.

I. The W. A. comprise the following prin. ranges: (1) The Maritime A., generally of no great height, but extremely broken and irregular. (2) The Cottian A., containing sev. peaks over 12,000 ft high. The small group of Oisans to the W. of this contains the Pic des Ecrins (13,462 ft). (3) The Graian A., generally higher than the Cottian, which attain in Mont Paradis a height of 13,300 ft. II. The Central A. are generally subdivided into a N. and a S. chain, running fairly parallel. They comprise many groups, of which the chief are the Bernese A. in the N. chain, and in the S. the Pennine, Lepontine, and Rhaetian A. It is here, in the neighbourhood of Mont Blanc, that the A. reach their greatest elevation and that the best-known peaks occur. In the Bernese A. we have Finsteraarhorn (14,026 ft), Jungfrau (13,670 ft), Mönch (13,468 ft), Eiger (13,042 ft), Schreckhorn (13,386 ft), and Wetterhorn (12,166 ft). The Pennine A. contain Mont Blanc (15,732 ft), Monte Rosa (15,217 ft), Weisshorn (14,770 ft), Breithorn (13,685 ft), and Matterhorn (Mont Cervin) (14,678 ft). The Rhaetian A. are at a lower level, though containing many peaks over 11,000 ft high. The Ortler A. to the E. of these are slightly higher, Ortlerspitze itself being 12,800 ft. III. Of the E. A. the prin. chains are: (1) the Noric A., with the height of Gross-Glockner; (2) the Carnic A.; and (3) the Julian A.

The extreme inequality of the A. renders them easy to cross. Even in the highest part, the W. end of the Central Div., passes are numerous, and 5 railway tunnels now render travel easy. These tunnels are the Mont Cenis, connecting France and Italy; the Simplon, connecting the valley of the Upper Rhône with Lake Maggiore; the St Gotthard, connecting Lake Luzern and Lake Maggiore; the Lötschberg tunnel, between Kandersteg and Goppenstein, which was opened in 1913; and the Aarberg tunnel, connecting Switzerland and Austria. There are passes over most of these mts, among the more notable being the 2 St Bernard passes and the Splügen.

The constitution of the A. is the result of much faulting and folding, mainly NE. and SW. Many upheavals have occurred at different periods, and remarkable examples of thrusts are common. The higher ridges consist chiefly of crystalline schists associated with granite. The summits rise considerably above the line of perpetual snow, and the forms of vegetable life vary with the altitude from that common to central Europe to that of the Arctic regions. The larger animals are becoming rare owing to the ravages of sportsmen, but the smaller fauna are numerous.

Glaciers occur chiefly in the Central A. They give rise to numerous rivs., of which the chief are the Rhine, Rhône, Po, and Danube. Their number is gradually decreasing, and must once have been very considerable.

The scenery of the A. is renowned throughout Europe and draws annually many tourists, who, before 1939, were gradually enriching the peasantry. The beauty of the lakes (such as Luzern, Geneva, Brienz, Thun, Zürich, Constance, Maggiore, Como, Garda) and the mt views, together with the excitement and pleasure of mt-climbing, combine as

The Alpine clubs all publish periodical journals. See Ball, *Alpine Guide* (3 vols.), 1863 on; Schlagintweit, *Untersuchungen über die physikalische Geographie und Geologie der Alpen*, Leipzig, 1850-4; Bonney, *The Alpine Regions of Switzerland and the Neighbouring Countries*, London, 1868; Tyndall, *Hours of Exercise in the Alps*, 1873, and *The Glaciers of the Alps*, London, 1896; Umlauf, *The Alps* (Eng. trans.), London, 1889; F. Heritsch, *The Nappe Theory in the Alps: Alpine Tectonics*, 1905-28 (trans. by P. G. H. Boswell, 1929); F. Muirhead and M. Monmarche, *The French Alps*, 1923; G. W. Young,

E.N.A.

THE NORTH WALL OF THE EIGER (LEFT), AND THE MÖNCH

attractions. Invalids may here seek repose and health in the sanatoria, such as Davos and St Moritz; tourists may contemplate the natural marvels or give themselves up to the Alpine sports. The A. indeed deserve their name of the playground of Europe.

During the period of the Second World War there was naturally an absence of foreign visitors and many of the largest Alpine hotels went out of business for the duration of the war. Again, owing to changes of fashion in travel some of the largest, even before the war, could not be made to pay. It was only by the summer of 1946 that all services began reopening. To these were added a service over the new Susten Pass post-road, which now links the valley of the Reuss at Wassen, in the canton of Uri with Meiringen in the Bernese Oberland. This fine motor road, a marvel of engineering, with a panorama of the finest Alpine scenery, is one of the most popular of the great Alpine routes. See also MOUNTAINEERING.

Collet, *The Structure of the Alps* (2nd ed.), 1936; W. W. Hyde, *Roman Alpine Routes* (Amer. Philosophical Society), 1936; J. J. Schatz, *Alpine Wonderland* (introduction by Sir C. Schuster), 1936; R. L. G. Irving, *The Alps*, 1939; G. Rébuffat, *Starlight and Storm*, 1956.

Alps, Lunar, massive mt range on the moon exceeded in importance only by the Lunar Apennines. Its extent—in a gentle curve for about 180 m.—forms the NW. boundary of the Mare Ibrum. Its highest peak, Mont Blanc, rises about 12,000 ft. The smallest telescope will show the great valley cutting through the A., which is thus vividly described by Dr H. P. Wilkins, regarded as a good authority on lunar topography: 'It looks as though a gigantic chisel had been driven through the mts, and the valley is

supposed by some people to have been caused by a meteor ploughing its way ages ago.' See *Astronomy for Everyman*, 1955.

Alpujarras, Las (Moorish *al Busherat*, the grassland), mountainous dist. of Spain, lying to the S. of the Sierra Nevada (q.v.) in the prov. of Granada (q.v.). It has beautiful and fertile valleys, in which the Moors sought to retain their independence after the fall of Granada in 1492 (see *SPAIN, History*). The prin. vil. is Ugijar.

Alred, see **ALURED**.

Airuna, word etymologically connected with runes and used to denote a witch in anet times. Sometimes the word was applied to images used in the black art.

Ais (Ger. *Alsen*), Danish is. in Little Belt, Baltic Sea, off the coast of Slesvig, about 19 m. long and 3-12 m. broad, with an area of 120 sq. m., and a pop. of 37,910. Sønderburg is the chief tn. Ceded to Germany in 1864, this originally Dan. is. was restored to Denmark in 1920. In the Second World War it was occupied by the Germans. Since 1930 the is. has been connected with the mainland by a bridge across A. Sound.

Alsace-Lorraine (Ger. *Elsass-Lothringen*), imperial ter. (*Reichsland*) of Germany from the end of the Franco-Ger. War (q.v.) in 1871 until the treaty of Versailles (q.v.) in 1919. It consisted of the anet Fr. prov. of Alsace, and of Ger. Lorraine (q.v.). The dist. is now part of France, and forms the depts of Haut-Rhin and Bas-Rhin (Alsace) and Moselle (Lorraine) (qq.v.). The chief tns are Strasburg, Metz, and Colmar (qq.v.). Area 5605 sq. m.; pop. 1,987,000 (1954). From the earliest times it has been a disputed ter. Originally inhabited by the Gauls, after the Rom. conquest it became largely Germanised. It became part of the Frankish empire, and after the 10th cent. of the Ger. empire, till part of it was ceded to France in 1648 at the Peace of Westphalia. The remaining portion was seized by Louis XIV in 1681, and secured by the Peace of Ryswick in 1697. A few outlying dists. were secured by France after the 1789 revolution. Early in the Franco-Ger. war of 1870-1 the dist. fell into the hands of the Prussians, and was immediately reorganised. It was formally ceded by the treaty of Frankfurt, much against the wishes of the inhab. In 1872, when obliged to make choice of nationality, 160,000 elected to be French, of whom 50,000 returned to France. In 1911 a local parliament or diet was estab. for A.-L.

After the Franco-Ger. war of 1871 the deliverance of A.-L. from the Ger. yoke became an article of faith in the political creed of France. When the First World War broke out, the hope of regaining the lost provs. was reawakened in all its intensity, and even during the darkest days of 1917 when the issue of the war seemed in doubt, the passionate determination to settle the future of the provs. never wavered. When Moltke in 1871 insisted upon, and Bismarck, against his better judgment, acquiesced in, the annexation, the dominant idea in their minds was to secure a strategic frontier.

At the same time, Germany, probably unwittingly, also secured the largest deposit of iron ore in Europe and thereby in the ensuing 40 years built up her imposing fabric of prosperity and power. From the natural wealth of the ravished provs. Germany, in fact, derived that metallurgical ascendancy and the motive power for her industries upon which was founded no small part of her material progress, and, in consequence, her formidable naval and military strength. In actual figures, of the 2,800,000,000 tons of iron ore in all Germany before the First World War, Lorraine alone yielded some 2,000,000,000. Up to 1903 Germany had no need to import from abroad a single ton of ore, the supplies from Lorraine enabling her to maintain for over 3 decades an unrivalled industrial expansion. Without these resources Germany would, long before 1918, have exhausted her capacity for turning out the essential material of war. The Fr. people were by no means oblivious of these commercial advantages, but their ardent desire to recover the provs. was not primarily founded on the possibility of crippling the industrial power of Germany by depriving her traditional adversary of over 40,000,000 tons of ore a year. This transference of material resources was but the means to the accomplishment of the one permanent object—namely to secure a boundary which, for the sake of future generations, should put an end once and for all to the perpetual menace of a Ger. invasion. Hence, throughout the vicissitudes of the First World War, the allied diplomacy was unequivocal in its assertion that when the time came for *pari passu*, no lasting peace would be possible unless the restoration of A.-L. to France was made an indispensable condition.

Both on humanitarian and sentimental grounds the claims of France were indisputable, and it was from these grounds that the ardour of Fr. hopes during the 40 years after 1871 derived its impulse. But these same inspiring motives were to a certain extent subordinated, during the war, which, by its very magnitude, threw into bold relief the greater issue of Germany's bid for world dominance. The relatively local question had in fact become a major issue for the whole of Europe, and it was axiomatic in the common policy of the Allies that the restoration of European equilibrium was not to be attained without the transfer of the 'lost provinces' to France.

If, however, the reinstatement was imperative as the solution of a question of modern practical politics, much justification for Fr. claims could be advanced on historical grounds. The Ger. plea that A.-L. ought always to have been Ger. ter. because the provs. formerly belonged to the Holy Rom. and Germanic Empire, was untenable, the subsequent long connection between the 2 provs. and France having so far eliminated all Ger. influences as to reduce the plea to a mere medieval archaism. From the standpoint of practical politics, however, it is useless to go further back than 1815,

when the provs. on the l. b. of the Rhine were taken from France by the rest of Europe and given to Prussia with the object of checking Fr. aggrandisement. Cynicism prompts the retort that the war merely showed that the boot was on the other foot; but inasmuch as this transference had failed, by reason of the unsuspected and unscrupulous aggressiveness of Prussia, as a political measure of precaution to preserve the balance of power in Europe, it was recognised even before 1871 as an initial error. Yet the error was repeated in 1871, when the powers stood by while Germany, grown immeasurably in political stature since Waterloo, annexed, without the smallest pretext of adjusting the equilibrium of Europe, yet another considerable portion of her neighbour's ter., a portion embracing the most valuable Fr. iron-mines and most of her blast furnaces.

In the strategic concentration immediately before hostilities opened in the First World War, the Ger. Sixth Army of 5 corps under Prince Rupprecht of Bavaria was concentrated in Lorraine, E. of Metz. A detachment of *ersatz* (reserves) and *landwehr* troops was posted in the S. portion of Alsace. From this it was clear that an offensive in Alsace and Lorraine was intended as soon as possible. To disturb the Ger. concentration, the Fr. 7th Corps, stationed at Belfort, was ordered to advance towards Mülhausen. One brigade reached Mülhausen on 10 Aug. 1914, but was driven back in disorder. After this the French formed an army of Alsace and projected a second invasion. The army, moving on 15 Aug., occupied the Vosges passes and reached Mülhausen on the 19th. An army of Lorraine was also formed to watch Metz, and protect the flanks of the Fr. Second and Third Armies by driving the Germans behind the outer works of Metz. These objectives formed part of the Fr. plan for a general offensive on the whole W. front, but the plan lacked the axiomatic merit of simplicity. When the French had reached Saarburg, the Germans counter-attacked, drove the French from the northerly passes and out of all but a small part of S. Alsace. In the course of 1915 a stalemate along the whole front resulted, which in Alsace involved give-and-take fighting on the high ground round Münster and very severe fighting for the massif known as Hartmannswillerkopf. No definite issue was reached and, as on the rest of the front, trench warfare succeeded the war of movement.

The Treaty Settlement.—Under Article 51 of the treaty of Versailles A.-L. was restored to Fr. sovereignty as from the armistice of 11 Nov. 1918, and the provisions of the treaty establishing the delimitation of the frontiers before 1871 were restored. Free zones were estab. in the ports of Strasbourg and Kohl, in conformity with the navigation and railways clauses of the treaty, and due provision was made for reinstatement of inhab. in Fr. nationality.

The Fr. Gov. reintroduced the old depts Haut-Rhin, Bas-Rhin, and Moselle,

and pursued, generally, a policy of assimilation. French was introduced in the school curricula as a language of instruction, and in 1925 the gov. proposed to control the Rom. Catholic Church by substituting Fr. lay legislation for the still valid Ger. laws. This proposal was dropped but it strengthened a Ger. autonomist movement, and in 1926 the *Elsass-Lothringer Heimatbund*, or Home League of A.-L., was founded to promote political autonomy within the Fr. framework, an *Alsatian* diet with a separate administration, equal language rights, and Ger. schools. In 1939 the autonomist party proper, called the *Elsass-Lothringische Partei*, had a number of representatives in the Fr. Chamber of Deputies who did not conceal their pro-Ger. sympathies. Ger. Nazi propaganda, in spite of Hitler's solemn renunciation of A.-L., was also very active in the provs. before the outbreak of the Second World War. Sev. autonomist leaders in A.-L. were arrested after war broke out, in Oct. 1939, and one of them, Charles Roos, was executed for espionage. Before 1940 there were about 1,500,000 Ger.-speaking people in A.-L., and while there are many who know no French others are completely bi-lingual. German was the prevailing language of the local press, and literature was produced in German, in the local Ger. dialect, and in French.

A.-L. was an occupied prov. in the Second World War. In 1940 the Germans expelled tens of thousands of Frenchmen from Lorraine to make room for Germans from the dists. subjected to Brit. bombing, giving them the choice of going to unoccupied France or to Poland. The persecution of the churches was carried out with special severity in Alsace in 1941. Lessons in religion by priests and in private schools and divine service were forbidden. The theological faculty in Strasbourg Univ. was abolished, and the cathedral closed to divine service. Germanisation of A.-L. proceeded apace in 1942. A decree was issued conferring Ger. citizenship on Alsace-Lorrainers who were serving in the Wehrmacht or S.S., or who were recognised as Germans 'worthy of confidence.' Compulsory military service in the Ger. Army was introduced in Alsace on 20 Aug., and in Lorraine a week later for certain classes. Bürokel, the Ger. head of the civil administration in Lorraine, made strenuous efforts to Germanise the ter. Names of Fr. origin were suppressed and replaced by Ger. names and the use of the Fr. language was forbidden. But the Alsatians and Lorrainers resisted these attempts passionately and unanimously. Liberation came with the advance of the Amer. and Fr. forces in 1944-5. See further under WESTERN FRONT CAMPAIGNS IN THE SECOND WORLD WAR. See O. Lorenz and W. Scherer, *Geschichte des Elsasses*, 1886; R. Reuss, *Histoire d'Alsace* (22nd ed.), 1920; C. Spindler, *L'Alsace pendant la Guerre*, 1925.

Alsatia, cant name given to the dist. of Whitefriars, between the Thames and Fleet St, London, formerly used as a

sanctuary for debtors and criminals. The rights of sanctuary, enjoyed originally by the Carmelite friars here, were confirmed by James I's charter of 1608, and finally abolished in 1697. The name derives from Alsace, the 'debatable land' between France and Germany. The 17th cent. society of A. is brilliantly portrayed in Scott's *Fortunes of Nigel*.

T. Fall

ALSATIAN

Alsatian, large wolfhound, with stiffly erect ears and deep chest, so named because at one time it was used as a sheep-dog in Alsace. It is a hybrid of varieties of N. and S. Ger. sheep-dogs, and, being intelligent, amenable to discipline, and readily trained, is often used as a police dog and a guide for the blind. Its popularity outside Germany and France is of comparatively recent date, but though a favourite both as companion and watch-dog it is uncertain in temper; this, however, may result from improper feeding, lack of exercise or companionship, and absence of training or restraint. The height at the shoulder should be about 24 in., and 2 in. less in bitches. Colour may be varying shades of grey, brown, fawn, or black.

Alster, riv. of Schleswig-Holstein (q.v.), formed by confluence of 3 streams. Forms Great A. Lake near Hamburg, through which it flows into R. Elbe (q.v.).

Alston, or **Aldstone**, mkt tn in Cumberland, England, 29 m. ESE. of Carlisle. There are limestone quarries, and lead and copper are found in the vicinity. Coal is mined for lime-burning. Pop. 2500.

Astroemeria, genus of fleshy-rooted, S. Amer. herbs, family Amaryllidaceae, about 50 species. *A. aurantica* and *A. ligula* are grown in gardens for their flowers.

Alt, see **ALUTAY**.

Altai, see **ALTAY**.

Altair, Arab word used to denote a star brighter than the first magnitude in the constellation of the Eagle (Aquila) and about 16 light-years distant. The luminosity of A. is about 9 times greater than that of the sun, and it has a proper motion of 39" a cent.

Altamaha, riv. of Georgia formed by the junction of the Oconee and Ocmulgee and flowing into the A. Sound. It is 137 m. long, and is navigable for its

entire length for boats drawing 5 ft of water.

Altamira, Sp. vil. in the prov. of Santander, near Santillana del Mar (q.v.). It is famous for its caves, discovered in 1868, which contain relics of Palaeolithic times. One cave has a remarkable gallery of prehistoric rock-paintings representing animals. The animal most frequently depicted is the bison, but the wild horse, stag, and wild boar also appear. Some of the figures have been partly engraved, and in many places paintings and engravings have been superimposed upon earlier works. See **CAVE ART**.

Altamura, It. tn, in Apulia (q.v.), 28 m. SW. of Bari (q.v.). It has a 13th-cent. Romanesque cathedral. There are tumuli near by, and there are indications of an earlier city on the site of A. The dist. produces fruit, olives, and wine. Pop. 38,900.

Altar, table (usually of stone) on which sacrifice is offered. The use of A.s seems to have been almost universal in all times and among all nations. Early sacrificial hearths have been excavated in Palestine, of the primitive type described in the early parts of the O.T. Later there were 2 kinds of A. in use among the Jews, for burnt-offering and incense respectively. In anct. Greece and Rome A.s were low pedestals which stood inside the temple before the sacred image, or large erections in the open air, used for burnt sacrifice. A.s have always been places of refuge, and frequently places for the solemnisation of oaths. The earliest Christians had no fixed A.s, but they came into use with the cessation of persecution, and were erected over the relics of martyrs. The A. was nearly square in shape and placed in the axis of the church. In cathedrals, monastic churches, and some larger par. churches there are sev. A.s, the chief being the 'high A.' See also **BALDACHINO**. See G. Dix, *The Shape of the Liturgy*, 1945.

Altay, mountainous region in S. Siberia and Mongolia, stretching from NW. to SE. Its highest ridges (highest mt Belukha, 13,644 ft) are rocky and ice-covered. The eroded parts, of middle height, are rich in non-ferrous metals, particularly in the NW., and the valleys are fertile. A. is divided between the A. Kray and E. Kazakhstan oblast of the U.S.S.R., Mongolia, and Sinkiang (China).

Altay Kray, kray in S. Siberia, in the Altay Mts in SE. and Kuluuda (q.v.) Steppe in NW., traversed by the Ob'; gold, non-ferrous metals, and salt deposits. Area 101,000 sq. m.; pop. 2,500,000, Russians (since 17th cent.), Ukrainians, Germans (since 1941), and local Turkic tribes (see **GORNO-ALTAY AUTONOMOUS OBLAST**). Prin. tns, Barnaul, Biysk, Rubtsovsk. It is a rapidly developing agric. and industrial region (wheat, sunflowers, sugar-beet, dairy cattle; varied food, textile, engineering, and chemical industries). The area was annexed by Russia in the 18th cent.; first smelting plant built 1726; agric. colonisation since 19th cent. The Second World War and the Virgin Land campaign gave new impetus to its economic development.

Altazimuth, important astronomical instrument for ascertaining the altitude (q.v.) and azimuth (q.v.) of celestial objects, whence the name. It consists of a telescope revolving on a horizontal axis, to the side of which is rigidly attached a vertical graduated circle (read by optical aid) for ascertaining altitude. This apparatus is capable of moving above a horizontal circle, also read by microscopes, by which the azimuth of a heavenly body is determined. It is sometimes called a universal transit, but as a rule in large instruments its horizontal motion is small, being confined to a few degrees each side of the meridian. The A. invented by the Dan. astronomer, Oleas Römer, 1690, was capable of measuring all parts of the visible sky. All important observatories have this instrument, and Airy's A., erected at Greenwich in 1847, considered a fine instrument in its day, was replaced by a larger one in 1897.

Aldorf, vil., cap. of the canton of Uri, Switzerland, lies in a fruit-growing valley, on the St Gotthard railway line, surrounded by imposing mts. It is the traditional scene of the exploits of Wm Tell (q.v.), the liberator of Switzerland from the Austrian yoke. A monument to him stands in front of an old 5th-cent. tower. In the Tell Theatre (1899) Schiller's *Wilhelm Tell* is performed by A. residents in summer. Pop. 7000.

Aldorfer, Albrecht (c. 1480-1538), Bavarian painter, engraver, and architect, b. and d. Ratibon, of which he was the city architect and burgher. His most famous picture is the 'Battle of Arbelá,' at Munich, with an amazing panoramic background of lakes, mountains, and cities. Napoleon admired this painting greatly and hung it in his bath-room at St Cloud. A.'s engravings on wood and copper rank next to those of Dürer.

Altea, Sp. port in the prov. of Alicante, on the Mediterranean. It has a good harbour, and a coasting trade. Pop. 4200.

Altels, well-known summit of the Bernese Alps, Switzerland, 11,930 ft in height, and situated E. of the Gemmi Pass. Avalanches make the ascent very dangerous. First climbed in 1834 by a Swiss.

Alten, Carl August (1764-1840), Hanoverian and Brit. general. Served in Hanoverian army till its disbandment in 1802, when he came to England and entered the king's Ger. Legion, serving in Hanover and Copenhagen. He commanded in the Peninsular war, and at Quatre-Bras and Waterloo. When the king's Ger. Legion was disbanded he went to France, and later returned to Hanover, where he became a field marshal.

Altena, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 38 m. E. of Düsseldorf (q.v.). It has an anct castle and a notable art collection. Metal goods are manuf. Pop. 22,000.

Altenavia, see ALTONA.

Altenberg, Peter (1859-1919), Austrian writer, pseudonym of Richard Engländer, b. Vienna of Jewish parentage. He studied law and medicine, but led the life

of a literary Bohemian. He was a master of small impressionistic prose writings: monologues, dialogues, aphorisms, idylls, and prose poems. His works include *Wie ich es sehe*, 1896, *Märchen des Lebens*, 1908, *Neues Alles*, 1911, *Vita ipsa*, 1918, *Mein Lebensabend*, 1919. See E. Kraus, *Peter Altenberg*, 1919.

Altenburg, Ger. tn in the dist. of Leipzig, 25 m. S. of Leipzig (q.v.), on the R. Pleisse. It was once the cap. of Saxo-A. (q.v.). On an almost perpendicular porphyry rock stands the ducal castle (11th-18th cents.), the scene in 1455 of the abduction of the princes Albert the Bold (q.v.) and Ernest. There are textile, engineering, and tobacco industries, and there are lignite mines in the dist. Pop. 52,000.

Altenessen, see ESSEN.

Alter Ego, see EGO.

Alter Ego (Lat.) signifies 'another I.' The phrase was used to denote Sp. viceroys when exercising regal power, and was used at Naples when the crown prince was made vicar-general during the rebellion of 1820.

Alternate. In geometry if 2 straight lines are cut by a transversal (see fig.)

the angles *a* and *c* are said to be A.; similarly the angles *b* and *d* are A. In the special case of parallel (q.v.) lines cut by a transversal the A. angles are equal. In algebra and arithmetic those terms of a proportion are said to be A. which are separated from one another by another term; thus in the proportion 2 is to 4 as 8 is to 16, 2 and 8 are A. terms, as also 4 and 16.

Alternating Current. The electromotive force induced in a coil moving in a magnetic field is at any instant propor-

FIG. 1

tional to the rate of change of the number of magnetic lines of flux embraced by the coil. If the coil in Fig. 1 rotates in the

field N-S, it encloses a maximum number of lines in the position shown, but a small movement to one side or the other makes no difference: the rate of change is zero. As the coil rotates towards the position shown dotted, the number of lines enclosed sinks towards zero, but at a rate increasing towards a maximum. During a further 90 degrees rotation the number of lines increases again, but at a decreasing rate. After the half revolution the coil again faces the magnetic poles, but the coil itself is reversed. During this time the electromotive force, following the rate of change, rises from zero to a maximum and falls again to zero. It is clear that, as the (reversed) coil completes the rotation, the electromotive force goes through a negative maximum and regains zero, following during the revolution a curve such as Fig. 2. Obviously the positive

FIG. 2

half is symmetric with respect to the maximum, and the positive and negative halves are identical but reversed. The coil is assumed to rotate at constant angular speed ω , and time t is reckoned from the position shown in Fig. 1. At any moment t the coil plane is at an angle ωt (Fig. 3) to the initial position, and

FIG. 3

encloses the lines through the area represented by HL. The number at any instant is thus proportional to $\cos \omega t$.

The linear velocity of the conductor AB is tangential to the circle and equals $\omega \times OA = GT = OT_1$. Its component at right angles to the field, OS, is proportional to $\omega \sin \omega t$. But this represents the velocity with which the number of lines through the coil varies, thus the electromotive force may be represented by the expression $E \sin \omega t$ where E is the maximum or 'peak' value, dependent on the field strength, shape and size of coil, and speed ω . An external (non-inductive) circuit connected to the slip rings (Fig. 1) will carry an A. C. $I \sin \omega t$, of 'periodic time' $T = 2\pi/\omega$, of frequency, or number of periods per sec., $f = 1/T = \omega/2\pi$, and of peak value I . The mean value of the current over a period is zero, as the positive and negative half-waves are equal. The mean of a half-wave is $2I/\pi$. The ampere value as measured on an ammeter is that producing as much heat in a wire in a given time, say T , as a direct current of A amperes: RA^2T . Dividing the period T into a large number n of equal parts, determining for each interval the value of $I^2 \sin^2 \omega t = I^2 \times \frac{1 - \cos 2\omega t}{2}$, adding up the n values, each multiplied by T/n , and multiplying by R , the total is $n \times \frac{T}{n} \times R \times \frac{1}{2} I^2$ since $\cos 2\omega t$ over a period consists of 2 positive and 2 negative equal half-waves. Thus $\frac{1}{2} RTI^2 = RA^2T$ or $A = I/\sqrt{2}$. This is the so-called root mean square (r.m.s.) value of an A. C., the value entering into most measurements. The form factor of a sine curve is the r.m.s. value \div the mean, or $\left(\frac{I}{\sqrt{2}}\right) / \frac{2I}{\pi} = 1.11$. The above mean, r.m.s. and form-factor values apply only to sine curves, and though A. C. and voltage do not always follow sine waves, it is the form aimed at in ordinary alternators, and most of A. C. theory is based on the assumption of sine wave form. This is also the case here. The curve $E \sin \omega t$ is plotted by dividing a circle of radius OE (Fig. 4) into equal

FIG. 4

parts and plotting the ordinates (see SINE CURVE OF). If a second coil rotates on the same axis at the same speed but following at an angle ωt_1 after the first, the electromotive force induced in the second coil is $E_1 \sin \omega(t - t_1)$. It is assumed that the second coil is of different size, hence E_1 . If now the second coil is connected to the same slip rings, the voltage across the brushes is at any instant the sum of the ordinates

of the sine curves (Fig. 2), $E \sin \omega t + E_1 \sin \omega(t-t_1)$

$$= E \sin \omega t + E_1 \sin \omega t \cos \omega t_1 - E_1 \cos \omega t \sin \omega t_1 \\ = (E + E_1 \cos \omega t_1) \sin \omega t - E_1 \sin \omega t_1 \cos \omega t, \\ \text{and putting } E + E_1 \cos \omega t_1 = R \cos \theta, \\ E_1 \sin \omega t_1 = R \sin \theta,$$

the sum is $R \sin(\omega t - \theta)$, i.e. another sine wave. It is easily shown analytically and verified by plotting that the sum is the sine wave obtained by rotating the diagonal OE_2 of the parallelogram formed by OE and OE_1 and plotting the ordinates of the circle in the usual way. The voltage $E_1 \sin \omega(t-t_1)$ passes its zero and maximum values t_1 sec. after $E \sin \omega t$; it is 'lagging' by an angle ωt_1 and the 'phase difference' is ωt_1 . The resultant is lagging by an angle θ . In A. C. diagrams voltage and current values may be represented by straight lines ('vectors') such as OE and OE_1 , drawn to a convenient scale and in their proper phase positions, it being always understood that these vectors rotate at the same speed and represent the sine waves that can be plotted from the circles. The 'vectors' may be treated like forces in Statics, added geometrically, split into components and combined into resultants. As an example, in a circuit consisting of a resistance R and inductance L carrying A. C. $I \sin \omega t$, the voltage (Fig. 5)

FIG. 5

across R is $RI \sin \omega t$ in phase with the current, across L it is $L \times$ (rate of change of current). It was shown above that rate of change of $\cos \omega t$ is proportional to $\omega \sin \omega t$, and as a sine curve is equal in shape to a cosine curve, the slope or rate of change of the sine curve is $\omega \cos \omega t$ (in the notation of the calculus, this is written $\frac{d}{dt}(\sin \omega t) = \omega \cos \omega t$, thus the voltage across L is $\omega LI \cos \omega t$. In the vector diagram RI is drawn horizontally, ωLI vertically, as $\cos \omega t$ 'leads' $\sin \omega t$ by 90 degrees. The resultant is $OE = I \sqrt{R^2 + \omega^2 L^2}$ leading the current by an angle ϕ , $\tan \phi = \omega L/R$. The quantity $\sqrt{R^2 + \omega^2 L^2}$ is the impedance Z , $\omega L = X$ the reactance. If the voltage is taken as the reference line, $E \sin \omega t$, the current is seen to be lagging, $I \sin(\omega t - \phi)$. The power at any instant is $E I \sin \omega t \sin(\omega t - \phi) = EI \frac{\cos \phi - \cos(2\omega t - \phi)}{2}$.

Over a period T the second term $\cos(2\omega t - \phi)$ vanishes and the power $P = \frac{1}{2} EI \cos \phi = VA \cos \phi$ where V and A are the r.m.s. values. The power factor is $\cos \phi = R/Z$. It is often convenient to

split all vectors in a diagram into horizontal and vertical components. For this purpose the prefix j is used to indicate that a quantity is turned anti-clockwise through 90°. In the example, Fig. 5, we may write $E = RI + jXI$, $Z = R + jX$. (See CIRCUIT, ELECTRIC.)

A. C. is now used almost universally for electric supply, owing to the facility with which voltage can be 'stepped up' from the generator through static transformers to high-voltage transmission lines, and again 'stepped down' for primary and secondary distribution. The A. C. induction motor is one of the simplest and most robust of machines. See CIRCUIT, ELECTRIC; DISTRIBUTION; ELECTRIC MACHINES; ELECTRIC SUPPLY; TRANSFORMERS; TRANSMISSION.

Alternation of Generations, biological phrase which indicates a curious form of the life-history of some plants and animals. Briefly, the organism has two distinct forms, one of which reproduces merely asexually by buds which become the alternate sexually reproducing individuals, whose fertilised eggs grow into asexually reproducing forms, thus completing the cycle. Either phase may be predominant in a particular species, and while the ability to reproduce by budding may be lost in the highest forms of life, it is believed that the processes of regeneration and wound-healing are limited forms of the same mechanism. In the vegetable kingdom the asexual plant which produces spores is called the *sporophyte*, the sexual plant which produces gametes (sexual cells) the *gametophyte* or *oöphyte*. In the ferns and horsetails the generation with which we are familiar is the sporophyte—in the fern the small brown bodies beneath the fronds are the asexual spores—and the sexual generation is not prominent; the gametophyte is a small green body growing on damp soil which gives rise to both male and female organs which produce again a fern as we know it. In the life-cycle of the mosses and liverworts the gametophyte generation is more conspicuous: the sporophyte is often seen rooted in the gametophyte as a brown stalk with a spore case at its apex. Among animals the Coelenterata exhibit A. of G. very clearly; here the ovum which has been fertilised produces a polyp capable of giving rise to buds, which in their turn give rise to jellyfish which contain sexual elements. See D. H. Scott, *Structural Botany*, Pt II, 1907, for comparisons of gametophyte and sporophyte generations; see also J. J. Steenstrup, *Om Forplantning og Udvikling gjennem vz-lende Generations Raekker*, 1842.

Alternator, electric machine generating alternating current (q.v.). See ELECTRIC MACHINES.

Althaea, genus of herbs, family Malvaceae, which are common in Europe. *A. rosea*, the hollyhock, found wild in China, grows in Brit. gardens; *A. officinalis*, the marsh mallow, grows in marshes.

Althing, Parliament of Iceland, founded in 830. (Down to the end of the Commonwealth (1262) it wielded not only the

legislative power, but was also the highest court of justice, and at the same time the centre of the country's social life. After Iceland's submission to foreign rule the legislative power was largely abrogated, though never altogether renounced, and the judicial power ceased to be supreme. Under the weight of growing foreign misrule and the economic misery of the pop., the power and the prestige of the institution continually dwindled until nothing remained but the pathetic shadow of a court of the second instance, and finally a royal edict of 1800 abolished it. But the people clamoured for its re-estab. and by a decree of 1843 it was revived in the form of an advisory body. With the constitution of 1874 it acquired legislative power (subject to a royal veto) and full control of the country's finances. As now composed it consists of 52 members, 14 of whom sit in the Upper and 38 in the Lower House. Franchise is universal for those who have reached the age of 21, and those who have reached the age of 30 are eligible for election to the A.

Althorn, tenor (E flat) or baritone (B flat) saxhorn (q.v.), often used instead of a Fr. horn in military and brass bands.

Althorp, see SPENCER, 3rd EARL.

Altitude, astronomical term signifying the angle of elevation of a celestial body above the horizon. Thus if A be the position of the observer on the earth, AB the line of the horizon directly beneath the heavenly body, and C represents the planet or star, then the angle CAB is the A. of the star.

The A. of a star, as ascertained by a sextant, is used for calculating a ship's position at sea. See ALTAZIMUTH and AZIMUTH.

'Altmark', see NAVAL OPERATIONS IN SECOND WORLD WAR.

Altmühl, riv. of Germany, in Bavaria (q.v.), which rises near Rothenburg and flows generally SE. to the Danube (q.v.). It is connected by canal with the Regnitz, and so with the Main and Rhine (q.v.). The idea of this canal was originally conceived by Charlemagne. Length 103 m.

Alto (It., 'high'), highest pitch in the male voice; in women (contralto) and boys it is the lowest pitch of the voice. It originated in church music of the 16th cent., and as it was too difficult for boys to learn to sing A., and women according to the rule 'mulier taceat in ecclesia,'

were not allowed to sing in church choirs, it was assigned to men of high-pitched voices.

Alto Alentejo, prov. of central Portugal, containing the dists. of Évora and Portalegre (qq.v.). It is bordered on the N. by the Tagus (q.v.), on the E. by Spain, and on the SE. by the Guadiana (q.v.). It is hilly, and forested, but the riv. valleys are fertile. Some minerals are found. The prin. tn is Évora. Area 4880 sq. m. Pop. 394,800.

Alto Clef, clef with C on the middle line, is now used only for viola music, but formerly was employed for the alto voice. See CLEF.

Alto di Viola, It. term for the tenor violin, so called because it used to take the highest parts, while the *basso di viola* took the lowest in instrumental music.

Alto-rilievo (It., 'high relief'), term applied to that mode of sculpture in which objects are made to project from their background to the extent of more than one-half their thickness, so that some portions of the figures stand free. See BAS-RELIEF.

Alton: 1. Tn and urban dist. of Hants, England, 11½ m. from Basingstoke. Here Spenser lived for a time, and his cottage may be seen. The church dates from the early Norman period; a second nave and chancel are 15th cent. There are two breweries and sev. other industries. Pop. 8581.

2. City in Illinois, U.S.A., on Mississippi R., 4 m. above the mouth of the Missouri R., a trade and distributing centre; it is the seat of Shurtleff College and Monticello College, and the scene of the last Lincoln-Douglas debate and of the killing of Elijah Lovejoy. A lock and dam in the Mississippi are near by. Its manufs. are steel, clay, glass, lead, and brass products, tools, and chemicals. Pop. 32,550.

Alton Towers, Staffordshire pleasure resort, famous for its gardens. It was once a seat of the Earls of Shrewsbury. The gardens, which extend as far as the Churnet R., are adorned with statuary, grottoes, ornamental fountains, and temples. The house contains a picture gallery and armoury. It is now the subject of a Building Preservation Order.

Altona (ancient *Altenavia*), former Ger. tn on the Elbe (q.v.), now part of Hamburg (q.v.). It became Dan. in 1640, was burned by the Swedes in 1713, and in 1866 passed to Prussia. There are textile, chemical, and tobacco manufs.

Altoona, city in Blair co., Pennsylvania, U.S.A., 80 m. E. of Pittsburgh. It has large locomotive works, machine shops, and freight yards connected with the Pennsylvania Railroad, and manufs. textiles, clothing, electrical and motor-car parts, and metal products. Pop. 17,177.

Altötting, Ger. tn in the *Land* of Bavaria (q.v.), 48 m. E. of Munich (q.v.). It is a place of pilgrimage, with sev. notable churches: in one, the *Heilige Kapelle*, is a famous 13th-cent. black image of the Virgin; and in another Tilly (q.v.) is buried. Pop. 9000.

Altranstadt, Ger. vil. in the dist. of

Leipzig, 10 m. W. of Leipzig (q.v.). In a treaty with Charles XII (q.v.) of Sweden, signed here in 1708, Augustus II (q.v.) of Saxony agreed to resign the crown of Poland. Pop. 2000.

Altrincham, or Altringham, tn in Cheshire, England, on the Bridgewater Canal, 8 m. SW. of Manchester for which it raises fruit and vegetables. It has saw-mills and an iron foundry, manufs. yarns, and is one of the main centres of the machine tool industry. Pop. 41,000.

Altruism (Fr. *l'altruisme*, from It. *altrui*, of or to others), word coined by the Fr. positivist philosopher, Auguste Comte, and introduced by his followers into this country, where it has passed into general use. It is the antonym of *egoism*, and if the latter be defined briefly as 'each for himself,' A. stands for 'living for others.' The altruistic instinct is a social instinct or impulse, and is evidenced in kindness, veneration, and affection. It is not the exclusive possession of humanity, but manifested by many of the higher types of animals. It was this instinct or tendency in man that Comte wished to raise to a conscious principle, or an ethical ideal, which made the chief aim of human action that of seeking the welfare of others. Herbert Spencer in his *Data of Ethics* sought to show that in the course of social evolution egoism and A. would be conciliated.

Alum, crystallised double sulphate of aluminium and potassium, corresponding to the formula $Al_2(SO_4)_3.K_2SO_4.24H_2O$. The name is also used to designate a group of bodies of the same general structure, where the first sulphate is that of a trivalent metal like aluminium, chromium, or ferric iron, and the second that of a univalent metal like lithium, potassium, sodium, the ammonium radical, rubidium, caesium, thallium, or silver. The A. of the anctes (Lat. *alumen*) included a group of astringent substances of which potash A. and the naturally occurring aluminium sulphate appear to have been the chief. In the Middle Ages the manuf. was mainly in the hands of Italians, and a factory at Tolfa in the papal states continued producing up to a recent period. The raw material of the manuf. is A. rock, composed chiefly of alunite or A. stone. This is mixed with fuel in a furnace and after roasting exposed to the air. The mass is then lixiviated with hot water, the clear liquid drawn off and allowed to crystallise. A. is also made from A. shale, which is either allowed to decompose by exposure, or roasted. During the process, free sulphuric acid is formed, which acts upon the clay, producing aluminium sulphate, which is then dissolved out. Potassium sulphate or ammonium sulphate is added to the solution, when potash A. or ammonia A. is produced.

A. possesses a sweet astringent taste, and is used as a mordant in dyeing and in the manuf. of paper. Most A.s have an acid reaction, but, if an alkali is slowly added to the solution, a precipitate is formed which is re-dissolved on stirring. If this be done until no more precipitate

can be dissolved, the product is a neutral A., which is much used in dyeing, as it gives up alumina to the colouring matter.

Alum Root, or Heuchera americana, family Saxifragaceae. A. R. grows in N. America; it makes a valuable styptic. The term is also applied to the *Geranium maculatum*, of the family Geraniaceae. A. R. is used for ulcers.

Alum Shale, geological shales with high organic and sulphur content from which alum, $KAl(SO_4)_2.12H_2O$, may be obtained. Found in Britain, in the Lias and Carboniferous Systems, and in many other formations abroad.

Alum Stone, or Alunite, double compound of potassium sulphate and basic aluminium sulphate. Mixed with quartz, it composes the alum rock from which alum (q.v.) is obtained.

Aluminium (written and pronounced in Canada and U.S.A. 'aluminum'), metallic chemical element, symbol Al, atomic number 13, atomic weight 26.97. The oxide alumina (Al_2O_3) occurs in combination with silica in clays and felspar of all kinds, and is therefore widely distributed. The oxide is found uncombined in bauxite, corundum, emery, ruby, amethyst, sapphire, and topaz, the different colours being due to the presence of oxides of iron, cobalt, or chromium. Alumina was supposed to be an oxide long before separation into its elements was actually accomplished. A. was first discovered by Sir Humphry Davy in 1807 and first produced in 1827 by Oersted (q.v.), who fused potassium with the anhydrous chloride of A. in a closed crucible, obtaining the metal in the form of a grey powder. Afterwards Wöhler improved this method and succeeded in procuring the metal in a purer form in fused globules and in determining its sp. gr. In 1854 Deville tried the same process, but replaced the potassium by sodium, and the 'silver made from clay' of the Paris exhibition of 1855 drew much attention to the question of its economical production. The method used at the present day is the electrolysis of alumina. An iron pot, lined with carbon is charged with cryolite and heated to about 800° C. by the electric current. For the electrolysis a bundle of carbon rods is used as the anode, whilst the pot itself forms the cathode. The oxygen liberated combines with the carbon of the anode to form carbon dioxide, whilst the A. falls to the bottom of the vessel. More alumina is added and the process continued, the molten metal being drawn off from time to time.

A. is a tin-white metal which is malleable and non-magnetic, has a specific heat of .222°, a sp. gr. of from 2.70, a coefficient of expansion of .0000238, and melts at 658° C. It is about as hard as silver under ordinary circumstances, but becomes harder on rolling. If pure, it does not oxidise easily on exposure to the air at ordinary temps., is soluble in hydrochloric acid, and forms numerous useful alloys. The properties which make A. such a valuable metal

are its lightness, ease of working, non-poisonous qualities, and the fact that it is not affected by air. It is used for making cooking utensils, electric conductors, motor-car parts, and, in fact, for any purpose where saving in weight is a great consideration. The bulk of the metal is used in alloyed rather than pure form. Alloyed with a small percentage of magnesium, its hardness and toughness are considerably increased without making any material difference in its weight. See also DURALUMIN. A. is used in the Thermit process for the extraction of high melting metals from their oxides. A. oxide is used in the manuf. of refractory bricks and as an adsorption filter in chromatography. A. hydroxide is used as a mordant in dyeing and A. chloride as a catalyst in organic reactions, e.g. Friedel-Craft.

Alundel Furnace, system of cylindrical furnaces used for the reduction of mercurial ores. Retorts of glass, called Alundels, collect the condensed vapour.

Alunite, see ALUM STONE.

Alunno, Niccolò, see FOLIGNO, NICCOLO DA.

Alunogen, aluminium rock with the formula $\text{Al}_2\text{O}_3\cdot\text{SO}_3\cdot 18\text{H}_2\text{O}$. It is monoclinc, has a sp. gr. of 1.7 and a hardness of 1.5-2.0.

Alured, Alred, or Alfred, of Beverley (fl. 1140), Eng. chronicler and historian, and treasurer of the church of Beverley. He wrote a hist. of Britain up to 1129.

Aluta, Oltu, or Alt, trib. of the Danube which rises in the Carpathian Mts, flows through Transylvania and Rumania, and enters the Danube near Nikopol. The total length is 348 m.

Alva, or Alba, Fernando Alvarez de Toledo, Duke of (1508-83), Sp. soldier, descended from one of Spain's noblest families. He fought with distinction in Germany and Italy in the campaigns of Charles V. In 1567 Philip II appointed him governor of the Netherlands. It was a mistaken decision, for the Netherlands were already on the brink of revolt, their grievances being partly religious, but also constitutional and economic. Judicious diplomacy might have saved the situation, but A. saw the problem largely in terms of a military mutiny, and proceeded to try and deal with any opposition solely by armed force. His economic policy, with its crushing burden of taxation, had almost destroyed Netherland commerce by the time it was dropped. By 1572 A. asked for his own recall, his defeat apparent, and Requesens replaced him in 1573. In 1580 he undertook the submission of Portugal for Philip.

Alva, burgh in Clackmannanshire, Scotland, at foot of Ochils, 7 m. N.E. of Stirling. Near by are the picturesque A. and Silver Glens, and Cochrane Park. A. House is the seat of the Johnstones. Textiles, printing, and canning are the prin. industries. Pop. (burgh) 4107; (par.) 5120.

Alvarado, Juan Bautista, Californian who raised an insurrection against the Mexican Gov. in California and defeated the Mexicans in the decisive battle of

San Buenaventura. From 1836 to 1838 he took the revolutionary title of governor, and from 1838 to 1842 was officially recognised by the Mexican Gov.

Alvarado, Pedro de (c. 1495-1541), Sp. explorer and adventurer, b. Badajoz. His first command was in the Cuban expedition to Yucatan in 1518, and he served under Cortés in the conquest of Mexico. In 1523 he was sent to subdue Guatemala, and was later appointed governor by Charles V. He became governor of Honduras in 1537. In 1541 he was killed by Indians near Guadalajara, Mexico.

Alvares, Fernam (1540-95?), Portuguese poet, b. India. He was leader of 2 expeditions to the Coromandel coast. The most remarkable of his works is his *Lusitania Transformada*, in which can be noted the first traits of exoticism in the Portuguese novel.

Alvarez, Francisco (d. 1540), Portuguese traveller, b. Coimbra in the latter part of the 15th cent. He was one of those sent by King Emanuel of Portugal on an expedition to Abyssinia in 1515, and on his return to Lisbon, 1527, he wrote an account of his travels. This work, a copy of which is in the Brit. Museum, is remarkable for its simplicity and frankness.

Alvarez, Don José (1768-1827), eminent Sp. sculptor, b. India. He first worked with his father, a stonemason, and obtained admission into the Academy of Granada, 1788. He afterwards became a member of the Academy of Cordova, and a student of the Academy of San Fernando, Madrid. In 1799 he received a pension from Charles IV to study at Paris and Rome, and his statue of Ganymede, in 1804, gained for him the reputation of the greatest of contemporary sculptors. He was appointed prin. sculptor to the King of Spain, 1825. He also modelled portrait busts of Ferdinand VII, Rossini, and the Duchess of Alba. A group representing the 'Defence of Saragossa' and a group of 'Antiochus and Memnon' are 2 of his chief works.

Alvarez de Cienfuegos, Nicasio (1764-1809), Sp. playwright and poet, b. Madrid. Of his tragedies the most famous are *Pitaco* and *Loraida*. His poems were collected in *Obras poéticas* (2 vols., 1816). He was a member of the Sp. Academy.

Alveary: 1. A bee-hive.

2. The outer canal of the ear, *meatus externus*.

Alvensleben, Konstantin von (1809-92), distinguished Prussian general, served in the Dan. war. He commanded in the Franco-Prussian war and won high distinction at Orleans and Le Mans.

Alverstone, Richard Everard Webster, Viscount (1842-1915), politician and lawyer, educ. Charterhouse and Trinity College, Cambridge. He was called to the Bar in 1868, and became Q.C. 10 years later. In 1885 he became attorney-general in the Conservative gov., though he was not a member of Parliament, and had not held the office of solicitor-general. He then entered the House of Commons as member for

Launceston. He led the case as counsel for *The Times* against the Irish party before the Parnell Commission in 1889; he was Brit. representative in the Berlin Sea arbitration in 1893; and leading counsel in the Venezuela arbitration in 1899. In May 1900 he became master of the rolls—a position previously held by Sir Nathaniel Lindley—and was raised to the peerage. In Oct. of same year he succeeded Lord Russell of Killowen as lord chief justice; and in 1903 he was one of the 3 arbitrators on the Alaska Boundary question. A. was made a viscount in 1913.

Alvin, Louis Joseph (1806-87), Belgian writer and librarian of Brussels library, b. Cambrai. Among his dramas are *Sardanapale*, 1834, a tragedy, and *Le Folliculaire anonyme*, 1835, a comedy. He also wrote *Souvenirs de ma vie littéraire*, 1843. *Les Récontemplations* (a reply to Victor Hugo's work, 1856), and *Les Commencements de la gravure aux Pays-Bas*, 1857-9.

Alvinczy, Nicolas, Baron of (1735-1810), Austrian commander, b. Transylvania. He distinguished himself in the Seven Years War, and fought against the Turks in 1789. He was Commander-in-Chief of the Austrian Army against Napoleon, but was defeated at Arcola (1796) and at Rivoli (1797), and lost Mantua. He was made governor of Hungary, and field marshal in 1808.

Alwar, city of former A. state, now merged in Rajasthan state, India. The city palace contains an outstanding library of Persian and Sanskrit MSS.

Alwyn, William (1905-), musical composer, b. Northampton, studied at the Royal Academy of Music in London, where he was appointed prof. of composition in 1927. His music includes orchestral and chamber works, and he has been particularly successful with music for numerous films.

Alyattes, King of Lydia (c. 610-560 bc), estab. the Lydian empire. He made war against Miletus and against the Medes. At the Halys, where hostilities were interrupted by the occurrence of an eclipse of the sun, peace was concluded with Media, and the riv. was made the boundary between the 2 kingdoms. A. greatly extended his empire before his death. His tomb is still in existence, but has been plundered by excavators. He was succeeded by Croesus.

Allyn, N. Wales, see ALLEN.

Alyssum (from Gk *lyssa*, madness, and *a*, privative, as it was reputed to cure madness), a genus of 80 species of herbs, family Cruciferae, of which the Mediterranean perennial, *A. saxatile*, and its varieties are chiefly grown in gardens.

Alyth, burgh in E. Perthshire, Scotland, on Burn of A., 20 m. NE. of Perth. It has jute manufs. To the NW. lies the forest of A. Pop. 2072.

Alzey, Ger. tn in the Land of Rhineland-Palatinate (q.v.), 18 m. SSW. of Mainz (q.v.). It has a trade in agric. produce and wine. Pop. 10,000.

Amadavat, or **Avadavat**, *Estrilda amadava*, small singing bird which is to be found in the Malay Archipelago, about

5 in. long, carmine coloured, with the upper parts brownish grey and wings spotted white. Belongs to the family Ploceidae.

Amadeo, Giovanni Antonio (1447-1522). It. sculptor and architect, b. Pavia. In collaboration with others, he decorated the Certosa at Pavia. His monument of Bartolommeo Colleoni, a Venetian general, with its fine bas-reliefs and statue of the commander, in Bergamo, is one of the masterpieces of Renaissance sculpture. He also took part in the sculpture of the great octagonal dome of the cathedral of Milan. See Lübke, *History of Sculpture*, 1878.

Amadeus, name of 9 counts and dukes of Savoy:

Amadeus I. (d. 1078), son of Adelaide, Marchioness of Susa, and of Umberto I. Count of Maurienne in Savoy, called the White-handed. After his father's death he governed conjointly with his mother the states of Susa and Maurienne. This made him master of the great pass over the Alps into Italy, by Mont Cenis, from which much of the subsequent importance of his family was derived.

Amadeus II (reigned 1103-48), succeeded his father, Umberto II, Count of Maurienne. As a reward for his loyalty the emperor Henry V gave him the title of Count of Savoy, and vicar perpetual of the empire. A. also took the title of Marquess of Turin. A. accompanied Louis VII of France to the Holy Land, distinguished himself at the siege of Damascus, and relieved Acre, which was besieged by the Turks.

Amadeus III (reigned 1233-46) succeeded his father Thomas, as Count of Savoy, and his brother inherited Piedmont. He conquered the Chablais and the Lower Valais, and sent troops over the Little St Bernard to subjugate the valley of Aosta.

Amadeus IV (reigned 1285-1323), called 'the Great,' succeeded his uncle as Count of Savoy. By his marriage with Sybilla, Countess of Bugey and Bresse, these dists. of anc. Burgundy were united to his states, and he succeeded in otherwise extending his dominions. A. afterwards embarked for the E. where he helped to defend Rhodes against the Turks in 1315.

Amadeus V (reigned 1329-42) succeeded his brother Edward as Count of Savoy, and continued the war against the Dauphin of Vienne.

Amadeus VI (reigned 1343-83), called the Green Count, son and successor of the preceding. In 1349 Humbert, last dauphin of Vienne, gave up his title and principality to Charles, grandson of Philip of Valois, and retired into a Dominican monastery. A. was angered at this cession, which gave him a much more formidable neighbour than he had before, and a war ensued, in which A. defeated the French in 1354. A treaty was concluded at Paris the following year, by which the Count of Savoy gave up to France the dists. he possessed in Dauphiny beyond the R.s Rhone and Guiers; and he, on his part, was acknowledged

undisputed sovereign of Faucigny and the country of Gex, as well as suzerain lord over the counts of Genevois, all of which titles had been till then subjects of contention between the counts of Savoy and the dauphins of Vienne. A. also forced the Marquess of Saluzzo to pay him homage, and thus extended his rule on the It. side of the Alps. A.'s alliance was sought by the prin. sovereigns of his time. The Venetians and the Genoese had long quarrelled about the possession of the is. of Tencos, in the Aegean Sea, but at last agreed to give full possession to the Count of Savoy. Later Pope Clement VII persuaded him first to accompany Louis, Duke of Anjou, on his expedition to Naples, and there A. went in 1382 and shared in the first successes of Louis, who conquered the Abruzzi and Apulia.

Amadeus VII (reigned 1383-91), called the Red Count, succeeded his father, A. VI. He made the important acquisition of the county of Nice in 1388.

Amadeus VIII (reigned 1391-1439), son and successor of the preceding, was created first Duke of Savoy in 1416 by the Emperor Sigismund, who declared the court of the duchy to be independent of the imperial chamber. A. waged war against Filippo Maria Visconti, Duke of Milan, and took Verelli, which he united to his dominions. He also annexed to them the country of Genevois, having purchased the rights of the various claimants after the extinction of the male line. Thus the whole of Savoy was finally united under one sovereign. He was also prince of Piedmont, baron of Vaud, lord of Nizza, Mondovi, and Valenza, duke of Aosta, etc. A. gave his subjects a code of laws called 'Statuta Sabaudiae.' After 43 years' reign, he retired in 1434 to the hermitage of Ripaille, on Lake Geneva, entrusting the administration of his states to his son, Louis. For 5 years he lived at Ripaille, and here he mediated the Peace of Arras between France and England. The council assembled at Basel, having deposed Eugenius IV in 1439, elected A. anti-pope as Felix V. At the same time he definitely abdicated his temporal sovereignty to his son Louis. France, England, Spain, Germany, and Lombardy acknowledged him as pope, whilst the rest of Italy and the Venetians supported Eugenius, who continued to reside at Rome. The schism lasted 9 years; but when Eugenius d., the cardinals at Rome elected Nicholas V, and Felix himself proposed to renounce his rights to Nicholas, thus terminating the scandal in the Church. He d. at Geneva in 1451.

Amadeus IX (reigned 1465-72), Duke of Savoy, succeeded his father, Louis. He was called the Pious, because of his charity to the poor.

Amadeus, salt lake (area 340 sq. m.) of N. Ter., Australia, surrounded by mts and desert country. It was discovered in 1872 by Ernest Giles.

Amador de los Rios, Don José (1818-1878), Sp. writer, b. Bacna. His greatest work is a *Critical History of Spanish*

Literature, 1861-5. He wrote, besides works on Sp. art, a *History of the Jews in Spain and Portugal*, 1861, and a *History of the Town and Court of Madrid*. He was prof. of literature at the Madrid Univ. and a member of the Academy.

Amadou (Old Provençal *amadou*, lover) (*Fomes fomentarius*), is a fungus which grows on old trees, and is used for stopping haemorrhages. Boiled in strong saltpetre it forms the Ger. tinder of tobaccoconists.

Amagasaki, seaport and industrial city of Hyogoken, Japan, situated on the Bay of Osaka. It has chemical and metallurgical plants, engineering works, and textile mills, and also produces glass, pottery, and beer. Metalwork, drugs, dyes, pottery, and woodwork are exported. It has a pop. of about 350,000.

Amager, is. of Denmark, in the Sound, separated from Zealand by Copenhagen harbour. Christianshavn, on the N. end, forms part of Copenhagen. The is. is flat and fertile and has shipping and gardening industries. Area 25 sq. m.: pop. 174,820.

Amalaric (c. 502-31), Visigoth king of Spain, was the son of Alaric II and grandson of Theodoric II. He was only 5 years old when his father was killed in 507, but he was proclaimed king when he came of age. He married Clotilda, daughter of Clovis, king of the Franks, but the marriage led to religious disputes and a war with Childebert, King of Paris, the brother of Clotilda. The Spaniards were defeated in 531, when A. was killed.

Amaldar, name used to designate the governor of a prov. under the Muslim rule in India.

Amalekites, anet tribe in S. Palestine, apparently connected with the Edomites, and including the Kenites, and frequently mentioned in the O.T. as foes of the Israelites. The references are disconnected and confused. The A. harried the Israelite rear as they entered Canaan from Egypt, for which their extermination was promised. They were defeated by Joshua, Saul, David, and the Simeonites. The traditional hostility still appears in Esther.

Amalfi, It. seaport in Campania (q.v.), 7 m. ESE. of Salerno (q.v.). It is on the NW. shore of the Gulf of Salerno, on the Tyrrhenian Sea. In the 10th cent. it was one of the prin. ports in Italy. It was reduced by King Roger II (q.v.) of Sicily in 1131, and was later taken by Pisa, after which it rapidly declined. At the height of its power it had a pop. of over 50,000. It was finally ruined by a great flood in 1343, but its maritime code of law, the *Tanole Amalfitane*, was recognised in the Mediterranean until the second half of the 16th cent. It has a fine archiepiscopal cathedral (partly 10th cent., but much restored), and many other medieval buildings. There is a growing tourist traffic. Pop. 6500.

Amalgam, mixture or compound of one or more metals with mercury. A.s are usually obtained by direct union or by placing the metals with mercury into dilute acid. Those containing a large proportion of mercury are in a liquid form,

but if there is a small proportion of mercury the A. is frequently found to crystallise. Tin A. is used for backing mirrors; tin and zinc A.s are used for coating the rubbers of electrical machines; gold and silver A.s are used for gilding purposes; and an A. consisting of gold, silver, copper, tin, and mercury, in varying proportions, is used for stopping teeth.

Amalgamation, process of uniting or alloying a metal with mercury. It is by A. that gold and silver are extracted from the rocks in which they occur. A. processes cause the metals to combine with the mercury to form an amalgam.

Amalia, Anna, Duchess of Saxe-Weimar-Eisenach (1739-1807), b. Wolfenbüttel, the daughter of the Duke of Brunswick - Wolfenbüttel. She married Duke Ernest Augustus of Saxe-Weimar-Eisenach, and at his death in 1758 became regent for 17 years for her son, Charles Augustus, in whom she and Wieland, his tutor, fostered a love of art and literature. She was distinguished for her benevolent rule, and especially for her patronage of letters and learning. Weimar became the literary centre of Germany, and the court was visited by Goethe, Herder, and Schiller. See life by F. A. Gerard, 1902.

Amaleto, Pomponio (1505-c. 1588), b. San Vito, Friuli, It. painter of the Venetian school, a pupil of Pordenone. His prin. works are the frescoes in the castle, and in the church of Santa Maria at San Vito, and in the church of San Francesco, Udine.

Amalthæa: 1. Nurse of the infant Zeus, represented as a goat, from which was taken the *cornu copiae* (horn of plenty), which automatically filled itself with whatever its possessor desired.

2. The sibyl who brought Tarquin the 9 books containing Rome's destiny.

Amara, or **Albana**, one of 'the rivs. of Damascus' (2 Kings v), now the Barada, the Gk Chrysorrhoas.

Amara, vil. in Iowa, U.S.A., 20 m. SW. of Cedar Rapids, oldest of 7 vils. owned by Amara Society—'Community of True Inspiration.' The members of the society, founded in SW. Germany about 1715 in revolt against Lutheran dogmatism, moved in 1855 to A., which has become noted for craftsmanship in furniture and in wool textiles. Profits of the members' labours are distributed on an equal basis. Pop. 200. See Bertha M. Shambaugh, *Amara, the Community of True Inspiration*, 1908.

Amanita, family Agaricaceae, genus of Toadstool fungi, of which *A. phalloides*, Death Cap, is the most poisonous fungus known. *A. muscaria*, Fly Agaric, is also poisonous; but *A. citrina*, False Death Cap, *A. rubescens*, The Blusher, and *A. pantherina*, are sometimes eaten.

Amanullah Khan (1892-), ex-King of Afghanistan, third son of Habibullah Khan, on whose assassination he became amir in 1919. He adopted the title of king instead of amir in 1926, and his second wife, Surlyyeh, a Damascus woman, whom he married in 1914, became

queen consort, her official style being the Shah Khanum. Made war on Brit. forces in 1918-19. In 1928 made an extensive tour of Europe with Queen Surlyyeh to study W. institutions, but the outcome of his reformative zeal was disastrous and he lost his throne (see also AFGHANISTAN).

Amapala, main port on Pacific coast of Honduras, situated on Tigre Is. in Fonseca Bay. Its roadstead is deep enough for the largest vessels to lie within a few yards of shore. A. has a small airport, and timber, coffee, hides, and live-stock are exported. Pop. 2701.

Amapala Gulf, see FONSECA.

Amaranthus, or **Amaranth**, genus of the family Amaranthaceae. It is found in tropical and temperate climates. *A. caudatus*, Love-les-bleeding, and *A. hypochondriacus*, Prince's Feather, are grown as hardy annuals in gardens.

Amarapura, former cap. of Burma, on R. Irawadi, 6 m. NE. of Ava. Founded in 1783, it suffered from fire in 1810, and from earthquake in 1839. In 1860 Mandalay became the cap. and A. now remains a small tn. Prin. industry is silk weaving. 10 m. SW. of Mandalay, A. is connected with it by road and rail.

Amarasimha, Hindu poet and lexicographer, Buddhist, author of *Amarakosa* ('the vocabulary of Amara'), written in verse. This lexicon became very popular in India, and about 50 commentaries on it are extant. As A. quotes Kālidāsa (Hindu poet of the 5th cent. AD) he must have lived in the 6th or 7th cent.

Amargosa Desert, see DEATH VALLEY.

Amari, Michele (1806-89), It. historian, orientalist, and politician, b. Palermo. His most famous work, *La Guerra del Vespro Siciliano* (1841), was prohibited, and he fled to France, where he studied Arabic and modern Greek. During the revolution of 1848 he returned to Italy, and was made vice-president of the committee of war in Sicily, later visiting France and England on diplomatic missions. He remained in Paris till 1859, when he again returned to Italy to fight under Garibaldi. He was minister of public instruction, 1862-4, and prof. of Arabic at Pisa and Florence till 1878, when he went to Rome.

Amarna, see TELL EL AMARNA.

Amaru, José Gabriel Condorcanqui (1742-81), a revolutionary of Peru, and known as the 'last of the Incas.' He was leader of the opposition party to the Spaniards, but suffered defeat, and he and his house were put to death with extreme cruelty.

Amaryllidaceae, family of monocotyledonous plants which differ from the Liliaceae in having an inferior ovary. They grow mostly in tropical Asia, Africa, and Brazil, but some are European. The perianth leaves are in 2 whorls of 3 joined, the stamens are the same, the ovary is trilobular and inferior; many of the plants have a well-developed corona. Genera include *Agave*, *Alstroemeria*, *Amaryllis*, *Crinum*, *Galanthus*, *Leucojum*, *Narcissus*, *Nerine*, *Sternbergia*, *Vallota*, etc.

Amaryllis, genus of Amaryllidaceae.

(q.v.), so called from Virgil's shepherdess of that name. See *BELLADONNA LILY*.

Amasa, son of the Ishmaelite Ithra and of Abigail, sister of David, commanded Absalom's army; after defeat by Joab he submitted to David and replaced Joab as chief commander. Joab treacherously slew him at 'the great stone of Gideon.' See 2 Sam. xvii and xx.

Amasis I, or **Ahmes** (c. 1580-1558 BC), first Pharaoh of the 18th dynasty. He expelled the Hyksos from Egypt and began conquests in Palestine.

Amasis II (568-525 BC), fifth Pharaoh of the 26th dynasty, an Egyptian general who seized the throne from Apries (q.v.); he founded Naukratis (q.v.), conquered Cyprus, and maintained close relations with the Gk world.

Amasya, ancient town and vilayet of Asiatic Turkey, in valley of Yeshil-Irmak. Formerly court of kings of Pontus. Exports silk and salt. Pop. (vilayet) 163,000; (town) 13,000.

Amateur (from Lat. *amare*, to love), one who follows study or art or sport for love and not for gain. With the rise of professionalism in all sports the word has come to be used to distinguish the A. player from the professional. Monetary considerations form the dividing line between A. and professional in athletics, boxing, football, golf, tennis, running, for example, but the rules of the governing bodies as to the acceptance of fees and expenses vary (see separate articles).

Amati, name of a family of It. violin makers and the founders of the Cremona school. Their instruments are now esteemed of priceless value. Andrea, the eldest, was b. c. 1520 and d. after 1611. According to Féris he was probably a pupil of one of the master violin-makers of Brescia—Gaspar da Salò or Maggini. But according to Dr Fellowes's article in Grove (5th ed.) he was not a pupil of these makers but a contemporary. In his instruments we can see the evolution of the violin out of the viol—in fact Andrea made viols as well as the newer violin. His workmanship far excels that of the older masters. Unfortunately the delicacy of the fabric he used in their making has little favoured the preservation of Andrea's violins. They are strikingly original, but still preserve the antique Brescian upright sound-hole. The shape is extremely elegant, and the workmanship singularly fine. The belly and back of the violins are high in proportion to their other parts. The finish is amber varnish. This pattern produced exquisitely clear, sweet, and delicate tones, but the volume of sound was proportionately small. The tone of the fourth string was particularly weak. Andrea also made violoncellos and tenors. Andrea was succeeded by 2 sons, Antonio (1550-1638) and Girolamo (1551-1635), whose services to the craft were also signal. However, it was Nicolo (1596-1684), son of the latter, who was the greatest of the family. His violins have what the violins of the first lack—intensity and richness. This was acquired by using thicker wood and reducing the elevation. Stradivari was

the pupil of Nicolo. The fame of their descendant has somewhat eclipsed the renown of Andrea and his sons, but they will always be remembered for their pioneer work in the introduction of a new craft into Italy.

Amatitlán, town and lake in Guatemala. The town is situated at the W. end of the lake, formerly centre for the manuf. of cochineal. Hot springs have made it a flourishing resort. Pop. 6700.

Amato, or **Amatus**, **Joannes Rodericus** (1511-68), often called *Amatus Lusitanus*, b. Castel-Branco, Beira, Portugal, and was an eminent physician. He travelled in France, the Netherlands, Germany, and Italy, and practised his profession in Ancona till 1555, and from there he went to Pesaro and Thessalonica (Salonica). His 2 works, *Exegmata in Prioris Duos Dioscoridis de Materia Medica Libros* (Antwerp, 1536), called in subsequent eds. *Enarrationes in Dioscoridem*, and *Curationum Medicinalium Centurie Septem*, show an intimate acquaintance with the writings of the Gk and Arabic physicians, and contain curious information both in medicine and in natural hist.

Amatol, see *EXPLOSIVES*.

Amatongaland (Tongaland), portion of Natal Prov., situated on the E. coast of S. Africa, N. of Zululand and S. of Portuguese E. Africa. The inhab. are chiefly Tongas, a div. of the Bantu race, and number about 40,000. A. was annexed to Natal in 1897, being previously a part of Zululand. Prior to that time it was ruled by an hereditary dynasty under Brit. supervision. The area is 600 sq. m.

Ammaurosis (Gk *amauros*, dark), partial or total blindness where the outward appearance of the eye is unaffected, and usually caused by affections of the brain.

Ama-Xosa, or **Xosa**, an important div. of the Bantu people. Their complexion is dark, nostrils broad, lips thick, hair woolly. They are sharp-witted and courageous. They inhabit chiefly Transkei, Tembuland, and Pondoland.

Amaziah, or **Amaziah** (c. 797-769 BC), literally 'one strengthened by Yahweh,' 9th King of Judah; succeeded his father Jehoash, whose murder he avenged (2 Kings xiv. 5; 2 Chron. xxv. 3), and gained a great victory over Edom in the Valley of Salt, taking Sebah of Petra. A. declared war on Jehoash, King of Israel, but was defeated and taken prisoner. Jerusalem was taken and plundered. A., after having recovered his liberty, was slain at Lachish, where he fled from a conspiracy against him.

Amazon, the largest riv. (if measured by vol. of water carried) in the world, flows through S. America. It has a great network of tribs. which drain and water a vast extent of ter. It is also designated by various local names according to the dists. through which it flows. To this riv., or especially the Peruvian portion of it, the name *Marañon* is frequently applied. Though some hold that *Marañon* is of Indian derivation, modern geographers incline to trace it to the Sp. word *maraña*, which means (1) tangled underwood; (2) a tangled skein; and

conclude that the word describes the tortuous course of the riv. or the rough country through which it flows. So also geographers tend to reserve the name Marañon for the more N. of the 2 head affluents of the A., the other being the Ucayali. Discovery of the riv. (1500) is attributed to Vicente Yañez Pinzon, a Spaniard. He called it the Rio Santa Maria de la Mar Dulce, afterwards corrupted into Mar Dulce. The word A., the most general name for the riv., is said to be derived from the Indian word *amassona*, a boat-destroyer, because the riv. at certain places and in certain seasons is very dangerous; but the name may simply have been suggested by the encounters of the early Sp. explorers with the fighting men of savage tribes who wore their hair long. Some difficulty in distinguishing the affluents makes the exact estimation of the length of the riv. itself subject to dispute. The length given is about 3300 m. with the Marañon; or between 3700 and 3900 m. with the Ucayali (including the Apurimac); so great is the vol. of water discharged from its mouth, that fresh water is said to be found on the surface of the ocean 40 m. out. The riv. and its tribs. drain an immense area—nearly one-half of S. America, about 2,700,000 sq. m. The prin. tribs. are the Tocantins, the Xingú, the Tapajós, the Madeira, the Purús, the Ucayali, the Negro, the Yapura, the Nago, and the Morona. The Casiquiare, a unique natural canal, covering 180 m., connects the Orinoco with the Rio Negro, and is a most interesting natural phenomenon. The riv. with its tribs. to a large extent is navigable, but is rendered dangerous by floods and rapids, e.g. the tidal phenomenon the bore or *pororoca* in the main stream of the lower riv. The natural resources of the area have consequently been slow in development. The riv. flows through deep gorges and vast forest stretches which are but thinly populated. The climate is naturally hot and vaporous, but is rendered equable by trade winds which blow regularly through the dry season. The riv. abounds in fish, but eatable meat and fruit are difficult to procure in the locality. The A. is subject to ann. inundations. The waters rise early in Nov. and reach their maximum height in June, and then the vol. decreases steadily till the end of Oct. The rise and fall of some of the affluents are not coincident. The riv. is navigable for ocean steamers for some 1000 m. to Manaus; and Lquitos, about 2300 m. from the sea, is at the head of navigation for ships of less than 14 ft draught. Belém, or Pará, on the Tocantins channel, and Manaus, on the Negro, are the 2 chief ports. The main channel of the A., though up to 6 m. wide, is dangerous to navigation owing to shifting is. and sand-banks; ocean vessels therefore use the Tocantins channel 200 m. to the S. In 1867 the riv. was opened to the commerce of all nations at certain points, i.e. Tabatinga on the A.; Cametá on the Tocantins; Santarém on the Tapajós; Borba on the Madeira; Manaus on the Rio

Negro. The forest tracts which the great riv. divides are to a large extent undisturbed. The wide variety of evergreens includes valuable hardwoods. Through the tangled growths the sun scarcely penetrates, and the fauna and flora are still incompletely classified, though sev. scientific expeditions have been made with that object. The most notable product of the basin is rubber, which early in the cent. was exported in large quantities. Being wild rubber and difficult to collect, however, it stood no chance in competition with the rubber of the E. Indies as soon as the plantations came into bearing. During the First World War, therefore, when shipping was scarce and few imports could be relied upon, the inhab. of the A. basin turned again to the growing of sugar-cane, corn, manioc, brazil-nuts, cinchona, cotton, tobacco, ipêcuanha, sarsaparilla, and vanilla, all of which are now exported, especially sugar, in commercial quantities. Some rubber is still exported, chiefly from Belém and Manaus; also hardwoods. So far progress in trade and agriculture has been hampered by the difficulty of obtaining food supplies and inadequate transportation facilities. The Mamoré-Madeira railway, 220 m. in length, which was opened in 1912, has reduced transport difficulties in one direction by circumventing the 200 m. of rapids and falls of the great Madeira. Expeditions to study the industrial possibilities of the dist., as the Fleming expedition of 1919, and that of the Amer. Rubber Mission in 1923-4, give further promise of future development. As yet, however, the land is for the most part still virgin and very difficult of access. Further knowledge was gained of the ter. in 1924, when an expedition under Dr Hamilton Rice explored and mapped the Rio Negro with the aid of a hydroplane. The pop. of the A. basin is estimated at 1,500,000. See A. R. Wallace, *A Narrative of Travels on the Amazon and Rio Negro*, 1853; H. W. Bates, *The Naturalist on the Amazons*, 1863; J. Orton, *The Andes and the Amazon*, 1870; H. M. Tomlinson, *The Sea and the Jungle*, 1912; J. F. Woodroffe, *The Upper Reaches of the Amazon*, 1914; K. G. Grubb, *Amazon and Andes*, 1930; P. Fleming, *Brazilian Adventure*, 1933; F. McDermott, *The Amazing Amazon*, 1933; A. S. N. Wadia, *A Thousand Miles up the Amazon*, 1936; E. P. Hanson, *Journey to Manaus*, 1938; W. N. Merryman, *Northern Caballero*, 1941; A. Fiedler, *River of Singing Fish*, 1948; Willard Price, *The Amazing Amazon*, 1952.

Amazonas: 1. Northernmost and largest state of Brazil and a federal state of the rep. It is watered by the Amazon, and has an area of 614,913 sq. m. The country for the most part is plain-land, covered with vast undisturbed forests, and subject to ann. flooding. The chief products are india-rubber, brazil-nuts, hardwood, and cacao. Valuable vegetable products are also found. The cap., Manaus, is a flourishing tn. Pop. (State) 530,920; (Manaos) 110,000.

2. N. dept. of Peru. Area 13,948 sq. m. The rvs. and mts of the country greatly impede trade, though Chachapoyas, the cap., has a fine cathedral and airport. Pop. about 107,000 (plus 20,000 Indians, estimated).

3. Large ter. in extreme S. of Venezuela, adjoining 1. It is drained by the Orinoco and Rio Negro. It is covered with dense forests which supply valuable rubber. Cap. Puento Ayacucho. Pop. 7000 (plus 40,000 Indians).

Amazons (Gk 'breastless'), legendary race of female warriors said to have come from beyond the Caucasus and settled in Asia Minor. They were governed by a queen, and according to some authorities the female children had their right breasts cut off in order to facilitate their use of the bow. The male children were killed or banished, and the race was preserved by periodical union with men of a different race. The A. constantly recur in Gk literature from Homer onwards, and were believed to have invaded Attica at a date corresponding to 1256 bc according to the Parian Marble. In art they are sometimes represented with two breasts, but with the right one bared. The legend of the A. is probably connected with invasions of beardless nomads (Scythian and Mongolian) from the Russian steppe. See J. Forsdyke, *Greece before Homer*, pp. 104 ff., 1956.

Ambala, name of a dist. of E. Punjab, India, and its chief city. Here was ratified, in 1869, the treaty between Lord Mayo, Governor-General of India, and the Amir Shere Ali of Afghanistan.

Ambassadors, diplomatic envoys sent by a king, or the head of a great state, to a foreign gov. to represent him, negotiate his affairs, and guard the home interests abroad. He bears credentials in the form of a sealed letter signed by the sovereign who sends the embassy, by which it is understood that his negotiations will be regarded as if transacted by the sovereign himself. Tradition has estab. that only important kingdoms and states are at liberty to negotiate by means of A. proper. Lesser states negotiate by means of ministers of the second rank. An ambas. is distinguished from a minister of the second rank by the right of transacting his negotiations in the king's presence in public and private, but in practice the sovereign with whom he has transactions is attended by his ministers. As representing the person of the sovereign, an ambas. is entertained at the foreign court with ceremony and pomp. He is not subject to the laws of the state in which he resides, and the exemption applies also to his suite, but violent abuse of this privilege may lead to his recall.

Ambato, tn of Ecuador, cap. of Tungurahua prov., about 70 m. S. of Quito between Chimborazo and Cotopaxi; altitude 8435 ft. In 1698 A. was destroyed by an eruption of Cotopaxi, and again in 1796, 1949, and 1951 by severe earthquakes; but it is now recovering. It trades in grain, cochineal, and sugar, and has shoe manufacturers. It is also a vine- and fruit-growing dist., the climate

being temperate. A. is connected with Guayaquil and Quito. Pop. 38,500.

Amber, anct. cap. of Jaipur, now part of Rajasthan, India, about 5 m. from the city of Jaipur, the present cap. It is most picturesquely situated and contains the very fine Old Palace (1600) in excellent preservation.

Amber, resinous fossil. The name is Arabic, but has reached us through the French. Thales, one of the 7 sages of Greece, discovered its power of attraction when subjected to friction. Friction generates negative electricity in A., and the word electricity is itself derived from the Gk word *elektron*, meaning A. A., though now a mineral product, was originally a distillation from an extinct coniferous tree. It frequently preserves within itself plant-structures and insects. The Gk legend is an explanation of its resinous origin. A. among the ancts was said to be the tears of the sisters of Phaethon, who, on account of their grief for his death, were metamorphosed into poplars. A. is of a golden hue varying greatly in intensity. The bluish tints occur when pyrites are present. A. is sometimes transparent and sometimes opaque. The cloudy appearance is caused by imprisoned bubbles. The chemical formula is $C_{10}H_{16}O$. A. melts at $280^{\circ}C$. Succinic acid is obtained from A. by dry distillation, and it is this that produces the aromatic odour familiar to those who have burned the substance. A. is obtained in greatest quantities at the Baltic. After storms quantities of A. are found cast up on the shore. Systematic dredging and mining operations are carried on in the sea and in the 'blue earth.' A. has a wide distribution, being found in varying quantities in Europe, Australasia, and America. A., when immersed in a hot oil-bath, becomes soft, and pieces of it may be fused by dipping the required parts in hot oil and pressing. A. is largely used for personal adornments, vases, mouthpieces of pipes, etc. An artificial A. is occasionally substituted composed of copal, camphor, and turpentine, which is detected by the fact that it melts in cold ether, whereas real A. remains unchanged.

Amber-fish, or **Yellow-tail**, spiny-finned fish of the genus *Seriola* and family Carangidae. These are large, active shoaling fishes, the larger species growing to about 6 ft.

Amberg, Ger. tn in the *Land* of Bavaria (q.v.), 92 m. N. by E. of Munich (q.v.). It has medieval walls, a castle, and sev. fine old churches, including the 15th-cent. Gothic *St Martinskirche*. There are iron-working industries which date back to the 14th cent. Pop. 43,000.

Amberger, Christoph (1500-62), Ger. painter, b. Nuremberg and d. Augsburg. He painted in oil and in tempera, chiefly portraits, the most important of which are 'The Emperor Charles V.' 1532, Berlin Museum; 'Hieronymus Sulzer,' 1542, Gotha; 'Sebastian Münster,' 1552, Berlin Museum; 'A Portrait of a Man,' Brussels Museum; and a Madonna in the cathedral of Augsburg.

Amberggris, waxy substance found floating on the sea or in the gut of sperm whales. It seems to be associated with the beaks of the squid that the whale consumes. It has a fragrant musky odour when warmed, and is used in the form of an alcoholic extract as a highly valued fixative in fine perfumes, to which it imparts a subtle velvety and great tenacity. It has been used in past cents. as a stimulant in nervous diseases and is still being used in the Far E. for its reputed aphrodisiac properties.

Ambert, Fr. tn, cap. of an arron., in the dept of Puy-de-Dôme, on the Dore. It has many old buildings. Textiles, paper, and cheese are manuf. Pop. 7000.

Ambianum, late Lat. name for Samarobria, the modern Amiens (q.v.).

Ambidexterity, capacity of using both hands with equal facility. Some philosophers maintain that man is born ambidextrous, and that the habit of using the right hand in preference to the left is acquired. An argument against this theory is the fact that nearly all savage peoples use the right hand more than the left. A. is cultivated in certain schools of drawing.

Amble, port in Northumberland, England, at the mouth of the R. Coquet, 1½ m. from Warkworth, with a good beach and caravan camping sites. Pop. 4800.

Ambleside, mrkt tn of Westmorland, England, 13 m. NW. of Kendal, and ½ m. from the head of Lake Windermere. Picturesquely situated, it has many literary associations. In the vicinity are Rydal Mount, Wordsworth's house; Fox Howe, a summer residence of Thomas Arnold; and the Knoll, home of Harriet Martineau. It is an attractive tourist resort. Pop. 2400.

Amblygonite, mineral similar in appearance to feldspar. It is a lithium and aluminium fluophosphate, Li(AlF)PO₄, and is used in commerce for the extraction of lithium.

Amblyopia, dimness of vision not due to refractive errors or organic disease of the eye. It may be congenital or acquired. In the latter case it is sometimes due to hysteria, but more often to the use of tobacco or ethyl and methyl alcohol, and in some cases to poisons such as lead, arsenic, quinine, and ergot. The condition is progressive and may ultimately, though rarely, lead to total blindness. The centre of the field of vision is most affected, and there are blind spots for both red and green. The cause is said to be retrobulbar neuritis or inflammation of the eyeball part of the optic nerve. The treatment consists in avoidance of the predisposing cause.

Amblyopsis (Gk *amblyos*, obtuse; *ops*, eye), the Kentucky blind-fishes, a species belonging to the teleost order Microcyprin. They live in subterranean waters and have very degenerate eyes.

Amblypoda, extinct group of large unguligrade mammals which lived in Palaeocene and Eocene times.

Amblystoma (Gk *amblyos*, obtuse; *stoma*, mouth), genus of salamanders of the order Urodela, mainly found in N. and

S. America. The larva of *A. tigrinum* is the axolotl, which at this stage may become sexually mature and lay eggs; it occurs in the U.S.A., Vancouver, and Mexico. Some axolotls never normally metamorphose into A.s., but may be made to undergo the change by administration of thyroid gland.

Ambo, reading pulpit for the reading of the Gospel and the Epistle in early basilicas.

Amboise, Georges d' (1460-1510), Fr. cardinal and statesman. He gained the favour of the Duke of Orleans, and through his influence was made Archbishop of Narbonne (1492) and subsequently of Rouen (1493). On the accession of the Duke of Orleans to the throne as Louis XII, A. was made cardinal and chief minister. His foreign and domestic policies were moderate and beneficial. On the death of Alexander VI he hoped to become pope, but was unsuccessful, and the remainder of his life was occupied with abortive scheming. He was buried at Rouen, where a fine Renaissance tomb was erected.

Amboise, historic Fr. tn in the dept of Indre-et-Loire, on the Loire (q.v.). Its château, one of the finest of the Loire châteaux, rises on a terrace above the riv., and was a residence of the Valois (q.v.) until an attempt in 1560 by the Huguenots (q.v.) to carry off the young king Francis II (q.v.). It was damaged during the Second World War, but has since been restored; the beautiful Gothic 'King's Lodge' dates from the 15th cent., as does also the tiny Chapel of St-Hubert, which is thought to contain the remains of Leonardo da Vinci (q.v.). There are other notable buildings in the tn, including a 12th-cent. church. The prin. manufs. are agric. machinery and textiles. Pop. 6500.

Amboyna, Amboina, or Ambon, is, and tn in Moluccas, Indonesia, in the Banda Sea, 7 m. S. of the SW. coast of Ceram. The interior is mountainous with a fertile coastal plain. Agric. products include nutmegs, cloves, rice, and sugar. The tn on the S. coast exports copra and spices. Portuguese, Brit., and Dutch forts were estab. in the 16th and 17th cents. (a massacre of British took place at A. by the Dutch, 1623). Occupied by the Japanese in Second World War, and became part of Indonesia in 1950. Area c. 20,000 sq. m.; pop. c. 40,000.

Ambracia, tn of anct Epirus. It was colonised c. 640 BC by Corinth. It became a democracy, but retained strong allegiance to Corinth. In the Peloponnesian war it played an important part. During the Macedonian supremacy it was autonomous, but eventually became the cap. of Pyrrhus's kingdom.

Ambracian Gulf, see ARTA, GULF OF. **Ambriz**, Portuguese seaport of W. Africa, which exports produce of the numerous plantations of the dist., principally vegetable oils.

Ambrose, St (c. 340-97), one of the most celebrated fathers of the Church, b. Trèves, in Gaul, where his father was praetorian prefect. After practising at the

Rom. Bar he was appointed governor of Liguria and Aemilia and made his official residence at Milan. In 374, while preparing to keep order at the episcopal election there, he was chosen bishop by popular acclamation, although he was still a catechumen. A. was consecrated on 7 Dec., a date which is now observed as his feast. He had accepted the post with extreme reluctance; but he proved to be one of the greatest bishops of all time, helping to crush Arianism, and even venturing to rebuke the Emperor Theodosius for the massacre of Thessalonica (390). He combined political genius with great theological acumen and a polished literary style. It was largely due to his preaching that St Augustine received the light of faith.

Ambrosia, mythical food of the gods, their drink being nectar. The word signifies 'immortal,' and A. was said to be able to bestow immortality on mortals, as in the case of Tithonus and Berenice. A. was also mythically applied to wounds and used as a hairdressing.

Ambrosian Chant, name given to the collected plainsong of the early Church, arranged by St Ambrose (q.v.). Of these chants we have no extant specimens, or, if we have, they are indistinguishable from the Gregorian chants of Pope Gregory, by which they were superseded in the 6th cent.

Ambrosian Library, famous library at Milan founded (1609) in memory of St Ambrose by Cardinal Borromeo. It numbers 400,000 vols. and 10,000 MSS. Among its most famous possessions are a Gk Pentateuch, 5th cent., a Josephus on papyrus, a Plautus, and a commentary on the Psalms by St Jerome. In air attacks in the Second World War fire severely damaged the building, but the most valuable contents were saved from destruction.

Ambrosius Aurelianus, or **Emrys** (fl. 5th cent.), Brit. military leader, probably of Rom. stock. He is referred to by Gildas, and is said to have driven the Saxons back to the is. of Thanet.

Ambulance (Lat. *ambulare*, to go, through Fr. *hôpital ambulant*), conveyance in which the disabled in battle or in civil life are removed to hospital, or in which patients are treated in default of hospital wards. For field use A. wagons were first introduced by the French as late as the end of the 18th cent. Larrey (1766-1842) was the inventor, and had the fervent support of Napoleon. Improvements were made by the French on the method of Larrey, e.g. a corps of stretcher-bearers was organised. In the Crimean War the British had no systematic A. corps, and attention to this dept was only given after Lord Herbert's commission of 1857-8. This method of first aid was subsequently adopted by other powers, and by the convention of Geneva (1864) the patients and the A. staff were secured neutral protection. Various independent charitable societies render A. aid in time of war. A civil A. association was first organised in England in 1878 by the Knights of St John. This society pro-

vided training in first aid, that assistance might be at hand for those who sustained injuries in civil life. The success of the enterprise led to the formation of A. corps in all parts of the country, and now policemen, railwaymen, and factory employees hold certificates of the association. This society also provides auxiliary relief forces which co-operate with the Royal Army Medical Corps in treating those who are injured in time of war. The evolution of A. work has been rapid and a notable success. An A. service is one of the provisions of the Brit. National Health Service (inaugurated in 1948), and the National Health Service Act, 1946, placed on local authorities the duty of administering it.

Lomas

INTERIOR OF A ST JOHN'S AMBULANCE

Ambulatory, in architecture, the space enclosed by a colonnade or an arcade. It is the name used for any part of a building intended for walking in, as the aisles of a cathedral or church. In the peripteral temple of the Greeks the lateral or flanking porticoes are properly termed A.s; and the cloister of a monastery is surrounded by an A.

Ambuscade, or **Ambush** (obsolete Embush). Both words are derived ultimately from the late Lat. *imboscare*. As the derivation shows, this term originally signified a military manoeuvre whereby troops were concealed in wooded ground in order to make a covert attack on the enemy, but now the word is more loosely used to denote a surprise attack of any description. An A. is an obvious manoeuvre of self-defence and is employed in the most rudimentary warfare. Ditches, trenches, and covers of that nature are merely developments of this simple ruse.

The great advantage to be derived from an A. is the fact that by its skilful manipulation a small company of men may gain the supremacy over troops which far outnumber them. The wide range of modern appurtenances of war and more advanced military tactics have made the employment of the simple ambush useless.

Ameer, see **EMIR**.

Amelanchier, genus of small deciduous shrubs and trees, family Rosaceae, about 25 species. *A. ovalis*, the Snowy Mesquill, of S. Europe, and *A. canadensis*, the Shad-bush of N. America, are popular in gardens.

Ameland, one of the Friesian Is. situated off the coast of Friesland, Netherlands. The inhab. are mostly fishermen. Pop. 3000.

Amelia: 1. Port on Pemba Bay in Portuguese E. Africa, a great natural harbour capable of development. 2. Is. in Nassau co., Florida, U.S.A., about 13.5 m. long.

Amelle-les-Bains (formerly **Bains-d'Aries**), Fr. spa in the dept of Pyrénées-Orientales. Its sulphur springs were known to the Romans. Pop. 2900.

Amen, **Amun**, or **Ammon**, originally an obscure deity of Thebes; became the supreme deity with the victory of the 18th (Theban) dynasty over the Hyksos, when the rivalry of Ra (q.v.), the older supreme sun-god of Heliopolis, was eliminated by the association of A. with Ra as Amen-Ra. The priests of Amen-Ra at Thebes became very rich and powerful. Other centres of his worship were Siwa and Napata. He is usually represented in human form (sometimes with a ram's head), with 2 very tall feathers on his head; sometimes as a ram.

Amen, Heb. liturgical word of affirmation; also used as a response at the conclusion of a doxology, prayer, etc. Justin Martyr is the first of the fathers who speaks of this latter use. The word varies in meaning according to its position. It has usually a final or detached position, and signifies 'So let it be.' The use in the gospels of A. (or more frequently a double A., trans. in A.V. 'verily, verily') is peculiar. The 'flat' force of the word is there lost, and it merely lays stress on an important statement about to be made.

Amende Honorable was in the old Fr. laws a public confession made by persons guilty of crimes coming under the head of public scandals, and was accounted an infamous punishment. It might also be a public acknowledgment of an injury to the reputation and honour of another; and in England the expression is used when a person publicly admits any wrong done to another.

Amendment, legal term signifying the correction of mistakes in the written records of judicial proceedings. For A. in the sense used in parliament and public meetings see HOUSE OF COMMONS (PROCEDURE). In ancient times, once proceedings were entered on record no A. however formal or trifling was permitted. This caused much inconvenience and expense, as an unsuccessful suitor, finding a mistake in the record made by a court

official, could deprive his opponent of the benefit of a judgment. An ordinance of Edward I required the judges to record the pleas placed before them and forbade them to amend the court records. The hardship caused by this ordinance necessitated the passing of a series of statutes of A. and statutes of *jeofails* (*jeo fail* or *j'ai failli*); the former permitted certain specific errors in the record to be amended, and by the latter judges were empowered to proceed to judgment notwithstanding such errors. The rules of court have been progressively modified until to-day when almost any A. in civil causes is allowed, provided that the A. does not subject the defendant to a larger pecuniary liability or embarrass him. In criminal causes the practice is more stringent, and once the indictment has been formulated at the assizes no A. is allowed. This stringency does not apply to the early stages of a criminal case in the magistrate's court, and it is for this reason that defence is so often reserved till after the committal of the prisoner to the assize court. The present law and practice of the courts is based mainly upon the Judicature Act, 1873, and, in Scotch courts, on the Court of Sessions Act, 1868.

Amenemhat, name of 4 Egyptian kings of the 12th dynasty. See EGYPT, *The Middle Kingdom*.

Amenhotep, or **Amenophis**, name of 4 famous Pharaohs of Egypt. A. I (c. 1570 bc), the son of Amasis I, conquered Nubia and Mesopotamia. A. II, son of Thothmes III, fl. c. 1500 bc. He was an energetic ruler, who suppressed a revolt in Asia. A. III, son of Thothmes IV, fl. c. 1450 bc. He devoted his reign to building. He constructed the great temples at Thebes, of which the ruins of the temple of Luxor remain. The Vocal Memnon, mentioned in Herodotus and Tacitus, is one of two colossal statues which stood before his funerary temple (no longer existent). A. IV was Akhnaton (q.v.).

Amenophis, see AMENHOTEP.

Amenorrhoea, see MENSTRUATION.

Amentet, Egyptian goddess, the personified West (*Ament*). She was often represented welcoming the dead to her realm, where she also received the setting sun.

Amercement, or **Amerciament** (from the Fr. *a merci*; from the Lat. *merces*, payment), term in O.E. law used to denote an arbitrary pecuniary forfeit imposed on an offender by a jury of his equals in status, or, if in the supreme courts, by the coroner. The amount of the pecuniary penalty was quite arbitrary, and was originally an alternative to a forfeiture of goods. The word in modern usages has practically lost its old technical sense, and is confined to poetical phraseology, where it has merely the meaning of a loss, fine, or deprivation of any kind.

America, general name given to the 2 continents which form the W. hemisphere, extending approximately from beyond 75° N. lat. to below 55° S. lat. The name, derived from Amerigo Vesputi (q.v.), who only reached the mainland of

N. A. sev. years after the discovery of the New World, is an historical accident. At the present day, 'America' and 'Americana' are often used as synonymous with the U.S.A., and a citizen of that nation respectively. As applied to both N. and S. A. the name is also anomalous, for the 2 continents have little in common and are all but disconnected physically. Geologists, seeking an explanation of the grouping of the continents of the world in the tetrahedral deformation of the earth's crust, afford some justification for treating N. and S. A. as a single geographical unit. There is, however, a recognised tendency in all land masses to assume the form of pyramids, with their vertices directed towards the S. This is strikingly exemplified in the form of both N. and S. A. Again, in some respects the general outlines of both are similar, and both have ranges of volcanic mts in the W. running almost due N. and S., and both are watered by similar great rvs. The physical features of both are on a vaster scale than the physical features of Europe. The rvs. are extremely long, the lakes very large, the prairies or *llanos* extensive. For the rest, however, the diversities are so great that it is more convenient to treat them separately. For the geology, ethnology, fauna and flora of A. see NORTH AMERICA and SOUTH AMERICA; for physical features, climate, products, manufs., forms of gov., hist., etc., see CANADA, MEXICO, UNITED STATES OF AMERICA, and the various countries of CENTRAL AMERICA; and ARGENTINA, BRAZIL, CHILE, and other countries of S. A.

American Architecture is here treated as the architecture of the United States only: other parts of America are dealt with elsewhere (see CANADIAN ARCHITECTURE and LATIN AMERICA, *Architecture*).

There were Sp. settlements on the coast of Florida, etc., before the end of the 16th cent.; but for all practical purposes the story of A. A. begins in the Brit. colonies of Virginia (founded in 1607) and New England (founded by the Pilgrim Fathers in 1620). In each case the colonists erected no permanent buildings during their first years, being preoccupied with defending themselves against the Indians and contenting themselves with temporary wooden buildings protected by stockades. Within a generation a small brick Gothic church (still standing) was erected at Jamestown in Virginia in 1632, and other brick buildings followed. In New England, where no brick was available, all the houses were timber-framed, covered with 'clapboards' (weatherboarding), and roofed with shingles. This type of building became very popular in New England, and still continues to be repeated. The beautiful parsonage at Topsfield, Massachusetts (1683), is a fine surviving example; another is the 'House of the Seven Gables' at Salem, Massachusetts. In 1623 the Dutch founded New Amsterdam, which was captured by the British in 1664 and rechristened 'New York'; but not a trace remains

there of the picturesque Dutch *gabled* houses which, in old engravings, recall European Amsterdam. Towards the end of the 17th cent., when the Brit. occupation of all the N.E. states was securely estab., a more formal and ambitious type of architecture was introduced from England. A splendid example exists in Williamsburg, founded 1691 as the new cap. of Virginia, and restored to its original appearance from 1925 onwards, regardless of cost. Here is the handsome William and Mary College (1693-7), vaguely reputed to have been designed by Wren (q.v.), and certainly characteristic of his style. Other fine buildings are the country mansion of Westover in Virginia, c. 1726, and George Washington's home at Mount Vernon (1743, enlarged 1785). From c. 1720 onwards the influence of the Eng. Palladian style, and later that of Robert Adam (q.v.), is very apparent. The White House at Washington was built in 1792-9, and the Capitol at Washington was begun in 1793. Thomas Jefferson (q.v.), whose name is familiar as the third President of the U.S.A., but who also practised architecture, built himself a charming house called Monticello in Virginia (1796-1809), and designed, among other things, the Capitol at Richmond, Virginia (1785-9). America was now independent of Britain, but continued to follow her architectural fashions; so in due course the 'Greek Revival,' the 'Gothic Revival,' and the 'Free Classic Revival' arrived from across the Atlantic. In the third quarter of the 19th cent., however, the architect H. H. Richardson (q.v.) introduced a 'Romanesque Revival' which showed some originality; and his pupil, L. Sullivan (q.v.), attempted to devise a new Amer. style, independent of all revivals and obsolete traditions, notably in the Transportation Building at the World's Fair, Chicago (1893). His mantle fell, in turn, upon his brilliant pupil, Frank Lloyd Wright (q.v.), who became the leading architect of America by the middle of the 20th cent.; but from c. 1900 to c. 1950 most of the important buildings in the U.S.A. were designed by architects trained in the classical tradition at the Ecole des Beaux Arts, Paris; though some of them favoured Gothic, especially for churches and for collegiate buildings. Their names, with their prin. buildings, are dealt with separately (see CORBETT, H. W.; CHAM, R. A.; GILBERT, C.; HUNT, R. M.; McKIM, C. F.). The invention of the skyscraper (q.v.) in the latter part of the 19th cent. was due partly to the tremendously high cost of land in the centre of New York and other Amer. cities; but partly to the nature of the rock subsoil of New York, capable of sustaining immense loads.

Political and racial persecution in Germany and central Europe during the second quarter of the 20th cent. led to the settlement in America of many distinguished architects. Many became profs. in Amer. univs.; all created large practices and became dominating forces in the trend of architectural design (see

Georgius, Naum, and others (Van der Borch). The powerful influence of Frank Lloyd Wright, however, still persisted, and gave A. A. a distinctive character. See T. E. Tallmadge, *The Story of Architecture in America*, 1928.

American Art Museums and Galleries. The U.S.A. has become an increasingly important centre of art, owing to the great benefactions of her millionaires. Thus the Metropolitan Museum of Art in New York City, already one of the great museums of the world, has been enriched by legacies of their entire art collections by the late Benjamin Altman and Henry Frick, in each case the gifts being estimated as worth some 25 million dollars; and the museum thus acquired some of the finest specimens of the work of Rembrandt, Hals, and other European old masters (see F. H. Taylor, *Art Treasures of the Metropolitan*, 1953). A more recent foundation (1929) made possible by munificent private support is the Museum of Modern Art, New York, which under the direction of Alfred H. Barr, Jr, has acquired examples of every new development in 20th-cent. painting, sculpture, and design. The National Collection of Fine Arts at the Smithsonian Institution, Washington, D.C., and the National Gallery of Art, formed through the gifts of the late Andrew Mellon, together constitute what may be regarded as the National Galleries of the U.S.A. A nucleus was the bequest of Harriet Lane Johnston, consisting of paintings by Beechey, Constable, Hoppner, Lawrence, Romney, Reynolds, Luini, and others. About the same time Charles L. Freer of Detroit gave his extensive art collection, including works by Chinese and Jap. artists, and also representative examples of the work of Amer. painters, Whistler being extensively represented. The next gift of importance was the collection of 24 old masters given by Ralph Cross Johnson, including works by Coques, Flnek, Francia, Gainsborough, Guardi, Hogarth, Lawrence, Lotto, Maes, Mainardi, Van Orley, Racburn, Rembrandt, Romney, Rubens, Titian, Turner, and Wilson; and in 1907 Wm T. Evans inaugurated his gift of paintings by contemporary Amer. artists, which by 1916 numbered 151 paintings by 107 artists. In 1929 John Galtaly gave his collection, which included 142 paintings by 44 Amer. artists and 22 by European artists, including Gonzales, Guardi, Puvis de Chavannes, Rubens, Tiepolo, and Van Dyck. In 1935 came the announcement of the plans of Andrew W. Mellon to present to the gov. his great collection of paintings and also to furnish funds with which to erect at Washington a building, to be called the National Gallery of Art, or a similar name. The completion of these plans was expected to place the U.S.A. upon an equality with other nations in regard to great art possessions. The building under the Mellon fund was completed in 1940, and is known as the National Gallery of Art, the former National Gallery of Art of the Smithsonian Institution being now known

as the National Collection of Fine Arts. The latter collection, besides the works mentioned above, contains a number of works by contemporary Fr. artists. The permanent collection in the National Gallery formed under the Mellon fund includes the Mellon collection of 126 paintings, chiefly of the It., Flem., Dutch, Eng., and Amer. schools, and 24 pieces of sculpture of the It. Renaissance, as well as the Kress collection of 375 paintings, 18 pieces of sculpture, and 400 Amer. prints.

Famous painters of all countries are well represented in the Boston Museum of Fine Arts, among the most notable being Fra Angelico, Rogier van der Weyden, Fiorenzo di Lorenzo ('Madonna and Child and St Jerome'), Piero della Francesca ('Madonna and Child'), Andrea Mantegna, Velazquez ('Don Baltazar and his Dwarf' and 'Infanta Maria Theresa'), El Greco ('Fray Felix Hortensio'), J. M. W. Turner ('The Falls of the Rhine at Schaffhausen' and 'The Slave Ship'), Manet ('Kneeling Monk'), Gauguin, and Van Gogh ('The Postman Roulin'). The paintings in the Fogg Art Museum (Harvard Univ.), which was founded by a bequest of Mrs Elizabeth Fogg (1891), include many by It. masters—Fra Angelico, Ghirlandajo, Botticelli, Simone Martini, Giovanni di Paolo, Girolamo di Benvenuto, and Cosima Tura; also, of the Sp. school, paintings by Luis Borrassa, Ribera, and Murillo, and, of the Fr., paintings by Cézanne, Monet, Renoir, Degas, Forain, Manet, and Toulouse-Lautrec; and also paintings by Copley, Gainsborough, and Van Dyck. The Art Institution of Chicago has a collection of over 1000 paintings, including Fr., Dutch, Flemish, It., and Amer., together with prints and drawings by Rembrandt, Whistler, Méryon, Toulouse-Lautrec, Zorn, Bredin, and others. The Cincinnati Art Museum has paintings by Mantegna ('Tarquin and the Cumæan Sibyl'), Lucas Cranach the elder ('St Helena'), Bernardino Luini, Lorenzo di Credi, Bronzino, Frans Hals ('A Dutch Family'), Rembrandt, Van Dyck ('John, Count of Nassau'), Gerard Ter Borch ('A Music Party'), El Greco, Murillo, Gainsborough ('Viscount Downe'), and a large group of Turner and Whistler prints. In the Wm Rockhill Nelson Gallery of Art, Kansas City (opened in 1933), are paintings by Titian, Veronese, Hals, Rubens, Goya, Rembrandt, Caravaggio, Tiepolo, El Greco, Hobbema, Poussin, Claude, Robert, Millet, Van Gogh, Ingres, Tintoretto, and Joos van Cleve. In the Carnegie Institute, Pittsburgh, founded in 1896, considerable interest is shown in contemporary Amer. paintings, and an international exhibition of paintings is held here annually. The permanent exhibits of the City Art Museum, St. Louis (reorganised 1909), include European and Amer. paintings—among them El Greco's 'St Paul.' Fine collections also exist at Cleveland, Detroit, Philadelphia, and Toledo. In Brazil a great art collection has grown up in the last few years, the São Paulo Museum founded in 1947, largely by the

vigorous effort of Senator Assis Chateaubriand. It now contains a Picture Gallery (strong in Fr. Impressionists), Schools of Art, Exhibition Halls for contemporary work, and an editorial dept publishing art magazines.

American Association for the Advancement of Science was the name given in 1847 to the new organisation of the former 'Association of American Geologists and Naturalists.' The first meeting was held on 20 Sept. 1848. The objects of the association are 'to further the work of scientists, to facilitate co-operation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.' In addition a number of independent organisations and societies are affiliated. The income which accrues from the permanent endowment of the association is mainly granted in aid of scientific research. The H.Q. of the association are at 1515 Massachusetts Avenue, NW., Washington 5, and the present number of members is about 50,000.

American Bankers Association, founded in the U.S.A. in 1875 'to promote the usefulness of banks,' represented in its membership in 1956 more than 99 per cent of the nation's banking resources. The 17,385 members included 13,906 head offices, 3303 branch banks, and 176 from foreign countries. Through the years its services have changed and expanded to deal with new techniques of management and operation, and relationships with the public, the gov., and such components of the economy as agriculture, manufacturing, merchandising, and transport. Between the ann. conventions the association is governed by its Executive Council composed of members elected from each state and the District of Columbia. Day to day activities are conducted by a permanent staff at the national H.Q. in New York City. The association has 2 major projects in banking education: the American Institute of Banking and the Graduate School of Banking. The institute offers courses to bank people in 465 cities and towns throughout the U.S.A., and in 1956 had an active membership of 127,006, with 68,599 enrolments in its classes. The Graduate School, for advanced study by bank officers, is conducted at Rutgers Univ., New Brunswick, New Jersey, with an ann. attendance of about 1100.

American Blight, a pest very common to apple-trees. It may be easily recognised by its dark brown colour and white covering. Spraying is essential to get rid of it.

American Civil War, see U.S.A.

American College Yells, see CHEERING.

American Federation of Labour, combination of craft and industrial unions founded in 1881 in Pittsburgh, Pennsylvania. It took the place of the Knights of Labour founded in 1869, which in the early eighties had a membership

of 700,000, conducted a large number of strikes, and then quickly declined. The A. F. L. was led by Samuel Gompers, a shrewd organiser of Brit. birth and Dutch-Jewish blood. Its policy was, from the first, conservative: it took the capitalist system for granted; and it made astute bargains with employers with as little reliance on the use of strikes as possible. No distinction of nationality, creed, or colour was to affect the rights of membership. By 1900 labour, under the aegis of the A. F. L., had become a power that no statesman could ignore. By ceaseless agitation the federation hastened compulsory education of the young, compensation for accidents to employees in industry, and health and sanitary regulations for all workers. It also pressed for the suppression of competitive convict labour and the restriction of alien immigration. During Roosevelt's New Deal the A. F. L. continued to represent most of the large craft unions; but beside it there arose a powerful new organisation, the Congress of Industrial Organisations (C.I.O.), which represented unskilled workers and labour in the mass-production industries. Under the C.I.O. collective bargaining received a new impetus; but there has inevitably been some rivalry between the 2 bodies. In foreign affairs the federation has supported Amer. participation in the World Court; the limitation of armaments; and Philippine independence—mainly to stop the immigration of Filipino labour. In general the A. F. L. has been strongly opposed to Fascism whenever it appeared. In 1933 it voted a boycott of Ger. goods and services until the Ger. Gov. recognised the rights of the working people of Germany to form independent trade unions; and in 1935 it voted concurrence with the League of Nations in declaring Italy an outlaw nation. In 1940 the federation came out strongly for full aid to Great Britain. There is now a labour dept and employment bureau in each of the Amer. states. The federation's official organ is the *American Federationist*.

American Independence, War of, see UNITED STATES OF AMERICA, *History*.

American Indians, aboriginal pop. of America. The use of the word 'Indian' is a misnomer due to Columbus's belief that he had found a new route to India. The name was kept, 'American' being added to distinguish them from the quite different races of India.

The A. I. are of the Mongoloid stock, being related to the Old World Mongols and having presumably originated in the Old World and crossed to America by the Bering Straits. All the Amer. Indian groups are physically very similar, with straight black hair, copper-coloured skin, aquiline nose, and prominent jaw. Today, however, the A. I. seldom remain in racially pure communities and are mixed with many other stocks (especially with whites) and have been affected by many different cultures, only a few indigenous Indian cultures still being in existence comparatively unaffected by outside contact.

A. I. may conveniently be divided into many large divs., which are based on differences of culture and language. Owing to intensive movement and interpenetration of tribes their distribution is a complex one. By 'tribe' is meant a distinct political group, and tribal boundaries are not necessarily the same as those based on language or culture. The main 'culture areas' usually distinguished are, in N. America: the Plains Area of the Middle W., based upon bison hunting; the Plateau and Basin areas to the W., near the Rockies; the California area, based on the acorn as staple food; the NW. or Pacific Coast area, based on dependence on salmon and sea food; the Eskimo area of the far N.; the Mackenzie area in the semi-arctic lands, based on the use of the caribou; the E. Woodlands area of the E. United States; the SE., based on maize, squash, and other vegetable foods; the SW. of Arizona and N. Mexico. In central or Meso-America are the Mayan and Aztec cultures; in S. America are the Chibcha area immediately to the S. of Costa Rica; the Inca area of the highlands of Ecuador and neighbouring ters.; the Guanaco area of the S., including Patagonia; the Amazon area of the Brazil forests; and the Antilles or Carib area of the Caribbean is. All these are marked by differences of economy, social organisation, culture, and language. Within each are many variations and many tribes, too many to list here. The most important are listed separately.

Besides classification by culture area, the N. Amer. Indian tribes are classified by language. There are many distinct stocks recognised in these many and diverse languages, the most important being *Eskimoan-Aleutian*; *Algonquian*, including many languages of the Atlantic coast area; *Iroquoian*, languages spoken in 3 distinct areas—Lakes Erie and Ontario, E. Virginia and N. Carolina, and S. Allegheny country; *Muskogean*, spoken in the Gulf region of U.S.A.; *Siouan*; *Caddoan* of the S. Plains; *Shoshonean* of the Great Basin region; *Athabaskan*, spoken in 3 areas—W. central Canada, the Pacific Coast, and the SW. United States; and *Salishan* of the NW. Coast. There are many smaller stocks, the distribution of which is extremely complex. These languages differ from one another in both phonetic and morphological respects. Some are polysynthetic or holophrastic, with long words each incorporating many notions; others are inflective, like Latin; others are analytic like English or agglutinative like Turkish.

Original Numbers and Causes of Decrease. The best available statistics indicate that at the time Columbus landed there were living in N. America approximately 1,250,000 Indians. By 1917 there were estimated to be about 380,000, and to-day there are perhaps 500,000. Factors that led to this decrease include smallpox and other epidemics; tuberculosis; sexual diseases; whisky and attendant dissipation; removals, starvation, and subjection to unaccustomed conditions; low fertility; wars. The

destruction by disease and dissipation has been greatest along the Pacific coast, where also the original pop. was most numerous. In California the enormous decrease from about 250,000 to less than 20,000 is due chiefly to the cruelties and wholesale massacres perpetrated by the miners and early settlers.

The contact of the A. I. with European races was for long very destructive to the former. The atrocities committed by the Sp. pioneers have long been a subject of shame to all white peoples. The A. I. do not easily withstand diseases not endemic, and countless natives succumbed to plagues and alcohol introduced by the Europeans. Whole tribes were exterminated, and the great majority of those who survived lost the civilisation that had reached an extremely high level in their free days and lapsed into decadence. Later the cruelties which had been inflicted on the people were recognised, and a new treatment was organised. To-day the curve of Indian pop. has taken a sudden upward swing and the drift towards assimilation has apparently slowed down. With these changes in the current of native existence has come a revival of Indian culture, the fruits of which no one can accurately foretell.

Arts and Crafts. The main employments of the people were agriculture and hunting. Before the advent of the Spaniards, beans, melons, potatoes, Indian corn, tobacco, cotton were all cultivated. Hunting was by means of intricate snares and nets. Spears, bows and arrows, harpoons, and clubs were the chief instruments employed. Sledges and skin-boats (coracles) were the chief means of transportation, and wheels were but little used. Arts and crafts were developed to a high degree, especially painting, on skin, bone, and pottery, and music played on drums, flutes, and rattles.

Religion. The religion of the A. I. is on the whole pantheistic. Divine power is manifest in all the operations of nature. This power was sometimes separately worshipped, according to the various phases in which it manifested itself. All the minor spirits had to be honoured and appeased with their own appropriate worship. This divine power was regarded in its oneness as the principle and origin of all life, infinite in power and eternal in duration. The soul of the individual was regarded as being immortal, inasmuch as it was a portion of the life principle, itself indestructible. In addition to their recognition of this divine power to dominate all existence, most tribes recognised their own peculiar demigod. This demigod was for the most part beneficent and benevolent, and was the guardian of the welfare of the tribe.

Social Organisation. Social organisation varied very considerably. Many tribes had only the simplest of clan organisations, others, such as the Inca, developed a complex state apparatus with a divine king. The highest organisations were those of Inca, Aztec, and Maya, and in N. America the Iroquois, Natchez, and Pueblo tribes. In S. and central America,

Cortés and the early Sp. invaders totally ignored the Indians' claims to humane treatment, though they witnessed the highest level of civilisation and advancement among them. The Sp. pioneers were regarded as gods—children of the sun. Advantage was taken of the ignorance of the people, and whole tribes were massacred to glut the Sp. greed for wealth. The rich gold ornaments and jewels of the Peruvians proved as attractive to Francisco Pizarro, the conqueror of Peru; nor did Pizarro fail to equal the atrocities of Cortés.

Present Conditions on Reservations. In the U.S.A. the Bureau of Indian Affairs was estab. in 1824 under the War Dept., and transferred to the Dept. of the Interior in 1849. For a long time it failed to prevent war with the Indian or improve his condition. To-day it is more successful in aiding the Indian in matters of agriculture, industry, education, and health. For a very long time the education of the A. I. had been of constant interest and the plan of many public-spirited bodies and individuals, but it is only comparatively recently that there has been any great response. It is not generally known that the original charter incorporating Harvard Univ. contains special provision for the education of Indians, while as long ago as 1873 the Amer. Gov., in the arrangements for Indian reservations, estab. boarding and day schools. Education of a rather higher nature was not seriously entered upon until the Indian School was started at Stockbridge, Massachusetts, in 1890. The younger generations of Indians are now making rapid advances, and, particularly in the S., are equipping themselves with professional knowledge and skill. During the last few decades the discovery of oil in the S. settlements and reservations has made the resident Indians enormously rich, so that there is now a great line of cleavage between them and their compatriots in the N., who still remain a poor race. An important point should not be overlooked: that the average Amer. citizen feels more kindly towards him than towards the other coloured races. It is not forgotten that he was the original owner of the soil, and now that he has ceased to hamper the advance of civilisation his rights are more fully recognised. This is exemplified by the fact that the veto on intermarriage of races is not in such strong evidence against Indians as against Negroes and Asiatics. Indeed, many contend that a drop of Indian blood improves the stock, and admit that the early settlers from whom good families spring intermarried with Indians. This attitude towards the Indians is, however, of comparatively recent date, and, in spite of laws that seemed fair, they were subjected to shameful ill treatment for a considerable period. Even now Indian administration presents serious problems in regard to economic and social conditions among the tribes. In the U.S.A. there are estimated to be 400,000 Indians, excluding Indians and Eskimoos of Alaska. Of the 400,000 about half are full-blooded

Indians and the remainder mixed with whites in varying degrees and, in the case of a few tribes, with Negroes. There are more than 200 reservations, most of them W. of the Mississippi R.; the largest number being in Oklahoma, Arizona, and S. Dakota. Of the total Indian pop. all but a very few are to a greater or lesser degree wards of the Federal Gov., and most of them live on Indian lands set aside for their use by the Gov. The Dept. of the Interior acts as trustee for the very large amounts of Indian tribal moneys accruing from mining and oil rentals or other sources of income. The right of citizenship was conferred on A. I. only in 1924; this gives the suffrage to all Indians b. in the U.S.A. The commonest occupations of the Indians of to-day are farming and the raising of cattle and horses; while many are engaged in the making of blankets and pottery and in embroidery, the chief market for the sale of their handicrafts being among tourists.

In Canada Indians are minors under the law, and their affairs are administered by a special branch of the Dept. of Mines and Resources under the authority of the Indian Act. Reserves have been set aside for the various bands of Indians in Canada since the earliest times, and the Indians located on them are under the supervision of the local agents of the departmental branch. The Indian Act provides for the enfranchisement of Indians. When an Indian is enfranchised he ceases to be an Indian under the law. Indians who become enfranchised lose the special protection attached to their wardship. There are approximately 128,000 Indians and Eskimoos in Canada.

American Law, *see* UNITED STATES OF AMERICA, *Law*; *see also* ACTION; EVIDENCE; etc.

American Legion, organisation of Amer. ex-service men and women, somewhat similar to the Brit. Legion, with patriotic and other motives of a high order. It was inaugurated in 1919. The idea originated among the troops in France. All who served between 6 April 1917 and 11 Nov. 1918, between 7 Dec. 1941 and 2 Sept. 1945, and between 25 June 1950 and 27 July 1953 in the naval, military, and air forces of the U.S.A. or associated

powers are (generally) eligible for membership. The Legion was influential in obtaining a bonus for Amer. veterans.

American Literature. In the colonial period preceding the revolution, A. L. was of necessity little but an offshoot of Eng., the earliest writers being in fact immigrants who were b. and educ. in England. As one might expect, the first writings are mainly descriptions of the new lands, reports of the progress of the communities, and personal journals recording the colonists' experiences. These works are of great historical value, and in modern times have been studied with increasing interest, some having been pub. in the 20th cent. for the first time. Among early writers may be mentioned Capt. John Smith (1580-1631), with his *True Relation*, 1608, and *General History of Virginia, New England, and the Summer Isles*, 1624; Wm Bradford (1590-1657), whose *History of Plymouth Plantation* was pub. in 1856; and Wm Byrd (1674-1744), author of the *History of the Dividing Line between Virginia and North Carolina*, 1729, whose *Secret Diary*, first pub. in 1940, has caused him to be styled the Amer. Pepys. Other diaries are those of Samuel Sewall (1652-1730) and Sarah Kemble Knight (1666-1727). Such creative writing as there was had mainly a theological trend. Cotton Mather (1663-1728), son and grandson of distinguished preachers, was one of the most learned Americans of his time, and in the intervals of his own church work wrote *Magnalia Christi Americana*, 1703, an eccles. hist. of the settlements; while Jonathan Edwards (1703-58), greatest of New England theologians, pub. numerous religious tracts. Little poetry was written, and it was mainly derivative in style. Anne Bradstreet (c. 1612-72), cited as America's first poetess, was b. in England, and her work follows Eng. fashions. The first typically Amer. writer was Benjamin Franklin (1706-90), whose autobiography, 1818, a work of the highest interest, was preceded by his *Poor Richard's Almanac*, a popular collection of pithy sayings. Political writing reached its highest mark with Thomas Paine (1737-1809), whose works, such as *Common Sense*, 1776, and *The Rights of Man*, 1791-2, had worldwide appeal.

Following the revolution, A. L. began to develop original lines in the 19th cent. There had already been a reaction against the Augustan tradition by the 'Hartford Wits,' Timothy Dwight, John Trumbull, and others, and Charles Brockden Brown (1771-1810) had reflected the early Romantic Movement with his 'Gothic' novels. But the first original Amer. writer of prose fiction was Washington Irving (q.v.) (1783-1859), whose first great success was *Knickerbocker's History of New York*, 1809, written in a vein of delightful humour. His *Sketch Book*, 1819, included 'Rip Van Winkle,' perhaps the most widely read of his writings, and also his delightful 'Legend of Sleepy Hollow.' Fenimore Cooper (q.v.) (1789-1851) passed a part of his boyhood among the Red Indians, and what he saw sank

deeply into his mind, to serve as inspiration for his novels. Among them may be named *The Last of the Mohicans*, 1826; *The Pathfinder*, 1840; and *The Deerslayer*, 1841. Though his writing is unequal, he possessed the highest narrative gifts. Wm Cullen Bryant (1794-1878) was one of the earliest of America's poets. The work of his mature years is distinctively American in its subject-matter and individual in its treatment. He had fine descriptive powers, although he never fully realised the promise he gave in *Thanatopsis*, 1817, his finest and best-known poem. Edgar Allan Poe (q.v.) (1809-49) is famous both as poet and as writer of short stories. His influence on the short story may be compared with that of Turgenev or Dickens on the novel. His tales include *MS. Found in a Bottle*, 1831; *The Fall of the House of Usher*, 1839; and *Tales of the Grotesque and Arabesque*, 1840; these are the products of a prodigal imagination. His poems are distinguished by charm of melody, power of lyric expression, and a command of lyric form. One of the best known abroad of America's poets is Henry Wadsworth Longfellow (q.v.) (1807-82). Among his early vols. of verse were *Voices of the Night*, 1839; *Evangeline*, 1847; *The Golden Legend*, 1851; *Hiawatha*, 1855; and *The Courtship of Miles Standish*, 1858; *Tales of a Wayside Inn* was pub. in 1863 and a trans. of Dante in 1865-7. Longfellow had a rare command of metre, and his metrical effects are often striking. Hardly inferior to Longfellow's are the poems of John Greenleaf Whittier (q.v.) (1807-92), the Quaker poet. His early vols. include *Lays of My Home*, 1843; *Songs of Labour*, 1850; and *The Panorama*, 1856. *Snow-Bound*, 1866, with its descriptive vividness and felicity of phrase, is his masterpiece. Longfellow was succeeded as prof. at Harvard by James Russell Lowell (q.v.) (1819-91), who had early dedicated himself to poetry, and who in 1841 pub. *A Year's Life*. In 1848 came *The Vision of Sir Launfal*, and in the same year appeared *The Biglow Papers*. His poetry shows a strong reforming and ethical bias. Lowell is also an essayist of great distinction. Another writer of both verse and prose is Oliver Wendell Holmes (q.v.) (1809-94). The works of Holmes most widely read are the Breakfast Table series: *The Autocrat*, 1858; *The Professor*, 1860; and *The Poet*, 1872. He also wrote some novels, and many poems are included in his vols. of essays. His essays have a lively humour, powers of keen satire, tenderness, and grace; his poems have a graceful charm, the best known being 'The Chambered Nautilus' and 'The Lost Leaf.'

The original genius of R. W. Emerson (1803-82) was a powerful force in the hist. of 19th-cent. thought and literature. His first pub. of note was *Nature*, 1836, which was not well received by the public, but the value of which was clearly seen by Carlyle. His chief works are *Essays* (2 series), 1841 and 1844; *Representative Men*, 1850; *English Traits*, 1856; *The Conduct of Life*, 1860; *Society and Solitude*, 1870; and a vol. of poems. His

transcendental philosophy is expressed in a style at once illuminating, arresting, vivid, and impassioned. His message to the ages is implicit in all his work, but is to be found practically complete in the essays on *Nature*, *Self-Reliance*, and *Compensation*. Emerson's friend, H. D. Thoreau (1817-62), ranks inferior only to Emerson as a transcendental writer and thinker. His greatest and best-known work is *Walden, or Life in the Woods*, 1854, but he also wrote other vols. of description and essays such as *A Week on the Concord*, 1849, and *Miscellanies* 1849. His works, reflecting the man, are full of whimsicality, eccentricity, and sudden excursions into philosophical ground, and are pervaded like Emerson's with a strong ethical sense. John Burroughs (1837-1921) may also be mentioned. His 3 great inspirations were Emerson, Walt Whitman, and Matthew Arnold. Burroughs is most significant as a naturalist, and his many books dealing with nature and animal life are full of original observation, and are distinguished by simplicity of style. The most revolutionary figure in A. L. is Walt Whitman (1819-92). It was not till 1855 that his first really great book *Leaves of Grass* appeared. His later poems include *Drum-Taps*, 1865, a record of his work as a nurse in the Civil war. He wrote in prose *Specimen Days in America*, 1882, and *Democratic Vistas*, 1871. Whitman has been called 'the first democrat.' He was supremely conscious of his dignity as the mouthpiece of democracy. His verse is unrhymed and free and has a swinging energy. Other 19th-cent. poets of America are Bayard Taylor (1825-78), who in addition to many fine lyrics made a well-known trans. of Goethe's *Faust*: C. G. Leland (1824-1903), translator of Heine and author of *Hans Breitmann's Ballads*, 1914; and Joaquin Miller (1841-1913), author of *Songs of the Sierras*, 1871. One of the best poets of the S. was Sidney Lanier (1842-81), author of *The Symphony*, 1875. Paul H. Hayne (1830-86) and Henry Timrod (1828-67) were also notable S. lyrists. Now recognised as one of America's greatest poets is Emily Dickinson (1830-86), whose individual poetry is important for its own beauty and as a forerunner of the later poetic movement, Imagism.

Among the really great novelists is Nathaniel Hawthorne (1804-64). His stories were written as interludes in a busy diplomatic career. His greatest works are *The Scarlet Letter*, 1850, *The House of the Seven Gables*, 1851, and *The Marble Faun*, 1860, together with his stories for children. *A Wonder Book*, 1852, and *Tanglewood Tales*, 1853, and his short stories in *Twice-Told Tales*, 1837, and *Mosses from an Old Manse*, 1846. He had a perfect feeling for form and for narrative construction, and is thus in a sense classical, though his prevailing temper is romantic, in his power to feel the glory and beauty of the New England past. By many Herman Melville (1809-91) is considered the greatest Amer. novelist. His *Moby Dick*, 1851, is a great prose epic of the sea, and in *Typee*,

1846, and *Omoo*, 1847, he took the S. Seas for a subject long before they were discovered by any other writer. Though Harriet Beecher Stowe (1811-90) wrote many novels, she is best known by *Uncle Tom's Cabin*, 1851-2. Later great Amer. fiction writers are Bret Harte (1839-1902) and his fellow humorist 'Mark Twain' (Samuel Clemens, 1836-1910), whose *Life on the Mississippi*, 1883, and *The Adventures of Huckleberry Finn*, 1884, are masterpieces. Henry James (1843-1916) is one of the greatest novelists of the second half of the cent., but in his essence he was really more of a European than an Amer. writer. Wm Dean Howells (1837-1920) was the founder and head of the realistic school, paying scrupulous attention to detail, deriving something of its method from the Russians. Mary E. Wilkins (Mrs C. M. Freeman, 1852-1930) was an important member of this group. Frank Norris (1870-1902), who lived to complete only 2 books of his projected trilogy of the 'epic of the wheat,' is one of the most significant of sociological novelists. He has sometimes been compared to Zola, while David Graham Phillips (1867-1911), owing to his comprehensive outlook on Amer. life, has been called the 'American Balzac.' With Norris is often associated Stephen Crane (1871-1900), whose *The Red Badge of Courage*, 1895, estab. the 'naturalism' of the nineties. Thomas Nelson Page (1853-1922) is the author of some striking stories of Virginian life, while George Washington Cable (1844-1925) made Louisiana his own particular field. His *Old Creole Days*, 1879, is one of the outstanding books of short stories by Amer. authors writing on Amer. subjects. Frank Stockton (1834-1902), author of *The Lady or the Tiger?*, 1882, was a master of humorous narrative.

A field in which Americans have been conspicuously successful from the first is the short story (see SHORT STORY). Irving, Hawthorne, Poe, Harte, James, Edith Wharton are masters of international reputation in this medium. Edward Everett Hale (1822-1909) is famous for a single short story, *A Man Without a Country*, 1865. A new school of short-story writers developed in the 20th cent. The founder of this school was 'O. Henry' (Wm Sydney Porter) (1867-1910), who, in *The Four Million*, 1906, and other books wrote of the life of the people, employed the Amer. idiom with much original power, and became one of the outstanding humorists of his time in the art of the short story. Earlier humorists, apart from 'Mark Twain,' are Charles F. Browne ('Artemus Ward,' 1834-67), Henry W. Shaw ('Josh Billings,' 1818-85), and Joel Chandler Harris (1848-1908), the author of the *Uncle Remus* stories, amusing dialect fantasies. The more serious short story of the nineties is represented in the work of Ambrose Bierce (1842-1914). Two important earlier writers who must not be overlooked are Sarah Margaret Fuller (1810-1850) and R. H. Dana (1815-82), author of *Two Years Before the Mast*, 1840.

The naturalistic novel which had been estab. in the nineties through Russian and Fr. influence working through such men as Howells, Norris, and Phillips, who have been mentioned above, survived into the 20th cent. and took the popular form of elemental virility in the novels of Jack London (1876-1916), whose *Call of the Wild* appeared in 1903. Naturalism of a type more in sympathy with humanity is found in the works of Theodore Dreiser (1871-1945), a writer who probes with compassion every detail of human life. A satirist of the effect of modern business life upon the Puritan conscience is Robert Herrick (1868-1938), author of *Waste*, 1924. Satire of social life, but in a lighter vein, is also a characteristic of the work of Booth Tarkington, while of modern novelists the satirist *par excellence* is Sinclair Lewis, who has turned his satire successively on life in the small town (*Main Street*, 1920) or small city (*Cass Timberlane*, 1945), on the business man (*Babbitt*, 1922), on the doctor (*Arrowsmith*, 1925), and on the clergy and revivalist (*Elmer Gantry*, 1927). Chief among the propagandists is Upton Sinclair, whose book, *The Jungle*, appeared in 1906 as a result of his investigation of the Chicago stockyards. A voluminous writer, he set out, in his 10 'Lanny Budd' novels, a cavalcade of world events from 1939 to 1952. Allied with him in what may be called 'sociological criticism' are Randolph Bourne (1886-1918), Van Wyck Brooks, Ludwig Lewisohn, and R. M. Lovett. Sherwood Anderson (1876-1941) was more a master of the short story than the novel, and he and Willa Cather share with Dreiser, Edith Wharton, and James Branch Cabell the distinction of being the leading Amer. novelists in the twenties. Another romanticist, but one who escapes from life into his colourful background, is Joseph Hergesheimer. Escape from realism is also found in the romances of Donn Byrne (1889-1928), and the more sophisticated type of romance, *The Bridge of San Luis Rey*, 1927, by Thornton Wilder. Another novelist of greater psychological penetration is Susan Glaspell, while in contrast is the terse style and vivid realism of Ernest Hemingway. Novelists equally competent are John Dos Passos, Louis Bromfield, Thomas Wolfe (1900-38), and Glenway Westcott. The vogue of fiction after the First World War produced many writers of varying and distinctive merit. Among them may be mentioned Gertrude Stein, remarkable for new experiments in both prose and poetry, and Wm Faulkner and Pearl Buck, who share with Sinclair Lewis the distinction of being Nobel prize-winners. The trend away from individualism and towards social consciousness is exemplified in *The Grapes of Wrath*, 1929, by John Steinbeck, and *Tobacco Road*, 1932, by Erskine Caldwell. Margaret Mitchell's monumental *Gone with the Wind*, 1936, was the finest of a series of epic novels dealing with the Civil war period.

Enduring work has been done in the essay by Henry Brooks Adams (1838-1918) and Woodrow Wilson (1856-1923),

and in philosophy by 2 writers of lasting influence and distinctive style: Wm James (1842-1910) and George Santayana. In literary criticism the flourishing condition of creative literature has produced many controversies, the main conflict being between the 'humanistic' and the naturalistic attitudes to life. The former was maintained by the 'conservatives'—Paul Elmer More, George Woodberry, J. J. Chapman, H. S. Canby, Irving Babbitt, and Stuart Sherman. On the naturalistic side are John Macy (1877-1932), Van Wyck Brooks, Ernest Boyd, and H. L. Mencken. The latter through *The American Mercury*, of which he was editor, wielded a powerful and salutary influence over Amer. life and letters. His championship of Dreiser and Cabell against unintelligent criticisms placed A. L. in his debt. Another critic of importance in setting standards of taste was W. C. Brownell (1851-1928), while personal and impressionistic criticism is exemplified by James G. Huneker (1860-1921) and G. J. Nathan. Historical criticism treating of nationalism as an asset in literature was exemplified in *The Irresponsibles*, 1940, by Archibald Macleish, and *What is Primary Literature*, 1941, by Van Wyck Brooks, author also of the monumental 5-vol. conspectus of Amer. writers from 1800 to 1915, entitled *Makers and Finders*, 1945-52.

Twentieth-century Poetry. The beginning of the cent. was marked by a poetic renaissance. The movement had been begun by Whitman, furthered by Hovey and the Canadian Carman, and continued by Edwin Markham (1852-1940), famous for his poem 'The Man with the Hoe'; and by Wm Vaughn Moody (1869-1910). In Oct. 1912 the first number of *Poetry*, a Magazine of Verse appeared. It was ed. by Harriet Monroe, and was an anthology of the 'new' poetry of the better Amer. poets of the 20th cent. Lee Masters with his *Spoon River Anthology*, 1915, scored the most phenomenal success, but his method of brief and acid portraits was anticipated by E. A. Robinson, a poet whose chief theme is the pathos of frustration. An interpreter of another aspect of Amer. life is Carl Sandburg, whose *Chicago Poems* appeared in 1916. The characteristic of these poets is their determined use of everyday speech, and a professed 'people's poet' is Vachel Lindsay (1879-1931). He and Sandburg, both poets of the Middle W., derived from Whitman. The Imagist movement was launched by Ezra Pound, a cosmopolitan poet who found much of his inspiration in Provencal and Chinese literature. The first declaration of Imagism in America was *Some Imagist Poets*, 1915, ed. by Amy Lowell (1874-1925), one of the most successful writers in free verse. Other Amer. poets who were Imagists were John Gould Fletcher and 'H.D.' (Hilda Doolittle). Conrad Aiken, a metaphysical, attached himself for a short time to the movement, while other successful exponents of free verse were Maxwell Bodenheim and Alfred Kreymborg. T. S. Eliot (q.v.), whose *Waste Land* was first pub. in

England in 1922 and then appeared in the Amer. magazine *Dial*, became the leader of poetic experimenters in England and America, and an outstanding figure among modern poets. With T. S. Eliot the influence of Laforgue and the Fr. Symbolists was evident in A. L., an influence equally apparent in younger poets of the period, including Hart Crane (1899-1932), whose poem *The Bridge* appeared in 1930, Malcolm Cowley, and Archibald MacLeish. The 2 last-named have also won a considerable reputation as critics. Allen Tate was a poet of the intellectual school, deriving from T. S. Eliot. He, with John Crowe Ransom and Robert Penn Warren, formed a group which became known through their magazine, *The Fugitive*, 1922-5. Narrative verse found a powerful exponent in Robinson Jeffers, whose *Tamar* appeared in 1924. Wallace Stevens is another important poet of the period. His first book *Harmonium*, of luxurious and eloquent poetry, did not appear until 1923, although he had been a discoverer of the 'new' Poetry anthology of 1912. He is an artist of great sensibility who reached maturity with *Ideas of Order*, 1935, and *The Man with the Blue Guitar*, 1937. Robert Lee Frost's finest poetry is descriptive, and gives vivid pictures of the countryside of New England. Among his pubs. are *The Lovely Shall be Choosers*, 1929, and *A Witness Tree*, 1943. The poetic renaissance in America between the wars was indeed remarkable, nor must the contribution of Negro poets be forgotten, headed by P. L. Dunbar (1872-1916), and including James Weldon Johnson (1871-1938) and the gifted Countee Cullen (see also NEGROES). More recently a stimulus towards the better appreciation of poetry was given by the personal vogue of the Welsh poet Dylan Thomas (1914-53), through the readings that he gave during his visits to the U.S.A.

Hart (ed.), *The Oxford Companion to American Literature* (revised ed.), 1956.

American Music. The hist. of Amer. composed music, in the narrower sense of the music of the U.S.A. (as distinct from the multiplicity of forms of folk music), dates only from the 18th cent. The first native composer is often considered to be Wm Billings (1746-1800), whose

settings of psalms contain fierce and unsubtle music. He also wrote patriotic songs for the War of Independence; he d. a pauper in Boston. Billings's reputation as the first Amer. composer is challenged by John Antes (b. 1740 in Pennsylvania), the Ger.-born Conrad Belsess (said to have contributed 1000 hymns to Franklin's *Ephrata* collection, 1730), and Wm Tuckey (1708-81). Another claimant is Francis Hopkinson (1737-91), the first secretary of the navy, poet, essayist, inventor, and painter. His cantata, *The Temple of Minerva*, 1781, may be called the first Amer. opera. James Hewitt's *Tammany*, 1794, contains the first music said to be based on Amerindian (Cherokee) melodies. Thus it is seen that the U.S.A. was producing a small amount of music for itself even before the musically important year of 1825, when the Garcia company introduced It. Grand Opera to New York. The 1840's and '50's were most noted for the popularity of the minstrel show. Outstanding in this field is the composer Stephen Foster (q.v.), one of the founders of the present-day U.S. supremacy in the popular song industry. The renown of popular song writers, such as Cole Porter, Jerome Kern, and Irving Berlin, contrasts with the undistinguished series of Amer. operas performed at the Metropolitan Opera House, New York. These began in 1910 with Converse's *Pipe of Desire*, and the more successful include Deems Taylor's *Peter Ibbetson*, 1931, and Parker's *Mona*, 1912. As far as symphonic music is concerned, no more than a handful of U.S. composers have become known to a large public, but a vast number of composers b. round the turn of the 20th cent. are writing serious instrumental and vocal concert music. Success within the U.S.A. has been largely dependent on the number of first-class orchestras; thus, the founding of the New York Philharmonic (1842), the Boston Symphony (1881), the Chicago Symphony (1891), and other orchestras coincided with the first symphonic composers, many of whom are now almost forgotten. The *Oedipus Tyrannus* of John Knowles Paine (1839-1906) was performed 17 years after his death; but his best achievement was really the success of his composer pupils, Daniel Gregory Mason, Frederick S. Converse, Arthur Foote, and John Alden Carpenter. Others of his pupils formed the so-called New England School, in which were found many of the foremost 20th-cent. composers, e.g. George W. Chadwick and Horatio Parker. Perhaps the foremost of all was Edward MacDowell (1861-1908); he has become a criterion for good modern Amer. music—though not for the so-called modernists, who form no integrated group, being each intensely individual. The most notable are Aaron Copland, Roy Harris, Samuel Barber, Roger Sessions, Paul Creston, and Walter Piston.

Folk Music and its Modern Derivatives. The true Amer. folk music is obviously the music of the Amerindian races. Important research has been done by such men and women as Theodore Baker, Alice

Cunningham Fletcher, Frederick Burton, and Frances Desmore, who have noticed similarities to Russian and Chinese folk music. Amerindian music, however, is very primitive and a thing apart, having had very little influence on composers, or on the other types of folk music. These other types have sprung from the same sources of the pop. of the U.S.A., and are just as varied. Minority groups of folk music exist, as the Scandinavian in the N.W., the Ger. in Pennsylvania, the Sp. of California and the Mexican border, and so on; but the two great origins of U.S. folk music and its derivatives are the heritages of the Brit. emigrants and of the Negro slaves. First, the old songs and ballads of England, Scotland, and Ireland were brought with the settlers to the Atlantic coast, whence they spread slowly inland. In the Appalachian Mts they found ideal conditions for preservation, so that in many cases old songs forgotten in Britain have been found still flourishing there. The Brit. songs also formed the basis for a tremendous variety of pioneer songs. Similarly, the greater part of the Amer. country dances are of Brit. origin (e.g. the Virginia Reel is almost identical with Sir Roger de Coverley). The second major root is that of the African Negro music, together with the Creole. The religious songs (spirituals) of the Negro (see NEGRO SPIRITUALS) took the fancy of the white pops. during the 19th cent., resulting in the pseudo-spirituals, minstrel and 'coon' songs, which, mingling with the white tradition, produced 'ragtime' (q.v.). This reached its peak about 1910, when it combined with the 'blues' (Negro songs of lamentation) to form jazz (q.v.). After the First World War 3 styles of music developed: blues, jazz, and swing. The decade following the Second World War witnessed further development in 'hot' music, the popularity of which was enormously increased by improved methods of television, radio, and high fidelity gramophone diffusion. See H. C. Lahee, *Annals of Music in America*, 1922; L. C. Elson, *History of American Music* (revised ed.), 1925; E. E. Hipsher, *American Opera and its Composers*, 1927; W. T. Upton, *Art-Song in America*, 1930, 1938; J. T. Howard, *Our Contemporary Composers*, 1941, and *Our American Music, Three Hundred Years of it* (revised ed.), 1955; I. Kolodin, *The Story of the Metropolitan Opera*, 1953; G. Chase, *America's Music*, 1955.

American Planning and Civic Association was formed in 1935 through the merger of the Amer. Civic Association, organised in 1904, and the National Conference on City Planning, organised in 1909. It is dedicated to the education of the Amer. people to an understanding and appreciation of local, state, regional, and national planning for the best use of urb. and rural land, and of water and other natural resources; the safeguarding and planned use of national parks; the wise management of national and state forests; the conservation of natural scenery; the improvement of living conditions; and the fostering of wider educational facilities in

schools and colleges in the fields of planning and conservation. The association publishes the *American Planning and Civic Annual* and a quarterly, *Planning and Civic Comment*. The National Conference on State Parks, originating in the office of the A. P. and C. A., and organised in 1921, endeavours to inform the public, through a central clearing house of information, pubs., conferences, and by other educational means, of the value of state parks, monuments, historic sites, and other types of area suitable for recreation, study of hist., natural hist., and science, preservation of wild life, and conservation of natural scenery and cultural resources through the estab. and operation of well-balanced state park systems. It issues *Park Practice*, *Grist*, and a *Yearbook of Park and Recreation Progress*.

American Scenic and Historic Preservation Society, founded by Andrew H. Green, and incorporated 1895, for the protection of natural scenery, the preservation of historic landmarks, and the improvement of cities.

American War of Independence, see UNITED STATES OF AMERICA, History.

Americanism, word or phrase originating among the people of the U.S.A., and obtaining general currency there. Some so-called A.s are merely Eng. words which have had applied to them a different meaning from that in use in England. For instance, 'corn' in America is applied only to Indian maize, whereas in Great Britain it is applied to all cereals. Some other A.s are of perfectly good Eng. origin, but have dropped out of current usage in Great Britain. Where Eng. people use the word 'autumn,' of Lat. origin, Americans commonly use the old pure Eng. word 'fall,' which is at once more apt and more poetic—the time of the fall of the year, the time when the leaves fall. Similarly, Americans say 'guess' for 'think,' 'hefty' for 'sturdy' or 'stalwart,' 'fetch' for 'bring.'

In another sense A.s reveal the story of the colonisation of the ter. that is now the U.S.A. by various European nations, and also of the relics of the native Amer. Indians whom they dispossessed. Thus of Indian origin are such common words as 'canoe,' 'hominny,' 'tomahawk,' 'pemmican,' 'toboggan,' 'pow-wow,' 'wigwam,' and the very expressive Eng. word the Indians invented to describe whisky, 'fire-water.' Traces of Fr. colonisation in the U.S.A. are shown by words like 'prairie' and 'bayou.' The Spaniards left their mark in words like 'mustang,' 'adobe,' 'canyon,' 'mesa.' But most A.s are of purely Amer. origin, growing out of the life of the people, their business, their politics, which are different from those in England. Amer. trade has altered the stereotyped vocabulary by a system of curtailed words, or words illustrating new methods of commerce. Americans have decided inventive genius, and have been just as skilful in creating new names for their new discoveries. The number of patented articles in America is enormous, and many of these have their own made-up names which

have passed into current usage. There are many A.s which originated as mere slang expressions, then became generally current in America, and finally secured a place even in the Eng. language as spoken in Great Britain. Such are, for instance, 'boodle' for money obtained illegally, particularly by politicians; 'bunkum (q.v.) platform' for a political party programme; 'plank' for an important section of that programme. The prohibition law in America, and the consequent successful attempts to evade it gave rise to a whole series of new words. Thus 'blind tiger' meant a place where alcoholic liquor was sold despite the law; 'bootlegger' was a man who made a profession of selling liquor illegally; 'hooch' was the name generally given to the stuff that was sold as whisky in the U.S.A. after prohibition came into force.

There are many A.s which are to-day in the transitional stage. Now they are mere slang. To-morrow they may be universally adopted or drop out entirely. The origin of many of these is obvious. Thus 'also ran' means an unsuccessful contestant, evidently adapted from the racecourse term. 'Boll-weevil,' from being the name of a pest that destroys the cotton plant, has evolved into a term for any obnoxious person. 'Tight-wad' means a stingy person, obviously because he keeps his wad of paper money unspent. 'Gold-digger' originated in the Broadway theatrical dist. of New York City. It originally meant a chorus girl who wheedled money and presents out of male admirers. It now means any woman who does the same. 'Hen-party' obviously means a party composed entirely of women. 'Muck-rake' (which comes from *Pilgrim's Progress*) to the agile Amer. mind quite obviously suggested obtaining secret and unsavoury data about institutions and public officials. 'Ritzzy' is a perfect laboratory example of how Amer. slang originates. At one time in America the Ritz hotels were supposed to be the last extreme of luxury and also of costliness. People who stopped at such hotels were supposed to be wealthy, and very likely to be snobs. Hence the word 'Ritzzy' means 'giving oneself airs'. The origin of other A.s is not obvious, and their life is also one of dubious duration. Thus 'apple sauce' for empty talk; 'fall guy' for one who is made a tool of; 'fahend' for a stupid person (dates from 1842); 'make whoopee' for making unbridled and drunken revelry. There was a time when most A.s were confined to America and known only there. But with the spread of both the Amer. silent and talking films, the average Eng. audience has picked them up and the younger people have at times adopted them. Amer. slang may often shock the purists. Some of it is coarse and some of it cheap. But it is in one way a sign that the Americans are in process of creating for themselves a language which steadily tends to differ from that spoken in Great Britain, not only by inventing new expressions, but also by

giving the old ones new twists applicable to a different continent. The same thing is observable among the Sp.-speaking peoples of S. America, where the language tends to differ from that spoken in Spain. See G. P. Krapp, *The English Language in America*, 1925; H. L. Mencken, *The American Language*, 1936 (with supplements, 1945, 1948); W. A. Craigie and J. R. Hulbert, *A Dictionary of American English*, 1938-44; S. Robertson and F. C. Cassidy, *The Development of Modern English*, 1955.

America's Cup, The, silver cup given, in 1851, by the Royal Yacht Squadron for a race for any yachts at Cowes, Isle of Wight. There were 15 competitors and it was won by an Amer. yacht called the *America*, of 150 tons. It was given to the New York Yacht Club by the surviving owner in 1887, and is offered as an international prize to any yacht-owner of another nation who can win it under conditions laid down in the Deed of Gift. Many unsuccessful attempts have been made by Brit. yacht-owners in Amer. waters to bring the trophy back to England. Sir Thomas Lipton built and raced no fewer than 5 yachts. His *Shamrock IV* was beaten in 1920 and after 10 years' interval *Shamrock V* failed in 1930. *Endeavour* (T. O. M. Sopwith) lost to *Rainbow*, 1934; *Endeavour II* (T. O. M. Sopwith) lost to *Ranger* in 1937. By a recent amendment to the 1887 Deed of Gift, vessels competing for the cup are no longer required to sail to the port where the race is to take place. Largely as a result of this and other changes in the originally rather severe conditions, another Brit. challenge was made in 1957 for a contest in the autumn of the following year.

Americium, see TRANSURANIC ELEMENTS.

Americus, co. seat of Sumter co., Georgia, U.S.A. It manufs. cotton-seed oil, clothing, stoves, lumber, and boxes, and has food canning and peanut processing. Pop. 11,389.

Amerigo Vespucci, see VESPUCCI.

Amerling, Friedrich von (1803-87). Austrian painter, b. Vienna. His portrait of the Emperor Francis I, 1832, made him celebrated in his country.

Amerongen, vil. in the prov. of Utrecht, Netherlands. The ex-Kaiser William II of Germany fled to the castle of A., seat of Count Goddard Bentinck, 10 Nov. 1918.

Amersfoort, tn in the prov. of Utrecht, Netherlands, 13 m. NE. of the city of Utrecht. It is an old tn, retaining many of its medieval characteristics; its walls still stand in places. The Koppelpoort, a crenellated gateway with bridge and water-port, is one of the most picturesque gateways in the Netherlands. A church tower built in 1441, 312 ft high, contains a carillon of 35 bells. Main manufs. are tobacco and woollen goods. Pop. (1954) 63,638.

Amersham, mrkt tn of Bucks, England, 7½ m. ENE. of Wycombe. Prin. industries are cosmetics, textile printing, bacon, pie, and cooked meat production, and timber haulage. Edmund Waller, the

poet, was b. at Colleshill (2 m.). Pop. 11,292.

Amery, Leopold Charles Maurice Stennett (1873-1955), Brit. politician and publicist, b. India, and educ. at Harrow and Balliol College, Oxford. He organised *The Times* war correspondence in S. Africa (1898-1900), and wrote *The Times History of the S. African War* (7 vols.), which was completed in 1909. He was elected to Parliament as a Conservative, 1911. In the First World War A. was assistant secretary of the War Cabinet in 1917 and on the staff of the War Council at Versailles in 1917-18. He was First Lord of the Admiralty in 1922 and afterwards, in Baldwin's administration, secretary of state of the dominions and colonies, in which capacity he twice presided over the Imperial Conference. As secretary of state for India in Churchill's Cabinet (1940-5) it fell to him to formulate a plan for Indian self-gov. He was defeated at the General Election of 1945 and after that devoted himself to lecturing and writing on imperial and constitutional affairs. Pubs. include: *The German Colonial Claim*, 1939; various collected speeches and lectures on imperial affairs and the constitution; *India and Freedom*, 1942; and, autobiographical, *My Political Life* (3 vols.), 1953-5.

A.'s son, **Julian A.** (1919-), educ. at Eton and Oxford, has been a Conservative M.P. since 1950. He was one of the leaders of the 'Suez Group' in 1956; in Macmillan's gov., 1957, he became parl. under-secretary at the War Office.

Ames, Fisher (1758-1808), Amer. orator, b. Dedham, Massachusetts. After graduating from Harvard in 1774, he practised law and became famous for his articles on Shay's rebellion. Elected to Congress, 1788, he later served on the Massachusetts Council. His works were pub. by Seth A., his son, in 1809.

Ames, Joseph (1689-1759), bibliographer and antiquarian, b. at Great Yarmouth. The nature of his trade is doubtful, but it was lucrative. A., at the suggestion of the Rev. John Lewis of Margate, undertook to write a hist. of printing in England from 1471 to 1600—his famous *Typographical Antiquities*. To facilitate his research he circulated a preliminary list of 215 Eng. printers with a request for information concerning their lives and work. This book is of great value to bibliographers. It was pub. in 1749.

Ames, Joseph (1816-72), Amer. painter, b. New Hampshire, U.S.A., d. New York. He was self-educ., but made enough by portrait painting to study in Rome, where he painted a fine portrait of Pius IX. He earned fame also for his portraits of Emerson, Ristori, Prescott, Cornelius Felton, and Rachel. Of his historical paintings the best known are 'The Death of Webster' and 'Maud Muller.'

Ames, William (1576-1633), Puritan divine, b. Ipswich. At Christ's College, Cambridge, he came into conflict with the authorities for his nonconformity and denunciations of univ. life. He fled to Holland and, clothed as a fisherman,

resumed preaching. At the synod of Dort he was the most active and influential of the foreign divines. Installed as pastor at Franeker (1622) he won renown as prof., preacher, and theologian. In 1639 through ill health he accepted a charge at Rotterdam, where he wrote *De conscientia et ejus jure vel casibus* (*Fresh Suit against Ceremonies*), 1630, a book which connected Christianity with the common things of life, and won Richard Baxter over to the nonconformists.

Ames, city in Iowa, U.S.A., 30 m. N. of Des Moines. It manufs. hats, laboratory aprons, metal products, etc., and is the seat of Iowa State College of Agriculture and Mechanic Arts and its Institute for Atomic Research. Pop. 22,900.

Amesbury, small tn in Wilts, England. St Mary's Church is of Early Eng. architecture. Near the tn is A. Abbey, the old residence of the dukes of Queensberry, which was built by Inigo Jones. Stonehenge and a rampart of the Rom. period are also near by. Here was erected in 980 the nunnery of Ethelfrida, wife of King Edgar. Pop. 3500.

Amethyst, species of quartz characterised by its beautiful violet, purple, or blue shades. According to the popular etymology, the word comes from the Gk α, privative, *methusheim*, to intoxicate, the stone having the supposed virtue of warding off intoxication. The violet colour is said to be due to the presence of manganese, but modern chem. inclines to discredit this. A tinged quartz has a wide distribution, but pure A. is confined to a comparatively small area—India and Ceylon chiefly. A. is found in Scotland and is one of the most popular stones in old Scottish jewellery.

Amharic, language of the inhab. of Amhara, the central prov. of Ethiopia, and the official language of Ethiopia. The earliest extant poems belong to the 14th and 15th cent. AD. It is a descendant of the old Semitic tongue known as Ethiopic or Ge'ez.

Amherst, Jeffrey, Baron (1717-97), b. Riverhead, Kent. Through the influence of the Duke of Dorset he obtained an ensigncy in the Guards. His career was brilliant, and in 1758 he became Commander-in-Chief of the Brit. forces in N. America. To him more than anyone else is due the success of Brit. arms on that continent during the Seven Years War. He was raised to the peerage in 1776, and became field marshal in 1796.

Amherst, William Pitt Amherst, Earl (1773-1857), Brit. diplomat. He was sent on an embassy to China (1816) in order to procure better terms for commerce between China and Great Britain, but through his spirited refusal to perform the 'kow-tow' to the emperor his embassy failed. In 1823 he was made Governor-General of India, holding this office till the year 1828. He conducted the first Burmese war with great success, and was awarded the earldom of Arakan. See A. T. Ritchie and R. Evans, *Lord Amherst and the Advance to Burma*, 1894.

Amherst: 1. VII. about 30 m. S. of

Moulmein in Lower Burma, founded by the British in 1826 and named after the then Governor-General of India, but now merely a fishing vil. and bathing-place for Moulmein.

2. Tn in Hampshire co., W. central Massachusetts, U.S.A., seat of A. College and the Univ. of Massachusetts. The poet Emily Dickinson was b., lived, and d. in A. Pop. 10,600.

3. Co. tn of Cumberland co., Nova Scotia, Canada, a manufacturing centre surrounded by fine farming lands reclaimed from the marsh. Pop. 9870.

Amherstburg, tn in Ontario, Canada, on the N. shore of Lake Erie. It has a good harbour and does a considerable trade in timber. Pop. 4014.

Amianthus (Gk *amiantos*, undefiled), a white variety of asbestos (q.v.).

Amice (Lat. *amicus*, a wrap), eccles. vestment—an oblong piece of linen tied round the neck under the alb. It was originally worn like a hood over the head, sometimes ornamented with an apparel, and thrown back like a cowl.

Amicis, Edmondo de (1846–1908). It. novelist, essayist, and writer of travel books, disciple of Manzoni. Although he lacked the latter's powerful creative imagination, his style is versatile and his descriptions skilful. He excelled in short stories. His main works are *La vita militare*, 1868, *Novelle*, 1872, *La Spagna*, 1873, *Constantinopoli*, 1877, *Il Cuore*, 1886, and *Sull' Oceano*, 1889. See B. Croce, *La Letteratura della Nuova Italia*, 1, 1929, and G. Mazzoni, 'L'Opera de E. de Amicis,' in *Nuova Antologia*, 1932.

Amicus Curiae (Lat., 'friend of the court'), legal term denoting a disinterested person, who, at the hearing of a case, informs or corrects the court.

Amides, see ACID-AMIDES.

Amidines, organic compounds corresponding to the formula

where R is a radical. They may be regarded as being derived from the acid-amides by replacing the oxygen by the group NH. They may be prepared by the combination of nitriles with ammonia and primary amines. The chief A. are *formamidine*, *acetamidine*, and *benzamidine*.

Amiel, Henri Frédéric (1821–81), Swiss philosopher, b. Geneva. In 1841 he became prof. of aesthetics, and afterwards of moral philosophy, at the Geneva Academy. A. is best known as the author of *Journal Intime* (2 vols., 1882–4), an introspective work of which there is an Eng. trans. by Mrs Humphrey Ward (1885).

Amiens (Lat. *Ambianum*), Fr. tn, cap. of the dept of Somme, situated at the confluence of the Somme and the Arve, 81 m. from Paris. It was the anct cap.

of Picardy, and is on the site of Samarobriva, cap. of the Ambiani, from whom the name A. is probably derived. The county of A. was joined to the Fr. crown at the end of the 12th cent. In 1264 the Provisions of Oxford (see under PROVISION) were placed under the arbitration of Louis IX (St Louis) at A., who decided in favour of Henry III and against Simon de Montfort and the barons; this episode, the 'Mise of A.,' led to war in England. In 1802, by the Peace of A., the claims of England, France, Spain, and Holland were settled: Britain acknowledged the new position of France in Europe, and agreed to give up her late conquests, excepting Ceylon, captured from Holland in 1796, and Trinidad, taken from Spain in 1797, and to restore Malta to the Knights of St John (see under FRANCE, History). The chief glory of the tn is the cathedral of Notre Dame, dating from the 13th cent., styled by Viollet-le-Duc 'the Parthenon of Gothic architecture.' It is the largest church in France, and has a wealth of magnificent medieval sculpture. A. suffered severely in both world wars, particularly in the second, but its finest buildings escaped irreparable damage. There are considerable manufs. of textiles, velvet, silk, woollen, and cotton goods; there are engineering works, food processing plants, and the tn is a famous market gardening centre. Peter the Hermit, Du Cange, Gresset, Delambre, and Bourget (qq.v.) were natives of A. Pop. 85,000.

Amiens, Battles of. A. was often threatened but never taken by the Germans in the First World War. In the second battle of the Somme (1918) it was the main object of the enemy to reach the city. On the sixth day of the battle (26 Mar.) the danger of the Germans reaching the city and driving a wedge between the Brit. and Fr. armies was very real. But the Germans could not sustain the momentum of their attack and were exhausted by the protracted and stubborn resistance of the allied armies under Foch's supreme command. On 24 April the Germans made a last attempt to break through to A., and for a short time were actually in possession of Villers-Bretonneux only 9 m. to the E. But the Brit. Fourth Army, under Gen. Rawlinson, who had been put in command on the A. front on 28 Mar., brilliantly counter-attacked on 24 April, recaptured Villers-Bretonneux, and so closed the gate to A. In the following Aug., after Foch had assumed the offensive, Haig attacked the enemy on the A. front (8 Aug.). Two thousand guns opened the bombardment almost simultaneously. Tanks, followed by the assaulting troops, burst through the Ger. lines in one irresistible torrent. Demoralisation spread in the Ger. ranks, and by 10 Aug. the dominion troops, aided by the Cavalry Corps, had pierced the Ger. lines to a depth of 12 m. Ludendorff himself said that '8 Aug. was the black day in the hist. of the Ger. Army.' In the Second World War A. fell to the Germans in the early summer of 1940,

at which time, and afterwards, considerable damage was done to the city. It was liberated by the Brit. 21st Army Group at the end of Aug. 1944. For First World War see A. Kearsey, *The Battle of Amiens, 1918, 1950*.

Amiens, Mise of, see AMIENS.

Amiloar, see HAMILCAR.

Amines, organic substances formed by the replacement of one or more of the hydrogen atoms of ammonia by an equivalent number of univalent organic radicals, such as alkyl groups (q.v.) or those derived from benzene, e.g. phenyl, C_6H_5 , groups. They are divided into primary, secondary, and tertiary A. according to the number of hydrogen atoms displaced by radicals. Primary A. are methylamine, $NH_2 \cdot CH_3$, ethylamine, $NH_2 \cdot C_2H_5$, etc.; secondary A. are dimethylamine, $NH(CH_3)_2$, diethylamine, $NH(C_2H_5)_2$, etc.; and tertiary A. are trimethylamine, $N(CH_3)_3$, triethylamine, $N(C_2H_5)_3$, etc. Among the aromatic A., aniline or phenylamine, $C_6H_5 \cdot NH_2$, is the most important.

Aliphatic A. are formed when an alcoholic or aqueous solution of ammonia is heated with an alkyl halide, the alkyl group taking the place of 1 atom of hydrogen in the ammonia. When excess of ammonia is employed all 3 A. are formed, but it is often possible by adjusting the proportion of ammonia and the time of the action to obtain a given amine as the main product, whence usually by fractional distillation the smaller quantities of the others can be eliminated. The 3 A. may be distinguished by their behaviour towards nitrous acid, primary A. yielding alcohols with evolution of nitrogen, secondary A. yielding yellowish liquids called nitrosoamines, whilst tertiary A. are unacted upon or oxidised. Aromatic A. are prepared by the reduction of nitro-compounds; thus nitrobenzene, $C_6H_5 \cdot NO_2$, yields aniline on reduction with tin and hydrochloric acid.

The lower aliphatic A. are inflammable gases, very soluble in water; and the higher members are liquids with low boiling points, and are miscible with water. Many have a curious odour of boiled lobster. Methylamine occurs in 'perennial mercury,' and dimethylamine and trimethylamine are constituents of herring-brine. Many of the very poisonous ptomaines (e.g. *putrescine* and *cadaverine*) are A. Aniline (q.v.), toluidine, and benzidine are among the chief aromatic A. Many aromatic primary A. are used in the preparation of azo-dyes.

Aminoisocaproic Acid, see LEUCINE.

Amino-Naphthalene, see NAPHTHYLAMINE.

Amiot, Père Joseph (1718-94), learned Fr. Jesuit, b. Toulon and d. Peking. He was sent as a missionary to China, and arrived at Macao, 1750, and at Peking, 1751, where he lived until his death. His knowledge of Chinese and Tatar languages allowed him to interpret many obscure passages in the Chinese writers, and his works contain valuable information

on China and Chinese literature, arts, and hist. Among them are *Art militaire des Chinois*, 1772, *Vie de Confucius*, 1791, and *Dictionnaire Tartare-Manchou-Français*, 1789-90.

Amir, see EMIR.

Amirante Islands, i.e. Admiral Is., named after Vasco da Gama, their discoverer, a group in the Indian Ocean, SW. of Seychelles, in lat. $5^\circ S.$, long. $53^\circ E.$ They are owned by Great Britain as a dependency of Seychelles. The scanty pop. supports itself by fishing.

Amisia, see EMS.

Amissus, see SAMSUN.

Amitemnum, see L'AQUILA.

Amliwch, seaside resort on the N. coast of Anglesey, Wales, with an old harbour. Bromine is extracted from sea-water. Pop. 3020.

Amman, Johann Konrad (1663-1730), Swiss physician, b. Schaffhausen, and graduated at Basel in 1687. Began to practise at Amsterdam. An early authority on the teaching of the deaf and dumb, his method being to attract the attention of his pupils to the motions of the lips and larynx, and then to urge them to imitate these movements. His great work, *Surdus Loquens*, was pub. in 1692. He d. Warmoud, near Leyden.

Amman, Jost (1539-91), Swiss painter and engraver, b. Zürich. His productions are extremely numerous, but he is most remarkable for his engravings on wood. His original drawings are chiefly to be found at the Berlin Museum.

Amman (biblical **Rabbath Ammon**), cap. of the Hashemite Kingdom of Jordan, 50 m. ENE. of Jerusalem. Modern A. has developed since the turn of the cent. on the site of a small Circassian vil. scattered over the ruins of a Græco-Rom. city famous for its well-preserved Rom. theatre, Es-Salt, the old cap., gave place to A. largely because the latter, being on the Hejaz railway, was a more natural centre for trade and communications. After the First World War A. became the H.Q. of the British and of the Emir Abdullah; to-day the city fills 3 neighbouring valleys and encroaches on the surrounding hills. On the plateau E. of A. is an air station; formerly a Brit. R.A.F. base, it was delivered to Jordan by agreement in 1957. The city has 3 royal palaces. The pop., which has been much increased by refugees following the Palestine crisis, is c. 250,000.

Ammanati, Bartolomeo (1511-92), Florentine architect and sculptor. He studied under Sansovino, did much work for Pope Julius III, and built the beautiful Ponte della Trinità over the Arno.

Ammanford, tn of Carmarthenshire, Wales, 12 m. from Swansea, with coal-mines and light industries. Pop. 7000.

Ammelide, substance obtained by the hydrolysis of ammeline. It is a white powder, insoluble in water, alcohol, and ether, but soluble by the alkalis and strong acids. Its formula is $C_5H_7N_4O_4$.

Ammeline, substance obtained by the action of hydrochloric acid on melam. It is of a splendid white colour, and is

composed of very fine silky needles; it is insoluble in water, alcohol, and ether, but soluble in the caustic alkalis. When fused with potassium hydroxide, A. is converted into ammonia and potassium cyanate. Its formula is $C_5H_5N_3O$.

Ammeter, instrument for measuring electric current in amperes. A.s are always connected in series in the circuit; a shunt in the instrument ensures that only a small definite fraction of the current flows in the sensitive coil or wire. Moving-coil A.s can only be used on direct current and must be connected as indicated on the + and - terminals. The scale is uniform. Hot-wire and moving-iron A.s can be used on both direct current and alternating current. The scale is not uniform. Dynamometer A.s have a uniform scale and may be used on direct current and alternating current. Rectifier A.s are only suitable for alternating current. See ELECTRIC METERS.

Ammianus Marcellinus (c. AD 330-c. 393), last of the great Rom. historians, b. Antioch in Syria. He served in the E., in Gaul under Constantius II, and later under Julian against the Persians. Settling in Rome some time after 371, he wrote in Latin a hist. of the empire from the accession of Nerva to the death of Valens, covering the period 96-378. Only 18 of 31 books have survived, but they provide most valuable evidence for the years 353-78. Notwithstanding his mediocre style, A. M.'s work is stamped with the soldierly qualities of its author—clarity, broadmindedness, and impartiality. See the text and trans. in Loeb Library and E. A. Thompson, *The Historical Work of Ammianus Marcellinus*, 1941.

Ammir, kind of canoe at one time in frequent use in the highlands of Scotland.

Ammodytes (Gk 'sand-dwellers'), genus of percomorph teleost fishes known as sand-eels. They are elongated fishes with a single long dorsal fin and burrow in the sand. In Denmark they are fished for commercially.

Ammon, see AMEN.

Ammonal, see EXPLOSIVES.

Ammonia, NH_3 , a pungent smelling gas, although the name is often applied to the aqueous solution. It was known to the ancients as being produced by burning nitrogenous organic substances, and owes its name to the practice of distilling camel's dung in Libya near the temple of Jupiter Ammon. Many animal and vegetable products containing nitrogen give off A. when heated and especially if an alkali is added. In the distillation of coal, A. is produced which dissolves in the water, and is recovered as ammonium sulphate by neutralising the liquor with sulphuric acid. A. is formed by bacterial decay of animal and vegetable matter and so finds its way into surface water and the atmosphere. A. is manuf. by the Haber-Bosch process (q.v.), and prepared on a small scale by heating ammonium salts with alkalis. It is also formed quantitatively by the alkaline reduction of nitrates. A. is extremely soluble in water, giving a basic solution of

ammonium hydroxide, from which the ammonium salts can be prepared by neutralisation. '880 ammonia' is the strongest aqueous solution of A. possible, having a sp. gr. of 0.880 and containing about 35 per cent by weight of A. A. can be liquefied at 0° C. by 7 atmospheres pressure, and the heat it absorbs on volatilisation has led to its use in refrigeration. A. is used as an antacid and as a stimulant in cases of fainting. It is a reducing agent at elevated temps. and is used in the manuf. of nitric acid by catalytic oxidation and in the manuf. of urea by reaction with carbon dioxide at 190° C. and 100 atmospheres pressure. A. and its aqueous solution form amines with many salts. The analogy between ammonium and alkali metal compounds suggests the possible existence of the ammonium radical, NH_4 , and this is supported by the formation of an ammonium amalgam by electrolysis of the aqueous solution using a mercury cathode. This was discovered by Seebeck in 1808. The ammonium salts are all water soluble, except the perchlorate, chloroplatinate, and cobaltinitrite, and decompose or volatilise when heated.

Ammonium fluoride, NH_4F , is used as an antiseptic in brewing, in mineral analysis as it decomposes silicates, and for etching glass.

Ammonium chloride, NH_4Cl (sal-ammoniac), is used as a flux in soldering since the hydrogen chloride formed on heating dissolves the metal oxides from the metal surfaces, thus leaving them clean. It is also used in the Leclanché cell and dry batteries.

Ammonium sulphate, $(NH_4)_2SO_4$, is used as a nitrogenous fertiliser.

Ammonium nitrate, NH_4NO_3 , is a very valuable nitrogenous fertiliser and is a constituent of various explosives, e.g. amatols as a diluent of T.N.T.; ammonal, a mixture of ammonium nitrate and powdered aluminium.

Ammonium carbonate, $(NH_4)_2CO_3$, is used in snelling salts, but the commercial carbonate (sal-volatile) is mainly a mixture of the bicarbonate and carbonate.

Ammoniac, Gum, see GUM AMMONIAC.

Ammonites, Semites descended, according to Gen. xix. 38, from Lot (their progenitor being Ben-ammi), and closely related to the Moabites. Their chief city was Rabbah or Rabbath Ammon; their national deity Moloch or Mileom; and their language was akin to Hebrew. Frequently at war with the Jews, they were defeated by Jephthah, Saul, and David, and finally by Judas Maccabeus. The last historical reference to them was by Justin Martyr, who said they were still very numerous.

Ammonius Saccas (c. 160-242), Gk philosopher, founder of Neoplatonism, b. Alexandria. He was originally a porter (whence the surname 'Saccas'). Among his pupils were the grammarian Longinus, Origen, and Plotinus. Although he left no writings, it is believed that he attempted the reconciliation of

Plato and Aristotle. (See NEOPLATONISTS and PLOTINUS.) Saccas must not be confused with Ammonius Hermiae (5th cent. AD), also of Alexandria, sev. of whose commentaries on the works of Aristotle have survived.

Ammonoids, fossil cephalopod molluscs with coiled chambered shells, very wrinkled transverse septa, and well-sculptured exteriors. They range from Upper Silurian to Upper Cretaceous times. They were probably tetrabranchiate, and are allied to the Nautiloids. A. occur abundantly as fossils, and their rapid evolutionary changes make them important index fossils for correlating rocks. An early div., the Goniatites, with rounded or angular sutures (the lines along which the transverse septa join the external shell), are used to zone strata from Devonian to Permian in age. The more specialised A., with minutely wrinkled sutures, enable the Jurassic and Cretaceous rocks to be zoned with great precision.

Ammunition (from Lat. *munire*, to defend, through the Fr.), term embracing all the stores used for attack and defence, including guns, gunpowder, projectiles, and all the accessories. A. is described as *fused* when the projectile, powder, and primer are combined in a single piece generally enclosed in a metal case. In small arms, machine guns, and quick-firing guns it is invariably of this kind. For the larger guns the 3 components are kept separate. The powder is generally packed in bags now made of silk, though serge was once common. The primer may be constructed to ignite by percussion, friction, or an electric current, or by a combination of the first and last (percussion electric). Projectiles are of numerous patterns, to suit the various types of guns. Plain spherical stone balls were first used, and *case-shot* may be traced back to the 15th cent. They are intended for use only at close quarters, and consist of a cylindrical case of sheet iron filled with bullets. On leaving the bore the case breaks and the bullets are scattered broadcast. This shot is useful only against the persons of the enemy, and is valueless for the destruction of defences. The case is the same with *shrapnel shell* (invented at the end of the 18th cent.). They consist simply of common shell filled with bullets, the bursting charge in the base of the shell being fired by a flash from the fuse in the head passing down a central tube. It was found that the bullets were apt to scatter too far and also that premature explosion was likely, so the bursting charge is now made only sufficiently large to open the shell during flight.

Common shell, to which reference has already been made, consist of a hollow cylinder of steel (or occasionally cast iron) filled with ordinary gunpowder or some high explosives such as lyddite. They are essentially a destroyer of material, and so the bursting charge is made as large as possible. High-explosive shell, generally known as 'H.E.', filled with various types of high explosive,

are of modern adoption. With the introduction of armour-plating for ships, armour-piercing projectiles became necessary, as the ordinary cast-iron projectile was useless. These consisted of pointed cast-iron shot specially hardened (by a method invented by Sir W. Palliser), but are now made of forged or cast steel, cast from a special mixture. *Hand grenades*, small, spherical common shell filled with powder weighing 3 or 6 lb., were used in the Russo-Jap. war of 1904. There are also various other extraordinary types of shell, such as the *segment* and *ring* shells, both varieties of the shrapnel. The question of the means to ensure correct rotation is important. In rifled muzzle-loading (R.M.L.) guns this was originally effected by a spiral arrangement of gun-metal studs. This was defective as it caused erosion of bore through the escape of powder-gas. Rotation is now secured by a cupped copper disk or 'gas-check' attached to the base of the projectile. The earlier Armstrong rifled breech-loading (R.B.L.) projectiles were coated with lead, which the explosion forced into the grooves. The lead coating, however, proved too soft, and the use has now become universal of a copper driving-band fitted into a groove round the body of the projectile. During the First World War many new types of A. were introduced to meet the varying methods of warfare. Among these the following are the more important: *Smoke shells*: these contained a smoky mixture which, on bursting, created dense clouds of smoke. Their tactical use was for screening movement, and for ranging guns where the observation of fall of shot was otherwise difficult. *Star shells*, containing parachute lights and made to open in the air by a small charge, were used to illuminate areas in the enemy's position. *Gas shells*: these were first introduced by the Germans. They contained poisonous gases which were released by the bursting of the shell. *Mortar bombs* were introduced for trench warfare. They were fired from trench mortars of varying sizes and were charged with gas or high explosive. Their simplicity of design and lightness in transport made them very suitable for use in trenches. *Aerial bombs*: cylindrical and torpedo-shaped, designed for dropping from aircraft by release from carriers in the machine. The chief types used were those filled with high explosives for damaging buildings, earthworks, railways, and A. dumps, and those with incendiary mixture for setting fire to buildings, etc. *Anti-aircraft shells*: these are filled with high explosives for attacking hostile aircraft, and are arranged to burst in the air by means of a time-burning fuse. All these types were again in use, though much developed in range and power, in the Second World War (1939). Many great changes were introduced in the Second World War. Among them were the much-increased size of bombs carried by bomber aircraft, ranging from 4500 lb. to 12,000 lb., and even heavier than that (see BLOCK-BUSTER). Some of the Ger.

anti-aircraft shells were rocket-propelled, and controlled by radar or radio, thus resembling the Amer. proximity fuse. Another development was the *flying bomb*, which the Germans used for attacking London in 1944-5 (see FLYING BOMB). The V2 or *rocket bomb*, another Ger. missile used against London, had a velocity of 3000 m.p.h. (see ROCKET). In the closing stages of the war missiles of many types were being developed—controlled and guided, target-seeking and free. The Germans had under development a transatlantic rocket that would be capable of making the crossing in a little over a quarter of an hour; while new forms of V1 (flying bombs) and V2, some of them piloted models, were in the experimental stage. *Anti-aircraft rockets, airborne rockets*, and many other types considerably in advance of any missiles then known were also under development in Germany. The *atomic bomb*, the principle of which depends on the fission of uranium nuclei, was used by the Americans against Japan with devastating results (see ATOMIC BOMB).

Ammurapi, see HAMMURABI.

Amnesia (Gk 'lack of memory'), partial or complete loss of memory. Complete A. is practically impossible, as without some memory no intellectual action could continue. The commonest form is that of verbal A., when the names of objects are forgotten. When the patient can partially articulate, the condition is known as A. aphasia. A. may be caused by old age, brain diseases, various forms of insanity, or even by excessive fatigue or weakness. It is not uncommonly met with as an hysterical manifestation in anxiety states, when it functions as a mechanism of retreat from some intolerable stress. See also PSYCHONEUROSIS and ANXIETY STATES.

Amnesty (Gk *amnēstia*, oblivion), act of state granted by a gov. by which pardon (or oblivion) of certain past offences is accorded. It is generally given in the case of whole sections of the community who have been guilty of some offence against the state, and it completely obliterates the offence whether granted before or after conviction. A.s. granted either by the sovereign or by Act of Parliament, are sometimes general, but more often have certain exceptions made; e.g. those responsible for his father's execution were excepted from the A. granted on the accession of Charles II. A.s. were frequently granted to criminals at coronations.

Amnion (Gk *amnion*, a lamb), innermost membrane which invests the foetus of mammals, birds, and reptiles. As time proceeds it thickens and separates from its close adhesion to the embryo; between it and its contents there then accumulates the *liquor amnii* which preserves the embryo from harm and keeps it at a constant temp. Its softness is responsible for its name.

Amoeba (Gk *amoibē*, change), genus of Protozoa, the lowest class of animal life, and type of the order Amoeboides. It consists of naked protoplasm contain-

ing a single nucleus, and the cytoplasm is granular. It contains a *contractile vacuole*, or pulsating space, and possesses the power of throwing out *pseudopodia*, processes which are continuously being drawn back while others are protruded. It is by this succession of pseudopodia formation that the organism is capable of motion in the water. The food is absorbed into any part of the body by intussusception, and the faeces are expelled by any part of the body. There is no sexual reproduction: the A. merely splits in two when it reaches maturity. The resulting organism is transparent and colourless, or faintly yellow, and may be found in fresh water; frequently it is extremely minute. (See illustration, p. 301.)

Species of an allied genus, *Entamoeba*, differing from A. in the absence of a contractile vacuole, occur in the human intestine; one of them, *E. coli*, is harmless, but another, *E. histolytica*, attacks the mucous membrane, causing amoebic dysentery, a disease which is rife in tropical and subtropical countries. See J. Leidy, *Fresh-water Rhizopods of N. America*, 1879, and R. Buchsbaum, *Animals without Backbones*, 1951.

Amoebaeae Verses (Gk *amoibaioi*, interchanging), species of verse in which 2 persons answer alternately. Such are some of Virgil's *Eclogues*.

Amol, dist. and tn of Persia, in the prov. of Mazandaran, on R. Haraz. Pop. of tn 10,000.

Amontillado, see SHERRY.

Amontons, Guillaume (1663-1705), diligent mechanician and experimenter in natural philosophy, b. Paris. He improved the instruments and devised others for measuring the density, temp., and humidity of the atmosphere; he discovered that the boiling-point of water varied with atmospheric pressure—a discovery made nearly at the same time by Halley.

Amoor, see AMUR.

Amorites ('mountaineers,' or possibly 'people of high stature'), anct inhab. of Canaan, on both sides of the Jordan. The name is sometimes used in the O.T. as synonymous with Canaanites, sometimes as that of a special tribe. Sihon and Og, the kings of the A. on the E. of Jordan, were defeated by Moses, and later those dwelling on the W. were defeated by Joshua in 2 battles, and their land was divided among the tribes.

Amoroso (It. 'loving' or 'tender'), in music, indicates a profoundly emotional manner.

Amorphophallus, genus of Araceae found in the E. Indies. The rhizome produces a single enormous leaf annually, and an enormous spadix, bearing both male and female flowers. In the species *A. titanum* the spadix is sometimes 3 ft high.

Amorphous (Gk *a-*, without; *morphē*, shape), term used in biology to denote that a body is formless or irregular in shape. In chem. a substance is A. when it presents no crystallised form.

Amortisation: 1. Law term, signifying

alienation in mortmain ('dead hand'), that is, the alienation of lands or tenements to a corporation.

2. In finance, the provision of a fund out of income for extinction of debt, redemption of bonds or shares, or replacement of capital expenditure.

Amory, Derick Heathcoat (1899-), politician, educ. Eton and Christ Church, Oxford. He entered Parliament as a Conservative in 1945. From 1951 to 1953 he was minister of pensions; minister of state, board of trade, 1953-4; minister of agriculture and minister of food, 1954-5; and minister of agriculture and food since 1955.

whose prophecies were written as well as spoken. The book of A. contains many difficulties, some of which are textual. The concluding passage (ix. 11-14), concerning the restoration of Judah from exile, may be a later addition. See S. R. Driver, *The Books of Joel and Amos* (Cambridge Bible for Schools), 1877, and R. S. Cripps, *The Book of Amos*, 1929.

Amoy (local pronunciation of Hsiamen), Chinese port on is. of the same name in lat. 24° 28' N. and long. 118° 8' E., in the prov. of Fukien. Prior to the Sino-Jap. war (1937) a great many Chinese emigrants were accustomed to sail from A. to

AMOEBA, MULTIPLYING BY DIVISION

Left: AMOEBA PROTEUS

ECT, ectoplasm; END, endoplasm; FV, food vacuole; CV, contractile vacuole; D, shell of a diatom which has been taken in as food; PS, pseudopodium; N, nucleus containing granules of chromium, CHR.

Amory, Thomas (c. 1691-1788), Irish author of eccentric habits who in 1757 was living at Westminster. His books are a medley of autobiography, fiction, scenic descriptions, sentimental rhapsodies, and deist theology. He pub. *Memoirs, containing the Lives of several Ladies of Great Britain*, 1755, and *Life of John Bunce, Esq.* (his best book), 1756 and 1766.

Amos, earliest of the 12 minor prophets. He was a native of Tekoa, near Bethlehem, and followed the occupation of a shepherd and a tender of sycamore figs. He prophesied in the N. Kingdom in the 8th cent. BC, when Uzziah (Azariah) reigned in Judah and Jeroboam II in Israel. He prophesied the death of Jeroboam and the captivity of Israel for the national sins, especially for disloyalty to Yahweh. His style is clear and vigorous, abounding in picturesque images drawn from pastoral and country life. He was probably not alone in warning the people that the expected 'day of Yahweh' might be one of judgment rather than of joy, but he is the first

Malaya and, after making their fortunes there, to return and live in A. The former foreign settlement is on a rocky little is. opposite. A Chinese univ. was founded in 1925. The city exports porcelain and paper, imports raw cotton, cotton manuf. goods, etc. It was captured by the Japanese on 19 May 1938, but returned to China when Japan surrendered in 1945. Since Chiang Kai-shek was defeated and driven from the mainland (1949) he has retained the Quemoy (Chinmen) is. 5 m. E. of A., and has made constant raids in the A. area, greatly hindering the port's trade. The A. is. has been linked with the mainland by 2 stone embankments built in 1956, and a railway was built from Yint'an (in Kiangsi) to the port (466 m.), so far the first in the prov. Pop. 240,000.

Ampelopsis, family Vitaceae, genus of deciduous climbers with twining tendrils, of America and Asia. *A. arborea* is the Pepper Vine of U.S.A.; *A. aconitifolia*, *A. megalophylla*, and *A. heterophylla* are Chinese; *A. brevipedunculata*, Asian; all with handsome foliage. The genus is

much confused with *Vitis* and *Parthenocissus* (q.v.).

Ampère, André-Marie (1755-1836), famous Fr. physicist, naturalist, and mathematician, from whom the ampere, unit of strength of an electrical current, took its name. He was b. in Polémieux, near Lyons. In 1793 his father was guillotined by the revolutionists. This event threw him into a state of deep melancholy, to alleviate which he redoubled his studies. As prof. of mathematics and physics at Bourg le pub. his *Considérations sur la théorie mathématique du jeu*. His great work was in the field of electro-dynamics (electro-magnetism). His records of his discoveries may be found in the *Ann. Chim. Phys.* from 1820 onwards.

Ampère, Jean Jacques Antoine (1800-1864), Fr. literary historian, b. Lyons, the only son of André-Marie A. He was prof. of the hist. of Fr. literature at the Collège de France, and a member of the Fr. Academy, 1847. He was a distinguished philologist, familiar with the languages of most of the many countries he visited. In 1839 and 1841 he pub. hist. of various periods of Fr. literature. In 1848 his *Greece, Rome et Dante* gave an impetus to the study of the great Italians in France. His chief work, on which he was engaged at his death, is his *Histoire romaine à Rome*.

Ampere, unit of electric current. The A. is legally defined as the continuous unidirectional current which, when flowing through a neutral solution of silver nitrate, deposits on the (internally) negative pole 0.001118 grammes of silver in 1 sec. An alternating current is said to have an intensity of 1 A. if it produces in a wire the same heat in the same time as a continuous current of 1 A. as determined by silver deposition. See CURRENT ELECTRICITY and UNITS, ELECTRICAL.

Ampersand (corruption of 'and per se and'), the typographical character & or &. See Jan Tschichold, *Formenwandlungen der & Zeichen*, for 288 varieties from year 79 to 19th cent.

Amphiaræus, legendary soothsayer and hero of Argos, son of Oicles and Hypernestra, and an Argonaut. His wife, Eriphyle, bribed by Polyneices with the necklace of Harmonia (q.v.), induced him to take part in the expedition of Seven against Thebes, where, after fighting bravely, he fled and was swallowed up by the ground. He became one of the immortals, and his temple held a famous oracle.

Amphibia (Gk *amphi*, on both sides; *bios*, life), class of vertebrates of which many are able to live on land for a considerable period—hence the name. The living species include salamanders, frogs, toads, and newts. The class is divided into 4 orders: the *Apoda*, which are limbless, and snake-like; the *Urodela*, which possess tails and usually 4 limbs, e.g. salamanders and newts; the *Anura*, which are tailless and have 4 limbs, e.g. frogs and toads; the *Stegocephali*, an extinct order, lizard-like and bony, usually with long tails.

Gills may be present in the young stages, though these are replaced by lungs in the adult; their hearts possess 2 auricles, 1 ventricle, and a conus arteriosus; when they have limbs the legs are pentadactyl. The eggs are usually laid in water; in the case of the axolotl (see AMBLYSTOMA) breeding takes place in the larval stage. The eggs often develop into tadpoles, but some A. are viviparous and bring to life perfect animals. They are carnivorous when adult, and hibernates. In organic life they rank between reptiles and fishes. Many live in tropical countries, but frogs and toads are universally distributed. See G. A. Boulenger, *Catalogue of the Batrachia in the British Museum*, 1882, and H. Gadow, 'Amphibia and Reptiles,' in the *Cambridge Natural History*, 1901.

Amphibole (Gk *amphibolos*, ambiguous), group of minerals which enter into the composition of a large number of rocks. They are essentially silicates of calcium and magnesium, but also include oxides of iron and of manganese. They crystallise in oblique prisms, and some are used as gems. The chief varieties are tremolite, actinolite, nephrite, and hornblende.

Amphibology, or **Amphiboly** (Gk *amphi*, on both sides; *ballein*, throw) means an ambiguous statement, a sentence susceptible of more than one interpretation, especially if it is capable of being construed grammatically in different ways, e.g. 'I have read your volume of verse and much like it.'

Amphibrach (Gk, 'short on both sides'), in prosody a foot of 3 syllables, the first and last short or unaccented, the middle long or accented, as in 'amazing.'

Amphictyonic League. An amphictyony was a confederation of neighbouring tribes, or those having interests in common. The participants in such a league were called amphictyons, or dwellers around. There were sev. A. Ls in anc. Greece, as those of Argos and Delos, but the chief was that which maintained the worship of Demeter at Thermopylae and of Apollo at Delphi. Its origin was certainly very early, being connected traditionally with Amphictyon, son of Deucalion, and, though much of its authority was lost in the 3rd cent. BC, it still existed with limited power under Rom. rule, and is last mentioned in the 2nd cent. AD. The names of the tribes concerned differ in various accounts. The list given by Arschines includes the Thessalians, Boeotians, Dorians, Ionians, Perthæans, Magnetes, Locrians, Oetaeans, Phthiotæ, Malians, and Phocians. It is known that there were 12 tribes, so to this list either the Dolopians or the Aenianians should be added. Each tribe sent 2 deputies of equal authority, forming a council which met twice each year, alternately at Delphi and Thermopylae. Though the functions of the council were mainly religious, judicial rights and the regulation of peace and war came within its scope.

Amphigouri, or **Amphigory** (Gk *amphi*,

on both sides; *agoreuein*, speak), meaningless composition with a semblance of sense, e.g. a nonsense verse such as that attributed to Dr Johnson:

If a man who turnips cries
Cry not when his father dies,
'Tis a proof that he would rather
Have a turnip than a father.

Amphilochus, son of Amphiarus (q.v.) and Eriphyle (q.v.), took part in the expedition of the Epigoni (q.v.) against Thebes, assisted Alcmaeon to murder their mother and, later, fought against Troy. Like his father, he was a noted seer. Killed in single combat by Mopsus, also a seer.

Amphimaer (Gk 'long on both sides'), in prosody, a foot of 3 syllables, the first and last long, the middle short, as in Lat. *căstîlîs*. It is little used in Eng. verse.

Amphion, skilful musician, son of Zeus by Antiope, who, driven out of Sicyon by her husband, Lycus of Thebes, and Dirce his wife, fled to Mt Cithaeron. There A. and his twin brother Zethus were born. They were exposed, but found and reared by a shepherd. At manhood they revenged their mother's wrongs on Dirce by causing her to be dragged to death by a bull. They then seized Thebes, and during the building of its fortifications the stones moved to, the sound of A.'s lyre. He married Niobe, and was killed by Apollo.

AMPHIOXUS LANCEOLATUS

The notochord runs from tip to tip. T, tentacular cirri; G, reproductive organs; AP, atriopore; A, position of anus.

Amphioxus, or **Branchiostoma** (Gk *amphi*, on both sides; *oxus*, pointed), genus of protochordates belonging to the class Cephalochordata. A gelatinous stiffening rod, the notochord, runs from the tip of the snout to the tip of the tail. The mouth is surrounded by a fringe of tentacular cirri and leads to a spacious, long pharynx which bears many gill slits. Currents set up by cilia on the tentacles and pharynx draw minute food particles into the foregut and these become entangled in a mucus secreted by glands on the floor of the pharynx. While spending much time partly buried in the sand they can swim readily by a series of undulating movements. The particular zoological interest of these creatures is that in many features of their structure they may well be not unlike the ancestor of the vertebrate animals. See A. Willey, *Amphioxus and the Ancestry of the Vertebrates*, 1884.

Amphipoda (Gk *amphi*, on both sides; *pous*, foot), order of Crustacea characterised by their laterally compressed bodies, sessile eyes, and absence of a

carapace. They are both marine and fresh-water animals. Species of the sub-family Orchestina are known as the beach-flea and sand-hopper.

Amphipolis, anct city of Macedonia, on R. Strymon, which almost encircled the place, whence the name A. Originally a Thracian tn belonging to the Edonians, it was colonised by the Athenians in 437 BC. Situated about 3 m. from the sea, and commanding the approach to mines and timber forests in that area, A. was one of the most important Athenian possessions N. of the Aegean.

Amphisbaenidae (Gk *amphisbaina*, a serpent that can go both forwards and backwards), family of the Lacertilia, or lizards. These worm-like reptiles have no limbs, and the scales are replaced by a series of horny rings. They are found in tropical America, Africa, and Europe, where they feed on worms and ants. *Amphisbaena fuliginosa*, of Brazil and Guayama, is dusky brown and nearly 2 ft long. The natives regard its dried and powdered body as of medical value.

Amphissa (modern *Salona*), tn of anct Greece, about 80 m. NW. of Athens, situated at the foot of Mt Parnassus. Its inhab., the Locri Ozolae, having tilled the ground of the temple of Delphi, the Greeks under Philip of Macedon attacked and destroyed the tn (338 BC). It was afterwards rebuilt. Pop. of modern Salona, 5500.

Amphitheatre, form of building invented by the Romans for the purpose of holding gladiatorial shows and displays of wild beasts. Originally these entertainments were held in the forum or the circus, but as early as 70 BC a wooden A. of the recognised shape, i.e. having seats all round the portion reserved for the performance, existed at Pompeii. The first A. to be erected in Rome was the temporary one of Curio in 59 BC, and Caesar erected a permanent structure in 46 BC. The Colosseum (q.v.), the most famous stone example still remaining, was begun by Vespasian and dedicated by Titus in AD 80. It is elliptical in shape, measuring 616 ft by 510 ft, and the exterior wall, 160 ft high, consists of 4 storeys, the lowest 3 being arcades in the Doric, Ionic, and Corinthian styles respectively, and the top a row of Corinthian pilasters. Inside, the *cavea* or portion for spectators (accommodating over 50,000 persons), consists of the *podium*, or lowest tier, reserved for guests of honour, and 3 rows of *maeniana*, for the various grades of the populace. The arena measures 280 ft by 176 ft. The A. at Arles was capable of containing 20,000 spectators; and the Rom. A. at Caerleon in Monmouthshire about 6000.

Amphitrite, Gk sea-goddess, daughter of Nereus and Doris, and wife of Poseidon.

Amphitryon, son of Alcaeus, King of Tiryns, married Alcmene, who, in his absence, was visited by Zeus disguised as her husband.

Amphiuma (Gk *amphi*, on both sides; *pneuma*, breath), genus of Amer. Amphibia of the order Urodela and family Amphiumidae. It is allied in most

essentials to the water-newt, is eel-like, about 2 ft long, has 2 or 3 jointless toes on each of its 4 limbs, minute eyes, and numerous teeth in the palate in 2 rows. As a tadpole it has gills; in adult life only the gill slits remain. It lives in ponds and marshes, and buries itself in mud in the winter. *A. means*, the 3-toed species, inhabits Louisiana; it is called the Congo snake by the inhab. of Florida, and is erroneously believed to be venomous.

Amphora (plural **Amphorae**), large, slender, two-handled jar, often with a blunt point at the base for insertion into soft ground to keep the vessel upright. Amphorae were used for the transport and storage of wine, oil, fish-pastes, hazelnuts, etc., and afterwards were sometimes used as cinerary urns. Pieces of them are common on Roman sites.

Ampleforth College, public school for boys, identified with the Benedictine community of Ampleforth. They were exiled to France at the Reformation, and restarted the school at Ampleforth, York, in 1802.

Amplepuis, Fr. tn in the dept of Rhône, 30 m. NW. of Lyons. It manufs. cotton, silk, and muslin. Pop. 1000.

Amplifier, circuit containing a valve (q.v.) or transistor (q.v.) for increasing the intensity of the signal in a radio receiver or of the input in a sound-reproducing or sound-recording circuit. The high-tension supply may be connected to the anode of the valve through a resistance or an inductance or the output circuit may be coupled to the A. through a transformer or a tuned circuit. Transformer-coupled and resistance-coupled A.s may be used on all frequencies, tuned A.s are used on narrow frequency bands. The various methods may be used in combination. In negative feedback, some of the output energy is returned to the A. circuit. This reduces distortion and noise, and the phase shift, but also the gain. See **LOUDSPEAKER**.

Amplitude, astronomical term denoting the angular distance of a heavenly body, at the time of its rising or setting, from the E. or W. point of the horizon. Thus the A. of fixed stars is constant, while that of the sun is zero at the equinoxes. The A. of the sun at any time other than during the equinoxes varies with the date and also with the lat., e.g. at the summer solstice the A. of the sun is 23° 28' at the equator but 39° 44' in the lat. of Greenwich.

Amphill, Arthur Oliver Villiers Russell (1869-1935), 2nd Baron, Brit. administrator, son of the 1st baron, b. Rome, and educ. at Eton and Oxford. He succeeded to the title in 1884. He was Governor of Madras 1899-1906, and during 1904 temporary Viceroy and Governor-General of India in Lord Curzon's absence.

Amphill, Odo William Leopold Russell, 1st Baron (1829-84), Brit. diplomat, b. Florence and educ. privately. He entered the diplomatic service in 1849 and served as attaché at Vienna. From 1850 to 1852 he was in the Foreign Office. Subsequently he was employed in turn at the

embassies in Paris, Vienna, Constantinople, and Washington. As secretary of legation at Florence and Brit. representative at the Vatican he performed valuable diplomatic services from 1858 to 1870. In 1870 he was appointed assistant under-secretary at the Foreign Office, and in 1871 he became ambas. at Berlin, where he attended the Berlin Congress. He was made a privy councillor in 1872 and created a baron in 1881.

Amphill, mrkt tn of Beds, England, 8 m. SW. of Bedford. Near it are the ruins of Houghton House, supposed to be the original of the 'House Beautiful' in Bunyan's *Pilgrim's Progress*. A. House was the seat of the A. family. Pop. 3000.

Ampulla (Lat. *ampulla*, bottle), Rom. bottle with a narrow neck; a vessel for holding the holy oil at coronations, etc.

Ampurdán, El, see **FIGUERAS**.

Ampurias, ancient settlement in Spain, near Figueras (q.v.), ruins of which still exist. The Phocaean (see **PHOCAEA**) in the 6th cent. BC transferred an is. settlement to the mainland here and called it Emporeium. Later a veterans' colony was founded here by Julius Caesar and named Emporiae; in Gothic times this was a bishopric.

Amputation, cutting off of a limb or projecting part of the body. A. is resorted to only if to leave the part would be dangerous to life or affect the health of the patient, or if the part has become so functionless as to be a handicap or a cosmetic embarrassment. Thus a limb or a part which is grossly infected, gangrenous, or irreparably injured may have to be amputated. A. may likewise be performed in the case of a part—a breast, for instance—which is the site of a primary cancer. Limbs that are completely useless are amputated as a last resort when all orthopaedic aids have failed and when it is certain that the substitution of an artificial part for the original will ensure better function. Careful consideration is always given to the functional importance of a part when the question of its A. arises. Thus a surgeon will preserve a thumb, an index finger, or a big toe as long as there is any hope of its recovery. But fifth fingers and fifth toes may be sacrificed with cosmetic loss only. The site of any A., when there is a choice in the matter, has to be selected with an eye to leaving a stump to which the most efficient type of artificial limb may be attached. Owing to the advent of the antibiotics, A.s for septic conditions are now rare.

Amr, Mosque of, earliest Arab building of Cairo. It dates from AD 643.

Amravati, ruined city of Madras state, India, on R. Kistna. Formerly one of the chief centres of the Buddhist kingdom of Vengi. There was once a great Buddhist tope of which very little now remains.

Amritsar, city of E. Punjab state, India, 33 m. E. of Lahore (Pakistan). An important commercial centre, A.'s most famous manufs. are *Pashmina* (fine wool fabrics), silk, and carpets. It is the religious centre of the Sikhs and contains

their famous Golden Temple, situated in the centre of the Sacred Tank (or lake). The temple, which was destroyed in 1761, was rebuilt in 1764 and roofed by Ranjit Singh with sheets of copper gilt in 1802. In the temple is the original of the holy book, the Granth Sahib. Close by is Jallianwala Bagh, an open space, where in 1919 Brig.-Gen. Dyer ordered troops to open fire upon a prohibited mass demonstration, an act for which he was severely condemned by the Brit. Gov. with the approval of the House of Commons. Pop. 320,465.

Amru-Ibn-Al-Aas (d. AD 663), famous

studied at Zürich, Munich, and Rome. He became prof. of line-engraving at Munich, 1829. His best works are 'Triumphal March of Alexander the Great' (Thorwaldsen), 'Triumph of Religion in the Arts' (Overbeck), and reproductions of Raphael.

Amsteg, Swiss tourist resort in the canton of Uri, 7 m. S. of Altdorf, on the St Gotthard railway.

Amstelodamum, latinised form of Amsterdam (q.v.).

Amsterdam: 1. (the dam of the Amstel) Official cap. and largest city of the Netherlands, in the prov. of N. Holland, situated

Netherlands National Tourist Office

THE CENTRE OF AMSTERDAM, SHOWING THE 'NIEUWE KERK'

Arabian warrior who, after bitter opposition to Mohammed, ultimately became one of the prophet's chosen supporters. From Mohammed's successor, Abu-Bekr, he obtained a command in the army in Syria. He fought at the battle of Aynadin and distinguished himself in the sieges of Damascus and Jerusalem. In the years 638-40 he conquered Egypt, the campaign terminating in the capture of Alexandria, when he is said to have been responsible for the destruction of the Alexandrian library. This charge, however, has never been proved. In his subsequent administration of Egypt he exhibited great ability, interesting himself in various public works, amongst which is said to have been the construction of a canal joining the Red Sea and the Mediterranean.

Amrum, or **Amrom**, one of the N. Frisian Is. in the N. Sea, belonging to Germany. Its length is about 6 m. Area 8 sq. m.; pop. 2840.

Amstler, Samuel (1791-1849), Ger. engraver, b. Schinznach, Switzerland,

at the mouth of the Amstel R., in the SW. corner of the IJsselmeer, formerly Zuider Zee. It is connected with the N. Sea by the N. Sea Canal, 15 m. long, to the construction of which (1876) it owes much of its present prosperity. A new canal, leading to the R. Vaal, S. of Utrecht, was completed in 1952 to improve the connection between A. and the Rhine; it is accessible for very large vessels by day and night, not depending on tide. Though the importance of its shipping is secondary to that of Rotterdam, it is the H.Q. of the ship-owning interest and of the trade with the Dutch E. Indies; its prin. imports are coal, ore, grain, petroleum, tobacco, tea, coffee, cocoa, sugar, timber, and oil seeds, while it has considerable exports of dairy produce, paper, cokes, artificial manure, sugar, and hides. A. is also an important centre of banking and insurance companies.

Among the chief industries are diamond cutting and polishing, for which the city has long been famous, sugar-refining, manufacturing of ready-made clothes,

letter-casting, printing offices, iron, soap, dye, chemical manufs., shipbuilding, brewing, distilling. The tn is remarkable for the number of its well-equipped docks and quays, and for its canals (*grachten*) by which it is intersected in all directions, crossed by about 400 bridges. In this last respect it has been likened to Venice. There are many notable buildings and institutions, among which must be mentioned the royal palace, completed in 1665, built as a tn hall; the New Church (Nieuwe Kerk), a splendid Gothic building dating from 1408 and notable for its stained-glass windows and monuments; the Old Church (Oude Kerk), dating from the beginning of the 14th cent.; the St Antonieswaag, originally a tn gate and now the site of the A. Historical Museum; the Trippenhuys (1662), and of modern date the Exchange (Koopmansbeurs) and the Netherlands Trading Co. office building. The Rijksmuseum (state museum) contains the wonderfully fine national collection of Dutch and Flem. pictures. Rembrandt lived in A. (1631-69), and his house is now a museum, containing sev. of his paintings and illustrations. There are also botanical and zoological gardens, the latter being one of the finest collections in Europe. A. has 2 univs., the Municipal Univ. and the Free Univ., and many other educational and charitable institutions. There are 54 Protestant and 40 Rom. Catholic churches, and 6 synagogues. The synagogue of the Portuguese Jews, built in 1670, has a magnificent interior. Houses are built on wooden piles, and the royal palace stands on 13,659.

The hist. of the city dates from the beginning of the 13th cent. when Giesebrecht II of Amstel built a castle there. At this time it was nothing more than a fishing vil. It received its first charter from Guy of Hainaut, Bishop of Utrecht, in 1300, and joined the Hanseatic League in 1369. In the 16th cent. A. accepted the Reformation and became known as a city of toleration for many religious refugees. Its prosperity greatly increased on the decline of that of Antwerp. In 1648, with the closing of the Scheldt by the treaty of Westphalia, A. secured even greater advantages at the expense of the Belgian city, though a due share of its commercial advance in the 17th cent. must be assigned to the foundation of the Dutch E. India Co. (q.v.) in 1602 and the Bank of A. in 1609. The Prussians occupied the city in 1787, and it was taken by the French in 1795. Chosen by Louis Bonaparte in 1808 as the cap. of the Netherlands, it was officially recognised as the third city of the Fr. empire from 1810 to 1814.

During the brief resistance of the Dutch forces to the Ger. invasion of Holland in May 1940, many air-raids were carried out at Schiphol (A. Airport). Ger. destruction of the harbour installations began early in Sept. 1944, when the Allies reached the S. border of the Netherlands. After a few days, with the halting of the advance, the work of destruction was stopped; it was not resumed.

Though falling short of what was originally planned, Ger. destruction was great. In spite of so much destruction, the port of A. was far from being a total loss. The greater part of the harbour, especially on the E. side, was almost untouched, except where cranes had been blown up. The links with the hinterland—to the E. across the IJsselmeer (Zuider Zee) and to the S. as far as the Rhine—were intact at the end of the war. The restoration of the port began immediately after the liberation of A., and by the close of 1945 much of the damage had been made good and the quays had been cleared. Pop. (1954) 863,800.

2. City of Montgomery co., New York State, U.S.A., 30 m. NW. of Albany, on the Mohawk R. An industrial city, it is important for the manuf. of carpets and rugs. Pop. 32,300.

Amsterdam, New: 1. Name of New York under the Dutch.

2. Port and market centre of Brit. Guiana, cap. of Berbice co. and dist., at mouth of Berbice R. 55 m. SE. of Georgetown. Pop. 9,570.

Amsterdam Island, see KERGUELEN ISLAND.

Amt, administrative dist. in Denmark. The country is divided into 25 *amter*, each headed by a chief administrative officer, called *amtmand*, who is appointed by the central gov. For police administration, however, Denmark is divided into 72 police dists.

Amu-Darya, known to the Greeks as the Oxus and to Arab geographers as the Jayhun. A great riv. of central Asia, it rises in the Pamirs, being formed by the junction of the Pyandzh and Vakhsh R.s. It forms the Soviet-Afghan border for 200 m., eventually flowing through the reps. of Tadzhikistan, Turkmenistan, and Ozbekistan into the Aral Sea. Its total length, including the Pyandzh, is 1,577 m. It is navigable as far as Termez.

AMULET

Amulet, charm, worn or placed in a building as a protection against evil spirits. The use of A.s comes from the E., where it has existed from very early times. The anc. Babylonians and Egyptians had a strong belief in the protective power of charms, and the custom was to a certain extent handed on to the Greeks and Romans in the W. A.s have been made of many substances, the most common being precious stones, metals, either in the natural state or

made into articles of jewellery or images, and inscribed parchments, often enclosed in sachets or gold balls. Plants and parts of animals, especially the teeth, were also used. A.s are still in vogue in the E. and in S. Europe, where their aid is particularly invoked against the 'evil eye.' Buddhists and the Muslims both use A.s with a religious significance.

Amun, see **AMEN**.

Amundsen, Captain Roald (1872-1928), Norwegian explorer and navigator, took to the sea after graduating at Oslo Univ. and studying medicine. He served for some time as an able seaman in various whaling and sealing vessels, at the same time studying navigation and equipping himself in other ways for more responsible positions. He was subsequently appointed by Capt. De Gerlache to be first mate of the *Belgica* on the occasion of his Antarctic expedition. This expedition visited the S. Shetland Is., and was the first known to winter in the Antarctic. About 4 years later A., with a few companions, started on the ambitious enterprise of navigating the NW. passage, which he succeeded in doing in 1906, being the first man to accomplish the feat. In 1909 he visited London and announced to the Royal Geographical Society his preparations for an important expedition to the Arctic. In 1910 he set out in the *Fram*, presumably for the N., but the success of Peary in reaching the N. Pole induced him to abandon his project, temporarily at least, and in 1911 it was found that he was going to try to forestall Scott in the dash for the S. Pole. In this attempt he was successful, reaching the Pole on 14 Dec. 1911, after a comparatively easy journey. In the First World War he served with the Norwegian Naval Air Service, and from that time would appear to have favoured aerial navigation for exploration. It was not until 1918 that he took any further part in exploration, in which year he bought the *Maud* with the idea of drifting across the Pole. He navigated the NE. passage, but early in 1919 his engine broke down and he was compelled to land in Alaska. Two years later he tried to reach the Pole in an aeroplane from the *Maud*, but without success. In 1925, having become bankrupt, he went to the U.S.A., where the Amer. explorer Lincoln Ellsworth offered to finance him in a joint flight from Spitsbergen. The 2 explorers, however, had only traversed some 500 m. when they were compelled to abandon the enterprise. A. then made arrangements to join Nobile in his dirigible, and in May 1926 he and Nobile, together with Ellsworth and Lt. Riiser-Larsen, started from Spitsbergen and in 3 days landed in Alaska. A.'s days of exploration finished with this feat, but in 1928, hearing of the plight of his old companion, Nobile, he set out in a seaplane to attempt his rescue. In this A. and his pilot lost their lives. See **ARCTIC EXPLORATION** and **ANT-ARCTIC EXPLORATION**.

The story of his 2 chief achievements is told in his *The North-west Passage*, 1908, and *The South Pole*, 1912. He

also wrote *The North-east Passage*, 1918-1920, *The Flight across the Polar Sea*, 1926, and *My Life as an Explorer*, 1927. See also B. Partridge, *Amundsen*, 1953.

Amur: 1. Riv. of E. Asia, known in Chinese as Heilungkiang (Black Dragon R.), formed by the confluence of the Shilka and the Argun', westward of the Khingan Mts. It has a total length of about 1700 m., not counting the head-waters, the first 800 m. being in a S.-easterly direction and dividing the A. oblast from Manchuria, after which it flows NE. through the Khingan Mts into the sea of Okhotsk at Nikolayevsk. It is navigable for its entire course. Its chief tribs. are the Sungari, the Ussuri, the Zeya, and the Bureya. The most important towns situated on it are Blagoveshchensk, Aygun', Khabarovsk, and Komsomol'sk.

2. Oblast in the Russian Far East, between A. riv. and the Stanovoy Range, largely forested, with rich mineral resources. Area 139,000 sq. m.; pop. (1956) 737,000, mostly (since 1850) Russians and Ukrainians. It is an important agric. and industrial area (grain and dairy farming; gold- and coal-mining, saw-milling, and food industries). The cap. is Blagoveshchensk.

Amurath, or **Murad**: 1. A. I, Sultan of Turkey 1359-89; he began the Turkish conquests in Europe, and estab. his kingdom as far as Sofia. 2. A. II, sultan 1421-51; he defeated the Hungarians at Varna and Kosovo. 3. A. III, sultan 1574-95. 4. A. IV, sultan 1623-40; notorious for extreme cruelty. 5. A. V, sultan May-Aug. 1876.

Amwythig, see **SHERWSBURY**.

Amyclae, anct in of Laconia, Greece, on R. Eurotas, 2½ m. SE. of Sparta. It was the chief tn of the Achaean, and remained independent after the Dorian conquest. The festival of the Hyacinthia was celebrated here annually. Excavations have revealed the sanctuary and 'throne' of Zeus Amyclaeus.

Amygdalin (C₂₀H₂₇O₁₁N), glucoside found in bitter almonds, cherry kernels, and other vegetable products. When macerated and kept in contact with water, fermentation sets in, due to the presence of emulsin, and the substance is decomposed into hydrocyanic acid (prussic acid), benzaldehyde, and glucose.

Amygdaloid (Gk *amugdalon*, almond; *eidos*, shape), the old name of a variety of igneous rock, usually basaltic, containing cavities in which round or almond-shaped bodies are formed, consisting of agate, calcareous spar, or zeolites.

Amygdalus, name of a sub-genus of *Prunus* formerly considered as a genus, of the family Rosaceae. It includes *P. communis*, the almond (q.v.), and *P. persica*, the peach (q.v.).

Amyl, organic radical corresponding to the formula C₅H₁₁. There are 8 A. alcohols, the most important being isobutyl carbinol, which is a constituent of fusel oil. A. nitrite is a yellow liquid with a penetrating odour, used in medicine for angina pectoris, etc., owing to its power of producing vascular dilation and of stimulating the heart's action.

Amylene Hydrate, see HYPNOTICS.

Amyloaine (Stovaine), in the form of the hydrochloride, used as a local anaesthetic. It is a white, odourless crystalline powder with a bitter taste. It has about half the toxicity of cocaine, but is much more irritant and less powerful as a surface anaesthetic. It is mainly used for the production of spinal anaesthesia (see ANAESTHESIA).

Amyloid Degeneration, also known as lardaceous degeneration, or waxy degeneration, a condition in which there is a degeneration of the cells of certain organs by which an amyloid or lardaceous substance is formed. It is a secondary condition and occurs in association with chronic suppuration or infections such as syphilis (q.v.) and tuberculosis (q.v.). It attacks most frequently the liver, kidneys, spleen, intestines, and lymphatics.

Amylopsin, diastatic ferment from the pancreatic juice, capable of converting starch into sugar. See DIGESTION.

Amylum, see STARCH.

Amyntas: 1. King of Macedonia (c. 540-498 BC).

2. King of Macedonia (393-369 BC), was the son of Philip, the brother of Perdiccas II. He sought the friendship of Athens, and left by his wife Eurydice 3 sons: Alexander, Perdiccas, and the famous Philip, called by Ovid Amyntiades.

Amyot, Jacques (1513-93), Fr. writer and translator, b. Melun. In 1540 he became prof. of Greek and Latin at Bourges; in 1558 tutor to the sons of Henry II; in 1560 grand almoner of France; and in 1570 Bishop of Auxerre, where he d. His most famous trans. was that of Plutarch's *Lives*, 1559, which, besides being used by Corneille and establishing itself as a model of Fr. prose style, formed the basis of North's trans. into English, 1575, from which Shakespeare took his Rom. plots. Other works were trans. of *Theagenes and Chariclea*, 1546; 7 books of Diodorus Siculus, 1554; Longus's *Daphnis and Chloe*, 1559; and Plutarch's *Moral Treatises*, 1572, all of which have become Fr. classics. See A. Clorancescu, *Vie de J. Amyot*, 1941.

Amyris, family Burseraceae, genus of evergreen W. Indian trees, yielding fragrant resin. *A. balsamifera*, Rhodes Wood, and *A. elemifera*, Gum Elemi Tree, are chief species.

An Tostal, see TOSTAL.

An Uaimh, chief tn of co. Meath, Rep. of I., at the confluence of the R.s Boyne and Blackwater. This historic tn, the scene of many wars, has numerous important archaeological remains in the vicinity, including Beective Abbey (q.v.) and Tara (q.v.). Industries include agric. implements, carpets, furniture, and woollen goods. Pop. 4300. (Formerly Navan.)

Ana, suffix added to the names of famous men to designate collections of their sayings and table talk, anecdotes about them, and notes in any way bearing on their life, e.g. Johnsoniana, Boswelliana, Shakespeariana. The use of such

titles dates from the *Scaligerana*, collected by the brothers Vassan and pub. in 1666 by Isaac Vossius.

Anabaptist, name of a Christian sect which appeared in Germany at the Reformation, repudiating infant baptism (hence the name, meaning 'baptised again,' which refers to their adult baptisms) and teaching equality and community of all goods. The movement was begun about 1520 in Saxony by the 'Prophets of Zwickau.' They were strongly opposed to Luther, but their leader, Thomas Münzer, travelled over Bohemia, Thuringia, and Switzerland preaching with much success, especially at Waldshut, on the Swiss border. He joined and largely engineered the Peasants' War in S. and central Germany, and was executed after the defeat of his party at Frankenhausen in 1525. The A. doctrines were still propagated by wandering preachers, like Melchior Hoffmann, who in 1528 installed John Matthiesen as a bishop at Emden. He sent out many disciples, 2 of whom founded the theocratic state of Münster in 1533. An era of wild licentiousness in this city followed, under Johann Bockholdt (q.v.), crowned in 1534 as prophet and king, assisted by Rothmann, Knipperdolling, Krechting, Kippenbrock, and Matthiesen. The city was besieged and taken by Protestant princes in 1535, and on the execution of the leaders the movement began to die out, though still continuing in the Netherlands under David Joris (John of Bruges) and others. A revival began with Menno Simons, who estab. a community which, while rejecting infant baptism, gave up the objectionable features of the A. creed. The Mennonites, who spread all over Germany, Switzerland, and Holland, practically correspond with the Baptists in England, by whom adults are baptised on joining the Church. Menno's doctrines are expounded in his book, *Elements of the True Christian Faith*, written in Dutch. See K. B. Bax, *Rise and Fall of Anabaptists*, 1903, and R. J. Smithson, *The Anabaptists: their Contribution to our Protestant Heritage*, 1935.

Anabas, genus of percomorph fishes of the family Anabatidae. *A. scandens*, the climbing perch, resembles a perch to some degree. It has large scales, and can remain for a considerable time without water, travelling overland in search of it. During these travels it may be seized by crows and kites and placed in the branches of trees for future use. Hence its supposed climbing habits.

Anabasis, name of 2 (Gk historical works: (1) Xenophon's (4th cent BC), recounting the defeat of Cyrus the younger by Artaxerxes and the retreat of the 10,000 Greeks in his army under Xenophon. (2) Arrian's (AD 166-8), recording the campaign of Alexander the Great.

Anableps (from Gk *anablepsin*, to look up), genus of cyprinodont fishes found in tropical America. They are remarkable for their projecting eyes, which are divided horizontally into upper and lower halves—for vision above water and below water respectively. They are the largest

of the cyprinodonts, reaching a length of a foot.

Anabolism (Gk *ana*, on high; *bolos*, heap), building-up process in the protoplasm of a living organism, as opposed to *katabolism*, or the breaking-down process. See **METABOLISM**.

Anacardiaceae, family of dicotyledonous plants growing chiefly in tropical countries. They are trees or shrubs which abound in an acrid resin. The flowers are usually in parts of 5, the stamens less than 10, carpels 3, with a single ovule. *Anacardium*, *Comocladia*, *Mangifera*, *Melanorrhoea*, *Pistacia*, *Rhus*, *Schinus*, and *Spondias* are chief genera.

Anacharis is synonymous with *Elodea*, genus of water-plants of the family Hydrocharitaceae which grows in America. *A.* (or *E.*) *canadensis*, the Amer. waterweed, was transplanted to England, and grew rapidly to choke watercourses, but in time became less rampant.

Anacharsis, Scythian philosopher said to have been a friend of Solon (q.v.), and the only barbarian admitted to Athenian citizenship. Some writers place him among the Seven Sages of Greece. Numerous epigrams were attributed to him, including the saying that at Athens were men who deliberated but left the decision to fools. His proverbs are preserved by Diogenes Laërtius, Plutarch, and Lucian. *A.* was killed by the King of Scythia for worshipping Cybele with Gk rites. Aldus, in his collection *Greek Epistolographers* (Venice, 1499, 4to), pub. 9 letters under the name of *A.*, which were pronounced by Bentley to be forgeries. The other works ascribed to *A.*, such as an epic poem of 800 verses, a work on war, on the laws of the Scythians and some Gk customs, are lost; but they were certainly no more genuine than the letters.

Anacharsis the Younger, see **BARTHELEMY**, JEAN JACQUES.

Anachronism (Gk *ana*, back; *chronos*, time), reference of an event, custom, or expression to a wrong date. This is common in literature and other forms of art, especially painting, and although it most often is the result of an oversight or of ignorance on the author's part, it is nevertheless sometimes a deliberately adopted device made for heightening a dramatic effect, or for achieving condensation. It is not easy to decide whether an *A.* is deliberately intended by the author. When Shakespeare peopled ancient Athens with Elizabethan joiners, weavers, and bellows-menders he may have been 'writing down' to his audience or have been unconscious of any *A.*, but when he makes Cassius in *Julius Caesar* say 'The clock hath stricken three,' the *A.* was probably intentional. In the 16th and 17th cents. *A.s* abound in the works of dramatic and other writers, but it does not follow that artistic merit of their work is thereby spoilt. When Lucifer is expelled from heaven with the aid of cannons and gunpowder, the dramatic effect of Milton's story is increased, for by the time he wrote his *Paradise Lost* men had come to think always of battle as being enshrouded in a sulphurous

canopy. Where, however, an attempt is obviously made to give correct local colour and *A.* is intentional, the artistic harmony is disturbed. For Shakespeare to make, as he does in *Troilus and Cressida*, Agamemnon quote Aristotle is almost as bad as when he places Verona on the sea-coast (the latter is an error, but not an *A.*, for it has no reference to time). But Virgil, in making Queen Dido the contemporary of Aeneas, violates no artistic canons. The Renaissance painters were frequently guilty of *A.*, and the Flem. school even went to the length of putting spectacles on the noses of scriptural characters.

Anacoluthon (Gk *a-*, not; *akolouthos*, following) is grammatical non-sequence, the latter part of a sentence failing to correspond with the first part. Usually it is a grammatical fault, e.g. 'As a regular reader of your paper, why does it give so little space to sport?' But it can also be deliberately employed to add force or emphasis, as in Luke v. 14, 'He charged him to tell no man; but go, and show thyself to the priest.' See also **FIGURE OF SPEECH**.

Anaconda, co. seat of Deer Lodge co., Montana, U.S.A. Smelting and the by-products of smelting are the prin. industries; bricks, metal castings, beverages, dairy products, live-stock, and potatoes are produced. The mine offices of the A. Copper Mining Co. are here. Pop. 11,260.

Anaconda, S. Amer. water-snake, allied to the boa-constrictor, which lives on the banks of rivs. in Brazil and Guiana. It is one of the largest of living snakes, growing to a length of over 30 ft.

Anacreon (c. 570-485 BC), Gk lyric poet, b. Teos, Ionia, and emigrated to Thrace before the Persian invasion. About 540 he went to the court of Polycrates of Samos, and in 521 to the house of Hipparchus at Athens. He lived here till the fall of the Pisistratids, about 514, and then accepted the patronage of Echekratidas of Thessaly. He is said to have been choked by a grape stone. The Alexandrians possessed 5 books of his odes to the muses, wine, and love, but of these only a few genuine fragments remain. The Anacreontic odes trans. by Cowley and Moore are later imitations. The fragments are included in J. M. Edmonds, *Lyra Graeca* (with trans.), 1922. See C. M. Bowra, *Greek Lyric Poetry*, 1936.

Anacrusis (Gk, 'striking up'), term in prosody used of an extra syllable prefixed to the normal rhythm of a line, such as the 'and' in the second line of:

Till danger's troubled night depart
And the star of peace return.

Anadiplosis (Gk *ana*, back; *diploos*, double) is a figure of speech consisting of the repetition of a word from one clause at the commencement of the next, where it starts a fresh thought, as in the line from Keats: 'She dwells with Beauty—Beauty that must die.' See also **FIGURE OF SPEECH**.

Anadolu, see **ASIA MINOR**.

Anadyomene (Gk *anadyomai*, I rise

from the sea), surname of Aphrodite (or Venus), who had arisen from the foam of the sea. The birth of Aphrodite was a favourite subject of ancient art, and furnished Praxiteles with a theme for his famous Aphrodite of Knidos. So too Botticelli.

Anadyr': 1. Riv. in NE. Siberia, rising in the Kolyma Mts and flowing E. into the A. Gulf of the Bering Sea. Its length is 730 m.

2. (until 1930's *Novo Mariinsk*) Russian settlement at the mouth of the above, administrative and cultural centre of the Chukchi (q.v.) National Dist.

Anaemia, deficiency of the red corpuscles and/or haemoglobin. Thus it may be a deficiency of quantity or quality. A. may be local, due to interference with blood supply to a part from pressure on an artery or from a blocking of it by embolism (q.v.), spasm, etc., or general.

Local A. is referred to as *ischaemia*. The term A. is as a rule applied to a general deficiency. Strictly speaking, A. is not a disease. It is a symptom either of a fault in the blood-forming mechanism, when it is known as primary A., or of iron deficiency when it is known as simple A., or of some intercurrent disease not directly associated with the blood, when it is known as secondary A. The commonest form of primary A. is *pernicious A.* or, as it is sometimes called, *Addisonian A.*, after Thomas Addison (q.v.) who first described the condition in 1855. It is now estab. that pernicious A. is due to the absence of secretion in the gastric juice of hydrochloric acid and of what is known as the intrinsic factor (see GASTRIC JUICE). The intrinsic factor normally combines with the extrinsic factor contained in the food to form the anti-pernicious A. factor, which is stored in the liver and acts as a stimulant to the blood-forming tissues in the bone marrow. Before the true aetiology of pernicious A. had been elucidated Minot and Murphy in America had already discovered, in 1926, the therapeutic properties of liver in this disease. There are now available various highly concentrated extracts of liver which, given in combination with hydrochloric acid by mouth, replace the missing anti-A. factor and keep the disease under control, although not curing it. The symptoms of pernicious A. are increasing shortness of breath, pallor of the mucous membranes, a lemon-yellow tint to the skin, a smooth tongue, and dyspepsia. The diagnosis is proved by pathological examination of the blood. In advanced untreated cases of pernicious A. there may be signs of degeneration of the nerve fibres of the spinal cord. A.s of a similar kind to pernicious A. may be associated with a tropical disease known as sprue, with cancer of the stomach, and occasionally with pregnancy.

Simple A. may be due to lack of iron in the diet, failure to absorb iron through the intestine, or due to blood loss. A normal diet contains sufficient iron for ordinary needs (see NUTRITION), but in pregnancy the demands are greater and for this reason the diet of pregnant women

is usually supplemented with iron in the form of ferrous sulphate or iron and ammonia citrate mixture. It is difficult to estimate the degree of A. purely from the patient's appearance. Many pale people are not anaemic, while others with a good colour are. The colour of the mucous membranes is a better guide. The only true test of A. is an estimation by pathological examination of the number of red cells and the amount of haemoglobin (see BLOOD). Blood loss may occur from a sudden large haemorrhage due to accident, disease, or operation, in which case it is usually treated by blood transfusion (q.v.), or it may occur from small continual losses of blood such as from a slowly bleeding peptic ulcer, a cancer, or excessive loss at the menstrual periods. **Secondary A.** is due to a number of diseases which have no direct association with the blood or bone marrow but which cause diminished production of red corpuscles. Of these diseases infections are the commonest cause of A., particularly chronic infections. *Uraemia* (q.v.), *rheumatoid arthritis* (q.v.), and *myxoedema* (q.v.) are other notable conditions causing secondary A. Certain drugs and poisonous substances cause A. Benzene inhaled from rubber solutions, dry-cleaning fluids, paints and varnishes, and motor spirit may act in this way when exposure to them is prolonged. The treatment of secondary A. is to treat the cause where possible and give the appropriate iron therapy.

Anaesthesia, condition of partial or complete insensibility, particularly to touch. It occurs in connection with diseases of the nerve centres, and is artificially induced for the purpose of conducting surgical operations.

The influence of certain substances in procuring some amount of insensibility to pain has been known for centuries, and there is evidence that opium, mandragora, and other drugs have been used on various occasions to lessen the sufferings attendant on surgical operations. In 1800 Sir Humphry Davy suggested the use of nitrous oxide, or 'laughing gas,' for operations where there was little effusion of blood, and at the beginning of the 19th cent. many observers remarked on the possibility of using the anaesthetic properties of ether in surgical operations. In 1847 the use of ether became general in England and America, and in Nov. of the same year chloroform was introduced by Sir James Simpson, and for a time entirely superseded ether. Other anaesthetics, such as ethyl chloride, were tried and abandoned, and chloroform held the field until recent years, when the value of other anaesthetics and mixtures used under certain conditions has become better understood and recognised.

The chief anaesthetics in use for general A. at the present time are nitrous oxide, nitrous oxide mixed with oxygen, ether, chloroform, ethyl chloride, chloroform-ether mixture, trichlorethylene, and the intravenous injection of barbiturates such as thio-pentone; eucaine, novocaine, and

cocaine for local A.; and stovaine, tropococaine, and novocaine for spinal analgesia.

Nitrous oxide (N_2O) is used for short operations, such as occur in dental practice, and is practically free from danger and painful after-effects. It is supplied in a liquid state in steel cylinders, the cylinder being connected by means of a rubber bag to a face-piece designed to cover the nose and mouth. The period of induction is usually less than 1 min., and that of A. about 40 secs. The patient's eyes have a fixed appearance, and there is usually a duskeness of the face. Nitrous oxide combined with oxygen is now used for prolonged surgical procedures. This is made possible by the administration at the same time of analgesic and relaxant drugs such as morphine and curare.

Ethyl chloride ($\text{C}_2\text{H}_5\text{Cl}$) is used as a substitute for nitrous oxide in short operations, such as the removal of adenoids, but it is not considered so safe. The after-effects often include headache and sickness.

Ethyl ether, ($\text{C}_2\text{H}_5\text{O}$), is commonly used for operations of long duration. In the open method the ether is dropped on a gauze mask which is held at first some distance from the face and gradually brought nearer. By the use of a bag and facepiece, such as Clover's inhaler, A. is more quickly brought about. Ethyl chloride and ether are frequently used in sequence.

Chloroform (CHCl_3) is administered at first in a dilute form and the percentage gradually increased, the supply of air and vapour being of course thoroughly under the control of the anaesthetist. Dangerous after-effects occasionally occur, and its administration is highly dangerous where the *status lymphaticus* exists. In cases where chloroform or ether may not be advisable a mixture of 2 parts of chloroform to 3 of ether is often used, and is generally considered a safe and convenient anaesthetic.

Thiopentone and *Hexobarbitone*, ultra-short-acting barbiturates (q.v.), and others of the same group of barbiturates are used for A. for minor operations or for inducing A. before proceeding to inhalation A. for major operations.

Local A. or analgesia is chiefly employed in superficial operations or where special circumstances make general A. inadvisable. Sometimes ether or ethyl chloride is sprayed on the skin until it freezes. Insensibility is produced for a short time and is only superficial. There is likely, too, to be considerable pain when the skin thaws. Cocaine is often injected for cutaneous and subcutaneous analgesia, but its use is attended with some disadvantages. It has a dangerous effect when absorbed into the general circulation, and there is also a risk of a cocaine habit being formed. Eucaine and novocaine are very effective analgesics, and have no dangerous by-effects.

Spinal analgesia. There are sometimes occasions for serious operations when respiratory affections, alcoholism, diabetes,

and other conditions make general A. inadvisable. If the operation is concerned with the lower part of the body, it is possible by a spinal injection to produce insensibility to pain in that part whilst general consciousness is maintained. Stovaine or novocaine is injected into the spinal fluid while the patient is in a sitting position, if that position is possible. The method has been used more on the Continent than in this country, where it is looked upon only as a substitute for general A.

Instead of administration by inhalation, some anaesthetics can be used by injection into the rectum, or by injection into a vein. Among drugs used by intravenous injection are derivatives of barbituric acid. See BARBITURATES.

Trichlorethylene ($\text{CHCl}_2\text{CCL}_2$), known as *Trilene*, a variant of chloroform, but less potent and less toxic. It has long been used in industry as a rubber solvent and for dry-cleaning. Vaporised accidentally it was found to induce unconsciousness and has since been used as an anaesthetic, particularly in obstetrics. A new pocket trilene inhaler, made for the purpose of deadening pain, may prove to be a great improvement on the morphine tubes equipped with hypodermic needle which were used widely for the same purpose in the recent war. Exhaustive tests have shown that it is successful with 85 per cent of persons.

In general, successful A. depends to a great extent on the proper preparation of the patient. The stomach should be empty at the time of the operation, so that no food can be forced up to lodge in the respiratory passages. It may be said that with modern appliances and mixtures in the care of a trained anaesthetist the risk is comparatively slight.

Owing to the use of supportive drug therapy it is now possible to keep a patient anaesthetised during an operation lasting many hours, with a minimum dosage of anaesthetic agent. The new techniques of hypothermia and 'artificial hibernation,' in which the patient's body temperature is so lowered that its metabolic needs are reduced to a minimum, enable extensive operations to be carried out with comparatively small amounts of anaesthetic, and consequent benefit to the patient. See also SURGERY.

Anagallis, genus of Primulaceae growing in all continents but Australia. *A. arvensis*, the Scarlet Pimpernel (q.v.), or Shepherd's Weather-glass, and *A. tenella*, Bog Pimpernel, are native to Britain. *A. linifolia*, Mediterranean, is a popular garden ann.

Anagni (anct **Agnesia**), It. tn in Lazio (q.v.), 12 m. NW. of Frosinone (q.v.). It was an important tn in Rom. times, and has been a bishopric since 487. The cathedral dates from the 13th cent., and there are remains of a palace of Pope Boniface VIII. Pope Adrian IV (q.v.) d. here. Pop. 14,900.

Anagram (Gk *ana*, back; *gramma*, letter), word or sentence made by rearranging the letters of another; to be effective the new coinage should have

some appropriate connection with the original. One of the most celebrated is the traditional retort to Pilate's scoff, 'Quid est veritas?' (What is truth?) with 'Vir est qui adest' (It is the man who is here). Caliban, the monster in Shakespeare's *Tempest*, is an A. of 'cannibal,' oftenspelt with one 'n' in those days. And John Bunyan pointed out to his readers that the letters of his name could be rearranged to read 'Nu hony in a B' (I and J being of course interchangeable). A.s on writers' names have often been used for pseudonyms; John Taylor, the 'Water Poet,' wrote under the name Thorny Allo, and George MacDonald signed himself Dalmocand.

Anah, in on the Euphrates in the Bagdad vilayet, Iraq. Its position in the desert made it an important resting-place. It contains the remains of 4 ancient castles.

Anahita (Anaitis), goddess of sacred waters, fertility, and war, once worshipped by the Persians in association with Mithras. Her worship spread throughout the Persian Empire, and in Asia Minor she was identified with Cybele. See also ZOROASTRIANISM.

Anáhuac, geographical region of Mexico. The name was applied by the Aztecs to their whole kingdom, but its boundaries are not definitely known. The term is applied to the whole region, from Rio Grande to Tehuantepec, but it is more properly used of the plateau valley of the city of Mexico, between 18° 4' and 20° 3' N. lat., having a mean elevation of 7500 ft. This region was formerly largely covered by lakes, which fits the meaning of the name 'near the water,' and is a prin. granary and stock-raising centre of the country.

Anak, ancestor of the Anakim (Deut. ix. 2) (see ANAKIM). Etymologically it is a common noun, meaning 'necklace' (Song of Solomon, iv) or perhaps 'neck' (Arabic 'ung, neck; 'anaqa, to embrace). If this be the correct derivation, the name *bene 'Anaq* meant literally 'sons of the neck' or 'giants.'

Anakim, O.T. term for a section of the pre-Israelitic inhab. of Canaan, a race of fabulous giants, the sons of Anak (q.v.), living in the mountain range of S. Palestine and in the Philistine cities (Joshua xl. 21 ff.), where one of them later was the giant Goliath. They were conquered by Joshua. The A. are also called descendants of Arba (Joshua xiv. 15; xxi. 11). Their chief stronghold was Kiriath-Arba, afterwards called Hebron.

Analekts, Analekta (Gk *analekta*, things gathered), literary gleanings, term used to denote a collection of extracts.

Analekts of Confucius, see CONFUCIUS.

Analeptics (Gk *analeptis*, restoration), restorative medicines or agents.

Analgesics, see ANAESTHESIA and ANODYNES.

Analogy (Gk *analogia*, proportion): 1. Term which originally implied an equality of ratios; but though ancient writers used it in this sense, and it still has this meaning in mathematics, it is now used in many depts of learning to signify resemblance

which falls short of absolute identity. In inductive logic it forms the basis of most hypotheses, but is subject to much fallacious reasoning. The reasoning runs on such lines as these: A and B resemble each other in possessing one or more similar characteristics; A possesses a certain additional characteristic, and B therefore probably possesses it also.

A. can never afford proof; at best it is but a suggestion for a good hypothesis. Metaphorical language may be a source of incorrect reasoning by A., e.g. in speaking of a country as being a mother-country and from this arguing that the duties of the country towards the individual should be those of a mother towards her child. See J. S. Mill, *System of Logic*, 1875; W. S. Jevons, *Principles of Science*, 1877; J. M. Keynes, *A Treatise on Probability*, 1921; J. Cook Wilson, *Statement and Inference*, 1926.

2. In biology, term applied to organs which perform the same functions, and may be superficially similar, but differ essentially in structure and origins. The wings of a bee and of a sparrow are analogous, and the leaf-like branches of butcher's broom are analogues of the leaves of ordinary plants. See HOMOLOGUE.

Analysis (Gk *ana*, up; *luen*, to loose), in philosophy, implies the mental act of unloosening some unity into its component parts, e.g. the dissection in thought of a man into his various attributes of height, weight, reasoning powers, and so on. Synthesis is its complement, and implies the converse process of knitting together the parts to form the unity, e.g. the description of his various attributes, until the man is complete. A. plays a great part in inductive logic, for it opens with the complex of experience and resolves it into the elementary relations realised in it. In this way it is largely experimental and leads to discovery. The propositions set forth in geometry illustrate this; they are, however, usually synthetic in proof, but the *reductio ad absurdum* (q.v.) is wholly analytical.

Analysis, Chemical, the determination of the elements comprising a compound or a mixture of compounds. For inorganic compounds or mixtures the methods may be divided into dry and wet A. Dry methods usually only give an approximate result, and should be supplemented by wet methods, if possible. The chief processes in a dry A. comprise heating to determine what sublimate is formed, what gas is evolved, or what water of crystallisation given up, or whether any of the substances are oxidised. Heating on charcoal in a reducing flame would possibly give a metallic globule or other indications, and heating with borax on a platinum wire in an oxidising flame produces beads of different colours characteristic of the various metals. The flame test consists in heating a small portion moistened with hydrochloric acid in the high-temp. area of a Bunsen flame, when a characteristic colour may be imparted. Such methods obviously give

only a general idea of the constituents of the mixture or compound; some elements may be masked by others unless a spectroscope (q.v.) be employed, when the presence of different elements in a flame test is very accurately indicated.

Wet methods consist of treating the given compound or mixture with reagents in a systematic manner, so that by the nature of the reactions produced certain groups of elements are indicated, further tests subdividing these groups and so on until the original compound is split up into the simplest possible forms. Such an A. is called qualitative, because it takes no account directly of the relative proportions of the constituents. If those proportions be required, quantitative A. must be employed, which may be either gravimetric, volumetric, or colorimetric. In gravimetric methods it is designed to obtain a precipitate of known composition from a weighed quantity of the compound. This being carefully filtered, dried, and weighed, a simple calculation gives the percentage of the required element in the original mixture. Occasionally electrolysis of the given solution is resorted to, the amount of metal deposited on the cathode indicating the strength of the solution. Volumetric methods aim at determining the strength of a solution of the substance by finding what quantity is required to bring about a certain definite reaction with another solution of known strength. Certain elements which give well-defined colour reactions with other substances can be determined quantitatively by comparing the colour produced by known weights of the substance with that produced by a standard solution.

The A. of organic compounds proceeds upon entirely different lines. If on burning a small quantity an ash or residue is left, the substance probably contains an inorganic impurity, which may be separated by the use of solvents, such as alcohol, ether, benzene, chloroform, etc., one or another of which dissolves the majority of organic compounds, when filtration and subsequent crystallisation in fractions may effect still further separation. Fractional distillation—that is, distilling at different temps.—is useful in separating liquids whose boiling-points are markedly different. The elements composing organic substances can be detected by characteristic tests: carbon by the formation of carbon dioxide turning lime-water turbid; hydrogen by the formation of water on decomposition; halogens by heating with sodium, when a sodium halide is formed; nitrogen by the evolution of ammonia on heating with lime; sulphur and phosphorus by oxidising to acids on heating with a mixture of potassium carbonate and nitre. The general principle underlying the quantitative determination of these elements is the collection and weighing of the products of combustion of a definite quantity of the substance. In recent years, accurate methods of qualitative and quantitative A. of very minute quantities of substance have been worked out

(micro-analysis), e.g. by F. Pregl, and these methods have proved exceedingly useful and important in biochemistry, where the amount of material available for A. is often extremely small.

Modern research on the structure of the atom has led to the development of analytical methods based on electrical phenomena, and these enable us to detect even a trace of a particular element in the presence of large quantities of others. See F. Sutton, *Volumetric Analysis*, 1924; Treadwell and Hall, *Analytical Chemistry* (2 vols.), 1924; Thorpe and Whitley, *Manual of Organic Chemical Analysis*, 1926; A. I. Vogel, *Text Book of Qualitative Inorganic Analysis*, 1939; A. I. Vogel, *Text Book of Qualitative Chemical Analysis*, 1937; A. J. Berry, *Qualitative Inorganic Analysis*, 1938; H. Middleton, *Systematic Qualitative Organic Analysis*, 1939; N. J. Allport, *Colorimetric Analysis*, 1945.

Analyst, Public, official appointed by a co. or bor. council under the provisions of the Food and Drugs Acts, 1875 and 1899, for the purpose of analysing samples of food and drugs and agric. products exposed for sale. The appointment must be confirmed by the Ministry of Health or the Board of Agriculture, and cannot be annulled without the assent of the dept concerned. By the latter Act both depts are empowered to appoint a P. A. where the local authority has failed to do so. The P. A. is generally a F.I.C. (Fellow of the Institute of Chem.). For his duties see ADULTERATION.

Analytical Geometry, see GEOMETRY.

Analytical (also known as **Explicative or Essential**) **Propositions** are those which affirm of their subject a predicate which is already contained in the definition of the subject. Such a proposition is 'A parallelogram has four sides and four angles,' the having four sides and four angles being part of the definition of a parallelogram. A. P. are distinguished from *synthetical* propositions, which affirm of their subject a predicate not already contained in the definition, such as 'A parallelogram is a schoolboy subject to the unintelligent schoolboy.'

Anamalai, or Annamullay, Hills, group of mts forming part of the Sahyadri range, S. India, about 65 m. S. of the Nilgiri Hills. The highest peak, Anamudi, is the loftiest point in S. India, attaining an elevation of 8840 ft. Tea and coffee are extensively grown here, and there is abundance of teak timber and wild beasts, such as the elephant and bison.

Anambas Islands, group of 3 small wooded and rocky is. in Indonesia, between Borneo and Malacca.

Anamnesia (Gk *ana*, again; *mnēsis*, memory), term used in medicine to signify the recollection of a patient or his friends of the first symptoms and past hist. of his case.

Anamur, or Anamour, Cape, is the most S. point in Asia Minor. It is named from A., the anct Anemurium, in which there are ruins of tombs and 2 theatres. A. Castle is 6 m. E. of the cape.

Ananas, genus of Brazilian herbaceous perennials, family Bromeliaceae. A.

comosus, the pineapple, is the host-known species; for a description of its fruit see PINEAPPLE.

Ananias, name borne by 3 characters in the N.T. and 1 in the O.T.: (1) Jewish name of Shadrach (cf. Daniel i. 7 and the Song of the Three Children (Benedicite)). (2) A Jewish Christian at Jerusalem, who, with his wife Sapphira, fell dead when rebuked by St Peter for falsely pretending to give all their property to the community (Acts v.). (3) A Jewish Christian elder of Damascus, who received St Paul after his conversion, restored his sight, and baptised him (Acts ix.). (4) The Jewish high priest, son of Nedeбалos, who was at the trial of St Paul before the Sanhedrin at Jerusalem and at Caesarea (Acts xxiii, xxiv.).

Anapaest, in poetry, a metrical foot, consisting of 2 short, or unaccented, syllables followed by a long, or accented, syllable. It is the opposite of the dactyl (q.v.) and is sometimes called the anti-dactyl. Examples are 'colonnade,' 'interrupt.' The A. was often employed in Gk and Rom. poetry, but its employment in England is largely restricted to the lighter forms of verse. In France the use of the A. is very general, forming indeed one of the marked characteristics of Fr. poetry. Aristophanes among the ancients, and Swinburne in our time have employed the A. with good effect.

Anaphora (Gk *ana*, back; *pherein*, to carry) is the repetition of a word or phrase in successive clauses, as in *Judges* v. 27: 'At her feet he bowed, he fell, he lay down: at her feet he bowed, he fell: where he bowed, there he fell down dead.' See also FIGURE OF SPEECH.

Anapl., see NAUPLICH.

Anarchism (Gk *alpha*, privative; *archē*, rule). A. may be defined as the negation of gov., as a state of society without a central gov., and in which individual autonomy is allowed its fullest development. The term *anarchy* is also used to imply the state of turmoil accompanying the weakening of central gov.

Anarchists have attempted, by means of international conferences, notably that of Amsterdam, 1907, to define their position. In a negative way their difference from the Socialists was made plain by the expulsion of the Anarchists, led by Bakunin, from the International (see THIRD INTERNATIONAL) at The Hague Conference, 1872. Many of the tenets of Socialism are held by Anarchists. Since they believe that the freedom of the individual is restricted by the monopoly of land and capital, the Anarchists are at one with the Socialists in the desire to overthrow it, but they differ fundamentally on the question in whom property should be vested, and on the governance of the remodelled society. The State Socialist's remedy is more gov., and better gov.; the Anarchist holds that all gov., however well intentioned, are bad and tend towards privilege and oppression, and that the individual is just as much a slave if he has unwillingly to conform to the majority as if he conforms to a

despot. His views are crystallised in the sentence, 'That gov. is best which governs least,' and in this conclusion he is not far removed from such individualists as Herbert Spencer, Auberon Herbert, and Harold Cox.

The modern Anarchist movement may be said to have begun with Pierre Proudhon (1809-65), although an atmosphere favourable to its reception had been created by the writings of the poet Shelley and the Fr. Encyclopaedists. Proudhon's most celebrated work is *What is Property?* in which he equated property with 'theft.' He asserted that in a perfect society order would be maintained by the reasonable self-control of the free individual. Since his time perhaps the greatest Anarchist was Mikhail Bakunin, the Russian, the apostle Paul of A. (1814-76). In addition to writing many uncompromising works, including the atheistic *Dieu et l'État*, he is chiefly remembered for his prolonged struggle in the International with the followers of Karl Marx, the father of orthodox Socialism. From this struggle Marx emerged victorious, but Bakunin had a large following, especially among the Lat. states. In recent years A. has numbered among its supporters many men of considerable erudition. Prince Peter Kropotkin, a Russian, and Enrico Malatesta, an Italian, made England their home, and the former wrote many scholarly works on Nihilism (q.v.), a form of A., chief among them being *The Conquest of Bread*, 1892 (trans. 1906), *Fields, Factories, and Workshops*, 1899, and *The Memoirs of a Revolutionist*, 1899. The return to the simplicity of the primitive Christians advocated by Count Leo Tolstoy has given rise to the term Tolstoyan anarchy. Prominent Fr. Anarchists include Élisée Reclus, Sébastien Faure, Charles Malato, and Louise Michel; It., Amilcare Cipriani; Sp., F. Ferrer; Amer., Emma Goldman and Benjamin Tucker. 'Propaganda by deed,' repudiated by some Anarchists, is the violent attacks made upon rulers and sometimes indiscriminately on the better-off members of society, the *bourgeoisie*, by pistol, knife, and bomb. A. has a long list of crimes to its 'credit.' Britain's comparative immunity from these attacks has been attributed to the fact that it has no exceptional laws directed against A. Among rulers to perish by the hands of Anarchists are President Carnot of France, 1894; Empress Elizabeth of Austria, 1898; King Humbert of Italy, 1900; and President McKinley of U.S.A., 1901. Ravachol, 1892, Vaillant, 1893, and Henry, 1894, were all executed in Paris for bomb outrages on the public. See INDIVIDUALISM.

Anarrhichas, genus of percomorph fishes, very closely allied to the blennies. They have round, smooth, blunt heads; elongated bodies, covered with minute scales; a single long dorsal and an extended anal fin, both separated from the caudal; no ventrals; the mouth armed with formidable crushing teeth. One species, the wolf-fish, sea-cat, or cat-fish, *A. lupus* of Linnæus, is common in the N. seas

and off the E. coast of Scotland and the Orkneys.

Anas, see GUADIANA.

Anas (Lat.), scientific name for a duck (q.v.).

Anasarca, dropsy of the subcutaneous cellular tissue.

Anaspids, fossil jawless ostracoderms (q.v.) from Silurian and Devonian rocks. The head is usually covered with small bony plates and the body with scales, and there is a reversed heterocercal tail fin. In some forms the armour is reduced.

Anastasius, pope (399-401), chiefly remembered by his opposition to the writings of Origen, whose advocate, Rufinus, he excommunicated.

Anastasius I, surnamed Dicorus, Byzantine emperor, 491-518, b. c. 430 at Dyrrachium. He succeeded Zeno, whose widow, Ariadne, he married. He ruled with great energy and justice. His reign was marked by the Isaurian (492-6) and the Persian wars (502-6), and by invasions of Slavs, Huns, and Bulgarians. **Anastasius II**, surnamed Artemius, Byzantine emperor, 713-716. He was deposed by a mutiny of the navy, which proclaimed Theodosius III in his place. A. became a monk in Thessalonica, but later headed a revolt against Leo, the successor of Theodosius, and was put to death.

Anastomosis, intercommunication of blood-vessels, so that the supply of blood to any part of the body is not wholly dependent upon one channel; it is particularly free around joints. The term is extended to apply to the estab. of a communication between 2 hollow parts, or 2 different portions, of the same organ.

Anata, vil. of Palestine, 3 m. NE. of Jerusalem. It is supposed to occupy the site of the anc. Anathoth, the bp. of Jeremiah. It possesses various anc. remains.

Anatase (Gk *anastasis*, extension), or **Octahedrite**, also called **Oisanite** and **Dauphinite**, is a mineral form of titanium dioxide. The crystals have either many pyramidal faces or occur as simple acute double pyramids. They are found in granite crevices in Switzerland and Le Bourg d'Oisans in Dauphiné.

Anathema, literally 'that which is set aside, or offered.' Used by the Greeks in respect of gifts made to the gods either in gratitude or for propitiation. As animals so offered were condemned to death, the word has gained a secondary sense of perdition. The word A. was used by the Catholic Church as part of the formula in the excommunication of heretics. In 1 Cor. xvi. 22 occur the words: 'If any man love not the Lord Jesus Christ, let him be Anathema. Maran-atha.' The word Maran-atha has for this reason erroneously been thought to be an amplification of the curse, but its meaning is merely 'the Lord cometh.'

Anatidae (Lat. *anas*, duck), family of web-footed birds belonging to the order Anseriformes. It includes swans, geese, and ducks among its 150 or so species.

Anatolia, 'Land of the Rising Sun' or Orient, the Gk name for Asia Minor. See ASIA MINOR and TURKEY.

Anatolike, or **Aetolikon**, tn of Greece, built on an is. 6 m. N. of Missolonghi, and connected with the mainland by causeways on either side. It exports fish and oil, and cultivates the vine and olive. In 1881 there was a violent eruption of sulphuretted hydrogen in the lagoon. Pop. 4400.

Anatomy, study of the form or structure of a living thing. Thus there are 2 prin. divs., vegetable A. and animal A. If the latter is concerned with the structures of various classes of animals as compared with one another it is called *Comparative A.* When one particular species of animal is the object of study the science is called *Special A.*, of which *Human A.* therefore forms a branch. It is in this latter sense that the term 'anatomy' is generally applied. It consists in the observation of the form of the various organs and tissues, the materials of which they are composed, and their possible variations, as distinct from physiology, which deals with the functions of those parts. Thus the work of the anatomist is to investigate and describe the shape, size, position, and construction of organs, etc.; he will, for instance, describe the various parts of the liver, the substances of which it is composed, and the position of the liver with regard to other organs, whilst the physiologist will deal with the problem of how the liver makes bile, and how the work it does affects the constitution of the blood and the whole process of nutrition. *Human A.* itself is a wide subject, to be approached from sev. points of view, and the investigation of a single part has provided a lifelong study for many a scientist. *Descriptive A.* is a study of the separate and individual parts in the body, apart from their relationship to surrounding parts; *Microscopic A.* deals with facts gleaned from microscopical examination; *Morbid or Pathological A.* is a study of diseased or abnormal structures; and *Practical A.* deals with the body as a subject for dissection. *Artistic or Surface A.* is an allied subject, and deals with the position of the various structures only so far as they affect the outward appearance for the purpose of representation by painting, sculpture, etc.

The organs may be classified according to function into systems, as the *skeletal system*, comprising the bones and ligaments; the *muscular system*; the *respiratory system*, comprising the lungs, wind-pipe, diaphragm, etc.; the *circulatory system*, comprising the heart and blood-vessels; the *alimentary system*, comprising the stomach, intestines, liver, and all those organs concerned with nutrition; the *excretory system*, comprising the kidneys, bladder, etc.; the *reproductive system*, comprising the ovaries, testes, etc.; and the *nervous system*, comprising the brain, spinal cord, nerves, and organs of sense. The organs are composed of tissues, of which the epithelial, the connective, the muscular, and the nervous tissues may be taken as the prin. groups.

The introduction of radiography into medical science has been of benefit not only to the physiologist but also to the

anatomist. In the *living body* the anatomist is now able to study the interdependence of various organs during life, to find out where weight is exerted in natural circumstances, to discover at what age and at what precise points ossification of the bones takes place; and he is also enabled to determine the normal positions of such organs as the heart and the stomach while performing their ordinary functions.

When an X-ray photograph has been taken of the bones, the shadow picture is made clear because of the solidity of the bones, but where the stomach is under review a 'test meal' of some such nature as porridge mixed with the innocuous and tasteless carbonate of bismuth is administered to make the organ opaque to the anatomist. By the injection of compounds of iodine into the lungs, and of oxygen into the brain, these organs are also enabled to show up clearly in the X-ray photographs.

See also MORPHOLOGY.

Consult A. M. Buchanan, *Manual of Anatomy* (8th ed.), 1949, and H. Gray, *Anatomy. Descriptive and Applied* (31st ed.), 1954.

Anatta, Anatto, see ANOTTO.

Anaxagoras (c. 500-428 BC), Gk philosopher, b. Clazomenae, Ionia. About 464 he went to Athens and taught there for 30 years, among his pupils being Pericles, Euripides, and perhaps Socrates. He exerted great influence, both on account of his mathematical and astronomical wisdom and the ascetic dignity and strength of his character. His attempts to explain physical phenomena by natural means laid him open to the charge of impiety. He was acquitted after being defended by Pericles, but left Athens for Lampsacus on the Hellespont, where he d. The physical theory of A. assumed an original 'mixture' which contained the 'seeds' of all natural substances; from this mixture identifiable substances were separated out by the action Nous (mind). Many strange opinions on physical philosophy are attributed to A. He said that the sun was a mass of hot iron larger than the Peloponnesus: the opinion that the moon derived her light from the sun is probably not his own. Fragments of A.'s single work *On Nature* have survived. See H. Diels, *Die Fragmente der Vorsokratiker* (6th ed.), 1952; J. Burnet, *Early Greek Philosophy* (4th ed.), 1948; J. Zafiropulo, *Anaxagore de Clazomène*, 1948.

Anaxarchus of Abdera (4th cent. BC), Gk philosopher of the school of Democritus (q.v.). He accompanied Alexander the Great into Asia (334 BC). After Alexander's death (323 BC) A. was shipwrecked on the coast of Cyprus where the vicerey Nicocreon, whom he had offended, had him pounded to death in a stone mortar. He is reported to have cried out 'You may crush my body, but not my soul.'

Anaximander, Gk philosopher (610-c. 545 BC), b. Miletus in Ionia. He was a pupil of Thales (q.v.), and explained the world as having developed from a first

principle which he called 'the Indeterminate.' Besides drawing the first map of the world, A. wrote the first Gk prose treatise, of which a few short fragments are extant. See J. Burnet, *Early Greek Philosophy* (4th ed.), 1948.

Anaximenes (fl. mid 6th cent. BC), Gk philosopher, b. Miletus, Ionia. Said to have been a pupil of Anaximander. He considered air to be the source of all matter, from which it (matter) was formed by condensation and rarefaction.

Ancash, coast prov. of central Peru. It lies partly in the Cordilleras, partly in the Marañon R. valley, and partly on arid Pacific coast land. It produces wheat, barley, coffee, and tropical fruits. There are lead-, copper-, silver-, and gold-mining industries. Cap. Huaráz. Area 14,705 sq. m.; pop. (1950), 554,000.

Ancaster, vil. of Lincs, England, 6 m. W. of Sleaford. Lying on the Rom. Ermine Street, it was the last Rom. station (*Causennae*) before Lincoln, the camp covering some 9 ac. Here, and at nearby Wilsford, is quarried A. stone, a quickly hardening limestone. Pop. 800.

Ancenis, tn, dept. Loire-Inférieure, France; situated on the Loire, 21 m. NE. of Nantes. Pop. 4800.

Ancestor Worship, feature of many religions. The line of demarcation between gods and men is clearly and distinctly drawn in Greece: the worship of heroes was a prominent feature of Gk religion, but this did not lead to deification except in rare cases, e.g. Hercules (see also EUHEMERUS). The same is true of Rom. worship. Spirits of the dead, *manes*, were worshipped with a ritual distinct from that bestowed on the gods. Access to their abode in the underworld was obtained through the *lapis manalis*, a stone covering a pit; and they were regarded as eating and drinking. A. W. is the basis of religion in China and Japan. The Hindus also attach great importance to the power of departed spirits, and believe that all their actions are watched by these deities. A. W. is a characteristic of the religion of many primitive peoples, in particular those in which the basic communities of the society are composed of kinsmen descended from a common ancestor: the dead kin of the group are worshipped, sacrifice being the occasion of communion between living and dead members.

Anchises, son of Capys and Themis, the daughter of Ilius, and King of Dardanus on Mt Ida. He became the father of Aeneas by Aphrodite. He was struck by lightning and became blind for having boasted of his intercourse with the goddess. When Troy was captured A. at first refused to leave, but was at last persuaded by Aeneas, who carried him on his shoulders from the burning city (see Virgil's *Aeneid*, ii). A. d. soon after Aeneas arrived in Sicily, and was buried on Mt Eryx.

Anchor, instrument used for the purpose of fixing the position of a ship by fastening it temporarily to the bottom of a riv. or sea. The word is derived from the Gk *ankura*, meaning a hook.

By its use drifting with currents, tides, and wind is prevented. The A. is attached to the ship by a cable. It is of early origin, though the primitive forms it took were not more scientific than large stones or sacks of sand. The first hook A. has been traced to the Greeks. The diagram illustrates the modern type of A. A sea A. is a floating A. somewhat like a stout parachute, trailed in the water behind the vessel to retard its movement, and used where anchorage to the bottom is impracticable. The grapnel is a small A. with 4 or 5 flukes. The A.s used by the Admiralty bear no stock, and have movable blades so arranged that they grip the bed of the sea irrespective of any position the A. may assume. This type is known as the Wasterneys-Smith.

ANCHOR

A, palm blade (or fluke); B, arm; C, crown; D, bill (or pea); E, trend; F, stock; G, shackle (or eye, or ring); H, shank.

Anchor Ice (Ground Ice), form of ice which adheres to the bottom only of those waters which are characterised by a never-ceasing tempestuous motion. The ice is very porous, and as it rises it often brings to the surface any matter to which it may be adhering. It forms only in a temp. lower than 10° F. Until zero its adherence to the bottom is not of any strength.

Anchorage. In special areas, a fee is chargeable to the captains of vessels who wish to anchor. Generally the ownership of the area is restricted to the state which receives the toll, but sometimes private companies and, rarely, separate individuals own the reserved water. The word also means anchor-ground, i.e. a bed composed of stiff clay or firm sand.

Anchorite, see HERMIT.

Anchovy, small fish belonging to the family Engraulidae and related to the herring family (Clupeidae). A.s are distinguished from the latter by the pointed snout that projects in front of the mouth. The numerous species occur in coastal seas of the tropical and temperate regions.

Anchovy Pear, *Orias cauliflora*, family Lucythidaceae, evergreen tree of 30 to 50 ft of the W. Indies, with fragrant yellow flowers, followed by edible, brown, berry-like fruits.

Anchusa, family Boraginaceae, genus of

herbs found in Europe, Africa, and W. Asia. *A. officinalis* is the common Alkanet of Britain, sometimes used in dye manuf. *A. azurea*, and varieties, is a popular garden border perennial, from the Caucasus. See PENTAGLOSSIS.

Ancient Buildings, Society for the Protection of, see PROTECTION.

Ancient Demesne, term which signifies estates or manors vested in the king at the time of the Norman Conquest. Freedom from many of the prevalent duties binding upon tenants was a privilege attached to them; among these exemptions were freedom from the Danegeld, from tolls and duties, from fines, and from sitting on juries. The conditions attached to their ownership gave rise to the modern 'freehold' property.

Ancient Lights, see LIGHTS, ANCIENT.

Ancient Monuments, Act for the Protection of, see PROTECTION.

Ancient Weights and Measures, see METROLOGY.

Ancients and Moderns. The celebrated controversy between the A. and M. which raged in Fr. and Eng. literary circles at the end of the 17th and beginning of the 18th cents. centred on the respective merits of classical and modern literature. Though not the first protest against the worship of the classics, the *Traité pour juger les poëtes grecs, latins, et françois* of Desmarets de Saint-Sorlin, pub. in 1670, in which he attacks Homer and Virgil, and the work of the same author entitled *Discours pour prouver que les sujets chrétiens sont les seuls propres à la poésie héroïque*, may be said to have actually started the dispute. For these he received severe handling from Boileau in his *Art poétique*, 1674, to which Desmarets replied with his *Défense du poème héroïque*, 1674, and *Défense de la poésie et de la langue française*, 1675. Subsequently the cause of the Moderns found its chief champions in the brothers Perrault, who for many years kept up the dispute with such doughty opponents as Boileau and Racine. An important contribution to the case of the Moderns was Fontenelle's *Digression sur les anciens et les modernes*, 1688. In England the dispute commenced with the pub. of Sir Wm Temple's *Essay upon the Ancient and Modern Learning*, 1692, written from the classical side, and answered by Wotton's *Reflections upon Ancient and Modern Learning*, 1694. In his defence of classical literature Temple strangely enough found himself opposed to Bentley, the most brilliant classical scholar of the day, who secured a signal triumph in the controversy by proving the spuriousness of the *Letters of Phalaris*, upon which Temple had bestowed high praise. The outstanding literary contribution to the discussion is Swift's *Battle of the Books*, 1704, written in favour of the classical view.

Ancillon, Charles (1659–1715), Fr. Protestant historian, b. Metz, son of the famous Protestant minister, David A. His chief works are *L'Irrevocabilité de l'édit de Nantes*, 1688, and *Histoire de l'établissement des Français réfugiés dans le Brandebourg*, 1690.

Ancillon, David (1617-92), Fr. Protestant divine, *b.* Metz and *d.* Berlin. In 1641 he was licensed to preach by the synd. of Charenton, and appointed minister at Meaux. In 1653 he accepted a call to Metz, and officiated there until the revocation of the Edict of Nantes compelled him to retire to Frankfurt. He wrote works in defence of the new Protestant faith. See *Mélange critique de littérature recueilli des conversations du feu M. Ancillon*, Basel, 1698.

Ancillon, Johann Peter Friedrich (1767-1837), Prussian historian, of Fr. Huguenot extraction, *b.* Berlin. In Berlin he became tutor to the crown prince of Prussia. In 1832 he was appointed foreign minister. He is the author of *Révolutions du système politique de l'Europe*. The exceptional quality of his work lay in its stress on the psychological element in the great movements of hist.

Ancon, fishing port, resort, and road and rail point in the dept of Lima, Peru. Pop. 1100.

Ancona, Alessandro d' (1835-1914), It. man of letters, *b.* Pisa, educ. Florence and Turin. At the latter place he took a prominent part in the agitation preceding the war of independence and represented the Tuscan Liberal party. In 1859 he founded and for some time ed. *La Nazione*. In 1860 he was appointed prof. of It. literature at the univ. of Pisa. He ed. Dante's *Vita Nuova*, and various other works of early It. writers. Among his original works on literary and dramatic subjects may be mentioned *Sacre Rappresentazioni dei Secoli XIV, XV, e XVI*, 1872; *I Precursori di Dante*, 1874; *Origini del Teatro in Italia*, 1877; and *La Poesia popolare italiana*, 1878. In 1882 was pub. his autobiography, under the title of *Il Primo Passo*.

Ancona: 1. Prov. of Italy, in the central Marches (q.v.). In the NE. there is an undulating coastal plain on the Adriatic; the SW. contains ridges of the central Apennines (q.v.). The chief rivs. are the Misa, Esino, and Musone. The prin. tns include A., Senigallia, Osimo, and Fabriano (q.v.). Area 765 sq. m.; pop. 406,000.

2. (Gk *ankōn*, an elbow, referring to the tn's position on a promontory) It. seaport, cap. of the prov. of A., and chief tn of the Marches, 86 m. NNE. of Rome (q.v.). It is on the Adriatic, and was founded c. 390 Bc by refugees from Syracuse (q.v.). It suffered from the depredations of the Goths and the Saracens (q.v.). The tn was occupied by the French in 1797 and 1832, and by the Austrians in 1849. During both world wars it was bombarded. A. has a triumphal arch and a mole of Trajan's reign, and many splendid medieval buildings, including the 11th-13th-cent. church of Santa Maria della Piazza and the Palazzo del Comune (partly 13th cent.). The Romanesque-Byzantine archiepiscopal cathedral (11th-13th cents.) suffered damage (now repaired) during the Second World War, as did sev. other anct. buildings. The harbour of A. is one of the best on the

Adriatic, has a busy trade, and has been used as a naval base since the last cent. There are shipbuilding yards and engineering works. Pop. (tn) 52,600; (com.) 85,700.

Ancre, Concino Concini, Marshal d' (*d.* 1617), Florentine favourite of Marie de' Medici, second wife of Henry IV of France. He married Leonora Galigai, one of the queen's women, and with the co-operation of his wife succeeded in aggravating the unhappy relations between Henry IV and Marie. Upon the king's death he became Marshal of France, though possessing no military knowledge or experience. He was eventually assassinated.

Ancre, Battle of the. This battle was an extension of the great Somme battle of July to Aug. 1916. The Germans were entrenched near the riv. The actual attack began on 13 Nov., three Brit. divs. under Gough taking part, the 31st being foremost in the advance. Great losses were sustained by the 3rd Div. on the S. of the 31st Div. on ground between Serre and the riv., and some success was obtained by the 2nd Div. on the right of the 3rd; but the divs. which were operating further S. fared much better, capturing St Pierre Divion vil. and Beaucourt and clearing the enemy from the last trench system between the Brit. front and the riv. Co-operating with these infantry divs. was the 63rd Naval Div., which attacked N. of the riv. The riflemen then threw a pontoon across the riv. so as to link up with the 39th Div. on the S. The Ger. redoubt surrendered. The strongly organised and important vil. of Beaumont Hamel was taken; meanwhile the remaining divs. S. of the A., of Gough's Fifth Army, also advanced and, though suffering great losses, made a little headway in the direction of Grandcourt and Petit Miraumont. At dawn on 18 Nov. the new advance was begun, a little ground being gained, much of which was lost by a prompt counter-attack. This battle was the last combined operation of 1916 and is usually claimed as a Brit. victory.

Ancren Riwe (anchoresses' rule), prose treatise written in M.E. It dates probably from the early part of the 13th cent. It was designed for the guidance of three women who had taken the vows but belonged to no order, living in a hermitage at Tarrant Keynes in Dorset. Its authorship is uncertain. Its theme is the need for rigorous renunciation, though the severity of its tone is softened somewhat by the affectionate phrasing. It also contains an interesting account of the early Eng. Church doctrines.

Anorum, vil. on the Ale Water, a trib. of the Teviot, in Roxburghshire, Scotland. Its name is derived from *crom*, a bend, as it is situated on the bend of the Ale or Alne. In the vicinity is A. Moor, the scene of a battle between the English and Scots in 1545. Pop. 890.

Ancus Marcius, 4th legendary King of Rome (640-616 bc), and reputed grandson of Numa Pompilius (q.v.). Notwithstanding his peaceful inclinations, A. M. was obliged to make war on the Latins; and his settlement of some captives on

the Aventine hill was the supposed origin of the Plebeians. A. M. was said to have fortified the Janiculum, bridged the Tiber, founded the port of Ostia, estab. salt works, and built a prison. See Livy, i. 32, 33; Dion. Hal., iii. 36-45.

Ancylys (Gk *ankylus*, bent), genus of fresh-water snails, often called riv. limpets. They belong to the family Limnaeidae and order Euthyneura of the gastropod molluscs. Their lung-sacs always contain water, and they cannot breathe on land. They are found in springs and streams, adhering to stones and leaves.

Ancyra, anct city of Galatia on a trib. of the Sangarius. It was once a centre of the Tectosages, one of 3 Gaulish tribes who settled in Galatia in 232 BC. An important eccles. synod was convened there in AD 314. There too was discovered, in 1555, the celebrated Monumentum Ancyranum erected by the Emperor Augustus to record his acts between 44 and 28 BC. See ANKARA.

Andalucia (Eng. *Andalusia*), region in S. Spain, with coastlines on both the Mediterranean and the Atlantic. It comprises the provs. of Almería, Cádiz, Córdoba, Granada, Huelva, Jaén, Málaga, and Sevilla (q.v.), and is thought to be the biblical *Tarshish* (q.v.). In the 5th cent. it was overrun by the Vandals (whence, possibly, its name, from *Vandalitia*), and it was the last part of Spain to be taken from the Moors. Some of it remained in Moorish hands until the end of the 15th cent. The legacy of the Moors remains to-day in its famous cities, its customs, its music, and its dialectic language. A. is, in general, a great plain, lying largely in the basin of the Guadalquivir (q.v.). In the N. it is bounded by the Sierra Morena (q.v.), and it contains also the Sierra Nevada (q.v.). It is one of the most fertile and productive regions of Spain, and is celebrated for horses and mules, oranges and other fruits, wine (sherry), and copper from the mines of Rio Tinto (q.v.). Area 35,700 sq. m.; pop. 5,711,700.

Andalusia, see **ANDALUCÍA**.

Andalusite (from *Andalusia* in Spain), anhydrous silicate of alumina found in France, Spain, and N. America. It occurs crystallised in the ortho-rhombic system, usually in square prisms. In colour it is flesh-red to brownish, greyish-red, and violet.

Andaman Islands, group of is. in the Bay of Bengal. They number 204 and vary in size. Total area is 2500 sq. m. The main portion consists of 5 large is. so closely connected that they are called 'Great A.' Their names in order from N. to S. are N. A., Middle A., S. A., Baratang, and Rutland Isle. The 4 straits separating them are Austin Strait, Homfray's Strait, Middle Strait, and Macpherson Strait. The Little A. group to the S. has been used, since 1858, by the Gov. of India as a penal settlement for life and long-term convicts, but the practice is being discontinued as it has had a morally deleterious effect upon the natives. There were 6000 convicts there in 1941.

The British settled there in 1789, in the N. A. Is., but abandoned the place for Penang. The cap. of the present settlement is Port Blair, in S. A. Its harbour is one of the finest in the world. There are other harbours and safe anchorages, including Port Cornwallis and Bonington. The climate is warm, tempered by pleasant sea breezes and the modifying influence of the sea. The is. are densely wooded, and among the best-known timbers is A. red-wood (or *padank*). Coco-nut and rubber are successfully cultivated. There is wireless communication with Burma and Madras. Raided for the first time by Jap. bombers in Feb. 1942. Jap. forces occupied the is. on 23 Mar. 1942, but surrendered them in Aug. 1945. The aboriginal inhab. are famous in anthropology, as representing a simple hunting and gathering culture. The total pop. of the is. (excluding the aborigines) in 1941 was 21,500. See A. K. Radcliffe-Brown, *The Andaman Islanders*, 1922.

Andante (from It. *andare*, to go, to walk), in music, is one of the 5 prin. tempos, midway between *adagio* and *andantino*. It indicates a steady calm movement. It is often modified, as *A. maestoso*, slow and majestically; *A. cantabile*, slow, in a singing style; *A. ma non troppo*, which, however, is a solecism, since 'walking, but not too walking' is meaningless.

Andantino (It. dimin. of *andante*), in music, movement a little faster (originally slower) than *andante*.

Andaqui, formerly an important confederacy of highly civilised tribes occupying the head-waters of the Cauquetá and Magdalena R.s in S. Colombia.

Andelys, Les, Fr. tn in the dept of Eure, on the Seine. It is in two parts, the Petit-Andely, which is dominated by the magnificent ruins of Château Gaillard (q.v.), and the Grand-Andely, which has a very fine Gothic church, parts of which are 13th cent. The Grand-A. was very severely damaged in the Second World War. A. was the bp. of Nicholas Poussin, Brunel, and François Blanchard (q.v.). It trades in cattle, grain, leather, and textiles. Pop. 5200.

Andenne, industrial tn in Belgium, 12 m. E. of Namur. Its manufs. include paper, porcelain, and tobacco-pipes (an industry dependent upon a bed of pipe-clay). A. was one of the Belgian tns whose inhab. especially suffered at the hands of the invading Germans in the 1914 invasion. Some 100 civilians were shot and a still larger number deported. Pop. 7700.

Anderab, or **Inderab**, tn of Afghanistan, in a fertile dist. on the Hindu Kush Mts. Pop. 6500.

Anderida, see **PEVENSEY**.

Anderlecht, one of the main suburbs of Brussels, Belgium, SW. of the city itself. The 15th-cent. church of St-Pierre, built over an 11th-cent. crypt, is of great artistic interest. The tn has an important cattle market. Pop. 91,100.

Anderlues, tn in the prov. of Hainaut, Belgium, 7½ m. W. of Charleroi. It has coal-mines. Pop. 13,000.

Andermatt, Swiss vil. in the canton of

Uri. It is a noted tourist and winter sports centre at the junction of the Furka Pass with the St Gotthard road. Elevation 4700 ft.

Andersaoh (anct **Antunnaeum**), Ger. tn in the *Land of Rhineland-Palatinate* (q.v.), on the Rhine (q.v.), 47 m. NW. of Mainz (q.v.). It was once a Rom. camp, but there is evidence that the site has been occupied since prehistoric times. The tn was admitted to the Hanseatic League (q.v.) in 1253. Chemicals and cement are manuf. Pop. 16,000.

Anders, Wladyslaw (1892-), Polish lieutenant-general. He served in the Russian army from 1914 to 1917 and in the Polish Poznan forces in 1918. During the Russo-Polish war of 1919-20 he commanded a cavalry regiment. At the time of the Ger. invasion of Poland in 1939 he was a brigade commander. He was deported by the Russians, but was released in 1941; he subsequently became commander of the Polish II Corps during the It. campaign. He refused to recognise the Lublin Gov. sponsored by the Russians, and since the war has lived in exile. His pubs. include *An Army in Exile: the Story of II Polish Corps*, 1949, and *Hitler's Defeat in Russia*, 1953.

Anderson, Hans Christian (1805-75), Dan. writer, one of the greatest children's story-tellers of the world. He was *b.* at Odense in Fyn, son of a sickly shoemaker, who *d.* in 1816. Thrown on his own resources he built himself a toy theatre, made clothes for his puppets, and read borrowed plays, especially those of Shakespeare and Holberg. It was planned to teach him tailoring, but he wanted to be an opera singer and set out for Copenhagen, where he was taken for a lunatic and rebuffed at the theatres. Befriended by the musician Weyse and the poet Guldberg, he became a dancing pupil at the Royal Theatre where, eventually, he gained the patronage and lifelong friendship of Jonas Collin, the manager. Later King Frederick VI, becoming interested in the strange lad, had him educ. at the grammar school at Slagelse. In 1830 he pub. his first vol. of poems, including the widely trans. *Dying Child*. This was followed by a literary satire called *A Walk to Amak*. Adverse criticism met him, but he eventually triumphed after travelling abroad, again at the king's expense. His works, the best of which are proverbially known as *Hans Andersen's Fairy Tales*, include *Picture-books without Pictures*, *A Poet's Bazaar*, *Tales from Jutland*, *The Wild Swan*, and *The Ice Maiden*. His *Ugly Duckling* and *The Brave Tin Soldier* are known and loved by children the world over; although his stories have a deeper meaning really meant for adults. A's *Fairy Tales* have been trans. into 35 languages. See S. Toksvig, *The Life of Hans Christian Andersen*, 1940; C. B. Burnett, *The Shoemaker's Son*, 1943; Rumer Godden, *Hans Christian Andersen*, 1955; *The Mermaid Man*, an autobiography (trans. M. Michael), 1955.

Anderson, Alexander (1845-1909), poet, *b.* Dumfriesshire, became a surfaceman on

the railway. He spent all his leisure in self-culture, taught himself sev. languages, and eventually rose to be librarian of Edinburgh Univ. His vols. of verse include *Songs of Labour*, 1873, *Two Angels*, 1875, *Songs of the Rail*, 1878, and *Ballads and Sonnets*, 1879.

Anderson, Carl David (1905-), Amer. physicist, *b.* New York. Studied at California Institute of Technology. In 1932 he discovered the positron or positive electron, predicted by Dirac (q.v.), and was awarded the Nobel prize in 1936.

Anderson, Sir Edmund (1530-1605), lawyer, appointed serjeant-at-law to Queen Elizabeth in 1579. He was the author of *Reports of Many Principal Cases Argued and Adjudged in the Time of Queen Elizabeth in the Common Bench*.

Anderson, Elizabeth (Garrett) (1836-1917), physician. She was the pioneer of the movement to include women in the medical profession. After a severe struggle she at last was admitted to the Society of Apothecaries, London. In 1866 she founded St Mary's Dispensary for Women. It later became the New Hospital; she officiated there 20 years. She obtained her degree of M.D. from the univ. of Paris, 1870. In London she took part in public life, working for women's education. She married in 1871 Mr J. G. S. Anderson, a shipowner, who *d.* in 1907. In 1908 she was elected mayor of Aldeburgh, her native tn, being the first woman mayor ever elected in England. See Naomi Mitchison, *Revaluations*, 1931, and E. M. Bell, *Storming the Citadel*, 1933.

Anderson, James (1662-1728), Scottish genealogist and antiquary, *b.* Edinburgh, and educ. at the univ. there. His main work was *An Historical Essay showing that the Crown and Kingdom of Scotland is Imperial and Independent*, 1703, for which he was rewarded by the Scottish Parliament.

Anderson, John (1726-96), natural philosopher, *b.* Dumbartonshire. He founded A. College, Glasgow. In 1756 he became prof. of oriental languages at Glasgow Univ., and 4 years later prof. of natural philosophy. He was interested chiefly in the application of science to industry. He *d.* in Glasgow. Produced *Institutes of Physics*, which went through 5 eds. in 10 years.

Anderson, Mary (1859-1942), Amer. actress of great beauty, *b.* California. Her father was an officer in the Confederate service during the Civil war. He *d.* in 1863. His daughter was educ. at Rom. Catholic institutions till she was 13, when she studied for the stage upon the advice of Charlotte Cushman. Her first appearance was at Louisville, in Kentucky, in the part of Juliet, in which she was a great success. She settled in England and had a most distinguished career on the London stage. In 1889 she retired and married Antonio de Navarro.

Anderson, Maxwell (1888-), Amer. dramatist, *b.* Atlantic, Pennsylvania, son of a clergyman. Educ. at Notre Dame Univ. and Stanford. He worked as a journalist in San Francisco and then in New York. He is counted one of the

greatest Amer. dramatists of his time, his greatest success being with historical plays such as *Elizabeth the Queen*, 1930, *Mary of Scotland*, 1933, *Joan of Lorraine*, 1946, and *Anne of the Thousand Days*, 1948. Both *Your Houses*, 1933, a political satire, was awarded the Pulitzer Prize. Others of his plays are *Saturday's Children*, 1927, *Winterset*, 1936, *High Tor*, 1937, *Key Largo*, 1939, *Journey to Jerusalem*, 1940, *Candle in the Wind*, 1941, *Truckline Café*, 1946, *Barefoot in Athens*, 1952, and *The Bad Seed*, 1955. *The Essence of Tragedy*, 1935, is a study of dramatic theory.

Anderson, Robert (1770-1833), Cumbrian poet, b. Carlisle. His first vol. of poems was pub. in 1798, and was followed in 1801 by the popular ballad *Betty Brown*. His best-known work, the collection of ballads in the Cumbrian dialect, appeared 4 years later. Amongst the best of his dialect poems are 'The Impatient Lass,' 'King Roger,' 'Will and Kate,' 'The Bashful Wooer,' and 'Jenny's Complaint.' His *Poetical Works* (and autobiography) were pub. at Carlisle in 1820.

Anderson, Sir Robert (1841-1918), criminologist and writer, b. Dublin. Educ. Trinity College, in 1868 he was appointed Home Office adviser in matters relating to political crime, and later became assistant commissioner of police of the metropolis. He was head of the Criminal Investigation Dept. from 1888 to 1901. In 1910 he caused a sensation by confessing the authorship of the famous *Times* letters of 1887 entitled 'Parnellism and Crime.' He was well known for his writings in defence of orthodox religion, among which may be mentioned *The Bible and Modern Criticism*, 1902, and *The Bible or the Church?*, 1908. He was also the author of *Criminals and Crime*, 1907, and *The Lighter Side of my Official Life*, 1910. See life by his son, A. P. Moore-Anderson, 1919.

Anderson, Sherwood (1876-1941), Amer. author, b. Camden, Ohio. At 14 he became a house painter, then joined the army and fought in Cuba. His first novel, *Windy McPherson's Son*, 1916, portrayed life in the Middle W. with marked psychological insight. *Winesburg, Ohio*, 1919, a collection of short stories, is often thought his best work. Other novels are *Marching Men*, 1917, *Poor White*, 1920, *Many Marriages*, 1922, and *Dark Laughter*, 1925; books of short stories are *The Triumph of the Egg*, 1921, *Horses and Men*, 1923, and *Death in the Woods*, 1933. *A Story Teller's Story*, 1924, and *Tar, a Midwest Childhood*, 1926, are autobiographical.

Anderson: 1. City, co. seat of Madison co., Indiana, U.S.A., 34 m. N.E. of Indianapolis. It has meat-packing and oil-refining industries, and manufs. tools, automobile parts, pumps, machinery, wire, glass, etc. It is the seat of A. College. Pop. 46,800.

2. Co. seat of A. co., S. Carolina, U.S.A., 28 m. S.W. of Greenville; it has textile mills, foundries, printing, and manufacturing, and produces cotton, fruit, and vegetables. A Junior College is here. Pop. 19,770.

Anderson's College, Glasgow, founded by John A., 1796, and endowed by him

with a library, museum, and philosophical apparatus, later called the College of Science and Arts. In 1886 the non-medical sections were incorporated with other institutions as the Glasgow and W. of Scotland Technical College. In 1912 it was renamed the Royal Technical College, and was affiliated to Glasgow Univ. (q.v.) in 1913.

Andersonville, vil. of Sumter, Georgia, noted as having been the site of a Confederate States military prison, where Union prisoners were confined during the Civil war. This prison was kept in so scandalous a condition that those incarcerated in it d. by thousands. Pop. 300.

Andersson, Karl Johan (1827-87). Swedish explorer, made sev. important expeditions in S. Africa, which he described in *Lake Ngami, or Discoveries in S. Africa*, 1856, *The Okavango River*, 1861, and *Notes of Travel in S. Africa*, 1875.

Andes, great mt system in one long continuous chain lying along the W. coast of S. America. Its length is approximately 5000 m., and it extends from the isthmus of Panama to Cape Horn. Its widest point has a breadth of 100 m. The average height of the chain is approximately 13,000 ft. It is the greatest mt system in the world. A theory that gains in evidence is that the A. are connected with the Rocky Mts of N. America. The whole system may be divided into 2 almost parallel chains separated by a declivity in which lesser mt ranges rise. The E. range is known as the A., but in Peru, Colombia, and Bolivia it is called Cordillera Real de los Andes. In Argentina the E. system merges into the W. div., and both ranges now bear together the name of Cordillera de la Costa. The W. section, in Colombia, Peru, and Bolivia, is called La Cordillera, while below lat. 23° S. it becomes the Cordillera de los Andes. The southernmost extremity is Cape Horn, and here the range extends into the sea and forms is. named Diego Ramirez. The great Chonos Archipelago owes its formation to a similar cause, and many authorities aver that it is the is. that constitute the prin. part of the range. In Patagonia the system is interrupted to some considerable degree by glaciers and deeply cut floods. The highest peaks are Tolima (18,300 ft) in Colombia; Cayambe (19,155 ft), Antisana (19,335 ft), Cotopaxi (19,600 ft), and Chimborazo (20,500 ft) in Ecuador; Huascarán (22,155 ft), Yerupaja (21,602 ft), and Ausangate (21,326 ft) in Peru; Illampu (21,500 ft), Illimani (21,221 ft), and Sahama (21,000 ft) in Bolivia; Llullaillaco (20,243 ft) and Copiapo (19,685 ft) to the S. of Atacama Desert; Aconcagua (23,080 ft), the highest peak in the whole range, in Argentine; Cima de Mercedario (22,210 ft) and Ojos del Salado (c. 23,000 ft) in Chile.

The whole region is volcanic and possesses many active volcanoes, the chief of which is Cotopaxi, in Ecuador, the glow from the crater of Cotopaxi sometimes attaining the extraordinary height of over 3000 ft above the crater. In tracing the world's 'ring' of volcanoes, the A. form a link of special significance owing to the

abundance of volcanic results and present-day activity. In Tierra del Fuego the Cordillera is composed of crystalline schists, the extremity of which portion is Mts Darwin and Sarmiento. The A. abound in plateaux, the most important of which are Assuay (14,500 ft), Colloa (12,500 ft), Cruz Verde (11,695 ft), Pasco (11,000 ft), Quito (9500 ft), and Bogotá (8958 ft). The mineral wealth of the A. is fabulous, the chief metals being gold, silver, platinum, mercury, copper, lead, tin, and iron. The climate in the Andean region is rendered very dry by the effect of the mts in cutting off the rain-bearing winds. From the A. eastwards, however, a heavy and beneficial rainy season owes its fall to the position of the A., as they lie directly across the trade winds. The great watercourses of the Amazon, Orinoco, and Plata owe their birth to the E. terraces of the A. The tremendous scale upon which all phenomena are created in this vast mt system forms one of the chief attractions to visitors. Mt exploration has been the work of expeditions from Germany, France, Italy, and America, but not from England, save those of Whymper to Ecuador in 1880 and Sir Martin Conway to Bolivia in 1898. Whymper climbed 8 peaks, including Chimborazo, and Conway 3, including Illimani. Peru offers splendid mountain-ering on ranges similar to the Himalaya in height, shape, and glaciation. Sov. hundred great peaks there remain unclimbed and these have drawn many expeditions since 1950. The best region for pioneer work is S. Chile and the interior of Tierra del Fuego, both being largely unexplored. See E. Whymper, *Travels Amongst the Great Andes of the Equator*, 1892; E. A. Fitzgerald, *The Highest Andes*, 1899; L. Gallois, *Les Andes de Patagonie*, 1901; Lord Conway, *The Bolivian Andes*, 1902; 'Climbs in the High Andes of Peru', *American Alpine Journal*, 1941; A. Heim, *Wunderland Peru*, 1948; Bennett and Bird, *Andean Culture History*, 1949; H. and S. Kinzl, *Cordillera Blanca*, 1950; B. Pierre, *La Conquête du Salcantay*, 1953; G. and L. N. Kogan, *The Ascent of Alpamayo*, 1954.

Andes, see MANTUA.

Andesite, name given originally to a group of lavas found in the Andes, but now applied to a large number of intermediate igneous rocks found in volcanic areas throughout the world and belonging to all geological epochs. They show considerable differences in composition, but usually consist of a ground-mass of felspar crystals, in which other minerals, such as biotite, hornblende, augite, and hypersthene, often occur. They are common in the Andes and Cordilleras of S., central, and N. America.

Andhra Pradesh, E. coast state of India, bounded by the Bay of Bengal on the E., Madhya Pradesh and Orissa on the N., Bombay and Mysore on the W., and Madras on the S., populated overwhelmingly by the Telugu-speaking Andhras, second largest linguistic group in India. The terrain varies from parched dists. in Telangana in the Deccan highlands to

hilly tracts pierced by riv. valleys in the E. Ghats and fertile delta tracts at the mouths of the Krishna and Godavari rts.

History. A powerful Andhra kingdom covered much of the Deccan in the 2nd and 3rd cents. AD; later various Hindu and Muslim overlords of India held sway here, followed by the Nizams of Hyderabad. In modern times Andhras, like other linguistic groups, have asked for their prov., and in Oct. 1953 the Teluga areas of Madras became a state. In 1956 much of the Nizam's domain, including his cap. at Hyderabad, was added to A. P.

Development. Delta irrigation gave A. P. a crop surplus in the past. Big irrigation projects will improve the yield further, and can be carried out more easily under a single state gov. Thus Nagarjunasagar, to irrigate 2.7 million ac., ceases to be an interstate project. Other schemes will cover 3 million ac. and also improve A. P.'s hydro-electric position. Main crops are rice, millet, maize, tobacco, oilseeds, and cotton. There is not much industrialisation save for Vishakapatnam (Vizagapatam) shipyards and some textile mills. Mineral resources tapped so far are mainly coal at Singareni. An inland riv. and canal transport system is fairly well developed.

Culture. Andhras speak Telugu, a Dravidian language, and have a distinct culture. Andhra Univ. is relatively new, but Hyderabad (Osmania) Univ. pioneered the use of an Indian language (Hindustani) as the medium for univ. teaching.

Government. The Governor acts through ministers responsible to an elected assembly of 301. A. P. has 18 representatives in the Upper and 43 in the Lower House of India's Parliament.

The cap. is Hyderabad (pop. 1,085,000). Other big towns are Vijayawada or Bezawada (161,000), Vishakapatnam (108,000), Guntur (125,000), and Rajahmundry (105,000).

Area 110,250 sq. m.; pop. 32.2 million. See also HYDERABAD (state and city).

Andira, genus of tropical Leguminosae. *A. inermis*, the cabbage-tree, is a species found in the W. Indies; its bark is a strong anthelmintic.

Andizhan: 1. Oblast (prov.) of Uzbek S.S.R. of the Soviet Union. Most of the oblast is under cotton cultivation. There are oil-fields producing petroleum and natural gas. Pop. 630,000.

2. Tn and cap. of A. oblast. It is a junction of railways to Kokand, Namanagan, and Karasu (Kirgiz S.S.R.). It has cotton and food processing plants. Pop. 105,000.

Andkhui, tn in Afghanistan, due N. of Balkh, on the edge of the desert. Its site is extremely unhealthy, and the pop. consists mainly of Turkmen, Uzbeks, and a few Tajiks. Pop. 15,000.

Andocides (440-c. 389 bc), Athenian orator. He was concerned in the mutilation of the Hermæ (415), but turned informer and fled from Athens. After a period of wandering and many adventures, he was recalled in 403 and occupied sev. responsible offices. His failure to negotiate peace with Sparta in 391 led to his

downfall, and he is said to have *d.* in exile. Meanwhile, however, in 399, he was prosecuted for impiety and successfully defended himself in a speech *On the Mysteries*. This is extant; it gives a remarkable account of the Hormae affair. See the ed. by F. Blaas, revised by C. Fuhr (1913). See also R. C. Jebb, *The Attic Orators* (2nd ed.), 1893.

Andorra, small, semi-independent republic, on the Franco-Sp. border, in the E. Pyrenees (q.v.). It is surrounded by mts, and is watered by the R. Valira, which joins the Segre at Urgel (q.v.). A. is said to have been declared a free state by Charlemagne (q.v.). By the *Partage* of 1278 the state was placed under the joint suzerainty of the Comte de Foix (q.v.) and of the Bishop of Urgel (q.v.). The rights of the Comte de Foix passed in time to the Fr. crown, and are now exercised by the President of the Fr. Rep. The co-princes are represented in A. by the 'Viguier de France' and the 'Viguier Episcopal.' The state pays bi-ann. dues of 960 francs to France and 460 pesetas to the bishop. The actual gov. of A. consists of a 'General Council of the Valleys,' which has 24 members (each elected for 4 years); this council elects a president (*Syndic Procureur Général*) and a vice-president, who must not be members of it. The altitude of A. varies from 6500 to 10,000 ft, and its climate is severe. It consists of sev. small valleys and defiles, and has 6 vils.: A.-Vicilla, Canillo, Encamp, La Massana, Ordino, and San Julian de Loria. The inhab. live mainly by pasturage and, in the more sheltered parts, agriculture. The hills are said to have mineral wealth, but this is unexploited. The Andorrans are of Catalan (see CATALONIA) origin, and their language is Catalan (q.v.). They have a reputation for being hospitable, cheerful, and hard-working. By religion they are Rom. Catholic. The cap. of the state is A. la Vieja (pop. 6000). Total area 191 sq. m.; total pop. 5000. See L. G. Leary, *The Hidden Republic*, 1912; V. W. Johnson, *Two Quaint Republics, Andorra and San Marino*, 1913; B. Newman, *Round about Andorra*, 1928; J. Corts Peyret, *Geografía e Historia de Andorra*, 1945.

Andover: 1. Mkt tn of Hants, England, on the R. Ann. a trib. of the Test. The centre of an extensive agric. dist., it owes its importance to its agric. products. It contains many very well-preserved Rom. remains. Its former industries of silk, iron, and parchment are now extinct. Pop. 15,600.

2. Tn of Essex co., Massachusetts, U.S.A., on the SE. side of Merrimac valley, the most important centre in the world for mills. It is noted for the manuf. of woollens and rubber goods, and for its educational institutions, Phillips Academy and Abbot Academy. Harriet Beecher Stowe resided, and is buried, at A. Pop. 12,437.

Andrada e Silva, José Bonifácio de (1763-1838), Brazilian scientist, author, and statesman, and one of the founders of Brazilian independence. Studied in Europe, and subsequently, in virtue of his

distinguished scientific attainments, was appointed prof. of geology and metallurgy at the univ. of Coimbra, Portugal. He returned to Brazil in 1819, took up the cause of independence, and in 1822 became minister of the interior under Dom Pedro I. He was banished in 1823 on account of his democratic opinions, but on the abdication of Dom Pedro was entrusted with the education of the prince imperial. In addition to important scientific memoirs he wrote *Poesias d'America Elysea*, Bordeaux, 1825.

Andrássy, Count Julius (1823-90), Hungarian statesman, b. Kassa, Hungary. In 1847 he was returned as a Radical member of the Diet. He took a prominent part in the Hungarian revolt of 1848, and subsequently went into exile for 9 years. When the Dual Monarchy was estab. (1867) A. was made the first Hungarian premier, and later succeeded Beust as chancellor. Here he advanced radical changes, and under his influence Austria regained something of her former prestige in Europe.

Andrássy, Count Julius (1862-1929), Hungarian statesman, son of the above. In Oct. 1918 he succeeded Burian as foreign minister, being the last foreign minister under the Dual Monarchy. In that capacity he notified Wilson that his gov. was ready to acknowledge 'the rights of the peoples of Austria-Hungary, especially those of the Czechoslovaks and the Yugoslavs,' and to make a separate peace without awaiting the issue between Germany and the Allies. He wrote *Diplomacy and the World War*, 1920.

André, or Andreas, Bernard (fl. 1500), historian and poet, a native of Toulouse, and an Augustinian friar. He is said to have come to England with Henry VII in 1485. He became tutor to Arthur, Prince of Wales. A. wrote in Latin an unfinished hist. of Henry's reign, *Historia Regis Henrici Septimi*, which is of some historical value.

André, John (1751-80), soldier, b. London, was adjutant-general to the Eng. forces during the Amer. war of independence. He was appointed in 1780 to carry on negotiations with the Amer. general Arnold (q.v.), who offered to betray his command at West Point. A., when returning from the interview in civilian clothes, was captured by the Americans and sent to Gen. Washington, who, after a trial, had him hanged at Tappan as a spy. His remains were brought to England in 1821, and a monument is erected to his memory in Westminster Abbey.

Andrea del Sarto (1488-1530), Florentine painter. He was the son of a tailor, hence his surname ('of the tailor'). Pupil of Piero di Cosimo, he also studied the works of Michelangelo and Leonardo da Vinci and the engravings of Dürer. He was known as 'Andrea senza errori' from his faultless drawing. In 1518 he went to France at the inducement of Francis I, but left after a year, having appropriated sums entrusted to him. He painted a number of frescoes for the brotherhood of the

Servites, his 'Madonna del Sacco' being considered his masterpiece. It is said that at the taking of Florence in 1529 the soldiers were so awestruck by his pictures of 'The Last Supper' at S. Salvi that they left the building without committing any violence. He painted portraits as well as religious subjects, and his 'Sculptor' is accounted one of the most popular works in the National Gallery. Among his many pupils were Vasari and Pontormo. He d. of plague. Browning wrote a poem, 'Andrea de Sarto,' in his *Men and Women*.

Andreae, Laurentius (1480-1552), Swedish pioneer of Protestantism, studied at Rome, but returned with Protestant convictions, and as archdeacon of his native place, Ströngnäs, brought Gustavus I over to the side of the reformed religion. The king appointed him to superintend the trans. of the Bible into the vernacular.

Andreas, an O.E. poem, in which are described the adventures of St Andrew in rescuing St Matthew from prison in Mermendon. It has been attributed to Cynewulf. Some of the sea passages, such as the description of the stormy voyage, are particularly fine.

Andrée, Saloman August (1854-97), Swedish engineer and explorer. In July 1897 he attempted to reach the N. Pole by balloon with 2 companions, Strindberg and Fraenkel. This hazardous journey was attempted in the days before the introduction of aircraft, and before the advent of radio-telegraphy. A.'s balloon was one of 5000 cub. metres' capacity, and a start was made from Danskøya, Spitzbergen, on 11 July. A.'s only means of communication with the outer world was by buoys dropped overboard and by carrier-pigeons. Sev. of the former were subsequently found, and a pigeon bearing a dispatch dated 13 July returned home. Thereafter nothing further was known of the intrepid party until the summer of 1930. In that year 2 Norwegian vessels engaged in scientific survey work came upon the bodies of the explorers on Kvitøya, between Spitzbergen and Zemlya Frantsa-Iosia. This discovery was only rendered possible by an exceptional melting of the snow and ice covering A.'s last camp. Among the finds were logs and diaries which showed that the balloon had remained in the air for 3 days and that death had overtaken the party, who had travelled on foot over the ice, or drifted on the floes, in Oct. 1897. The bodies were brought home to Sweden, with the impedimenta of the expedition, and the contents of the diaries and logs pub. According to these the ice fringe was reached on the first day, the drift being at first northerly and NW., then easterly. 82° N. was reached at about midnight of the first day. The balloon then remained stationary for some hours, then moved westerly and then S. The balloon finally landed at 83° 4' N. lat., and was abandoned. The death of the party, after a passage over the ice to a spot many scores of m. to the S., was not due to hunger, for food was found next to the bodies. The

diaries were trans. into English by E. Adams-Ray and pub. 1931.

Andrew, St, brother of St Peter (q.v.) and the first disciple of Jesus. Both brothers were fishermen. St A. preached in Scythia, Thrace, Asia Minor, and in Greece, and tradition tells us that he was crucified at Patras on an X-like cross known as St A.'s Cross. The Russians revere him as having brought them the gospel, and he is the patron saint of Scotland and Greece. The supposed anniversary of his martyrdom, 30 Nov., is honoured as his feast.

Andrew (Arpad), name of 3 Hungarian kings. A. I reigned 1046-61, and was dethroned by his brother. A. II reigned 1205-35, and in 1217 conducted a crusade to Jerusalem; while A. III, last of the Arpad (q.v.) dynasty, came to the throne in 1290, and reigned till 1301, most of his reign being taken up with civil wars.

Andrewes, Lancelot (1555-1626), Anglican bishop, b. London. He was educ. at Pembroke Hall, Cambridge, and in 1589 was made a canon of St Paul's and master of Pembroke Hall. He was chaplain-in-ordinary to Queen Elizabeth I and in favour also with James I. He was made Bishop of Chichester in 1605, and trans. to Ely in 1609, and made a privy councillor. He helped with the preparation of the A.V. of the Bible. In 1618 he was made Bishop of Winchester. One of Milton's early Lat. elegies bewailed the death of A. His best-known work is his *Manual of Private Devotions and Meditations for every Day in the Week*, 1648.

Andrews, Charles McLean (1863-1943), Amer. historian and educator, b. Wethersfield, Connecticut. Educ. at Trinity College, Hartford, and Johns Hopkins Univ. Appointed Farman prof. of Amer. hist. at Yale. A distinguished scholar. A. is known to research workers by his 'Guides' to the materials for Amer. hist. up to the year 1763. The following are among his chief pub.: *River Towns of Connecticut*, 1889; *Contemporary Europe, Asia, and Africa, 1871-1901*, 1902; *The Colonial Period of American History*, 1912; *Fathers of New England and Colonial Folkways in Chronicles of America* series, 1919; and *The Colonial Background of the American Revolution*, 1924.

Andrews, Ellisha Benjamin (1844-1917), Amer. economist and historian. At the Brussels Monetary Conference of 1892, to which he was U.S. delegate, he ardently championed the cause of international bimetallicism. Amongst other works he wrote *An Honest Dollar*, 1889, *History of the Last Quarter Century in the United States*, 1896, revised and enlarged as *The United States in our own Times*, 1903, and *History of the United States*, 1913.

Andrews, Roy Chapman (1884-), b. Beloit, Illinois. Eminent as a zoologist and chief of the div. of Asiatic exploration of the Amer. Museum of Natural Hist. Has discovered oldest known mammals and extensive evidence of primitive human life in the central Asiatic plateau. Discovered many geological strata previously unknown including some of the

richest fossil fields. He was the first to discover fossilised dinosaur eggs, and skull and parts of the skeleton of the baluchitherium, the largest known mammal. Has proved central Asia to be one of the chief centres of the origin and distribution of reptilian and mammalian life. Member of many Amer. scientific societies and corresponding member Zoological Society and Central Asiatic Society of London.

Andrews, Thomas (1813-85), chemist and physicist, was a native of Belfast, where, after practising medicine for some years, in 1845 he became prof. of chem. at Queen's College. His most important scientific achievement was the discovery of the continuity of the liquid and gaseous states. His scientific papers, with a memoir, were ed. by Tait and Crum Brown, 1889.

Andrews, St. see ST ANDREWS.

Andreyev, Leonid Nikolayevich (1871-1919), Russian writer. His stories and plays deal with the phenomena of death, sex, and solitude, with God, evil, and fate, with abnormal conditions and extreme situations. At once impressionistic and symbolistic, they enjoyed great popularity in pre-revolutionary Russia. Politically A. stood close to the revolutionaries in 1905, but was hostile to the 1917 revolution; he d. an exile in Finland. See study by A. S. Kaun, 1924.

Andria, It. tn in Apulia (q.v.), 30 m. WNW. of Bari (q.v.). It has a fine cathedral (partly 11th cent.). Majolica is manuf., and there is a trade in agric. produce and almonds. Pop. (com.) 65,200.

Andrieux, François Guillaume Jean Stanislaus (1759-1833), Fr. poet and dramatist, b. Strasburg. At first he was a lawyer, but forsook that calling for literature. His comedies are distinguished by their wit and charm, among the best being *Les Etourdis*, 1787, and *La Comédienne*, 1816. He also wrote many poems and romances. He was secretary of the Fr. Academy from 1829.

Androclus (often, but inaccurately, **Androcles**), Rom. slave and hero of a story found in the *Noctes Atticæ* (v. 14) of Aulus Gellius. When hiding from his master in the African desert, A. extracted a thorn from the foot of a lion. Recaptured, he was condemned to the beasts; but the lion which confronted him in the arena merely fawned upon him, being the same animal whose pain he had relieved. A. was thereupon set free. See also Aelian, *De Natura Animalium*, vii. 48.

Androgynous (Gk *anēr*, man; *gunē*, woman), biological term synonymous with hermaphrodite. It implies in zoology that the animal, such as a leech, possesses in its one body the organs of both sexes; and in botany that the plant, such as the arum lily, has both male and female flowers on one inflorescence.

Andromache, daughter of Eëtion, King of Thebes in Cilicia, and wife of Hector, one of the finest female characters in the *Iliad*. After the fall of Troy she was given to Pyrrhus (Neoptolemus),

son of Achilles, by whom she had 3 sons; but Pyrrhus afterwards left her to Helenus, the brother of Hector.

Andromeda, daughter of the Ethiopian king Cepheus, and of Cassiopeia. Her mother's boast that her daughter's beauty surpassed that of the Nereids caused Poseidon, their father, to send a terrible sea-monster to invade the kingdom of Cepheus. To appease him A. was delivered to the monster. She was rescued by Perseus, who saw her chained to the rock; he slew the monster and wedded A. She is the subject of one of Corneille's tragedies, and has given her name to a constellation.

Andromeda, constellation situated in a region of the heavens below Cassiopeia. It is to be found by drawing a line through the bright star Beta Cassiopeiae (The Lady in the Chair) and the Pole Star. This passes through a star of the first magnitude in the head of A., marked α and called Alpheretz. Perseus is a neighbouring constellation. A. is a constellation rich in astronomical interest, and includes a remarkable nebula, a triple star, and the radiant point of a meteoric shower. The nebula was first observed through a telescope by Simon Marius on 15 Dec. 1612, who compared it to a candle shining through a horn lantern, but there is evidence that it was discovered by Al Sufi in the 10th cent. The nebula in A. is memorable as the first discovered nebula, its great rival in Orion not being discovered till 40 years later. It is spiral in shape, as shown by a photograph by Dr Roberts in 1888. The Andromedids, a shower of meteorites radiating from a point in A. on 28 Nov. are known to be the fragments of the disrupted, short-period Biela's comet (see **BIELA**). Almaach, or Gamma Andromedae, was found by Herschel to consist of 2 stars of magnitude 2.5 and 5.5, about 10" distant. Subsequent discovery revealed that the fainter of these 2 stars is a pair, green and blue in colour, revolving round the primary orange-coloured or solar star.

Andromeda, genus of plants belonging to the Ericaceae. They are shrubs, natives of Europe, Asia, and N. America. *A. polifolia*, wild rosemary, grows in Brit. peat bogs; *A. rosmarinifolia*, rosemary-leaved marsh A., is found in Newfoundland and Labrador.

Andronicus, see LIVIUS ANDRONICUS.

Andronicus, advocate of the Jews under the reign of Ptolemaeus Philometor against the Samaritans in Egypt, who asserted the authority of the temple on Mt Gerizim against that at Jerusalem. Ptolemaeus Philometor was appealed to; Sabbai (Sabbacus) and Theodosius, the Samaritan advocates, lost their case and were put to death.

Andronicus I (c. 1110-85), Byzantine emperor, grandson of Alexius I. He had Alexius II murdered and seized the throne himself in 1183, but in 1185 he was himself assassinated. He did much to restore the prosperity of the empire, but his severity alienated the nobility and this led to his downfall.

Andronicus Palaeologus, the elder and

the younger, Byzantine emperors. The former reigned from 1282 to 1328 and the younger 1328-41. Both reigns were noted for the wars with the Turks, who, in the latter, conquered all the Asiatic ter. of the empire.

Andronicus Rhodius (c. 58 bc), Rom. philosopher. He is chiefly known through his exposition of the teachings of Aristotle.

Androphagi, race of cannibals, mentioned by Herodotus as inhabiting a region adjacent to Scythia. Later the term is used for cannibals generally.

Andropogon, family Gramineae, genus of grasses of warm temperate or tropical regions. *A. argenteus*, with silvery panicles, 4 ft high, of N. America, and *A. glomeratus*, with dense, feathery panicles, are warm border plants in gardens.

Andros, Sir Edmund (1637-1714). From 1674 to 1681 he was governor of New York, and afterwards of New England. In 1689 the colonists deposed and arrested him and he was sent to England to be tried for attempting to seize the charter of Connecticut, but acquitted and appointed governor of Virginia in 1692. This post he held for 6 years.

Andros, is. of the Grecian Archipelago, situated to the SE. of Euboea. It is 25 m. long, 8 m. broad. Area 148 sq. m. It is mountainous, and the soil is not fertile, but springs are plentiful and fruit trees, vines, onions, and grain are produced. The most important tn is A., or Castro, situated on the E. coast. Pop. of is. 14,700.

Andros Island, one of the W. Bahamas, has a length of 100 m., and varies in breadth from 10 to 45 m. It is low and swampy, but well timbered, and exports timbers, pineapples, and sponges. Area 1600 sq. m.; pop. 6720.

Androscoggin, riv. of New Hampshire and Maine, in U.S.A., which rises in the White Mts and subsequently joins the Kennebec below Augusta after a course of 175 m. It furnishes power at Rumford, Auburn, Lewiston, and Brunswick.

Andújar, Sp. tn in the prov. of Jaén, on the Guadalquivir, S. of the Sierra Morena. It produces *alcarrazas*, porous jars which keep water cool. Pop. 26,000.

Anegada, see VIRGIN ISLANDS.

Aneirin, see ANEURIN.

Anelectrotonus. A current can be caused to flow in a nerve by the application of an electromotive force to 2 electrodes attached to the nerve. The part of the nerve near to the anode is found to need a stronger stimulus than under normal conditions to display functional activity. This decreased excitability near the anode is referred to as A. Near the cathode there is a corresponding increase of excitability known as catelectrotonus.

Anemometer, instrument for measuring the speed of the wind. In the Robinson or cup A. 4 hemispherical cups are fixed on 4 arms at right angles so that their concave surfaces are in the same direction of rotation. The motion imparted by the

wind is trans. by a series of cog-wheels so as to indicate m.p.h.

The Dines or pressure-tube A. consists of 2 tubes, one of which has an open mouth kept facing the wind by a vane as in a weathercock. The increased pressure is communicated down the tube to a recording apparatus. The other tube is perforated by small holes arranged in rings so that suction, or a decrease in pressure, is produced by the wind passing across the holes. The decrease in pressure is also communicated to the recording apparatus, which consists of a float in a closed vessel, so arranged that when the wind is blowing the increased pressure in the first tube is applied underneath the float, raising it in the water, and the decreased pressure is communicated to the air above the float, also tending to raise it. The movements of the float are registered graphically on a slowly revolving drum. For very exact and delicate measurements the hot-wire A. is used. This depends on the fact that wind blowing over a wire, maintained at just below red heat by an electric current, changes its resistance by cooling.

SEA ANEMONE, CLOSED AND EXPANDED

Anemone, genus of Ranunculaceae, includes sev. well-known and beautiful flowers which possess the property of extreme acidity. *A. hepatica*, and varieties, *A. narcissiflora*, *A. pavonia*, *A. ranunculoides*, and *A. ricularis* are popular garden flowers. *A. nemorosa* is the wood-A. or 'wind-star,' *A. hepatica*, the hepatica, and *A. coronaria* the common garden A.

Anemone, Sea, name given to the polyps which do not form coral, the Actinaria, of the order Zoantharia, because their spread-out tentacles give them a resemblance to the flower A. They are found attached to rocks and the shells of hermit crabs; they feed on small animal life.

Anemoscope, instrument for determining the direction of the wind. Now usually combined with the pressure-tube anemometer (q.v.).

Anerio, Felice (c. 1560-1614), and **Giovanni Francesco** (probably 1567-1630), It. church composers of the Rom. school, in which they upheld the polyphonic church style of Palestrina. Both also wrote secular music in the new style.

Aneroid, type of barometer in which the pressure of the air is measured without the use of mercury or other liquid. It consists essentially of a hollow box shaped like a bellows in which there is rarefied air. Any external pressure causes a proportionate amount of compression on this box, which is conveyed through a multiplying arrangement to the pointer on the dial. A preliminary graduation in comparison with a good mercury barometer enables the atmospheric pressure to be indicated, or recorded on a drum, as in the standard meteorological barograph. The A. principle is also used in the radio- and radar-sondes to obtain upper air pressures.

Anethum, see PEUCEPANTUM.

Aneurin, or **Aneirin** (fl. c. 600), Welsh poet. Educ. at St Cadoc's College, Llancarvan, he was taken prisoner at the battle of Cattraeth, 603, in which the Saxons defeated the Britons. After being liberated he wrote his epic poem *Gododin*, celebrating the Britons' heroic deeds in the battle. He is said to have been murdered by Eiddyn ab Einyan. See *The Text of the Book of Aneirin*, ed. J. G. Evans, 1908; trans. T. Stephens, 1888.

Aneurysm, or **Aneurism**, circumscribed dilatation of an artery, the wall of the dilatation being the wall of the artery. A.s may be found in any artery but are usually in the thoracic part of the aorta. They are caused by a degenerative condition of the intimal layer of the arterial wall known as atheroma (q.v.), the weakened wall stretching and dilating under the fluid pressure. A.s may attain a considerable size and cause symptoms by pressing on neighbouring structures such as the oesophagus, trachea, bronchi, or spine. *Dissecting A.*, not a true A. because there is no dilatation. It is caused by a haemorrhage into the medial layer of the arterial wall through an atheromatous plaque, the extravasated blood forcing its way between the layers of the intima and splitting them longitudinally. This splitting process may extend from the beginning to the end of the aorta, and even into the iliac arteries, before eventually rupturing externally. *False A.*, a haematoma due to a rupture of an arterial wall—usually traumatic—and having its walls formed by the surrounding tissues. *Mycotic A.*, caused by an infected embolus (see EMBOLISM) settling on the wall of an artery and weakening it through inflammation. *Arterio-venous A.*, a direct connection between an artery and an adjacent vein, usually caused by trauma.

Antfossi, Pasquale (1727-97), It. opera composer, b. Taggia, near San Remo, studied at Naples, visited London in 1783-6 and then settled in Rome as chapel master at St John Lateran. He wrote some church music, 12 oratorios, and over 70 operas, the libretto of one of

which, *La finta giardiniera* of 1774, was also set by Mozart the following year.

Angara, right affluent of R. Yenisey in Siberia, flowing through Lake Baykal. Its length is 1300 m. Large hydro-electric stations are under construction near Irkutsk and Bratsk.

Angary, Right of, in international law, formerly a right claimed by a belligerent, deficient in vessels, to lay an embargo on and seize neutral merchant vessels in their harbours and to compel them and their crews to transport troops and supplies on payment of advance freight. The modern right consists in the right of belligerents to use, or destroy in case of necessity, for the purpose of offence and defence, neutral property on their own or on enemy ter. or on the open sea. See also NEUTRALITY.

Angel (Gk *angelos*, messenger, trans. of the Heb. *mal'akh*), in both the O.T. and N.T., means a spiritual being awaiting God's commands, a messenger, and a means of manifestation of God to man. In the early historical books of the Bible the A. is a manifestation of God Himself. Sometimes it has no form—only a voice, as when the A. of God spoke unto Jacob in a dream (Gen. xxxi. 11); and sometimes there is a form as of a man (e.g. Gen. xviii, xix, xxxii. 24 ff.). Later on the A. is a messenger carrying out the commands of the Lord, as in Ex. xxiii. 20-3 and 2 Sam. xxiv. 16.

A.s are given many other names in the O.T.: 'sons of God' (Gen. vi. 2), 'sons of the mighty' (Ps. lxxxix. 6), 'saints' (Zech. xiv. 5), 'Holy Ones' and 'Watchers' (Dan. iv. 13). They are described as warriors in Joshua v. 13 and Ps. lxxviii. 17, and in the expression 'Lord of Hosts'. Different ranks or degrees exist among them according to Gen. iii. 24, Ps. lxxx. 1, and Ezek. x. 2, which name *Cherubim*; Isa. vi. 2, which names *Seraphim*; and Dan. and Tobit which name 7 Archangels (q.v.), and in particular Michael, Gabriel, and Raphael. In pseudographical books yet more angelic names and classes appear. (For evil or fallen A.s, see under DEVIL.) In the N.T. the Archangels Gabriel and Michael appear again (Luke i, Rev. xii); Jesus mentions the *Guardian A.s* (Luke xv. 7, 10); and from Eph. i. 21 and Col. i. 16 we learn of the existence of *Thrones*, *Dominions*, *Principalities*, *Powers*, and *Mights* (or *Virtues*). Pseudo-Dionysius in his 5th cent. work, *De Hierarchia Celesti*, systematised the evidence as indicating that there were 9 choirs of A.s. According to Heb. ii and 1 Cor. vi. 3, Christians have by the Incarnation been exalted to a higher status than A.s. In Col. ii. 18 the giving of divine worship to A.s is strictly forbidden.

A.s are pure spirits, or intelligences. The attribution of wings to them (as in Isa. vi) is entirely symbolic, and intended to represent their superior heavenly origin, and their swiftness to do the will of God. St Thomas Aquinas, who taught that the individuating principle in creation is matter, declared accordingly that each A. is distinguished specifically

from every other, i.e. each is of a different species (see his *Summa Theol.* 1, 1, q. 50-62). See also J. Hastings, *Dictionary of Christ and the Gospels*, 1906, and A. Edersheim, *Life and Times of Jesus the Messiah*, 1908.

Angel, originally a gold coin of France, where it was first coined in 1340. It was introduced into England by Edward IV in 1465, when it was valued at 6s. 8d., and, being of the same value as the noble, was sometimes called the A.-noble. Under Henry VIII its value was raised to 8s. and under Mary to 10s., and it was last coined by Charles I. The device on the obverse of the coin was St Michael piercing the dragon with a spear, and on the reverse it had a ship, with a large cross for a mast, and the royal arms in front. It was the coin used for 'touching' for the King's Evil (q.v.).

Angel-fish, or **Monk-fish** (*Squatina*), shark much resembling the ray. The species of the family Squatinidae are found in the more temperate seas, where they live on the bottom waiting for the fishes which are their food.

Angelica, family Umbelliferae, genus of herbs of which *A. archangelica*, native to Europe, is chiefly grown, its roots being candied as a sweetmeat; at one time of medicinal and flavouring uses.

Angelico, Fra (1387-1455), Florentine painter who was also a Dominican friar. His full title was 'Il Beato Fra Giovanni Angelico da Fiesole,' or in English 'The Blessed Brother John the Angelic of Fiesole.' He was b. at Vicchio. He is famous for his frescoes, which are in Rome, Florence, Fiesole, and other It. towns, the most wonderful being the series at San Marco, Florence. See *Klassiker der Kunst Fra Angelico*, 1924.

Angélique, see ARNAULD, ANGÉLIQUE, and JANSENISM.

Angell, George Thorndike (1823-1909), Amer. philanthropist, b. Southbridge, Massachusetts, U.S.A. Admitted to the Boston Bar in 1851. In 1868 became founding president of the Massachusetts Society for the Prevention of Cruelty to Animals. Became ed. of *Our Dumb Friends*. Initiated the movement for the estab. of the Bands of Mercy. In 1889 founded and became president of the Amer. Humane Education Society.

Angell, James Burrill (1829-1916), Amer. educationist, b. Rhode Island. Educ. at Brown Univ. Was prof. of modern languages and then took up journalism. Subsequently became president of the univ. of Michigan, which institution he brought to a high state of efficiency. Later became Amer. minister to China and then to Turkey. Pub. *Progress in International Law*, 1875, *Reminiscences*, 1912, and *Selected Addresses*, 1912.

Angell, James Rowland (1869-1949), Amer. psychologist and educationist, b. Burlington, Vermont, son of James Burrill A. (q.v.). From 1894 to 1919 he was in the dept. of psychology at the univ. of Chicago, from 1905 to 1919 as head of the dept. President of Yale Univ., 1921-37. Works: *Psychology*, 1904 (new ed. 1908);

Chapters from Modern Psychology, 1911; *American Education*, 1937.

Angell, Sir Norman (1874-), journalist and economist, son of Thomas Angell Lane of Holbeach. Educ. privately and in France. His early years were spent in ranching in the U.S.A. and, later, in journalism. In Paris he ed. *Galvani's Messenger* from 1899 to 1903 then joined the staff of the *Éclair* and, from 1905 to 1914, was general manager of the Paris ed. of the *Daily Mail*. Dropping the name of Lane, he became

SIR NORMAN ANGELL.

world famous as the author of *The Great Illusion*, 1910, the theme of which is that war is unprofitable to victors. Labour M.P. for N. Bradford in 1929; he was knighted in 1931 and received the Nobel peace prize, 1933. His works include *The Story of Money*, 1930, *The Unseen Assassins*, 1932, *The Money Mystery*, 1936, *For What do we Fight?*, 1939, *Let the People Know*, 1943, *The Sleep Places*, 1947, and the autobiography, *After All*, 1951.

Angeln, dist. in Germany, in N. Schleswig-Holstein (q.v.), said to be the original country of the Angles (q.v.).

Angelot, gold coin, struck in France by Henry VI of England; also a Fr. gold coin first struck in 1310; also a musical instrument like a lute.

Angels of the Elements, see ELEMENTAL SPIRITS.

Angelus, bell rung 3 times a day, at dawn, noon, and sunset, to mark the time of a prayer in memory of the Incarnation. It was instituted in 1326. Its name is derived from A. Domini, the

angelic salutation to the Virgin Mary with which the prayers begin.

Angelus a Sancto Francisco, assumed name of the Franciscan friar, Richard Mason (1601-78), author of *Regula et Testamentum S. Francisci*, 1643, *Apologia pro Scoto Anglo*, 1656, and other rare works.

Angelus Silesius (1624-77), Ger. poet and philosopher, b. Breslau. His proper name was Johann Scheffler. He first practised medicine, but in 1653 joined the Rom. Catholic Church, though his parentage was Protestant. He wrote books on mysticism and also many hymns, which are still used by Protestants in Germany. His main works are *Geistreiche Sinn- und Schlussreime*, 1657, *Cherubinischer Wandersmann*, 1674, and pastoral poems called *Heilige Seelenlust*, 1657.

Angermanland, dist. in Sweden under the gov. of Västernorrland. It is a wild and picturesque country, and well cultivated. Its riv., the Angerman, is over 200 m. in length, and joins the Gulf of Bothnia at the prin. tn of Hernösand. The riv. is navigable near its mouth.

Angermünde, Ger. tn in the dist. of Frankfurt-on-Oder, 53 m. NNW. of Frankfurt (q.v.). It is a mkt. tn and has an iron industry. Pop. 11,000.

Angers, Sir Auguste Réal (1838-1919). Canadian statesman, b. Quebec, of which he was premier in 1876-9. He resigned from the Supreme Court (1887) to become lieutenant-governor of Quebec. In 1892 he joined the dominion cabinet, but resigned in 1895 over the issue of separate Rom. Catholic schools in Manitoba.

Angers, old cap. of Anjou in France, now in the dept. of Maine-et-Loire. Its old name was Andecavi. It is the see of a bishop, has a large theological college and a fine library. The castle, now used as a prison, and the cathedral were both built in the 13th cent. The R. Maine is navigable at this point, and the dist. has extensive industries in wool, cotton, and metal. It is also an agric. centre, and there are slate quarries near by. Pop. 94,400.

Angerstein Gallery, see NATIONAL GALLERY, THE. The A. collection of 38 pictures was purchased by the nation in 1824.

Angevin Line of Eng. kings began with Henry II (1154), who was son of the Count of Anjou (whence the name), and ended strictly with Richard III (1485). John is sometimes described as the last of the A. dynasty because he was the last Eng. king to reign over Anjou.

Angilbert, St (c. 740-814), friend and counsellor of Charlemagne, whose daughter, Bertha, he married. He later became a monk. He was a distinguished poet and was described by Charlemagne as the Homer of the age.

Angina, any disease associated with a sense of suffocating or choking, thus *angina pectoris* (q.v.). The name is also attached to inflammatory conditions of the throat and to a certain kind of septic ulceration of the mouth and fauces known as Vincent's angina.

Angina Pectoris, paroxysmal pain accompanied by a sense of intense oppression about the heart. It is occasioned by a partial blockage of the coronary arteries which supply the heart muscles, and usually occurs in men over 40. The immediate cause of the attack is exertion or emotion; there is a sudden pain affecting the whole chest, then radiating through the left shoulder and penetrating sometimes right down to the fingers. Accompanying the pain is a sense of impending death, the respiration is shallow or arrested, and the patient's anxiety becomes extreme. The attack may suddenly cease, and, although there is temporary weakness, there may be no other signs of the disease until another attack. The number and frequency of attacks vary; there may be only one or two, there may be a chronic form in which the attacks grow in intensity, or a number of severe attacks may end with complete recovery. Usually the outlook is very grave.

Angiolieri, Cecco (c. 1260-c. 1312), lt. poet, the first master of lt. humorous and realistic verse. In his poems he shows himself as an undoubted *bon viveur*, with a marked predilection for wine and women. About 120 of his sonnets are still extant.

Angioma, vascular tumour caused by the enlargement or new formation of blood-vessels. There are sev. varieties.

Angiosperms (Gk *ageion*, vessel; *sperma*, seed), plants with their seeds enclosed in a pericarp, as opposed to Gymnosperms in which the seeds are not so enclosed; the 2 classes making up the Phanerogams or Spermatophyta (q.v.).

The A. are divided into 2 classes, the Dicotyledons and Monocotyledons (q.v.); in the former are such flowers as buttercups, primroses, and nettles, in the latter arum lilies, grasses, and daffodils. These flowering plants do not necessarily have bright petals or sepals, but it is essential that they should have carpels and stamens; reproduction, however, may take place also by budding, apogamy, or parthenogenesis.

Angkor, ant. cap. of the Khmer kingdom of Tchen-la and site of some of the most remarkable examples of massive religious architecture in the world. A. stands in the modern Cambodian prov. of Siem-Reap. The numerous stone monuments of A., built during the 9th-12th cents., spread over an area of nearly 20 sq. m., the largest being A.-Vat and the Bayon. The wealth of rich decoration and statuary of these monuments, which have been partially restored by Fr. archaeologists, is unparalleled. The style is Indian, but is modified by a strong Khmer influence. A. was abandoned by the Khmers in the 15th cent. and was swallowed up by the surrounding jungle. Its subsequent rediscovery in the 19th cent., incorrectly ascribed to Henri Mouhot, has given rise to numerous tales of lost jungle cities. See G. Coedès, *Pour mieux comprendre Angkor*, 1943.

Angle, inclination of one line to another, which meets it, but is not in the same

straight line. This is Euclid's definition of a plane *A.* If the lines are straight the *A.* is *rectilinear*, if curved the *A.* is *spherical* or *curvilinear*. A curvilinear *A.* is measured by the *A.* between the tangents to the curves at the meeting point. *A.s* are usually measured in degrees, one degree being 1/360th of a complete revolution. In circular measure the unit is a *radian*, which is an *A.* at the centre of a circle opposite an arc equal in length to the radius; there are 3.14159... radians in 180°. A *solid A.* is the space contained by 3 or more planes meeting at a point. A *dihedral A.* is an *A.* between 2 planes, a *trihedral A.* one between 3 planes. *A.s of incidence, reflection, and refraction* are, in physics, the *A.s* formed by the direction of a wave with the normal to the surface at the point of incidence, reflection, or refraction. The *critical or limiting A.*, in light, is the *A.* at which a ray of light strikes the surface between 2 media so that the refracted ray passes along the surface. The *critical A.*, in friction, is the *A.* at which the component of the weight directed down the slope of the inclined plane balances the friction. The *A. of capillarity* is the *A.* formed, owing to surface tension, when a liquid is placed in contact with a solid.

Anglebert, Jean Henri d' (1635-91), Fr. organist and composer, b. Paris. He was one of the important masters of harpsichord music of the Fr. school. His pieces include many arrangements of airs and dances from Lully's operas, and he also wrote organ music as well as a treatise, *Principes d'accompagnement*.

Anglers are any fish of the order *Peculiati* of the Teleostei. The *Lophius piscatorius*, known also as monk-fish, sea-devil, frog-fish, or goose-fish, angles for its prey in a peculiar fashion. The 3 anterior spines of the dorsal fin are transformed into tentacles, the foremost of which ends in a bright, worm-like tip which acts as bait and can grow again readily. The angler swims badly and lurks near the coast; it attains a length of 3 to 5 ft, and is found in Europe and America. The deep-sea angler fishes (*Ceratoides*) have an angling rod tipped with a luminous lure.

Angles, or Angli, Ger. tribe who occupied the dist. of Schleswig-Holstein known as Angeln. They invaded Britain in the 5th cent., and settled in E. Anglia, Mercia, and Northumbria. From them the name England is derived (Angleland).

Anglesey, Henry William Paget, 1st Marquess of (1768-1854), soldier and statesman, a son of the Earl of Uxbridge, educ. at Westminster and Christ Church, Oxford. He entered the army and served with great distinction in Flanders and the Peninsula. He was created Marquess of A. for his bravery at the battle of Waterloo, where he lost a leg. He was appointed Lord-Lieutenant of Ireland in 1828, but was recalled by Wellington for supporting Catholic emancipation, though he was later reappointed by Grey (1830) and was afterwards responsible for the Irish Board of Education (until 1833).

Anglesey, is. off the N. Wales coast, and divided from the mainland by the Menai Straits. It is 21 m. long by 19 broad. It forms a co. and sends a member to Parliament. Lead, copper, and zinc are among the minerals found on the is., and sheep- and cattle-breeding are carried on. It is joined to the mainland by a fine suspension bridge and also by the Britannia tubular bridge. Holyhead is on an adjoining is., and is the starting place of the route to Ireland; Llangefni is the administrative centre, and other tns are Beaumaris (co. tn) and Amlwch. Pop. 52,000.

Anglia, East, kingdom founded c. 500 AD, which consisted of roughly the modern Norfolk, Suffolk, Cambs, and the Isle of Ely, and formed one of the kingdoms of the A.-S. Heptarchy. It was from time to time forced to acknowledge Mercian supremacy, and submitted to Egbert of Wessex in 826. Soon after it was invaded by the Danes, who held it until forced to submit to Edward the Elder, 918. Under Canute it was one of the 4 great earldoms, the other 3 being Northumbria, Mercia, and Wessex.

Anglican, see ENGLAND, CHURCH OF.
Anglican Communion, see ANGLICANISM.

Anglicanism, the body of doctrines and observances of the Church of England (q.v.) and of those Churches throughout the world in communion with it. This fellowship of Churches is known as the Anglican Communion. Its growth is largely due to the expansion of the Brit. Empire, and to the missionary enterprise of the 19th cent. What were originally chaplaincies in the colonies or missionary outposts have now been organised into the diocesan and prov. system, and the Anglican Communion now comprises about 350 dioceses. Its member churches are the Church of England, the Church in Wales, the Church of Ireland, and the Episcopal Church in Scotland; the Protestant Episcopal Church of the U.S.A., whose first bishop was Samuel Seabury, consecrated in Aberdeen, Scotland, in 1784 after the Amer. War of Independence, the Amer. Church hitherto having been within the jurisdiction of the Bishop of London; the Anglican Church of Canada (first bishop, Charles Inglis of Nova Scotia, 1787); the Church of England in Australia (first bishop, Wm Broughton, 1836); the Church of the Prov. of New Zealand (first bishop, George Augustus Selwyn, 1841); the Church of the Prov. of S. Africa (first bishop, R. Gray, 1847); the Church of India, Pakistan, Burma, and Ceylon (first bishop, T. F. Middleton, 1814); the Church of the Prov. of the W. Indies (first bishops, C. Lipscomb of Jamaica and W. H. Coleridge of Barbados, 1824); the Church of the Prov. of W. Africa, inaugurated in 1951; the Church of the Prov. of Central Africa, inaugurated in 1955; the Church in China (Chung Hua Sheng Kung Hui); the Church in Japan (Nippon Sei Ko Kwa). There are also 19 scattered dioceses, not yet integrated into any prov., whose bishops are under the

metropolitcal jurisdiction of the Archbishop of Canterbury. See also LAMBETH CONFERENCES.

Angling, art of catching fish with a line and hook which is baited with worms, flies, or small fish. The antiquity of this pastime is proved by mention of it in the works of Gk and Lat. writers, while allusions to it appear in the O.T., and the pursuit of A. is known to have been practised in ant Egypt. Much has been written about it, and the oldest work printed in English on the subject was issued in 1496 by Wynkyn de Worde, in a later ed. of a work on hunting and hawking, *The Book of St Albans*, which appeared in 1486. To a woman may belong the honour of being first to write on the piscatorial art, for the work is ascribed to a nun, the prioress of a nunnery in Herts, Dame Juliana Berners.

The most famous work on the subject, however, is that of Izaak Walton, a linen draper of Fleet Street, whose book, *The Compleat Angler or the Contemplative Man's Recreation*, is world renowned. The first ed. appeared in 1653, and it passed through 5 eds. during the author's life, the last being in 1676. With the later eds. a treatise was added by Walton's friend, Charles Cotton, containing instructions how to angle for a trout or grayling in a clear stream. This essay is still usually printed with the work.

The Compleat Angler is in truth more than a work on fishing, for the author depicted the delights of the countryside with great delicacy and charm, and the unaffected humour of the dialogue and its purity of style all add to the high reputation of the book. Since Walton's day the output of books upon the subject has been very prolific. Some of the prin. are mentioned at the end of this article. In this article we shall deal chiefly with fresh-water fishing.

The chief appliances needed by anglers are the rod, line, and hook. The first is made of various materials. Cane rods are the most common and perhaps the most serviceable in use to-day. Split cane is favoured for trout and salmon rods, because of its ability to stand up to the stresses and strains of continual casting. Bottom rods of quality are often made of Sp. reed, whole cane and split cane. Greenheart rods and rods of lancewood and hickory are still used, but greenheart rods of first quality are hard to come by. Perhaps the greatest step forward in the search for more durable rod materials lies in the development of glass fibre, which makes excellent fly rods when constructed as hollow-glass fibre rods and powerful and light spinning rods when made from solid glass fibre. As a material fibre glass is competing with split cane, and even sea rods are now made of fibre glass. The reel is another piece of A. equipment much improved in the past twenty years. A variety of salt- and fresh-water fishing-reels are now in use, and these, because of development and engineering skill, enable anglers to master heavy fish. As a direct result of the fixed spool reel, with

its slipping clutch mechanism, it is possible for an angler to land a 15- or 20-lb. fish on a line of 4 or 5 lb. breaking strain. The multiplier reel, with a 4 to 1 geared line recovery, precludes the entanglement of the angler's line and simplifies the handling of fighting fish.

Lines too have been greatly improved since the day of silkworm gut, although for trout and salmon fly-fishing water-proofed silk remains the best material. For spinning and bottom fishing nylon has taken the place of gut, as it has for the fly-fisherman's cast. Gut of the finest quality was imported from Japan, but it was expensive, deteriorated, and required steeping before use. Monofilament nylon and braided nylon are now the first choice for spinning lines, and most bottom fishing is done with nylon lines, which are comparatively cheap and can be obtained in a wide range of breaking strains and diameters suitable for fine fishing for roach or dace or handling fish of 30 or 40 lb. in weight.

For bottom fishing the entire line may be of one breaking strain, although a terminal length of finer line is used on occasion, and to this is attached the hook and shot used to weight the line and keep the bait fishing at the required depth. A variety of floats are used, from fine quills used in roach-fishing to large cork floats essential for supporting a line when live bait is being offered for pike. In other forms of coarse fishing no float at all is employed, the line being floated on the water when a crust is used to lure such fish as carp which are fond of bread cubes. The angler must, of course, choose his bait with reference to his fish. Artificial flies are of 2 varieties, the dry fly and the wet fly. The former is used for cocking on the water and the latter for sinking beneath the water. The dry fly floats on account of its extra dressing. Dry fishing is done with single flies, while 2 or 3 wet flies are used at one time. Wet flies are used in strong running streams.

The finest fresh-water fish in this country is undoubtedly the trout and it affords the best sport to anglers. Trout abound in most of our lakes and rivers, and are usually angled for with an artificial fly. They are voracious, and by their agility and cunning frequently succeed in making their escape. A good landing-net is necessary for this fish. The trout usually spawns in Oct. and Nov., sometimes earlier or later, according to the season.

There is no great measure of agreement on the choice of rods for fly-fishing. Indeed, as has been well said, 'one of the charms of angling is that it presents an endless field for argument, speculation, and experiment' (T. E. Pritt). But for loch fishing anglers at least seem to agree that nothing is to be gained by laying down a hard and fast rule, because so much depends on the characteristics of the individual. Progress in rod-building has been rapid in the last cent., and 'with the advent of the built cane or split bamboo rod, we have an

article which combines lightness with strength to an extent which no wooden rod can equal' (R. A. Chrystal). In salmon-fishing the very long rods of 18-20 ft, once considered essential, have almost disappeared, as the same work can be done by a cane rod of 15 ft, as far as length of cast is concerned—though the long rod enabled the angler to hang the fly over fish lying well out in a riv. In loch fishing the conditions are different and trout rods in general have undergone a shortening, so that on a loch a rod of 14 ft is about the longest in use. Those who still use rods of 14 ft for loch fishing mostly use wooden rods. In choosing a line for loch fishing the almost universal practice is to have it short and to splice on enough backing almost to fill the reel. Most reels for trout rods are big enough to take 30 yds of line and 40 to 50 yds of thin silk backing, and this is ample to deal with most heavy fish. A level line, which is as heavy as the rod, will cast properly, and is most generally useful, as a very light one flaps in the wind too much and causes loss of touch with the flies. Greasing is of doubtful value; it keeps some lines in good order, but others become soft and sticky and are useless long before they are worn out. For worm fishing for trout the rod should be fairly stiff; one cannot throw a bait accurately with a supple one. Perhaps the best rod is one about 12 ft. For fly-fishing for brown trout on rivers the rod should be of greenheart, split cane, or hollow glass, not too supple in the middle, while the point should be fairly flexible—for with a rod supple in the middle the angler cannot cast into a wind coming from his front, and not well with a wind blowing from either side; and a stiff top piece does not yield when a fish splutters, and thus the hook is liable to be torn from the fish's mouth. Present-day ideas favour very short and very light rods; but some anglers are strongly opposed to both and think that the length and weight of the rod must depend on the breadth of the riv. The reel should be too stiff rather than slack, and those made with a brake which can be regulated are often preferred.

The salmon is one of the angler's most coveted prizes and affords excellent sport. It is partly a fresh-water and partly a salt-water fish, though its spawn is generally deposited in the former. The spawning season is from the end of autumn until the beginning of spring. The length of rod for this fish is usually from 13 to 15 ft. The Scottish rivers are famous for their salmon. *See further under SALMON.*

Roach are generally caught with maggots or paste placed on the bottom of ponds or streams, or with brandling worms. The perch is a bold-biting fish, and the best bait is a worm. The pike, or jack, as the young ones are called, is perhaps the greediest of fish, and spawns about Mar. in very shallow water. The finest specimens are those found in clear rivers. The best bait is a small fish.

The barbel is a fighter fish when found

in weir pools and it is a good plan to use ground bait, sometimes put in overnight. Bream are generally reckoned as pond fish (golden bream are common in the Norfolk Broads), although they are sometimes met with in slow-running streams. In fishing for these the angler should take care to keep concealed from the fish and let his bait sink near the bottom among the weeds. Carp and tench are also pond fish and thrive best in mud, but never well in cold bare water; both are also found in sluggish rivers. Tench are noted for frequenting the foulest and muddiest portions of the pond. The fisherman must angle for these very near the bottom and allow the fish plenty of time to gorge the bait, or fish on the surface, sitting well back from the bank and presenting his bait in a previously cleared patch in the weeds. They are in season from Sept. until the end of May. Grayling are remarkably timid fish, and must be angled for with very fine tackle, and when hooked the angler must be careful to work the catch carefully as the hold gives way easily in the mouth. They will return to the bait, however, as a rule. The chub will rise easily at a natural or an artificial fly, and at spawning time will take most bait, such as worms, etc. It usually requires the aid of a landing-net.

Dace are very active and cautious, but will nearly always rise to the fly of a skilful angler. They frequent gravelly and sandy bottoms and deep, weed-shaded holes. In sultry weather they are often caught in shallows with gentles or grasshoppers. Bream and bream kneaded into small round cakes is a very good ground bait for these fish, but it must always be thrown upstream. The gudgeon is allured with almost any kind of bait. It spawns 2 or 3 times a year, and frequents gentle streams with gravelly bottoms. In A. for gudgeon a good plan is to stir up the bottom previously, which rouses the fish from a state of inaction and causes them to collect in shoals. A float is always used, but time should be allowed for the fish to nibble at the bait, as they will do this for some time before swallowing it. The loach can best be caught with a small red worm, while minnows are of little use for sport, but make excellent bait for pike, trout, salmon, and other fish. Close seasons are observed for most fish according to their natures and haunts.

For further details of all the fish mentioned here the reader is referred to the articles under their various headings, where their natures, habits, and haunts are dealt with more fully. Those we have mentioned here are, of course, those taken by anglers in Great Britain. The Anglers' Association is the chief body in this country which looks after the interests of this sport.

Anglo-Catholics are, as their name indicates, those in the Church of England who, regarding it as part of the Universal or Catholic Church, maintain that at the Reformation none of the essential marks of catholicity was lost. This section, therefore, tends to resent the term Protestant and to stress the term Catholic. The more popular name for this party is the 'High Church' party (q.v.). Anglo-Catholicism is undoubtedly a growing power in the Church of England, and the increase in its influence can be ascribed, in part, to the zeal of its adherents and the intellectual eminence of its protagonists. A.-C. are organised in the Church Union (q.v.) and their most influential organ is the *Church Times*. From time to time Anglo-Catholic congresses are held in London, which afford evidences of an emotional fervour that has been compared to that roused by Wesley, the founder of Methodism. A.-C. display a desire for recognition by the Rom. Catholic Church and are concerned to secure that schemes for reunion between the Church of England and other bodies shall not jeopardise eventual reunion with Rome. The claim to papal infallibility is denied by all but a few, some of whom have introduced into churches the whole of the Rom. ceremonial and teach Rom. dogmas. Others are content, relying on the ornaments rubric in the Prayer Book, to use a ceremonial which has its roots in Rom. Catholic practice. But A.-C. are frequently eclectic in these matters. In general they hold a high doctrine of the church as a divinely founded society and as guardian of the sacraments. They are the successors of the Oxford Movement (q.v.), while extreme A.-C. are the successors of the Ritualists (q.v.). See C. B. Moss, *The Christian Faith*, 1943, and V. Johnstone, *Anglican Way*, 1948.

Anglo-Japanese Treaty. By the terms of the treaty signed in 1902, Great Britain and Japan undertook to support each other in maintaining the independence and territorial integrity of China and Korea. In 1905 this agreement was amplified by an offensive and defensive alliance, applying to E. Asia and India. The agreement gave a free hand to Japan in the protection of her interests in Korea, and similar freedom to Great Britain on the Indian frontier. It also affirmed the principle of equal opportunities for the commerce and industry of all nations in China. In any hostilities

caused by aggressive action directed against the interests specified, the 2 countries agreed to wage war and make peace together. This agreement was renewed in the form of a new treaty, on 13 July 1911, for a period of 10 years. The alliance was formally dissolved in 1921 through the operation of the agreement reached at the Washington Conference on disarmament (1921-2).

Anglomania, term used for the imitation amongst the French, Germans, or other foreigners of Eng. manners and customs, or an admiration of anything English. In the 18th cent. Eng. literature was greatly admired in Germany, and numerous Eng. books were trans. into German. In France, just before the outbreak of the Fr. Revolution, there was a decided admiration of the free institutions of England. On the other hand, Anglophobia is a horror or fear of anything English.

Anglo-Saxon Chronicle, series of chronological records written in English at various centres, including Winchester, Canterbury, and Peterborough, from the 9th cent. to the middle of the 12th. It contains some picturesque passages and poems, and is the oldest and most complete set of annals in any European vernacular. The earlier part may have been written by King Alfred or under his guidance. See trans. by G. N. Garmonsway, 1953, and parallel ed. of 2 MSS. by C. Plummer, 1892-9.

Anglo-Saxon Language. The terms Saxon and A.-S. are popularly used to designate the form of language introduced into England by Germanic tribes who invaded this country from the 5th cent. onwards. The chief of these tribes were the Saxons, the Angles, and the Jutes. All these tribes spoke closely allied dialects of the Anglo-Frisian group of the W.-Germanic branch of the Indo-European family of languages (see **INDO-EUROPEAN**). The general term of the invaders for the whole country which became their new homeland was *Englaland*, 'Land of the Angles,' and the language was called *Englisc*. Redused the expression *Angli sive Saxon*es, implying that both terms meant the same thing, but Alfred the Great, the founder of the W. Saxon prose, the Abbot Aelfric, a W. Saxon writer, and the first Eng. Christian king Ethelbert of Kent called their language *Englisc*. *Lingua Saxonica* or *Saxonice* is rarely used as a generic term, but it is more often employed in specific reference to the Saxon dialects. The term A.-S., coined in the 17th cent., is rather misleading; it is sometimes used in opposition to 'continental Saxon.' The term more commonly employed is O.E. (see **ENGLISH LANGUAGE AND ENGLISH LITERATURE**).

O.E. soon became split up into various dialects, which can be distinguished into three or four groups: the S. Eng. dialects and the Anglian dialects, divided into Northumbrian (dialects of the Angles N. of the Humber) and Mercian (the dialects of the Angles of the Midlands). There were probably also E. Anglian dialects, but we do not know anything of their early form. We have no written documents in O.E.

of the first few hundred years. The earliest documentary knowledge of this language consists in some names of places and persons which appear in a few Lat. charters of the late 7th and the early 8th cents. Of the S. dialects the most important by far is that of Wessex, or W. Saxon, which became dominant for literary purposes during the reign of King Alfred (871-99), and maintained its supremacy until the close of the O.E. period. Another form of A.-S. is known as S. Patois (of the Blickling Homilies and the Harleian Glosses). Kentish and the Anglian dialects are mainly known to us in charters, glossaries, glosses, or paraphrases of the Gospels and the Psalms. Therefore the study of literary O.E. is mainly based on W. Saxon.

Like German, Latin, and Greek, and unlike modern English, W. Saxon was a highly inflected language. It retained the elaborate system of genders; its nouns were masculine, feminine, or neuter; and they had four case-forms in the singular and plural, together with corresponding ones of the dual number, which has disappeared in all modern Germanic languages except Icelandic. The adjectives agreed with the nouns, and were declined with them. In the conjugation of the verbs there were twice as many forms as in Mod. E.: as in German there was a large number of verbs, called 'strong,' in which changes in tense were indicated by internal vowel change (some Mod. E. words still show the basic similarity of pattern, e.g. write, wrote, written). There existed a second larger group of verbs called 'weak,' which used a different method for forming tenses, a suffix, consisting in a syllable containing a dental consonant (-de, -ode, -le). The verb had a special infinitive form (-ian, -an, -n), and a past participle (prefix *ge-*).

See ENGLISH LANGUAGE; for A.-S. literature see ENGLISH LITERATURE.

Anglo-Saxons, see SAXONS.

Angmering: 1. Vil. of Sussex, England, near the coast, 3 m. from Worthing. Pop. 1270.

2. *A.-on-Sea*, or *E. Preston*, modern coastal resort near A. vil.

Angoche, see ANTONIO ENES.

Angola, name applied to the Portuguese possessions on the W. African coast, lying between the Congo and Benguela or from the border of Belgian Congo to Cape Frio. A. was discovered in 1482 by the Portuguese mariner, Diogo Cao, and exploited by slavers. Its landward boundaries are the Fr. Congo, the Belgian Congo, Rhodesia, and SW. Africa. It has a coastline of 1000 m. on the Atlantic Ocean. The waters of the Rua Cana Falls and the Kunene R. are shared jointly for irrigation and power purposes by Portugal and the Union of S. Africa. The area is about 785,000 sq. m. and it is divided into 12 administrative dists. and ruled by a high commissioner. The coast is barren and unhealthy, but inland the country is well watered and sisal, rice, and sugar are widely grown. The 3 chief rvs. are the Kwanza, the Kunene, and the Kwango. In the mts are various mines, chiefly copper, lead, and sulphur. The

resources of the country are not by any means fully developed under Portuguese rule. The cap. is Luanda, formerly São Paulo de Luanda (pop. (1950) whites, 20,170; all others, 141,037). Luanda has 600 metres of quays with depths varying from 11½ to 5½ metres. The other chief tns are Kabinda, Benguela, Nova Redondo, and Nova Lisbon, formerly Humambo, which are also seaports. The chief products are maize, coffee, rubber, and coco-nuts as well as the products noted above; and some of the best agric. lands are traversed by the Benguela railway running from Lobito Bay to Katanga (and thence to Beira)—the last-named being a mineral dist. Benguela's trade has declined, but it still exports considerable quantities of beeswax, sugar, and maize, though ships have to lie 2 m. out. the port being on a roadstead. Lengue, Cubal, S. Pedro, and Ganda are other trading centres. There is a twice weekly air service from Luanda to Leopoldville, a weekly service to Lisbon, and a good internal air service. The Mossamedes railway goes inland from Mossamedes to Sá da Bandeira (Huila).

Angora, see ANKARA.

Angostura (Santo Tomé de la Nueva Guayana), see CIUDAD BOLIVAR.

A. Bark is derived from *Cusparia febrifuga*, a species of S. Amer. tree of the family Rutaceae. It is used in the manuf. of drugs which have a tonic effect, but its value as a febrifuge is small. Trinidad is the source of *A. bitters*, the manuf. of which was transferred to the is. from A. or Ciudad Bolívar in 1875, owing to the troubled state of Venezuela.

Angoulême, Charles de Valois, Duke of (1573-1650), Fr. courtier, was the natural son of Charles IX of France and his mistress, Marie Fouchet. He plotted against Henry IV, and was imprisoned from 1605 to 1616. He was then released, and spent the rest of his life as a soldier and diplomat of France, taking part in the Thirty Years War and being in command at the siege of La Rochelle. He was an author of some note.

Angoulême, Duchesse de Montmorency et d', see DIANE DE FRANCE.

Angoulême, Louis Antoine de Bourbon, Duke of (1775-1844), Fr. soldier and prince, eldest son of Charles X of France, b. Versailles. He left France at the outbreak of the revolution. In 1799 he married his cousin, Marie Thérèse, and on the recall of his uncle, Louis XVIII, to France he was made lieutenant-general of the kingdom. He attempted to oppose Napoleon's return in 1815, but was deserted by his troops. In 1823 he commanded the Fr. expedition to Spain. After the revolution of July 1830 he retired with his father, Charles X, into exile. He d. at Görz.

Angoulême, Fr. tn, cap. of the dept of Charente, on the Charente. It was the anc. cap. of the prov. of Angoumois (q.v.). The tn stands on a 317-ft high promontory. It is a bishopric, and has a 12th-cent. cathedral, with a very richly decorated façade. Brandy is produced, and pottery, paper, and metal goods are manuf. Margaret of Navarre (q.v.) was b. here. Pop. 44,200.

Angoumois, anc. Fr. prov., corresponding to parts of the present depts of Charente and Dordogne. It was united to the crown in 1714. The cap. was Angoulême (q.v.).

Angra (Do Heroísmo): 1. Administrative dist. of the Azores (q.v.), comprising the is. of Terceira, Graciosa, and São Jorge. Area 268 sq. m.; pop. 86,600.

2. Seaport in the Azores, at the head of a deep bay on the S. shore of Terceira is. It has a 16th-cent. cathedral and a 17th-cent. castle. There is a trade in agric. produce, wine, fruit, tobacco, and embroidery. Pop. 11,000.

Angra Pequena, bay in SW. Africa, lat. 26° 38' S., long. 15° E., on which stands the tn of Lüderitz. This was estab. in 1883 by a Bremen merchant of that name, and in 1884 the dist. was proclaimed a Ger. protectorate. The surrounding country is desert, and the harbour itself is not good, freight having to be landed by lighters. The tn is connected by rail with the S. African system to Keetmanshoop by a service which runs thrice weekly.

Angrézabad, see ENGLISH BAZAR.

Anгри, It. tn in Campania (q.v.), 10 m. NW. of Salerno (q.v.). Pop. 6000.

Ångström, Anders Jonas (1814-74), Swedish physicist, b. Lögddö, Medelpad; studied at Upsala Univ. From 1867 to his death he was secretary to the Royal Society of Sciences at Upsala, at which univ. he had already occupied sev. posts. He was the first to examine the spectrum of the aurora borealis in 1867, and he detected and measured the characteristic bright line in its yellow-green region. His chief work is *Optiska Undersökningar*, on spectrum analysis. The unit for expressing wave-lengths of light is named after him. $1\text{Å} = 10^{-8}$ cm. See also PHYSICAL UNITS.

Anguilla, or Snake Is., dependency of St Kitts-Nevis, Leeward Is. (Brit. W. Indies), has an area of about 35 sq. m. The surface is flat, some cattle are pastured there. Sea Is. cotton and salt are the chief products. Pop. 5050.

Anguis, genus of reptiles of order Lacertilia and family Anguillidae. *A. fragilis*, the slow-worm, is a limbless, snake-like lizard with well-developed eyes, found in Asia, Europe, and America. The genus is viviparous, the female producing from 6 to 20 silvery young.

Angular Motion, motion of a body about a fixed axis. Different parts of the body describe arcs of different lengths in the same time, but the angular velocity is the same for all points of a rigid body. Angular velocity is the angle turned through per sec. by a line in the body perpendicular to the axis of rotation. It is

usually measured in radians per sec. A radian is $180^\circ/\pi$, or $57^\circ.29578$. Thus, if a body rotates through 30° per sec., its angular velocity is $30/57.29578 = 0.5236$ radians per sec.

Angus, David McKenzie (1855-1901), bookseller, b. Thurso, Scotland. He was apprenticed to E. and S. Livingstone, booksellers in Edinburgh, and in 1882 migrated to Sydney, Australia, where he resumed his career, later owning his own shop. In 1886 he was joined by **George Robertson** (1860-1933), b. Halstead, England, and trained by James Macle-hose, bookseller to the Univ. of Glasgow. Together they founded the firm of Angus & Robertson, booksellers and, later, publishers. A. relinquished his share in the business in 1900 and returned to England, where he d. in the following year. The firm fl. and is now the largest bookselling and publishing organisation in Australia, with H.Q. in Sydney and branches in Melbourne and London. The subsidiary of the firm, the Halstead Press, is named after G. Robertson's bp.

Angus, Marion (1866-1946), poetess, b. Aberdeen, daughter of a minister. Brought up at Arbroath, she did not start writing poetry seriously till she was over 50; her themes are nearly always sad. Her works include *The Lill*, 1922, *The Tinker's Road*, 1924, *Sun and Candlelight*, 1927, *The Singin' Lass*, 1929, *The Turn of the Day*, 1931, and *Lost Country*, 1937. *Selected Poems* with a memoir appeared in 1950.

Angus, formerly Forfarshire, maritime co. of E. Scotland, bounded by Aberdeen and Kincardine on the N., the N. Sea on the E., the Firth of Tay on the S., and Perthshire on the W. The surface is varied; the foothills of the Grampians (q.v.) lie in the N. and between the heights are the fertile valleys of Glen Isla, Glen Clova, Glen Prosen, and Glen Esk. The Sidlaw Hills (q.v.) run parallel to the former range, and between these lies the wide valley of Strathmore. The chief streams are the Isla and the N. and S. Esk; the prin. lochs are Lintrathen, Forfar, Lee, and Balgavies. Sandstone and granite are quarried in the hills. Wheat is grown extensively in the valley of Strathmore, and oats and potatoes are cultivated. The salmon and herring fisheries are important, but the chief industry is flax and jute manuf.; Dundee is the centre of the linen and jute trade. At Carnoustie there is a noted golf course. The chief tns are Forfar (the co. tn), Dundee, Arbroath, Montrose, Brechin, Carnoustie, Monifieth, and Kirriemuir. With Kincardine the co. returns 2 members to Parliament. Area 885 sq. m.; pop. 275,000.

Angussola (or **Angusciola**), **Sophonisba** (c. 1535-c. 1625), It. portrait-painter, b. Cremona. Of her Van Dyck is said to have declared that he learnt more from her conversation on art than from the best masters. She was called to the Sp. court by Philip II to paint portraits of himself and his queen.

Anhalt, ter. in Germany on the W. bank of the Elbe (q.v.), now mainly in the dist.

of Halle (q.v.). Until 1918 it was a duchy, and consisted of E. and W. A. and sev. small enclaves in Prussian Saxony (q.v.). The ruling family had various branches, of which the prin. were A.-Dessau, A.-Zerbst, and A.-Köthen. Until 1918 the state religion was Protestantism. Area 893 sq. m.; pop. Dessau (q.v.).

Anhima Cornuta, see HORNED SCREAMER.

Anhinga, Amer. snake-bird, darter, or water-turkey (*A. anhinga*), akin to the cormorants.

Anholt, small Dan. is. in the Cattegat. It was occupied by the English from Mar. 1811 to Jan. 1814. Area 8 sq. m.; pop. 225.

Anhui, see ANHWEI.

Anhui, prov. of China, bounded on the E. by the provs. of Kiangsu and Chekiang, on the W. by Hupeh and Honan, and on the S. by Kiangsi. It is watered by the Yangtze, which flows through the fertile tea-growing dists. of the prov. Other products are wheat, cotton, rice, and indigo. The prov. is mountainous in the SW., reaching an elevation of over 7000 ft. The N. section is drained by the Huai H. Iron and coal are mined. Its cap. is Hefei, which has railway communication with Nanking. Other tns are Anking, Wuhu, Pengpu, Hsuanchen, and Ch'imen. The prov. is crossed by 3 railways. Area 55,692 sq. m.; pop. (1954) 30,343,637.

Anhydride, or anhydrous acid, term applied to compounds formed by the dehydrating of acids, or which represent in their composition the acid minus water. Thus sulphuric A. is $\text{SO}_3 = \text{H}_2\text{SO}_4 - \text{H}_2\text{O}$.

Anhydrite, mineral consisting of calcium sulphate, CaSO_4 , but differing from gypsum in that it contains no water of crystallisation. The colour is white, red, grey, or blue, and it usually contains a small amount of sea-salt, being found in salt deposits. Nearer the surface the mineral absorbs water, and is converted into gypsum; its liability to this change makes it unsuitable for building purposes.

Ani, anct. ruined city of Armenia, about 25 m. SE. of Kars, on the Arpaçai. During the Middle Ages it was the seat of the Bagratide kings of Armenia. About 1062 it was taken and pillaged by the Seljuks, and during the next 2 cents. it was repeatedly sacked. Its ruin was finally completed by an earthquake. Sev. interesting remains (of buildings and the city wall) are still to be seen.

Aniche, tn, dept of Nord, France, 8 m. ESE. of Douai. Has coal-mines, glass-works, and chemical manufs. Pop. 8300.

Aniello, Tommaso, called by corruption **Masaniello** (c. 1623-47), Neapolitan rebel leader, b. Amalfi and d. Naples. The Duke of Arcos, viceroy of Philip IV of Spain, who was Governor of Naples, levied a tax on fruit and vegetables in 1647. The people, with A., at that time a poor fisherman, as their leader, rose in revolt, and the troops of the viceroy were defeated. As a result, all imposts upon articles of consumption were abolished, and the privileges granted by Charles V were restored. For a short time A. was

master of Naples, but he gave himself up to despotism and excess, and was soon assassinated by the viceroy's agents.

Aniene, or **Teverone** (anct. **Anio**), riv. of Italy, a trib. of the Tiber (q.v.), in the prov. of Rome (q.v.). Since the 3rd cent. its aqueducts have supplied Rome with water, and it is famous for its beautiful cascades at Tivoli (q.v.). Length 73 m.

Aniline, aminobenzene or phenylamine, $\text{C}_6\text{H}_5\text{NH}_2$, first prepared by the dry distillation of indigo, whence it derives its name (Portuguese *anil*, indigo). It is now manuf. by the action of steam and iron scraps, together with a little hydrochloric acid, on nitrobenzene contained in a cast-iron cylinder with a stirring apparatus. Lime is added when the reduction is complete and the A. distilled with steam. A. is also obtained by the electro-reduction of nitrobenzene. An almost colourless oil when pure, boiling point 184°C . A. rapidly darkens on exposure owing to atmospheric oxidation. It is an important starting material for the manuf. of many dyes and intermediates, particularly some of the earliest synthetic dyes. Hence the name 'aniline dyes,' which is now outdated. See DYE.

A. is a colourless liquid, but if not pure it turns brown on exposure to the air, probably owing to the presence of sulphur compounds. It boils at 183° and has a sp. gr. of 1.024 at 16° . It is slightly soluble in water, but is easily dissolved in alcohol and benzene. It is very poisonous if taken internally, and workmen who are engaged in manufs. in which it is used often suffer from headaches and nausea through inhalation of its vapours. It forms salts with the mineral acids, combines with alkyl iodides to form secondary and tertiary amines, and when heated with acetic acid it produces acetanilide or antifebrin.

A. is largely used for the manuf. of dyes and the preparation of benzene derivatives. The so-called A. dyes (see DYES) are not necessarily derivatives of A., but were developed after the study of A. compounds which provided the earliest dyes, e.g. mauveine. *Rosaniline*, or magenta, is produced by the oxidation of A. and toluidine. By substituting methyl groups for hydrogen, the colour becomes reddish-violet and then bluish-violet as the number of methyl groups increases. By substituting ethyl, phenyl, or benzyl groups still more marked changes are produced, so that a series of reds and blues with all their intermediaries can be obtained in substitution products of rosaniline.

Anima Mundi, anct. belief that all the chances and changes of the universe are due to an overruling consciousness, just as the ordering of the body is due to the operation of the human mind. Anaxagoras was among the earliest occidentals to believe that the universe was ordered by a single consciousness or reason. Aristotle held much the same view, but he held that nature itself is a living, conscious being, separate from God, who is a transcendent spirit. The Stoics' belief merged into pantheism, for they conceived of the A. M.

as pure spirit, the one vital force pervading everything. The belief was revived by Cornelius Agrippa (1486-1535), who, however, changed the terminology to *spiritus mundi*; it has been held with slight variations by many moderns, including Bruno, Sebastian Franck, Boehme, Van Helmont, More, and Cudworth.

Animal Flowers, name sometimes applied to the genus *Actinia*, a sea-anemone. The name, of course, originated in the resemblance to a flower of this polyp, which belongs to the animal kingdom.

Animal Magnetism, see HYPNOTISM.

Animal Worship, cult found in most ancient religions, and also at the present day. Men early held that animals had souls (see ANIMISM), and as they were swifter, stronger, and more cunning than themselves, they respected and feared them. Every tribe and div. of the Amer. Indians has its totem, many being animals, which it holds sacred, regarding the animal as its protector and its image as a charm (see TOTEMISM). Similar was the Teutonic use of the boar. A. W. is of 2 main types, that in which the animal itself is worshipped, and that in which the animal is revered as a symbol of a spirit. The prin. animal worshippers now are the Hindus: 'Hera the sacred cow is not merely to be spared; she is, as a deity, worshipped and bowed to daily by the pious Hindu, who offers her fresh grass and flowers. Siva is incarnate in Hanuman, the monkey-god, Durga in the jackal; Ganesa wears the elephant's head; the king of birds, Garuda, is Vishnu's vehicle; the forms of fish, boar, and tortoise were assumed in the avatar legends of Vishnu, which so curiously resemble Red Indian myths.'—Tyler's *Primitive Culture*, 1871. See books listed under TOTEMISM.

Animalculae (dimin. of Lat. *animal*, living being), term formerly applied to the smallest forms of animal life such as can be seen only with the aid of a microscope. They include Bacteria, Protozoa, and Rotifera, and the term is applied in a loose sense to the Infusoria.

Animalcules, Bear, or Sloth, see TARDIGRADA.

Animalcules, Wheel, see ROTIFERA.

Animals (Lat. *animus*, mind), living organisms which are distinguished from plants by their powers of locomotion, capacity for assimilating organic substances, and the absence of the compounds chlorophyll and cellulose. None of these distinctions, however, is complete; either may be unable to move from the spot to which it is attached—plants are usually in this condition, but they frequently have reproductive cells or spores which are free-swimming. Corals remain stationary, whilst amongst plants, diatoms and certain algae and fungi have distinct powers of locomotion; some plants (e.g. the sundew) are insectivorous and digest organic matter; chlorophyll is absent from fungi; the cellulose cell-wall is absent in some plants and present in some A. such as tunicates, or sea-squirts. Both plants and A. frequently live in a parasitic state. A. require to have their

carbohydrate and protein substances already formed for them, and take into their systems in living or dead form pre-existing organic life; all green plants, however, which possess chlorophyll can, with the aid of sun and air, manuf. from inorganic salts their own carbohydrates and protein substance. It is thus in their method of nutrition that A. differ fundamentally from green plants. Both plants and A. are sensitive to external conditions and have an irritable protoplasm. In reproduction there is again great similarity, for in the lowest forms of each, cell-div. may take place or specialised cells may form new life. Higher A. and higher plants differ from one another to a great extent, but the processes of nutrition and reproduction are common to both.

In view of the difficulty of an absolutely distinct line of demarcation, it is justifiable to assert that both forms of life have a common origin and that the processes of differentiation have roughly followed the 2 directions as laid down in the above definition. That both botanist and zoologist consider certain forms to belong to their respective spheres is a gain rather than a loss, and does not disturb the bases of their classification.

In all but the lowest A. the process of life is carried on by a more or less complex machinery of organs—muscles, alimentary canal, heart and blood-vessels, gills or lungs, nervous systems, organs of excretion, and organs of reproduction. But in all A. as in all plants, the effective and essential part consists of protoplasm, and A. exist with structures varying from the mere mass of protoplasm of the amoeba to the highly complex organism of man. See also ARCTIC ANIMALS and CAVE ANIMALS.

Classification. Each large group is divided into phyla, which are divided either into classes containing orders or directly into orders, and these again are divided into families, genera, and finally individual species. In a very broad sense they may be grouped under the heads of Invertebrates and Vertebrates. The following groups or phyla are arranged in order of complexity:

(A) *Invertebrates*. I. Protozoa, a cellular organism such as *Amoeba*. II. Porifera, or sponges. III. Coelenterata, including jelly-fish, sea-anemones, and corals. IV. Platyhelminthes, or flat worms. V. Nemathelminthes, including Nematodes, the round or thread worms. VI. Trochelminthes, including rotifera. VII. Mollusca, including corallines and certain shell-A. VIII. Echinodermata, including star-fishes and sea-urchins. IX. Annelida, including earth-worms. X. Arthropoda, including crustaceans, insects, and spiders. XI. Mollusca, shell-fish, and cuttle-fish.

(B) *Vertebrates*. XII. Chordata, including A. possessing a structure called the notochord, a cord of cells along the middle line on the dorsal side of the enteric cavity, developing into the backbone in vertebrata. It is an extensive and important group, including fishes (Pisces), amphibians (Amphibia), reptiles

(Reptilia), birds (Aves), and mammals (Mammalia). The Tunicata (e.g. sea-squirts) and amphioxus or lancelet possess a notochord, and are simple forms of chordates, resembling in some respects the ancestral Vertebrate. (See AMPHIOXUS.)

Colours of animals. Most of the multicellular A. are coloured in some way or other. But many A. of the marine plankton, such as arrow-worms, heteropod molluscs, copepods, salps, and doliolids are quite colourless and transparent. In other invertebrate A. (sea-anemones, worms, crustaceans, echinoderms, etc.) there are many kinds of pigments in the skin. The vertebrates have developed fewer kinds of skin colouring materials. However, besides these pigments, which are usually carried in definite cells in the skin, there are colours due to the surface structure of the A. The white of fur and feathers may be structural, due to the presence of enclosed air bubbles which reflect all light waves and thus throw back white light. Some of the most striking colours, those shown by the feathers of peacocks, humming birds, and paradise birds and moths are partly due to surface effects. The play of light on the thin layer of horny material on the feathers and the small scales on the wings of these insects gives rise to certain iridescent colours. Horny material covering the sides of chameleons and iguanid lizards gives rise to structural colours which combine with the colours in the pigment cells in the skin. Brown and black colours are due to a dark pigment known as melanin, one of the most common pigments in A. Red and yellow pigments are generally due to carotenoid substances. And mention should be made of the respiratory pigments such as haemoglobin in vertebrates and certain invertebrates and the haemocyanin of arthropods and molluscs. The pink colour of certain fishes and amphibians with transparent skins is due to the red haemoglobin in the blood.

Many A. have the power of changing their colours; notably, certain crustaceans, molluscs, fishes, amphibians, and reptiles. In such species the colour of the body may match the colour of the background and this presumably has some camouflaging effect. For instance, the prawn *Hippolyte* is green when living in green seaweed while on brown and red weed its colour is nicely matched. In the skin of the prawn are cells each bearing red, yellow, and blue pigments. On green weed the red is concealed and the combined colour of the 2 other pigments is, of course, green. Cuttlefishes, squids, and octopuses also have most astonishing powers of quick colour changes.

Flat-fishes are able to match their colour to that of the ground in which they are resting. The chameleon, which has been much studied, has a skin with 4 layers giving colour effects: an upper yellow layer; then in order below this 3 layers giving blue, white, and brown effects. According to the degree of spreading out of the yellow, blue, and

brown colours in the pigment cells, different combined colours are produced. The remarkable way in which the chameleon may change its colour to match its immediate environment is effected through the eye, thence through the brain to nerves controlling the colour cells. Certain colour changes are also produced by the direct effect of light on the skin.

In A. without the power of colour change both the presence of a definite colour pattern and the absence of any such pattern may have a concealing effect. Concerning the latter, the transparent A. of the marine plankton have already been mentioned. Certain butterflies and moths have colour patterns that are so like the trees, etc., on which they rest that they are very difficult to spot. Disruptive patterns (when the colours are arranged in sharply different sections) as in certain coral fishes, birds, and mammals (such as the zebra) are assumed to break up the form of the A. and make them less conspicuous to their predators. Counter-shading in fishes, the back being darker and gradually merging with the white or silver underparts means that when viewed from above it will tone with the sea and when seen from below will match the silvery surface film. Warning colorations are striking colour patterns associated with certain noxious characters such as stings in insects, an unpleasant taste and an offensive smell (as in the skunk). And other creatures, particularly in the insect world, mimic these warning patterns.

There are a number of species of syrphid flies (hover-flies) some of which look like wasps and some like bees. But besides mimicry in colour patterns there may be mimicry of behaviour. Finally it must be emphasised that colour patterns are not only of use in camouflage, etc., but generally play an important part during the breeding season. The elaborate displays during the courtship of birds is an obvious example but the precise study of this subject is only just beginning. See H. B. Cott, *Adaptive Colouration in Animals*, 1940, and E. M. Stephenson and C. Stewart, *Animal Camouflage*, 1946.

Animals, Cruelty to. It was not until the beginning of the 19th cent. that any measures were taken either for the prevention or for the punishment of C. to A. England took the lead, and founded the Royal Society for the Prevention of C. to A. (R.S.P.C.A.). 1824, and Scotland followed in 1839. Later the U.S.A., France, and Germany had organisations for the prevention of C. to A. Few countries are now without such an organisation; the R.S.P.C.A. has branches in Commonwealth countries. The various statutes on the subject were consolidated in the Protection of Animals Act, 1911. All domestic A. come within the statutory provisions and also wild A. if in captivity or confinement, or maimed, pinioned, or subjected to any contrivance for the purpose of preventing their escape from captivity. The Act of 1911 re-enacts the general provisions of the old Acts by which A. may not be ill-treated, overdriven, or kept without proper food and water. It

is also forbidden to perform painful experiments on living A. except under licence from the Home Office, and then only in accordance with statutory regulations. An application for such licence and a certificate for any exception from the regulations must be signed by the president of some scientific body such as the Royal College of Physicians and Surgeons. By the Protection of Animals (Anaesthetics) Act, 1954, anaesthetics must be used for certain specified operations on A. Besides the more obvious forms of cruelty, it is also forbidden to convey any animal in such manner as to cause it unnecessary suffering; or to administer poisonous or injurious drugs or to perform an operation without due care and humanity, while bull-baiting, bear-baiting, and cock-fighting have long been prohibited. Other offences are selling poisoned grain or flesh for animal food and using dogs for draught; while the exhibition and training of performing A. are regulated by the Performing Animals (Regulation) Act, 1925, which provides for the registration with a local authority of persons so training or exhibiting A. People convicted of C. to A. may, under the Act of 1933, be prohibited from keeping A. Under the Protection of Animals Act, 1934, certain public contests, exhibitions, and performances in which A. are used are prohibited. These include throwing or casting with ropes or other appliances any unbroken horse or untrained bull; or wrestling, fighting, or struggling with an untrained bull; or riding or trying to ride a horse or bull which, by appliances or treatment involving cruelty, has been stimulated to make it buck. On a conviction under the Act of 1911 the court may order the destruction of any animal if satisfied that it would be cruel to keep it alive, or deprive the offender of its ownership. Compensation up to £10 may be awarded for any damage or injury to the animal or any person or property. A constable may, on getting a veterinary certificate, cause an injured animal to be slaughtered. The enforcement of the statutory provisions relating to C. to A. is mainly undertaken by the R.S.P.C.A. with the assistance of the police. By the Protection of Animals (Amendment) Act, 1954, the fine for offences of cruelty is increased to a maximum of £50. Further, this Act permits a court on a second or subsequent conviction for cruelty to disqualify the offender from having custody of any A. Many prosecutions are also instituted under the Protection of Birds Act, 1954, which includes the offences of keeping birds in very small cages and the killing and taking of wild birds. Homes for stray dogs and cats have been founded in Great Britain and in the U.S.A. and elsewhere; animal welfare organisations provide free treatment for sick and injured A. of needy folk.

Animi, term applied to various oleoresins, sometimes to a variety of copal, but most frequently to elemi. Brazilian A. is the product of a leguminous tree called *Hymenaea courbaril*.

Animism (Lat. *anima*, soul), title first

given by the Ger. chemist Stahl in the early 18th cent. to the doctrine that all phenomena peculiar to the animal world are produced by an immaterial 'soul' or vital principle distinct from matter. E. B. Tylor, however, in his *Primitive Culture*, 1871, gave it to the attribution of a living soul (q.v.) to inanimate objects and natural phenomena, and the term is used now generally in that sense. Tylor postulates A. as the first requirement of religion, stating that nothing below this should be considered as religion. See also FETISHISM and RELIGION. See E. B. Tylor, *Primitive Culture*, 1871; Sir James Frazer, *Golden Bough*, 1890-1915; R. R. Marett, *The Threshold of Religion*, 1914.

Animuccia, Giovanni (c. 1500-71), It. musician and composer, b. Florence. In 1555 he was appointed *maestro di cappella* at the Vatican. His hymns, *Laudi spirituali*, are said to be the origin of the oratorio. He composed a number of masses, motets, magnificats, madrigals, and other works.

Anio, see ANIENE.

Anions, see IONS.

Anise, or *Pimpinella anisum*, ann. species of the Umbelliferae found in the S. of Europe. The fruit is known as aniseed, and is much used in flavouring.

Anjou, old prov. of France, now covered by the dept of Maine-et-Loire, and parts of those of Indre-et-Loire, Sarthe, and Mayenne. In Rom. times it was the ter. of the Andecavi, whence the name of Angers, the anet cap., is derived. The son of Geoffrey V of Anjou by Matilda, daughter of Henry I of England, came to the Eng. throne as Henry II, and thus founded the Angevin line of kings. In 1204 Philip Augustus of France took it from King John. It was later bestowed as a fief upon Charles, the son of Louis VIII, who, conquering Naples and Sicily, became there the founder of the Angevin line. Charles was also count of Provence, and for nearly half a cent. the 3 were united. Margaret, daughter of Charles II of Naples, took A. with her as part of her dowry to Charles of Valois. In 1328, on the accession of her son, Philip VI of France, it was joined to the Fr. crown. In 1360 it was made a duchy, and with Louis I returned to the dominion of Naples. In 1480 A. was finally annexed to the Fr. crown, and the title of Duke of A. became an honorary title given to princes of the royal family of France.

Anjouan, see JOHANNA.

Ankara, or **Angora**, tn in Asia Minor and cap. of the il of the same name and, since 1923, of Turkey and H.Q. of the Republican Gov. The city was until recently poorly laid out and of primitive sanitation. Kemal Atatürk planned a new city on the Amer. system and, by the time he d., many modern improvements had been carried out. Its anet name was Ancyra (q.v.), and it was the cap. of the Rom. prov. of Galatia Prima. A temple, now in ruins, contains the *Monumentum Ancyranum*, inscribed with a record of the reign of Augustus Caesar. A. is just over 200 m. ESE. of Constantinople. It was the scene of a great battle in 1402

between the Turks and the Tatars, when the former were defeated. It is famous for its breed of goats, which have long, silky hair and are very valuable. This hair is known as mohair in its manuf. state. Pop. of fl 1,120,622; of tu 435,151.

Anker, measure of wine and spirits, containing about 10 wine gallons, formerly used in England. It was borrowed from the Dutch, and is still used in Holland, Denmark, Sweden, etc. The name is also given to a cask containing an A.

Ankerite, naturally occurring carbonate of lime, iron, and magnesia. Found in impure limestones and in veins and concretions. Crystals are commonly rhombohedral with curved faces.

Ankh, in anc. Egypt, the symbol of life.

Anking, see **HWANGING**.

Anklam, Ger. tn in the dist. of Rostock, on the R. Peene 4 m. from its outlet on the Stettiner Hafl (q.v.), 65 m. E. by S. of Rostock (q.v.). It was severely bombed during the Second World War. There are shipbuilding and engineering industries. Pop. 20,000.

Ankle, joint between the leg and the foot. It is a hinge joint with backward and forward motion, although a certain amount of lateral motion is possible. There are 3 ligaments, the anterior, internal, and external. As the A. is the joint which most often has to bear the whole weight of the body with the greatest amount of leverage, sprains are a common occurrence. Hot fomentations should be applied if the swelling is considerable, and not too severe bandaging resorted to. Complete rest for the joint is the first desideratum, after which gentle massage should be employed. Passive movements of the muscles should precede any effort to move the joint by the muscles alone, and exercises gradually proceeded with until the weight of the body can be endured.

Ankober, or **Ankobor**, tn of Ethiopia, in Shoa, situated about 8500 ft above the sea, in lat. 9° 34' N. and long. 39° 54' E. It contains a royal palace, the climate is good, and the pop. was once considerable.

Ankole, mountainous dist. of Uganda bordering on Lake Edward and centred on Mbarara; also a Bantu kingdom of W. Uganda. The king, the *Mugabe* ('giver'), is head of a state comprising Negro peasants and non-Negro aristocrats, the latter herding cattle and probably being of anc. Egyptian (Hamitic) origin. See K. Oberg, 'The Kingdom of Ankole,' in Fortes and E. E. Evans-Pritchard, *African Political Systems*, 1940.

Ankylosis (Gk *ankulos*, curved), immovable union of 2 bones naturally connected to form a movable joint, caused by an osseous growth in *true A.*, by a fibrous growth in *false A.* It is liable to occur after a fracture in the neighbourhood of the joint, and after inflammatory conditions in a joint or the ends of bones forming the joint, as in tubercular infection and rheumatoid arthritis. *A.* may occur in any joint which is immobilized in one position for a long time. Because of the rigid position of the limb, *A.* naturally attacks the Indian fakirs, whose

religious devotion condemns them to remain motionless for years. Cases are on record of a general *A.* of all the bones of the human body. Sometimes a joint is ankylosed deliberately as a surgical procedure when permanent immobilization is desirable. The operation is known as *arthrodesis*.

Ankylostomiasis, or **Uncinariasis**, morbid condition produced by the presence of the parasite *Ankylostoma duodenale* (hook-worm) in the human intestine. The parasite is found in tropical countries, and is also known in Germany, Belgium, Switzerland, England, and the S.E. section of the U.S.A. The disease is most common amongst brickmakers, tunnel-workers, and miners, and is sometimes known as miner's anaemia. The eggs of the parasite are expelled from the intestine with the faeces, and develop in warm, damp soil into larvae which can infect new hosts by boring through the skin, usually of the foot. The larvae are taken in the blood to the lungs, whence they are coughed up into the mouth and then swallowed. In the stomach and intestine they become the mature hook-worms, 1-2 cm. long, which attach themselves by their hooks to the mucous membrane, producing internal haemorrhage, often fatal; milder attacks cause anaemia and vomiting. Moreover it is impossible for infected individuals to lead a normal, active existence, and attacks of the parasite were responsible for such epithets as 'poor white trash,' formerly applied to dwellers in the S. U.S.A. Vermifuges and purgatives remove the worm from the intestine; carbon tetrachloride is much used nowadays, and is extremely effective. Infection can be prevented by the wearing of leather footwear and faeces should be properly disposed of by adequate sanitation. The disease may also be spread by the practice in many countries of using human manure for the growing of crop plants.

Ann, **Annal**, or **Annatine**, in Scots law, is the half-year's stipend payable for the vacant half-year after the death of a minister to his family or next of kin. As it belongs to his next of kin, and not to the minister himself, it is not assignable to him, nor can it be attached for his debts. It is not payable to widows of ministers admitted after 1925.

Ann Arbor, city, cap. of Washtenaw co., Michigan, U.S.A., on R. Huron, in an agric. and fruit-growing area, 38 m. W. of Detroit. It manufs. metal products, chemicals, and precision instruments, and is the seat of the univ. of Michigan (19,000 students). Here is the Nichols Arboretum and there is an ann. May Festival. Pop. 48,300.

Anna, Indian and Pakistani coin, value about 1d., the sixteenth part of a rupee.

Anna Comnena (1083-1148), daughter of the Emperor Alexius I (Comnenus), famous as probably the first woman historian. Having unsuccessfully attempted, first by means of influence over her father and secondly by means of conspiracy, to obtain the crown for her husband, the historian Nicephorus Byzantius, she fled to a convent, where

she wrote her hist. called the *Alexiad*. It consisted chiefly of a panegyric of her father's reign and is not now generally considered a serious historical contribution.

Anna Ivanovna (1693-1740), Russian empress, daughter of Ivan V, elder brother of Peter the Great. She married a Duke of Kurland and was soon widowed. In 1730, being offered the crown of Russia, she accepted, signing articles which limited her power in favour of the aristocracy, but which she soon repudiated. She was cruel and vindictive and entrusted the gov. of the country entirely to her favourite, Biron (q.v.), who instituted a reign of terror.

Anna Leopoldovna (1718-46), Ger. princess, grand-daughter of Russian Tsar Ivan V (elder brother of Peter the Great). The Empress Anna Ivanovna, her aunt, left the throne to A. L.'s infant son, Ivan VI. A. L. overthrew the regent, Biron, and was regent herself for a year, but in 1741 was in turn overthrown by Peter the Great's daughter, Elizabeth, who had the infant emperor imprisoned. She eventually died in banishment.

Annaben, see ANNABON.

Annaberg, Ger. tn in the dist. of Karl-Marx-Stadt, in the Erzgebirge (q.v.), 18 m. S. by E. of Karl-Marx-Stadt (q.v.). It was founded in the 15th cent. as a silver-mining tn. There are also uranium, tin, and cobalt mines in the dist. Pop. 20,000.

Annabon, Annaben, Annobon, or Anobon, Sp. is., gulf of Guinea, W. Africa, 4 m. long, 2 m. wide. It is mountainous (3000 ft.) and has a pop. numbering between 2000 and 3000. On it is situated the tn of San Antonio de Praia.

Annah, see ANAH.

Annals were formerly records of events (in chronological order) which happened during the year, and the Chinese, Assyrians, Egyptians, Greeks, and Romans had their A. According to Cicero (*De Oratore*, xii) it was the custom from the commencement of the Rom. state down to the time of Publius Murius for the pontifex maximus to draw up an account of the transactions of the past year to be publicly exhibited. These A. were afterwards called *Annales Maximi*, the Great A., and it is probable that they were the same as those referred to by Livy as *commentarii pontificum*. *Annales Gentium* and *Annales Consulares* were written by such men as G. Calpurnius Piso, consul 67 BC, and contained the hist. of Rome in chronological order. Later the term A. was given to any historical work written in chronological order, e.g. the A. of Tacitus; and now it is frequently used of an account of events digested into so many successive years, as the *Eccles. A.* of Baronius and the *A. of Scotland* by Sir David Dalrymple, or of a periodic pub. containing records of discoveries, transactions of societies, etc., as the *A. of Science*.

Annam, one of the 3 regions (Tonking, A., and Cochín-China) into which France divided Viet Nam during the 19th cent. A. and Tonking became Fr. protectorates,

while Cochín-China was made a Fr. colony. The name A. was frequently used to include the whole of Viet Nam. A. extends northward to Tonking, southward to Cochín-China, being bounded on the W. by Laos and on the E. by the China Sea. A range of high, jungle-clad mts runs from N. to S. along the W. side, so that almost the entire pop. lives in the strip of low-lying, cultivable land between the mts and the sea. This coastal tract is crossed by sev. short rvs. unsuitable for navigation. In 1937 the inhab. of

Paul Popper

ANNAMESE FISHERMAN

A. numbered 5,656,000, but there have been great shifts in pop. since then and no further census has been taken. The cap. of A. is Hué, the seat of the emperors of the Nguyễn dynasty, and the prin. ports are Tourane and Qui-nhon. The soil is rich and the agric. products include rice, fruits, cotton, sugar, tea, silk, coffee, tobacco, cinnamon bark, and areca nuts. Coastal fishing is carried on. The frontier between Communist N. Viet Nam and non-Communist S. Viet Nam was estab. by the Geneva Conference of 1954 along the 17th parallel and cuts A. in two. The N. part is now governed from Hanoi and the S. part from Saigon. The terms Trung-bô or Central Viet Nam are gradually replacing the name A. See VIET NAM.

Annamaboe, Ghana (Gold Coast), tn 10 m. E. of Cape Coast Castle, W. Africa. It has a strong fort and a good breakwater. Pop. 5000.

Annan: 1. Anc. royal burgh of Dumfriesshire, Scotland, on the R. Annan, 16 m. S. of Dumfries, with boiler and glove factories, a fishing industry, and

cattle and sheep markets. A. is in the Dumfriesshire parl. area. Pop. 4031.

2. Riv. of Dumfriesshire, Scotland, rising in the Moffat Hills and flowing S. for 40 m. to enter the Solway Firth at the tn of A. Annandale is largely rural in character.

Annapolis, cap. of Maryland, U.S.A., port of entry and co. seat of Anne Arundel co. It is on the Severn R., 23 m. SW. of Baltimore. The U.S. Naval Academy was founded here in 1845. The students, formerly called cadets, are now called midshipmen. Two are allowed for each senator, representative, and delegate in Congress, 2 for the dist. of Columbia, and 5 each year for the U.S.A. at large. After a course of 4 years the midshipmen go up for examination, and those who pass are appointed in the lower line of the navy. The city is a port of entry and a trade and shipping centre for a truck- and fruit-growing region; it has a sea-food industry. Pop. 10,047.

Annapolis Royal, port of entry of Nova Scotia, Canada, co. seat of A. co. The oldest settlement in Canada, founded by the French in 1605 under the name of Port Royal. Fort Anne is a natural hist. park. A. valley is famed for its apples and mixed farming. Pop. 784.

Annapurna, Himalayan mt in N. Nepal, lat. 28° 40' N., long. 83° 50' E.; height 26,493 ft. It was the first peak of 26,000 ft. to be climbed. The summit was reached on 3 June 1950 by Maurice Herzog and Louis Lachenal of the Fr. Himalayan Expedition. The descent was marred by misadventure, foul weather, and benightment; severe frost-bite crippled the climbers. See M. Herzog, *Annapurna*, 1952.

Annat, see ANN.

Annates, see FIRST-FRUIT.

Anne (1456-85), Queen of England, daughter of the Earl of Warwick (the king-maker). She was betrothed to Edward, Prince of Wales, but after his death at Tewkesbury in 1471 married Richard of Gloucester (1474). She became queen when he seized the throne as Richard III, 1483.

Anne (1665-1714), Queen of Great Britain and Ireland, b. London, the second daughter of James II and Anne Hyde. She was educ. as an Anglican, and her religion was the only subject on which she seems to have had strongly consistent views, from which none of her favourites could shake her. In 1683 she married Prince George of Denmark, who showed little interest in state affairs. The marriage seems to have been a happy one, but of the couple's 17 children only one, Prince William, survived infancy, and he d. at the age of 11. Soon after A.'s marriage, the future Duchess of Marlborough, Sarah Churchill, was appointed to her household, and soon gained enormous influence over her, which she used for personal and political ends.

During her father's reign A. led a secluded life, having little interest in the glamour of the court, but she supported the accession of her brother-in-law William of Orange, and her sister Mary, and

on William's death in 1702 A. succeeded him on the Eng. throne. The Marlborough influence declined from about 1707, and after a particularly violent quarrel the duchess was dismissed from court in 1710. Abigail Masham (q.v.) became the queen's new confidante, and used her influence to further the Tories.

It is clear that A. was continually beset by conscientious worries on the succession question, her feelings of family loyalty convincing her that the succession should revert to the son of her father's second marriage. But before her death (1714) she seems to have tacitly recognised the Hanoverian claim.

A.'s reign is notable for the bitter party faction, for which her favourites were at least partially responsible, and for the glorious Brit. military victories won in Europe by Marlborough. It was a reign rich in literary talent. In an epoch of low political and personal morality, the private life of the queen was exemplary, and her religious convictions were sincere if narrow in character. See life by M. It. Hopkinson, 1934.

Anne Boleyn, or **Bullen**, see BOLEYN, ANNE.

Anne Elizabeth Alice Louise, Princess (1950-), younger child and only daughter of Queen Elizabeth II and the Duke of Edinburgh, b. Clarence House, London.

Anne Hathaway's Cottage, see SHOTTERY.

Anne of Austria (1601-66), Queen of France, eldest daughter of Philip III of Spain; she married in 1615 Louis XIII of France, who detested Austria. Largely owing to the influence of Richelieu the marriage was very unhappy. On the death of Louis XIII she became regent for the young king, Louis XIV, adopting as her minister Mazarin (q.v.). She was entirely under Mazarin's influence, and may have actually married him, though there is no positive evidence of this. On his death in 1661 she retired to a convent, where she d. See life by M. Buchanan, 1937.

Anne of Cleves (1515-57), Queen of England, fourth wife of Henry VIII. She was the daughter of John of Cleves, a powerful supporter of Protestantism in W. Germany, and the marriage was arranged by Thomas Cromwell (q.v.). It took place in Jan. 1540, but Henry seems to have found her completely unattractive, though his unwillingness to become allied with the Ger. Protestants was probably an equal reason for his having the marriage annulled by Parliament in July 1540. A. was given a pension on condition that she remained in England. She d. at Chelsea and was buried in Westminster Abbey.

Anne of Denmark (1574-1619), Queen of Great Britain, daughter of Frederick II of Denmark and Norway, and wife of James I of England and VI of Scotland, whom she married in 1589. She was later suspected, probably correctly, of being a secret Catholic. She bore James 5 children, of whom 2 survived, Charles I and Elizabeth of Bohemia. A.'s extravagance was the subject of unfavourable

comment by contemporaries. She seems to have had little or no influence on state affairs.

Annealing, process to which glass and metals are subjected, which consists in heating and subsequent cooling. During the fabrication of an article from glass, internal stresses are developed which render the glass very brittle. These stresses are removed and the brittleness decreased by heating the article uniformly to a temp. where the glass just begins to soften followed by slow cooling. Metals become hard when they are deformed during fabrication. A stage is reached where further deformation without cracking can be carried out only after softening by A. Similarly, it is found that the links of a metal chain harden during use, so that it is no uncommon thing for a chain to be re-annealed after it has been in use for some time to ensure that toughness and ductility are maintained. See also METALLURGICAL HEAT TREATMENT and METALLURGY.

Anney, Fr. tn, cap. of the dept of Haute-Savoie. It is the seat of a bishop. A pleasant old tn, in beautiful surroundings, it is a popular tourist resort. There are textile and metal manufs. Pop. 26,700.

Annelida (Lat. *annellus*, little ring), phylum of animals, consisting of segmented worms most of which bear minute spines or setae by which locomotion is assisted; the blood is usually red, and the perivisceral cavity is part of the coelom. Usually the A. are aquatic, but in some cases they are terrestrial (earthworms); some species are hermaphrodite. The nervous system consists of a pair of preoral ganglia connected by commissures with a pair of ventral nerve cords, which generally expand into a pair of ganglia in each segment. There is a vascular system in most A. and respiration is often effected by means of gills; the alimentary system contains a tubular canal opening in the first segment as the mouth, and in another as the anus. Reproduction may take place sexually or asexually by budding; in many instances, if a worm is cut in two each part will produce the missing segments. These animals generally hide themselves by means of burrowing, but some may form round themselves a dwelling made of exudations from their bodies and accumulated external material. The 3 main groups of A. are Polychaeta, all marine, examples being rag-worms, lug-worms, and tube-worms; Oligochaeta, nearly all land and freshwater forms, e.g. earth-worms; and Hirudinea, leeches.

Annexation, term applied in international law to the act by which a nation adds to its terr. lands previously independent or in the possession of another state. It may be the result of conquest, of voluntary cession, or of mere occupation of a previously unoccupied or uncivilised dist. Often, again, it is the sequel to the estab. of a protectorate. Acquisition of ter. by purchase or lease, as a bilateral action, is not spoken of as A. A., except in case of cession, must always be supported with an armed force sufficiently

large to carry the proclamation into effect; otherwise it is purely fictitious. For example, in Sept. 1900 Lord Roberts proclaimed at Pretoria that Great Britain had annexed the ters. of the Transvaal republic. Yet the war continued for another 2 years.

The annexing state takes over all the ter. annexed, with its benefits and obligations, provided they be not contrary to the new order. Laws previously passed are, of course, no longer binding. Questions of detail are perpetually being settled in the courts of various nations, and recourse should be had to these cases for fuller information as to the practice of individual states.

Anniston, co. seat of Calhoun co., Alabama, U.S.A., among the Blue Ridge Mts, 63 m. N.E. of Birmingham. It is a centre of the cotton trade, and has large manufs. of all kinds of ironwork and machinery. It was founded in 1872. Pop. 31,000.

Annihilationism, see CONDITIONAL IMMORTALITY.

Anniversary (Lat. *anniversarium*, from *annus*, year, and *vertere*, *versum*, to turn) is a term used to express the yearly return of any remarkable day. A.s of religious festivals, of great events in hist., and of birthdays in domestic life are kept. The Christians keep Christmas Day, Good Friday, Easter, and Whitsun in commemoration of the great events in the life of Christ. The sovereign's birthday is officially kept on 12 June. See CALENDAR.

Annonaceae, family of dicotyledonous plants consisting of tropical and sub-tropical trees and bushes. The flowers have a perianth in 3 whorls of 3, numerous hypogynous stamens, and numerous superior carpels, usually with many ovules. The genera include *Annona*, *Asimina*, *Artabotrys*, *Centabotrys*, *Gualteria*, *Uvaria*, and *Xylopia*.

Annonay, Fr. tn in the dept of Ardèche, on the Cance. It manufs. paper, textiles, and chemicals. Pop. 15,500.

Annotto, **Anatta**, **Anatto**, dyestuff from seeds of *Bixa orellana*, W. Indian evergreen tree.

Annual Register, pub. yearly, a record of contemporary events. It was started in 1758 by Dodsley the bookseller. It is now pub. by Messrs Longmans, and contains information on literature, art, science, and events of the current year.

Annals, strictly anything lasting for one year only, or repeated every year. The term usually refers to (1) ann. plants which flower for a year and then seed themselves, and (2) books of which successive numbers are pub. once a year. Very popular as gift books in the early 19th cent. were the ann. anthologies of prose and verse, sumptuously produced, and illustrated with steel engravings. The first one, *Forget Me Not*, appeared in 1823, followed by *Friendship's Offering* and *The Literary Souvenir*. *The Keepsake* and *The Book Of Beauty* continued till 1836. They often contained the first printings of the work of famous authors. In the latter part of the cent. Christmas A.

were issued by the publishers of fashionable magazines such as *Belgravia*. The *Saturday Book*, first pub. in 1941, is a return to the sumptuous gift book illustrated in colour, first ed. by Leonard Russell, and since 1954 by John Hadfield. Children's A. are issued by the publishers of most children's magazines, and contain stories, articles, puzzles, etc. See also YEAR BOOKS.

Annuity, term applied to a sum of money which is paid yearly, or at certain periods of each year. The most general application of the term is in the case of what are otherwise called *life A.s.*, that is, where a certain sum is paid *per annum* until the death of a stated person. *A.s.* certain are not dependent upon any contingency, and may be *terminable*, in which case the payments continue until a stated date, or *perpetual*, where the payments are presumably for ever. When the first payment has to be made at the time of the transaction, it is called an *A. due*, but when payment has not to commence until a stated date, it is called a *deferred A.*

The gov. uses the principle of terminable A.s. to discharge certain obligations within a given time, with a view to limiting in some degree the burdens placed on posterity by the national debt. Such A.s. may be held by private persons, and are exchanged either for cash or for gov. stock, which is cancelled when the A.s. are taken up. The gov. may also make an arrangement with itself, as it were, as a banking concern, to make payments to include a proportion of the cap. as well as the interest of gov. stock, as in the 'Old Sinking Fund.' The value of such an arrangement is that it can be varied upon an emergency, although, for obvious reasons, such a proceeding is usually avoided if possible. Instances of perpetual A.s. are provided by the various irredeemable gov. stocks, where the security is practically absolute. In calculating the present value of an A. certain, or the yearly amount for a certain purchase value, the interest reckoned is compound. Methods of calculation are to be found in any text-book of algebra. See also PUBLIC DEBT.

Life A.s. present some more complicated features than A.s. certain, because the probability of the contingency becoming actual enters into the calculation. Hence the importance of tables of mortality, etc., for insurance companies and others who deal with A.s. The tendency in early times was to use very simple rules for the probability of death, which were generally very inaccurate for extreme cases. Thus the rule in Rome up to AD 230 was to reckon for all ages under 30 an A. was worth 30 years' purchase, and for every additional year of age 1 year was taken off the purchase value. Thus the purchase value actually vanished at 60 years of age. In 1725 Abraham DeMoivre enunciated the rule that out of 86 children born one would die every year until the last one died between the ages of 85 and 86. This was found to fit in approximately with observed facts, but continual improvements

have since been made. Perhaps the same conclusion had been arrived at in 1671 by Huddle, in a correspondence with Jan de Witt, grand pensionary of Holland. In 1693, Halley, the famous astronomer, worked out the probability of death for every fifth year from the records of births and deaths in the city of Breslau, and computed the purchase value of A.s. at 6 per cent interest, this being probably the first attempt to arrive at values on a scientific basis. Shortly afterwards the Eng. Gov. attempted to raise money by the sale of A.s. at 14 per cent, that is to say, at about 7 years' purchase. Notwithstanding the pub. tables of Halley, which showed that such A.s. were worth from 17 years' purchase at age 10 to 44 years' purchase at age 75, the proposal was by no means eagerly accepted by the investing public. In 1808 the Northampton table was adopted by the gov., based on statistics of the deaths in Northampton between 1735 and 1780. A.s. were offered on the lives of nominees, this time based on age with no distinction of sex, but at much too favourable a rate. Again little business was done except by Dutchmen, who were more conversant with the subject and chose their lives carefully, but the loss on such transactions increased until it amounted to as much as £8000 a week. The next scheme was much more scientifically constructed, but included A.s. for men of 90 years of age at 62 per cent or less than 2 years' purchase. This provided an opportunity for speculators who nominated all the healthy old men they could lay their hands on and reaped a rich harvest. Thenceforward A.s. on aged lives were not offered, and some time afterwards it was enacted that no one could nominate a life over 65 unless the nominee had a direct interest in the A.

Naturally such experiences and the gradual accumulation of reliable statistics have enabled the gov. to ascertain what rates are profitable. The gov. tables, however, are based on the assumption of a 2½ per cent interest, whereas many insurance companies can afford to allow for at least 3½ or 4 per cent interest. The tables in general use by the priv. insurance offices are those prepared by the Institute of Actuaries, and are distinguished by the symbols *a(m)* and *a(f)* denoting select male lives and select female lives. See also ACTUARY and INSURANCE.

Examples of such tables are appended:

TABLE 1. *a(m)*

Showing the value of an A. of £1 at certain ages.

Age next Birth-day	Value of an A. of £1	Age next Birth-day	Value of an A. of £1
20	£19.552	50	£14.220
25	19.029	55	12.772
30	18.382	60	11.186
35	17.588	65	9.513
40	16.634	70	7.832
45	15.510	75	6.233

TABLE 2

Approximate A.s for a purchase price of £100

Age next Birth-day	A. for £100 Males	A. for £100 Females
40	£5 16 0	£5 11 0
45	6 4 0	5 16 0
50	6 14 0	6 4 0
55	7 9 0	6 14 0
60	8 9 0	7 9 0
65	9 18 0	8 11 0
70	11 18 0	10 1 0

Annulet, in architecture, a narrow stone ring round a column, much used in Romanesque and Gothic buildings; also beneath the capital of the Greek Doric Order.

Annulus, in geometry, the space enclosed between the circumferences of 2 concentric circles. Its area is the difference between the areas of the circles.

Annunciation, announcement to the Virgin Mary by the angel Gabriel of Christ's Incarnation. The Feast of the A. (commonly known in England as Lady Day) is kept throughout the Church on 25 Mar. The highest lit. order of knight-hood was that of the A. The subject has frequently been treated in sacred art.

Annunzio, Gabriele d' (1863-1938), Prince of Monte Nevoso, lt. poet, novelist, and dramatist, b. Pescara, educ. at the college of Prato, Tuscany, and at the univ. of Rome. He was the son of the Duchess Maria Gallese di Roma, of Dalmatian extraction. His first pub., *Primo vere* (verse), 1879, won him notice, and he was welcomed at Rome by the Cronaca Bizantina group. The *Terra Vergine*, 1882, was a continuation in prose. *Canto Nuovo* appeared the same year. As a journalist on the staff of the *Tribuna* at Rome he wrote under the name of Duca Minimo. Other earlier works are *Intermezzo di Rime*, 1883; *San Pantaleone* (collection of short stories), 1886; *Il libro d'Isotta*, 1886; *Odi Navali*, and *Poema Paradisiaco*, 1893; *Chimera*, 1895; *La Canzone di Garibaldi*, 1901; *Elegie romane*, 1905; *Laudi*, 1909; *L'Orazione e la Canzone in morte di Giosue Carducci*, 1907. Chief among his novels, which contain vivid descriptions, and show much beauty of style and psychological insight, may be mentioned *Il Piacere*, 1889 (trans. into English as *The Child of Pleasure*, 1898); *L'Innocente*, 1891; *Il Trionfo della morte*, 1896; *La Vergine delle Rocce*, 1897 (Eng. trans. 1899); *Il Fuoco*, 1899. Among his tragedies are *La Citta morta* (written for Sarah Bernhardt), 1898; *La Gioconda*, 1899; *La Gloria*, 1899; *Francesca da Rimini*, 1901; *Più che l'amore*, 1906; *Le Martyre de Saint Sébastien* (in French), 1911. A miscellany entitled *La Leda senza cigno* appeared in 1913. In 1914 he produced a play in French, *La Pisanella ou la mort morte parfumée*; also *Parisina*, for which Massenet composed music. In 1892 he had begun to read Nietzsche who exerted

a strong influence on his writings, as also Schopenhauer, Dostoyevsky, and Wagner. Many of his shorter stories were obviously suggested by the works of other writers, e.g. *The End of Candia* was clearly founded on Maupassant's *A Piece of String*; *San Pantaleone* reminds us of Verga's tale of the rival saints; and *Mastro Peppe's Magic* is a variation of a well-worn comic theme of old lt. novelists. Similarly, with many of his long novels, the theme, treatment, and even the phraseology may at times be traced to anterior writers. He is original, however, in his predilection for pathological and psychological abnormalities, as well as in his rhetoric; he employs words as a musician employs sounds, and expresses his individuality in swift vital language shot through with colour.

He was in France at the time the First World War broke out, and instantly made it his business to urge Italy to side with the Allies. *Per la più grande Italia*, addresses concerning the war, appeared in 1915. A. took a passionate interest in politics, and had surprised many by his performances on active service, the extreme sensuality of his literary work having led people to believe him a weakling. He had been in the artillery, and had lost an eye when practising aviation; but his most remarkable exploit came after the armistice of 1918 when he prevented the internationalisation of the port of Fiume. He pub. in 1921 *Notturmo*, dealing with the blindness he suffered after the aeroplane accident. In 1924 he was made Prince of Monte Nevoso, and there appeared the first vol. of *Le faville del Maglio*. In the spring of 1925 he was visited by Mussolini, who had become dictator of Italy. In 1927 the lt. Gov. commenced the pub. of his works in 48 vols.; the issue was completed in 1938, the year of A.'s death. A.'s influence in lt. literature cannot be exaggerated; he freed Italy from the intellectualism of the 19th cent., and transformed the language into a vehicle for the expression of sensuousness and poetic emotion. See A. Sodini, *Ariel armato* (biography), 1931; G. Griffin, *Gabriele d'Annunzio*, 1935; D. Pastorino, *Gabriele d'Annunzio*, 1941.

Annus Deliberandi, period allowed to an heir by Scots law to decide whether he will accept or reject the inheritance. This was formerly of importance, as acceptance rendered the heir liable for the whole of his ancestor's debts regardless of the value of the estate.

Anoa, species of ruminating quadruped (*A. depressicornis*), intermediate between the antelopes and the ox or bovine group. It is about the size of a sheep; is wild and fierce; and its horns are erect, straight, sharp, depressed anteriorly, and irregularly ranged at the base. It is found in large herds in the is. of Celebes.

Anobium, genus of coleopterous insects. It consists of small beetles which live on organic matter. *A. paniceum* is the biscuit weevil, and *A. striatum* the death-watch, which makes a curious tapping

sound by knocking the lower part of its head on the wood.

Anobon, see ANNABON.

Anode, in electrolysis (q.v.) and other electric phenomena, the electrode in connection with the positive pole of the battery. The direction of the conventional current is from the A. through the liquid to the cathode. In electric discharges and radio valves, the electron current is from cathode to anode. See CATHODE.

Anodynes, or **Analgesics**, medicines which relieve pain by their action on the brain, or their influence over the conductivity of the sensory nerve fibre. The prin. A. are opium, Indian hemp, belladonna, aconite, chloroform, antifebrin, antipyrine, etc. They should never be used except in accordance with the advice of a medical man.

Anointing, see BAPTISM; CHRISM; CORONATION; EXTREME UNCTION.

Anolis, genus of lizards belonging to the family Iguanidae, and peculiar to tropical America and the adjacent is. The structure of their toe pads enables them to traverse a smooth wall or ceiling, and to climb with great facility. They are slender, active, and for the most part of small size, and are mostly found in woods and rocky places. They are timid and harmless, and when under the influence of fear they dilate the dowlap, and the skin, especially of the throat, changes its hues with great rapidity.

Anomalistic Year, period of time, between 2 successive passages of the earth through its perihelion, the point in its orbit when it approaches nearest the sun. This point is not fixed, and as a result the A. Y. is over 4½ min. longer than the sidereal.

Anomaluridae, African rodent closely allied to the flying squirrels and having flight membranes, but forming a distinct genus (*Anomalurus*) by reason of the horny scales on the lower surface of the tail. These project from the skin and act as an 'antiskid' device when the animal lands from a leap.

Anomaly (Gk *an-*, negative; *homalos*, even), term used in astronomy to denote the position of a body—usually a planet or comet—in its orbit. There are 3 different kinds of A. The *true A.* is the angle between the line drawn from the sun to the position of the body in its orbit and the line from the sun to its perihelion: this angle is measured in the plane of the body's orbit and in the direction of its motion. The *mean A.* represents what the angular distance of the body from perihelion would be if it moved with uniform velocity in a circle whose radius is equal to the mean distance of the body from the sun, and is usually denoted by *M*. The *eccentric A.*, denoted by *E*, is connected with *M* by the relation $M = E - e \sin E$, where *e* is the eccentricity of the orbit of the body, and the *true A.* *v* is connected with *E* and *e* by the relation

$$\tan \frac{1}{2} v = \sqrt{\frac{1-e}{1+e}} \tan \frac{1}{2} E.$$

Anonymous (Gk *an-*, not; *onuma*, name),

description of a writing or work in which the author's name is not given. A. work is described as pseudonymous when an assumed name is given. Most of the works of art of antiquity which have come to us are A., and in past cents. many great writers have pub. their work in this form. Swift's *Tale of a Tub* is an example. The first ed. of Jane Austen's *Sense and Sensibility* was 'By a Lady,' while *Pride and Prejudice* was 'By the author of *Sense and Sensibility*.' Most journalistic essays were until comparatively recently pub. anonymously, as concealment was felt to give greater freedom to the writer. The work of reference in general use for discovering the authorship of A. books is Halkett and Laing's *Dictionary of Anonymous and Pseudonymous Literature*, 1926-34, to which a supplementary vol. was pub. in 1936 covering the years 1900-50. See also PSEUDONYM.

Anopheles (Gk *an-*, without; *phleleia*, benefit), genus of mosquitoes, of the order Diptera and family Culicidae. *A. maculipennis*, a common Brit. species, is one of the distributors of malaria in tropical countries. See ROSS, SIR RONALD.

Anorthite, mineral of the feldspar group, consisting of calcium and aluminum silicate. The colour is white, grey, or red, and its hardness about 6. A. is a constituent of igneous rocks such as some basalts and gabbros, but the most completely developed crystals are found in rocks ejected from Mt Vesuvius.

Anorthoclase (Gk *an-*, not; *orthos*, straight; *klasis*, fracture), feldspar similar to orthoclase, but with soda in place of some of the potash in its composition.

Anouilh, Jean (1910-), Fr. dramatist, b. Bordeaux. He was in turn copy-writer and secretary to Louis Jouvet. Since the great success of his *Voyageur sans Bagage* (1936), he has become one of the leading Fr. dramatists of his time. He divides his plays into *pièces noires*, tragical and pessimistic plays, including *L'Illermine*, 1932, *Jezebel*, 1932, *La Sauvage*, 1934, and *Roméo et Jeannette*, 1945; *pièces roses*, rooted in traditional Fr. comedy, including *Le Bal des Voleurs*, 1932, *Le Rendez-vous de Senlis*, 1937, and *Léocadia*, 1939; and *pièces brillantes*, including *L'Invitation au Château*, 1947, *Colombe*, 1951, and *La Valse des Toréadors*, 1952. Even in the *pièces roses*, however, the dark shadow of despair and bitterness is easily distinguishable. Many of A.'s plays are drawn from antiquity, as *Eurydice*, 1942, *Antigone*, 1942, *Médée*, 1946, and *Oreste*, 1947. There are Eng. and Ger. trans. of his most successful plays. See H. Gignoux, *Jean Anouilh*, 1946; J. Didier, *À la rencontre de Jean Anouilh*, 1946; E. G. Marsh, *Jean Anouilh*, 1953.

Anquetil Duperron, Abraham Hyacinthe (1731-1805), Fr. orientalist, b. Paris, brother of Louis Pierre A. He studied theology, and his slight acquaintance with oriental languages became a passion. He visited India and collected stores of knowledge and MSS. In 1771 on his return he pub. the first European

trans. of the *Zend-Avesta* (3 vols.). In 1801-2 he pub. a Lat. trans. from the Persian of the *Oupnek'hat* (*Upanishad*).

Ansars, or **Nossairians**, Arab tribe of N. Tripoli, whose mystic religion is a compound of Mohammedanism and ant. Syriac cults, with traces of Gnosticism. Its origin is lost in obscurity, but it probably dates from the 9th cent. See *Dussaud's Histoire et religion des Nasairis* (Paris), 1900, a standard work on the Alawis and Druses.

Ansbach, or **Anspach**, Ger. tn in the Land of Bavaria (q.v.), 92 m. NW. by W. of Munich (q.v.), on the Rezat. From 1460 to 1791 it was the seat of the margraves of A., and from 1791 to 1806 belonged to Prussia. It has a baroque castle, streets of fine baroque houses, and sev. notable churches, including the 15th-cent. pilgrims' church of the Holy Cross. The tn is a road and rail junction, and has manufs. of machinery and buttons. Pop. 35,000.

Anscharius, see **ANSGAR**, St.

Anschluss, movement of the political union of Austria and Germany, which first found concrete expression in 1931 in the Austro-Ger. Customs Union proposal and finally ended successfully in the forcible incorporation of Austria in the Third Reich, 1938-45. See **AUSTRIA**.

Ansdell, Richard (1815-85), landscape and animal painter, b. Liverpool, first exhibited at the Royal Academy in 1840. His travels in Spain led to various Sp. subjects. Among his paintings are 'Grouse Shooting' and 'A Galloway Farm' (both exhibited at the Royal Academy, 1840), 'Death of Sir William Lambton at Marston Moor, 1842, and 'Treading out the Corn,' 1865.

Anselm, St (1033-1109), b. Aosta in Piedmont. In 1056 he joined the Benedictine order at Bec, in Normandy, of which he afterwards became abbot. In 1093 he was summoned to succeed Blessed Lanfranc as Archbishop of Canterbury, and immediately had to contend with the encroachments of William Rufus upon ecclesiastical rights. Exiled by that monarch, he was recalled on the accession of Henry I, and soon found himself involved in a controversy with the king over the question of investiture. There followed a second exile, which was terminated in 1106 by the famous compromise, leaving temporal investiture to the king but reserving investiture with the emblems of spiritual jurisdiction to ecclesiastical authority. Of A.'s writings we possess his theological treatises *Monologion*, *Proslogion*, and *Cur Deus Homo*, and also a revelation of his personal sanctity in the *Meditations and Letters*. See *Opera Omnia Sancti Anselmi* (ed. F. S. Schmitt), 1948. A. was buried next to Lanfranc in Canterbury Cathedral. He was canonised in 1494 and declared a Doctor of the Church in 1720; his feast is on 21 April. See Endmer (A.'s chaplain), *Vita Anselmi* (ed. M. Rule), 1884; J. Clayton, *St Anselm: a Critical Biography*, 1933; Daniel-Rops, *Cathedral and Crusade* (Eng. trans.), 1957.

Anser (Lat., 'goose'), scientific name for

the genus of birds which contains the goose (q.v.). *A. cinereus* is the grey goose, *A. hyperboreus* the snow goose, *A. segetum* the bean goose.

Ansgar, **Ansharius**, or **Ansgarius**, St (801-65), 'the Apostle of the North,' was b. near Amiens, and d. Bremen. He went as a missionary first to Denmark, and then to Sweden. In 831 he was made Archbishop of Hamburg, and the see was transferred to Bremen in 847. Among his works are some essays and a *Life of St Willibrord*.

Anshan, Chinese industrial tn in Liaoning, situated half way between the cap., Shenyang (Mukden), and its port, Yinkow, to the SW. It produces most of China's iron and steel and is the supply centre of rails and seamless tubes for her heavy industry. Since 1949 its production has increased from 150,000 to 3 million tons, and the pop. has increased from 130,000 to 270,000 (1956).

Anson, **George**, Lord (1697-1762), famous admiral and circumnavigator of the world, b. Shugborough in Staffs. In 1712 he entered the navy, and by 1724 had reached the rank of captain. In 1740, during the war with Spain, he was made commodore of the S. Amer. squadron, and though the expedition was hopelessly mismanaged, his indomitable perseverance earned some success. See his *Voyage round the World*, 1748.

Anson, **Sir William Reynell** (1843-1914), jurist, b. Walberton, Sussex. In 1874 he became Vinerian reader in Eng. law at Oxford, and in 1899 was returned as Liberal-Unionist M.P. for the univ.; parl. secretary of the Board of Education, 1902. He pub. *Principles of the English Law of Contract*, 1884, and *Law and Custom of the Constitution*, 1886-92.

'**Anson**', battleship of the *King George V* (q.v.) class, laid down on the Tyne in 1937 and commissioned in 1942. Displacement 35,000 tons. Complement 1500 men. Length 739 ft 8 in., beam 103 ft, and draught 27 ft 8 in. Equipped with 4 aircraft, with enhanced defence against air attack. Armament 10 14-in. guns, 16 5.25-in. guns, and 4 multiple pom-poms. The 14-in. guns were a new model with an effective range greater than the 15-in. guns mounted on earlier ships.

Ansonia, city of New Haven co., Connecticut, U.S.A., on the R. Naugatuck. It produces brass, copper, hardware, clocks, electrical equipment, tools, machinery, textiles, and wire and sheet-metal products. Pop. 18,700.

Anspach, see **ANSBACH**.

Anstey, Christopher (1724-1805), poet, b. Cambs. He was educ. at Bury St Edmunds, Eton, and King's College, Cambridge. His *chef-d'œuvre* was the *New Bath Guide*, a poem pub. in 1766. This satirical sketch of Bath life made a decided hit at the time, and is enthusiastically praised by both Gray and Walpole in their correspondence. None of his other works attains the same standard.

Anstey, F., pseudonym of **Thomas Anstey Guthrie** (1856-1934), novelist, b. London. Educ. at King's College School and Cambridge, he studied law and was

called to the Bar in 1881, but turned to writing after the success of his fantasy *Vice Versa*, 1882, the story of a man who exchanges bodies with his schoolboy son. From 1887 to 1930 he was on the staff of *Punch*. He is best remembered for his fairy-tale extravaganzas: *The Tinted Venus*, 1885, *A Fallen Idol*, 1886, *The Man from Blankley's*, 1893, *Baboo Jabberjee, R.A.*, 1897, and *The Brass Bottle*, 1900. His serious novels had little success. *A Long Retrospect*, 1936, is autobiographical.

Anstruther, tn on the Firth of Forth, Fifeshire, Scotland, since 1929 comprising the royal burghs of Kilrenny, A. Easter and A. Wester, which is the tn's full title. It is the hp. of the poet, Tennant and the great divine, Dr Chalmers. Fishing, oûskin manuf., and golf-club manuf. are the main industries. Pop. 3000.

Ant (O.E. *amete*; A.-S. *aemete*; Ger. *Ameise*, from Old High Ger. *meizan*, to cut), Emmet, or Pismire, insect of the family Formicidae (Lat. *formic*, ant) of the order Hymenoptera, to which also belong the wasp and the bee. They are social animals of many genera and about 3500 species; they vary greatly, not only among the various genera, but also among the individual species. The *white A.s* (termites) are often thought to belong to the A. family, but they are in reality members of the order Isoptera, and though in habit and construction of their homes they somewhat resemble A.s, they are not closely related morphologically.

A.s are omnivorous, feeding on both vegetable and animal life, when alive and when dead. The harvesting A.s (*Aphaenogaster*) store up grain for food, the leaf-cutting A.s (*Atta*) completely denude trees and store the leaves in their nests for the sake of a fungus which will grow on them; other A.s are cannibalistic. All delight in saccharine matter, and it is on this account that they keep their *cows* i.e. aphids, which excrete a sweet substance, seen on plants as *honey-dew*.

The queen A. is the greatest in size, and in her nest there will be males, females, and neuters, or aborted females.

Sometimes both male and female are winged, sometimes winged and wingless live together. Among neuters the *soldiers* have larger heads than the mere ordinary *workers*, and these defend their home when it is attacked. Both workers and fertile females have stings, and the poison they eject is known as *formic acid*. The male A. is usually smaller than the female. In the colony occasionally beetles and smaller A.s, as the *Formica rufa*, live peacefully, and are thought to take the place of domestic pets. Mating takes place between winged A.s when in flight; the male soon after perishes, and the females which escape such perils as drowning and insectivorous birds tear off their wings and perform their new role. They either go voluntarily to a nest to lay their eggs, or are dragged to one by workers, who will attend to the needs of the young. Occasionally the females found a new colony without the workers, performing all the work alone until the first brood is hatched; as this consists of workers, the female does not long pay attention to the eggs. The workers carry the eggs from one part of the nest to another as the temp. requires, the nest consisting of irregular cells connected by passages. The larvae are fed on semi-digested food by the workers, and when they grow older some species form cocoons; even in the pupa stage the workers feed them, and when the time is ripe for their entrance into the world, they help them to extricate themselves from their cases and lick them over when they are free. The so-called 'ants' eggs' often used for feeding goldfish are really the pupal stage of the A.; their food value is small. Some A.s, as the *F. sanguinea* and the genus *Polyergus*, make slaves of other A.s, and in some instances are unable all through life to feed themselves, actually depending on their slaves to put the food into their mouths. *F. sanguinea*, the blood-red robber A., occurs in Britain; the workers carry out special slave raids during which they attack workers of other species (chiefly *F. fusca*), and carry off the pupae.

Mention may also be made of the peculiar partnership existing between some common species of A.s and certain butterflies, reaching its highest level in butterflies of the family Lycaenidae. The caterpillars have on the seventh abdominal segment a gland secreting a sugary liquid which is licked up by A.s; the caterpillars benefit from the association since they are protected from their enemies (ichneumons) by the A.s. The caterpillars of the large blue butterfly are not only attended and 'milked' by A.s, but they are even taken by the A.s into their nests. Here the caterpillars become parasitic and prey on the A. larvae; if deprived of the larvae, they are unable to complete their development into the adult butterfly.

A.s are usually very short-lived. The queens may last for sev. years, but the ordinary A.s usually endure for only one summer; the workers survive in winter by hibernating. The intelligence of A.s

is a disputed subject, but they are known to show signs of excitement at the return of a strayed companion or on the approach of the queen, and they recognise members of their own species which have entered other nests. The workers of some species are almost sightless, but A.s have the power of vision generally. They communicate with each other seemingly by means of their antennae, and by stridulating organs of the abdomen. They take great care of the sanitation of their nests, removing the dead and all unnecessary objects immediately. The nests are frequently mounds of earth and leaves, but often are found beneath stones. An Australian A., the *Myrmecia*, builds enormous mounds, and a S. Amer. A. forms hills 5 or 6 ft. in height. See J. T. Moggridge, *Harvesting Ants*, 1873; F. White, *Ants and their Ways*, 1883; F. W. Frohawk, *Natural History of British Butterflies*, 1926; H. St. J. K. Donisthorpe, *British Ants*, 1927; Sir John Lubbock, *Ants, Bees, and Wasps* (ed. J. G. Myers), 1929; E. N. Marris, *The Soul of the White Ant*, 1937; Caryl P. Haskins, *Of Ants and Men*, 1946.

Ant-bear, the popular name of the *Myrmecophaga jubata*, is also known as the great ant-eater (see under ANT-EATERS).

Ant-eater, Scaly, see PANGOLIN.

Ant-eater, Spiny, see ECHIDNA.

ANT-EATER

Ant-eaters, popular name for members of the mammals known as Myrmecophagidae, of the order Edentata, peculiar to central and S. America. It is toothless, its head being prolonged into a long snout containing a protrusible tongue always well moistened with saliva, with which it picks up the ants and termites on which it feeds. *Myrmecophaga tridactyla*, the great ant-eater, also known as the ant-bear or tamanoir, is about 4 ft. long, and the bushy tail, which serves as protection against cold, about 2½ ft. As it walks it bends its long and sharp claws beneath it, but it can use them in its defence. It produces a single offspring at a birth. *Tamandua* and *Cyclopes* are other genera, both arboreal.

Ant-lion, larva of the family Myr-

meleonidae, of the order Neuroptera. The eggs are laid in loose sand, and when the larva has appeared it forms a conical pit, at the bottom of which it hides, and seizes upon any small insect, such as an ant, which may fall into it. By means of its legs it throws sand on its victim to hasten its fall, and by means of its mandibles, which communicate with the alimentary canal, it holds it firmly and absorbs its juices, then throws away the body. The mature insect has 4 wings. It is unknown in England, but is found in various parts of Europe and America.

ANT-LION

Ant-thrush, or Ant-catcher, species of perching bird belonging to the family Formicariidae. As their name implies they feed largely on ants. These birds, which range in size from a jay to a wren, are found in central and S. America.

Antacids in medicine, substances which have the power of neutralising or counteracting acids in the gastric juices or excreta. The most important are caustic soda and potash, with their carbonates, bicarbonates, acetates, and citrates; ammonium and magnesium, with their preparations; bismuth subcarbonate. More recently aluminium hydroxide has been used as an antacid. Some of these, like soda and aluminium, act directly upon the gastric membrane; others, like the acetates and citrates, act indirectly through the blood, being converted into carbonates. The direct A. are used in dyspepsia, where it is required to counteract the excessive acidity of the stomach; and the indirect in gout, where the excess of uric acid in the blood is to be counteracted.

Antaeus, son of Poseidon and Gaia, Libyan giant invincible at wrestling until overcome by Hercules.

Antakya, see ANTIOCH.

Antalcidas, Spartan soldier and diplomatist, who succeeded in undermining the friendly relations between Athens and Persia, in the 4th cent. bc, and who later, by his naval operations in the Hellespont, forced Athens, in 386 bc, to accept the peace of A. By this treaty all Asia Minor was to be under Persian rule, and

all the Gk cities, except Lemnos, Imbros, and Scyros, became independent.

Antalkalia, substances which neutralise alkalis, such as acids.

Antalya, formerly *Adalia*, anct Attalia, seaport of Turkey on the Gulf of A. Built on the slope of a hill, the streets rise in tiers above one another, facing the harbour. It exports fruit, timber, and wheat. Its former importance as a port has been greatly lessened by the extension of railways and the unsuitability of its harbour for modern steamers. Pop. about 28,000.

Antar, Arabian warrior and poet of the 6th cent. A poem by him is one of the 7 to 10 called *Moallakāt* and he is the hero of a medieval romance, trans. into English by Terrick Hamilton, 1819. This romance gives a description of the manners and customs of the Bedouin Arabs.

Antarctic and Antarctica, circum-polar S. continent of roughly $5\frac{1}{2}$ million sq. m. It has as yet no permanent settlements, but divs. have been named: Alexander Land, Coats Land, Dronning Maud Land, Ellsworth Highland, Enderby Land, Graham Land, Kaiser Wilhelm II Land, Kemp Land, King Edward VII Land, King George V Land, MacRobertson Land, Marie Byrd Land, Oates Land, Princess Elizabeth Land, Queen Mary Land, Ross Sea Dependency, Terre Adélie, Victoria Land, Wilkes Land. The Brit. Commonwealth has claimed three-quarters of Antarctica, an area between 3 and 4 million sq. m. There are 5 main A. sectors: the Falkland Is. Dependencies, administered from the Brit. Colonial Office; the Ross Sea Dependency, governed by New Zealand; the vast prov. claimed by Australia in 1933, when Sir Douglas Mawson (q.v.) took possession of a large sector of Antarctica; Norway in 1939 annexed Dronning Maud Land stretching from the border of the Falkland Is. Dependencies in the W. to the border of the Australian A. Dependency in the E.—i.e. between 20° W. and 45° E.—together with the land within this coast and its territorial waters. The ter. is of great importance for the Norwegian whaling industry. The fifth sector (Marie Byrd Land and Ellsworth Highland) is yet unclaimed, since the Americans, who have mostly explored it, neither make nor recognise territorial claims in Antarctica. The continent is covered by a vast ice sheet from which huge tabular icebergs, sometimes miles in width, break off and float out to sea. In winter the sea freezes to form sea ice many feet thick. The depth of the A. Ocean varies considerably. From the neighbourhood of Tierra del Fuego to Kerguelen Is. it is about 2500 fathoms. Round the Pole at 60° S. it is over 2000 fathoms, while E. of Victoria Land it varies from 200 to 800 fathoms. Submarine ridges rise up at Graham Land to about 100 fathoms beneath the surface. Borchgrevink assigned to the magnetic pole the position of $73^{\circ} 20'$ S. and 146° E., but the local attractions of volcanic rocks and magnetic storms made his observations erroneous, and Profs.

Mawson, Mackay, and David have subsequently located it with more probability at $72^{\circ} 25'$ S. $155^{\circ} 16'$ W. on the inland ice some 7000 ft above sea level. Some mt ranges (e.g. Prince Charles Mts, Australian A. ter.) and isolated peaks (nunataks) pierce the land ice and sometimes reach 14,000 ft. Some parts are known to have copper and coal deposits; but the coastal lands are chiefly important for the whaling fisheries. There is a considerable pop. of animals either living in or dependent on the sea (penguins, sea-otters, whales, plankton, sharks, etc.), but only lichens exist on land. Most of Antarctica has been photographed from the air, but serious mapping, with ground control, has only been accomplished (since 1943) by the Falkland Is. Dependencies Survey.

Some day a delicate task may await the International Court at The Hague or elsewhere in adjudicating on the claims to the S. Polar continent which in recent years have been pressed with increasing insistence. Commander Byrd, for example, set out in Jan. 1940 from New Zealand for Antarctica, among his aims being the consolidation of the work of previous Amer. explorers with a view to making formal territorial claims to some 650,000 sq. m. of Antarctica. Until lately previous exploration has been the commonly accepted principle. Thus Norway, in making large claims in 1939, took care to avoid inclusion of parts discovered by Britain in the W. or by Australia in the E., just as Australia, in delimiting the regions charted by Sir Douglas Mawson, left a gap where the name of Terre Adélie (Fr.) bears witness to the exploration of D'Urville in 1840. An added difficulty subsequently arose from a new type of claim. Both in the Arctic and in the A. it has been suggested that nations whose shores border on the oceans in question should draw lines from their E. and W. extremities to the Poles and claim all in between. On this basis Argentina would gain a S. Polar section that would strike straight across regions charted by Great Britain and the U.S.A. But a final element of confusion is added to the whole question because, if it were referred to the judgment of the International Court of Justice, that court would be bound to find that till now international law has taken no account of any claim to ter. that was not backed by permanent settlement, and that as no country has yet found it worth while to keep a permanent pop. in that inhospitable land all claims alike are spurious. Settlement of the case U.K. v. Chile and Argentina, over claims to the Falkland Is. Dependencies, was attempted by the U.K. at The Hague in 1956. The case was removed from the list, since neither Argentina nor Chile recognised the court's jurisdiction. The activity of many nations during the International Geophysical Year (1957-8) in setting up bases for simultaneous scientific observations, and especially the new Soviet interest, after more than 100 years' lapse since Bellingshausen's voyage (q.v.), will most

probably lead to further claims and counter-claims. See *Polar Record*, 1931-; E. W. H. Christie, *The Antarctic Problem*, 1951; F. A. Simpson (ed.), *The Antarctic To-day*, New Zealand, 1952.

Antarctic Exploration. The hist. of A. E. may be said to begin with Capt. James Cook's voyages in the *Resolution* and *Adventure*, 1772-5, though Bouvet, Dalrymple, and others had done something to dispel the illusion of a S. Atlantic continent stretching to tropical lat.

It is impossible here to describe in any detail the voyages before 1874, but Ross in H.M.S. *Erebus* and H.M.S. *Terror* discovered and explored Victoria Land (1839-43), naming numerous is. and capes. The *Challenger* in 1874, commanded by Nares, was the first steamer to cross the A. circle, but though Nares went only to 66° S. southward of Kerguelen Is. the marine flora he collected and his recorded soundings and other information enabled Sir John Murray to draw numerous valuable inferences as to the existence and trend of an A. continent. The circle was not again crossed until 1893, when Evensen in the *Hertha* sighted Alexander Land, reaching 69° 10' S. 76° 12' W. In 1894 Christensen reached 74° S. at Coulman Is., finding that the sea was easily navigable to the S. Landing near Cape Adare, his party were the first people to set foot on what is generally believed to be the A. continent. In 1898 funds were raised to organise the expedition of the *Belgica*, which in Jan. of that year left Staten Is. for the A. The geographical results were poor so far as land discovery or penetration towards the Pole was concerned, but soundings estab. the existence of a continental shelf of great breadth connected with land to the S. In 1900 Borchgrevink (q.v.) with his party of the *Southern Cross* landed on Possession Is. and on the mainland at the base of Mt Melbourne. With the aid of sledges and dogs he advanced S. to 78° 50'. The next year the *Discovery*, equipped under the supervision of Sir Clements Markham, under the command of Commander R. F. Scott, R.N., left Cowes with Lt. (later Sir Ernest) Shackleton, Dr Wilson, and others on board. The expedition during 1901-4 discovered King Edward VII Land, a vast stretch of the austral continent reaching from 152° to 157° E.; and ascended the glacial sheet ice of Victoria Land, touching, after a 300-m. journey, an altitude of over 9000 ft in 77° 39' S. 146° E. The work of this expedition, together with the contemporaneous voyages of Nordenskjöld, who explored Palmer Land, and of the Ger. expedition under Drygalski, and the somewhat later journey of Dr Charcot in 1904 to W. Palmer Land, confirmed the theory of the existence of an A. continent which, until Bruce discovered Coats Land in 74° S. 24° W., directly opposite S. Victoria Land, had begun to be disbelieved. In 1908-9 Sir Ernest Shackleton carried out the brilliant scientific, geodetic, and geographical discoveries which earned for him his knighthood. He travelled nearly 2000 m., and ascertained the nature and

extent of the Great Barrier and reached a glacier-capped plateau of 11,000 ft elevation in 88° 23' S. 162° W., approaching within 100 m. of the Pole. The next year Capt. Scott set out on his tragic second journey to the Pole. In the meantime Amundsen, the celebrated N. Pole explorer, reached the Pole on 16 Dec. 1911. Scott also reached the Pole, only to find when he did so that Amundsen had preceded him (see SCOTT, ROBERT FALCON). In Jan. 1913 Lt. Filchner, in command of a Ger. expedition, reported the discovery of Prinz Luitpoldland and Kaiser Wilhelm II Land. Prof. (now Sir Douglas) Mawson set out in the *Aurora* in 1911 with Dr Mertz to gain additional knowledge of those lands which lie close along the arc of the A. circle due S. of Australia between S. Victoria Land and Kaiser Wilhelm II Land (where the *Gauss* Ger. expedition had its winter quarters in 1902-3), a tract which had scarcely been touched since the voyages of Balleny, Wilkes, and D'Urville. Sir Douglas Mawson has done much to delineate the A. plateau from the N., and the installation nearly 40 years ago of 2 wireless stations in communication with the Gov. Meteorological Office of Australia, on lands never before sighted, proved of great value as a means of warning ships and agriculturists and others, especially in Australia, of the approach of blizzards and storms.

No explorer has yet crossed the A. continent. Shackleton in 1914 proposed to make the attempt, as did Bruce in 1908, but the expense involved in such an expedition was prohibitive. At the end of 1928 Commander Byrd set out at the head of an Amer. expedition for a comprehensive exploration of the A. continent, and after establishing a base in the Bay of Whales made aeroplane flights. He took photographs during his flight over the S. Pole and obtained much new scientific information on meteorology, geology, etc. Meanwhile the Brit. 'Discovery Committee' (q.v.) organised whaling research expeditions in these waters, both in the wooden ship *Discovery* and in the new steel ship *Discovery II*, the main object of these expeditions being the utilitarian one of checking the threatened disappearance of the whale as a commercial asset by supplementing our existing knowledge of its migrations and breeding. At the end of 1928 Sir Hubert Wilkins, using *Deception* Is. as a base, flew over Graham Land, proving that it was not part of the main mass of the A. continent. In 1934 Adm. Byrd claimed to have discovered extensions of Little America which he named Marie Byrd Land and described as giving evidence of important coal deposits some 200 m. from the S. Pole. Lincoln Ellsworth, the Amer. explorer, with a Brit. pilot, Herbert Hollick-Kenyon, left New Zealand towards the end of Nov. 1935 for a research flight, reaching Little America by sledge, after which their wireless sets failed and nothing further was heard of them till mid Jan., when they were rescued by the R.R.S. *Discovery II*. They had flown some 2000 m.

to Adm. Byrd's base on the Ross Sea before being forced down. In the same year Norwegian explorers are said to have found new land between 80-45° E. long. and 67-50° S. lat. and 73° E. long. and 69-10° S. lat. in the Enderby quadrant, which they named Ingrid Christens Land. Early in 1937 Lars Christensen, the Norwegian explorer, accompanied by M. Wideroe, as pilot, reported the discovery

E.N.A.

THE BARNE GLACIER, VICTORIA LAND

A photograph by Herbert Ponting, taken during Scott's last expedition to the Antarctic.

of a range of mts between the 35th and 40th deg. of long., the highest peak of which was 4500 ft. They dropped the Norwegian flag at a point 38° E. and 69-30° S. New mountainous country with peaks rising to 10,000 ft was seen running from 26° E. and 71-30° S. for some 200 m. westward. Between 1935 and 1937 the *Discovery II* circumnavigated the A. continent, covering a distance of 50,000 m., investigating the distribution of whales in the whole region, besides taking observations of the hydrology and biology of the Ross Sea. The prin. geographical feature discovered by the Brit. Graham Land expedition under Mr John Rymill, which left London in 1934, has been named King

George V Sound. This sound separates Graham Land from Alexander I Land and at its mouth is 15 m. wide, extending some 250 m. in a southerly direction before turning W.

There were sev. A. expeditions during and following the Second World War, the largest being from the U.S.A. Brit. explorers and scientists of the Falkland Is. Dependencies Survey commenced in 1944 a systematic survey of all aspects of their sector and research into human adaptation to low temps. The Brit.-Scandinavian Antarctic Expedition estab. a base at Maudheim in Dronning Maud Land. In 1956 Brit. expeditions estab. themselves on the shores of the Weddell Sea in preparation for the A. observations to be made in the International Geophysical Year, 1957-8, when Brit., Amer., Russian, Fr., Norwegian, Jap., and Argentinian expeditions plan to work in the A. and the first crossing of the continent is to be attempted by Brit. Commonwealth parties. See also ANTARCTIC.

Antares, name of a bright star, Alpha Scorpionis, which is about 330 light-years distant. Its diameter is 430 times that of the sun but its mass is only 25 times the sun's mass, and hence its density must be extremely small. It has given its name to the 'Antarian' type, i.e. those stars whose spectra contain a number of dark bands, sharp on the violet end and fading off at the red end.

Antecedent: 1. In grammar, the substantive to which a relative refers.

2. In logic, (a) the first of 2 propositions in an enthymeme, or syllogism in which one premise is suppressed. The second proposition is called the 'consequent.' Thus in 'Every man is mortal; therefore every king is mortal,' 'Every man is mortal' is the A., and 'every king is mortal' is the consequent; (b) the conditional part of a conditional or hypothetical proposition, e.g. in 'If luxury prevails, kingdoms must decay,' 'If luxury prevails' is the A.

3. In mathematics, the first of the 2 terms of a ratio. Thus in the proportion 2 : 4 :: 8 : 16, 2 and 8 are A.s, and 4 and 16 are consequents.

Antediluvian (Lat. *ante*, before; *diluvium*, flood), word used in speaking of

anything which is supposed to have existed or happened before the Flood. In palaeontology it is not used with the biblical significance, as science does not recognise a universal flood, but with the sense of having existed before the transformation of the earth by water. In this connection, however, it is to be noted that recent excavators at Ur and Kish, in Mesopotamia, have found proofs of a flood having occurred there and that the inhab. after it differed from those that preceded it. The 10 A. patriarchs were Adam, Seth, Enos, Cainan, Mahalaleel, Jared, Enoch, Methuselah, Lamech, and Noah. The term is now used generally in irony to describe anything of great antiquity.

Antefixa (Lat. *ante*, before; *fixae*, fixed), blocks with vertical fronts placed along the top of a cornice in classical buildings to hide the ends of the joint tiles. They were usually ornamented with a flower, leaf, head, or group of figures. The word was also applied to small projecting ornaments on friezes.

Antelope, name applied to many bovids of the order Artiodactyla. It is most properly used in speaking of the *Antelope*, or Indian black-buck, but it is often used in connection with the *Antilocapra*, N. Amer. prongbuck, or prong-horned A., which constitutes in itself the family Antilocapridae and is the sole species. A.s are, however, confined to the family Bovidae, which do not shed their hollow horns; the Antilocapridae, however, shed their horns, which are branched. Among the Bovidae are included sheep, goats, and oxen, and the A.s may almost be regarded as any of the animals which cannot be considered as any of these. They are found in immense numbers in S. Africa, and also in other continents, but are totally absent in Australia; in many cases reckless hunting has practically exterminated genera which were extremely numerous. They are graceful creatures living in the plains (exceptionally on mountains, e.g. chamois), have rounded or lyrate horns present in all males, though not in all females, and generally there is a curious tear gland filled with waxy matter beneath the eyes. They are dependent on their swift flight for their safety, as their horns provide small means of defence.

Among the numerous animals grouped under the term A. are the gnus, elands, hartebeests, addax, klipspringers, chamois, gazelles, chirus (serows), pallas, saigas, nilgais, and koodoos; the blesboks, duikerboks, black-bucks, springboks, water-bucks, bonteboks, reedboks, gemsboks, steinboks, grysboks, bushbucks; the royal, sable, roan, equine, Baker's, and harnessed A.s.

The royal A., or *Neotragus*, includes only one species, and the females are hornless; it is about the size of a hare. The sable, roan, equine, and Baker's A.s belong to the genus *Hippotragus* (with the extinct blaubok), and greatly resemble the addax; they are large animals, and both males and females carry long horns. The harnessed A.s constitute the genus

Tragelaphus, to which the bushbucks belong; they are the largest of the A.s, usually only the males have horns, their faces are marked and their beautiful bodies are striped as if they bore harness. For characteristics of the gnus, eland, etc., see under their respective headings. Consult P. L. Selater and O. Thomas, *The Book of Antelopes*, 1894-1900.

Antenna, see AERIAL.

Antennae (Lat. *antenna*, a sail-yard), popularly known as *horns* or *feelers*, are the anterior appendages on the heads of some arthropods, namely the crustaceans, insects, and myriapods. In insects there are always 2, but crabs and lobsters have 4 or more. They vary greatly in length, form, and comparative thickness, and may have over 100 joints; they form tubes carrying auditory, sensory, and olfactory nerves.

Antenor: 1. Athenian sculptor of the 6th cent. BC. He made the bronze figures of Harmodius and Aristogiton, which were carried away to Persia by Xerxes in 480 BC. They were restored to Athens by Alexander the Great. Two bases signed by him have been found in the Acropolis.

2. The wise Trojan who advised that Helen should be sent back to her husband, and advocated peace. There are legends that he betrayed Troy to the Greeks, and founded another city on its site, or migrated to Cyrene, or founded Patavium.

Antequera, Sp. tn in the prov. of Málaga, with a Moorish castle and sev. old churches. There are textile mills, iron foundries, and a trade in agric. produce and oil. Pop. 41,900.

Anthelion, phenomenon observed by a person whose shadow is cast upon a moist surface, such as a cloud, fog, or dewy grass; around the shadow are sev. concentric rings, luminous and coloured, shading into white at the edge. Also known as Broken Spectre.

Anthelmintics, medicines which destroy or cause the expulsion of worms, as santonin for the round worm; koussou, kamala, male fern, turpentine, arca nut, and pomegranate for the tape and broad worms; injections of salt, tannin, quassia, alum, iron, etc., for the thread-worm; and thymol for *Ankylostoma duodenale*.

Anthemion (from Gk *anthos*, a flower), conventional ornament derived from the flower of the acanthus (q.v.), resembling honeysuckle, and carved on Greek *antefixae* (q.v.) and cornices.

Anthemis, genus of the Compositae, of which the Brit. species are known as camomile (q.v.), they possess medicinal properties. *A. arvensis*, *A. cotula* (mayweed), and *A. nobilis* grow in fields and on commons. *A. tinctoria* is used in France for a yellow dye.

Anthemius (6th cent. AD), Gk mathematician and architect, b. Tralles in Lydia. He began the rebuilding of St Sophia in Constantinople for the Emperor Justinian, the church having been destroyed by fire in 531; it was completed by Isidorus of Miletus in 537. He wrote sev. mathematical treatises.

Anthems, type of sacred music of the Anglican Church, for voices, sometimes with solo parts and usually accompanied by the organ. Not being part of the liturgy, yet designed for performance during a service, they are in that respect the counterpart of the motet in the Catholic Church. Two types are known: the full A., which are exclusively choral, and the verse A., which contain passages or even complete pieces for a solo voice. Byrd, Gibbons, and other Elizabethans wrote great A., and those by Purcell stand out magnificently in the Restoration period, but can no longer be performed in church, being orchestrally accompanied. Later anthem-writers include Clarke, Croft, Greene, and Boyce, and in more modern times, Stanford.

Anthems, National, see NATIONAL.

Anther, pollen-bearing body at the tip of the filament of a stamen. It is united to the filament by means of a *connective*; and A., filament, and connective form the stamen. The A. consists of 2 A.-lobes, sometimes of 1, each containing 2, sometimes many, pollen-sacs, which burst open when ripe to free the pollen. It is said to be *versatile* if it swings on the filament (as in grasses), *dorsifixed* or *basifixed* if immovable. In some plants, e.g. daisy and potato, the A.s cohere, while the filaments are free; this is called the *syngenesious* or *syanththerous* condition.

Anthocyanin, in botany, name of a complex group of pigments which, in the main, give to red and blue flowers, etc., their peculiar colours. The red colour of roses, poppies, and geranium flowers, as well as of the roots of beets and radishes, is due to A. Similarly, the blue colour of violet, larkspur, and cineraria flowers, as also of the fruits of grape-vines and bilberry bushes, is due to A. Again, it is due to the development of a red A. pigment that many leaves derive their autumnal redness. The different colours of flowers and of fruits are due to the varying colour of the cell-sap and also to the different distribution of the cells containing the coloured cell-sap, also to the different combinations of dissolved colouring matter with the yellow, orange, or red chromoplasts and the green chloroplasts. Like litmus, some A.s are blue or violet in an alkaline solution and red or reddish in an acid solution. Under certain conditions they are also dark red, dark blue, and even blackish blue. Alkalis, too, frequently change the colour to green. Willstätter's researches have extended our knowledge of the chemical constitution of A.s. They are glucosides, i.e. compounds of glucose with other substances known as anthocyanidins, into which they can be decomposed by boiling with acids (hydrolysis). Thus cyanin, the blue colouring matter of the cornflower and the first A. to be studied by Willstätter, yields on hydrolysis 2 molecules of glucose and cyanidin. The other fundamental anthocyanidins besides cyanidin itself are pelargonidin (in the geranium) and delphinidin (in the larkspur). A large number of

compounds of glucose with these 3 parent substances cyanidin, pelargonidin, and delphinidin are possible, giving a wide range of colours in different flowers. The anthocyanidins are closely related to flavones, yellow pigments of wide occurrence in plants. Blood-coloured leaves, such as those of the copper beech, owe their characteristic appearance to the combined presence of green chlorophyll and A.; when such leaves are boiled in water the A. is dissolved, leaving chlorophyll, so that the leaves turn green in colour. See M. Wheldale, *Anthocyanin Pigments of Plants*, 1916, and L. T. Hogben, *Pigmentary Effector System*, 1924.

Anthology, compound Gk word, used metaphorically, which means literally a 'collection of flowers.' This title is applied to a work which is a collection of select extracts or choice passages from various branches of literature, but more generally the term is restricted to collections of short or lyrical poems. Most countries have their poetic A.s. Asiatic literature being extremely rich in them. To Confucius is attributed the compilation of the Chinese *Shi-King* (Book of Songs), and it is claimed for it that it is the oldest A. in the world. Rückert pub. a Ger. trans. of it in 1833, and his countryman, Von Hammer-Purgstall, rendered in 1818 a similar service by introducing Persian literature to the W. By far the most important A. is the Gk A. The first collection of Gk poems, called the *Stephanos* (Garland), was made by Meleager, a Syrian b. at Gadara at an uncertain date, but probably about the end of the 2nd cent. BC. It included poems by 46 poets, among them being Sappho, and, as is not an uncommon thing in A.s—their compilers being but human—a few poems by the editor. This work was added to by succeeding editors, whose MSS. have been lost, the earliest and fullest of the extant versions being that of Constantinus Cephalas, a grammarian who fl. in the middle of the 10th cent. AD. It contained excerpts from more than 300 poets, and the poems ranged from the 7th cent. BC to the 10th cent. AD. Early in the 14th cent. Maximus Planudes clumsily revised this beautiful collection of Cephalas, abridging, rearranging, and even altering. For 300 years his was the only Gk A. known, but in 1606 Salmasius rediscovered the A. of Cephalas in the library of the counts palatine at Heidelberg, whence it is called the Palatine A. There was no A. among the anc. Romans, and it was not until 1573 that Scaliger pub. in Leyden an imitation of the Gk A. under the title *Catlecta Veterum Poetarum*. Other editors of Lat. A.s are Pitthöus (Paris, 1590) and Peter Burmann (Amsterdam, 1759 and 1773). That of Riese (1870) contained nearly 1000 poems.

Among the earliest Eng. A.s were *Tottel's Miscellany*, 1559, *England's Parnassus*, 1600, and *England's Helicon*, 1602. Eng. verse from the Elizabethan poets down to Wordsworth has been collected in F. T. Palgrave's *Golden Treasury*. By many this is regarded as the standard

Eng. A., and undoubtedly as a pioneer in this field it may be said to have influenced its successors. *The Oxford Book of English Verse* was ed. by Sir A. T. Quiller-Couch, who profited by the mistakes of his predecessor, and in it are included many beautiful numbers the omission of which by Palgrave is difficult to account for. Such omissions included Coleridge's *Kubla Khan* and Keats's *Ode on a Grecian Urn*. The range of the *Oxford Book* is from 1250 down to 1918 in strict chronological order of birth. The total number of poems is 967. Other modern Brit. A.s are Allan Ramsay, *Tea-Table Miscellany*, 1724-40; Percy's *Reliques of Ancient English Poetry*, 1765; Thomas Campbell, *Specimens of British Poets*, 1841; T. H. Ward, *English Poets*, 1883; F. Locker Lampson, *Lyra Elegantiarum*, 1867 (rev. 1891); W. B. Yeats, *A Book of Irish Verse*, 1895 (revised 1900 as *Modern Irish Poetry*); Sir A. T. Quiller-Couch, *The Oxford Book of Victorian Verse*, 1912; *Poems of To-day*, of the Eng. Association (4 series, 1915, 1922, 1938, 1951); Robert Bridges, *The Spirit of Man*, 1916; Sir A. Methuen, *An Anthology of Modern Verse*, 1921; Sir Henry Newbolt, *An English Anthology of Prose and Poetry*, 1921; T. Caldwell, *The Golden Book of Modern English Poetry*, 1922; Sir A. C. Quiller-Couch, *The Oxford Book of English Prose*, 1925; Grace Rhys, *A Celtic Anthology*, 1927; G. Bullett, *The English Galaxy of Shorter Poems*, 1933; M. Roberts, *The Faber Book of Modern Verse*, 1936; W. B. Yeats, *The Oxford Book of Modern Verse*, 1936; G. Lacey May, *English Religious Verse*, 1937; W. H. Auden, *Oxford Book of Light Verse*, 1938; Lord David Cecil, *The Oxford Book of Christian Verse*, 1940; Edith Sitwell, *Anthology* (verse from Chaucer to Hardy), 1940; Hugh Macdiarmid, *The Golden Treasury of Scottish Poetry*, 1941; C. Day Lewis and L. A. G. Strong, *A New Anthology of Modern Verse, 1920-1940*, 1941; R. Church and M. M. Bozman, *Poems of Our Time*, 1945; M. Lindsay, *Modern Scottish Poetry*, 1946; D. Young, *Scottish Verse, 1851-1951*, 1952; C. Day Lewis and J. Lehmann, *The Chato Book of Modern Poetry*, 1956; while among Amer. A.s should be mentioned E. C. Stedman, *American Anthology* (1787-1899), 1900; Bliss Carman, *The Oxford Book of American Verse*, 1927; Louis Untermeyer, *American Poetry from the Beginning to Whitman*, 1931; H. H. Clark, *Major American Poets*, 1936; F. O. Matthiessen, *The Oxford Book of American Verse* (a new collection), 1950.

Anthron, Charles (1797-1867), Amer. classical scholar, b. New York. He was called to the Bar in 1819, appointed adjunct prof. of anc. languages in Columbia College in 1820, and prin. prof. in 1835. He ed. Lemprière's *Classical Dictionary* in 1841 and compiled a *Dictionary of Greek and Roman Antiquities* in 1843.

Anthony, St. see ANTONY, ST.

Anthony, Susan Brownell (1820-1906), Amer. reformer, b. Adams, Massachusetts, of Quaker parents, and taught in a New York school from 1835 to 1850. She was

a zealous agitator for total abstinence and the abolition of slavery, and, after the Civil war of 1861-5, for female suffrage. In 1868 she founded the *Revolution*; she was one of the authors of a *History of Woman Suffrage*, 1881-7. See her life by Ida Harper, 1898.

Anthophyllite (Gk *anthos*, flower; *phylon*, leaf), mineral belonging to the Amphiboles (q.v.), containing silicate of magnesium and of iron. It is of a brownish-yellow colour, has a pearly lustre, and its structure is fibrous. It is metamorphic.

Anthospermum Aethiopicum, or amber tree, is a small S. African evergreen shrub, of a genus of Rubiaceae, allied to coffee, needing a heated greenhouse in Britain.

Anthoxanthum, genus of grasses (Gramineae) of which the species *A. odoratum* is known to farmers as sweet vernal grass. It has pale yellowish-green flowers and only 2 stamens; the stems contain coumarin, which causes the fragrance of new-mown hay.

Anthozoa (Gk *anthos*, flower; *zōon*, animal), class of Coelenterata which includes corals, madrepores, and sea-anemones. All inhabit the sea, usually in the warm climates. They are synonymous with the Actinozoa.

Anthracene (C₁₄H₁₀), substance prepared from coal-tar. The coal-tar is subjected to fractional distillation; the fraction up to 170° consists of crude naphtha, from 170° to 230° carbolic oil is separated, from 230° to 270° creosote oil is separated, and above 270° the distillate is A. oil, whilst the residue in the still is pitch. The crude A. oil is cooled, the crystalline A. paste being filtered to obtain 40 per cent A. *a* or *b*, depending on the paraffin content. This is purified by treatment with high boiling-point pyridine bases to give 90-2 per cent A. which is then sublimed to obtain 94-5 per cent A.

A. is a crystalline solid, melting at 213° C. and boiling at 351°. It is only slightly soluble in alcohol and ether, but is easily soluble in benzene. Its commercial importance arises from the fact that it is the basis of the manuf. of many important dyestuffs, the 94-5 per cent A. being used.

Anthracite, or stone coal, a particularly hard and lustrous variety of coal, slow in ignition, but giving out an intense heat with little effusion of smoke. It is used for drying hops and malt; in blast furnaces where a high temp. is required; and for steam navigation purposes. It has been suggested that A. has been produced from vegetable matter that has been more completely macerated and deprived of its putrescible constituents before submergence than that producing ordinary bituminous coal, or that the submergence took place in shallow water where the plant substance was exposed to the oxidising influence of the air, thus minimising the amount of hydrogen and carbon compounds. Most A.s contain 90 per cent carbon, whilst bituminous and gas coals contain from 75 to 80 per cent of carbon, the remainder being made up of

hydrogen, oxygen, and nitrogen together with varying amounts of ash.

A. is found in large quantities in Pennsylvania and in S. Wales, where more than half of the supply is exported for use on steamers in all parts of the world.

Anthracotheres, large primitive pig-like artiodactyl mammals which are common in the middle Tertiary rocks of Europe and Asia. *Anthracotherium* was a typical member.

Anthraquinone ($C_{14}H_8O_2$), organic substance derived from anthracene by oxidation with chromic acid. It is manuf. on the large scale by oxidising 94-5 per cent anthracene produced in the distillation of coal-tar with sodium bichromate and sulphuric acid. The dried filtrate is heated at 100° with concentrated sulphuric acid, by which means the impurities are converted into soluble sulphates, so that the pure A. may be separated out. Another equally important manufacturing process is that from the condensation of phthalic anhydride and benzene.

A. crystallises in light yellow needles, melts at 286° , and sublimes at higher temps. in sulphur-yellow prisms. It is insoluble in water, but soluble in acetic acid and to a lesser extent in benzene and other organic solvents. Its commercial importance lies in the fact that it is an important intermediate for the manuf. of many vat, acid, and disperse dyes. The elucidation of its structure by Zincke and Pittig paved the way for the synthesis of alizarin and other important compounds. See also DYE.

Anthrax, acute, infectious disease, common to animals and man, caused by the *Bacillus anthracis*. It is also known as splenic fever, from the enlargement of that organ which invariably accompanies all types of A.

The disease is widely distributed as it affects animals, but appears to be particularly associated with marshy districts. There are 2 forms, external and internal. External A. is accompanied by malignant pustules in all parts of the body, accompanied by fever. They rapidly attain a great size, and general infection takes place, causing death within a few hours. Internal A. exhibits no reliable premonitory symptoms in animals; the first indication may be sudden death or staggering followed by convulsions. If death does not take place at once, ultimate recovery is possible. The only protective measure is inoculation with A. serum.

A. in man may also be external or internal. In external A. a small papule appears at the point of infection, which is usually a small wound on an exposed part. The papule increases in size, then breaks, leaving a dark blue or black scab. The scab gradually extends, may be cast off if recovery occurs, but is accompanied by general disturbances comprising fever and prostration leading to ultimate collapse in unfavourable cases.

Internal A. is usually due to infected drinking-water or diseased meat. Indefinite symptoms, such as headache and

languor, are followed by gastro-intestinal disturbances with bloody diarrhoea. Convulsions or spasms are followed by collapse. Certain cases of A. are traceable to particular occupations, such as woolsorters' disease, occurring among operatives in factories in which imported wool or hair, mostly from Russia and S. America, is sorted; and rag-pickers' disease, occurring among the rag-sorters in paper-mills near Graz. These latter forms affect the respiratory tract, causing septicaemic broncho-pneumonia, which is usually fatal.

Where cases of A. have occurred in animals, the hair, hides, wool, and bodies should be burnt. Disinfection of the premises and prohibition of grazing in the infected area should be made compulsory.

Anthropoid Apes (Gk *anthrōpos*, man; *eidos*, resemblance) is a term sometimes applied to large monkeys of the family Anthropomorphidae or Simiidae, on account of their morphological resemblance to man. They have no cheek-pouches or tails, are arboreal and omnivorous. There are extinct and fossil species, but there also occur living species in the gorilla, orang-outan, chimpanzee, and gibbon, which are found in the E. Indies and W. Africa. See T. H. Huxley, *Man's Place in Nature*, 1863; R. Hartmann, *Anthropoid Apes*, 1883; R. M. and A. W. Y. Yerkes, *Great Apes*, 1929; Zuckermann, *Functional Affinities of Man, Monkeys, and Apes*, 1933.

Anthropolatry (Gk *anthrōpos*, man, *latría*, worship), payment of divine honours to a human being, a term always used in a condemnatory sense (cf. APOTHEOSIS). The charge of A. was brought against the heathen by the early Christians.

Anthropology, the study of man, involving the consideration of man's place in the animal kingdom as determined by his physical, mental, and moral characteristics, his hist. and development, the origin and growth of language, ethics, religion, and social institutions; the div. and subdiv. into races, nations, and castes, and all the manifold activities of which man is capable. The subject may be divided into 2 branches—the study of man as a physical individual (physical A. etc.), and of man as a member of society (social A., ethnology, ethnography; sociology, archaeology, and linguistics are closely related).

Physical anthropology aims at studying man as a physical member of a race, at studying the range of biological variation in mankind and at reconstructing man's physical origins and development from the primates. Physical A. has spent much time trying to establish significant criteria, factors that are transmitted genetically and are not affected by external considerations such as climate and disease. For a long time most attention was devoted to the skull and other skeletal material, because it was only upon such material that the palaeo-anthropologist could rely to reconstruct man's development. This work has gone hand in hand with primatology.

The more important finds of fossil man include the 2 early types (often called Protoanthropic) of giant man exemplified by *Meganthropus palaeojavanicus*, found in Java in 1941, and *Gigantopithecus blacki*, whose giant teeth were found in Chinese apothecaries' shops; both these types were found by von Koenigswald. Then there are the palaeoanthropic types, exemplified by *Pithecanthropus erectus*, 'Java Man,' found in Java at various times between 1890 and 1939, by Dubois and von Koenigswald; other types found in Java are *homo modjokertensis* and *homo soloensis*; *Sinanthropus pekinensis*, 'Peking Man,' like Java Man of the Middle Pleistocene age but of more advanced type, was found in 1929. *Homo rhodesiensis*, found at Broken Hill in 1921, and *Africanthropus njarasensis*, found in Tanganyika in 1934, are from Africa and similar to the Java-Peking types; Heidelberg Man (q.v.) and Neanderthal Man (q.v.) are probably the last of the Palaeoanthropic types. Among the more important Neanthropic types are the Cromagnon men, late contemporaries of the Neanderthal men, and found first at Cromagnon in S. France in 1868; others were found at Mentone in 1872 and 1902 and at Paviland in Wales; others include Grimaldi Man, skeletons of a woman and a child, the latter being stained with red ochre, the Predmost people found near Brunn between 1888 and 1928, and the Fontchevade skulls found in 1947 in Charente, France, physically a late neanthropic type but of earlier date than the Neanderthal types, thus showing there was no necessary evolutionary sequence between the two; finds of Neanthropic types in England include the London skull found in 1925; Swanscombe man, found in 1935-6 in Kent; the Galley Hill skeleton, found near Swanscombe in 1888 and which now seems much more recent than was once thought; and the Wallbrook skull found in London in 1943 near the site of the London skull. The once famous Piltdown Man (q.v.) has now been discovered to have been a forgery. It is now accepted that many of the Neanthropic types predate some of the Palaeoanthropic men, and the Neanderthal types show signs of greater cultural development (in the forms of implements found at the sites and the signs of burial) than do many of the Neanthropic types. The older notion of linear development of man from primates must be given up; man's development has been rather multilineal, there being many centres of development and distribution. One such is that of early Java man, through the later Wadjak man, found in 1889 by Dubois in Java, and the Australian Aborigines: a clear line of development can be traced here. The same can be done in certain other cases elsewhere, as in the possible line of fossil remains found in S. Africa at Boskop, Florisbad, and elsewhere, which seem to represent the ancestors of the Bushman people. The earliest remains in the Americas date from only some 25,000 years, their earliest

inhab. presumably originating in Siberia and crossing the Bering Sea in recent times.

The work of Boas (q.v.) and others on changes in skull measurements of Central and E. Europeans after a few generations in America showed that for classification of modern man skeletal criteria were inadequate, physical measurements of those sort apparently being affected by climatic and social conditions. Recently much attention has been given to finding more stable genetic criteria for the tracing of relationships between various types of man and for the comprehending of the range of physical variation found in man to-day. The main criteria used have so far been those to do with blood types. Landsteiner and others first isolated the blood types A, B, AB, and O, which have been used in Physical A. for racial classification. Later work has been done on M, N, and MN types, on the Rhesus factor in blood, and on the sickle-cell trait, also in blood. The latter is now thought to have a connection with the incidence of malaria and so not to be suitable as a stable genetic factor. Other criteria are also being used in experimental work, such as the P.T.C. reaction (ability to taste phenylthiocarbamide), which seems to be genetically determined. From none of these can a simple clear classification of man be possible due to the immense amount of racial intermixture and migration that has occurred: a pure 'race' does not exist anywhere. But a body of knowledge as to origin, variation, and dispersal of types of man is being assembled.

Social anthropology and ethnology. Social A. is the study of human culture and the ways in which men are organized into societies and communities. It is a recent discipline and has developed from the older ethnology, the 'study of peoples,' which differ from and resemble one another in culture as well as in racial character. The ethnologist is concerned to classify people on a cultural basis and to discover their relationships and migrations in the past.

Inspired by ideas of biological evolution, and by the schemes of evolution of material artifacts which originated in the work of the archaeologist de Perthes, the early ethnologists tried to construct schemes of social evolution, to show the development of cultures. Of these perhaps the most important were lawyers, concerned to show the development of political and allied institutions, and with a background of rigorous legal training which has made their work of formidable significance. Such were the American, L. H. Morgan (q.v.), the English Sir H. Maine (q.v.) and J. F. McLennan, and the Swiss, J. J. Bachofen, whose *Das Mutterrecht*, 1861, postulated an original stage of matriarchy in all societies and whose influence is not yet dead.

In England Sir E. B. Tylor (q.v.) and Sir J. G. Frazer (q.v.) mark the end of what may be called the 'historical' phase of A. Both attempted to formulate stages of cultural evolution, and were

concerned particularly with the origins and development of religion and magic. They were followed by many lesser workers such as Crawley, Marrett, and others, whose work is to-day regarded as of little importance. Their work was vitiated by the reliance on what has been called 'conjectural history' and the comparison of isolated traits of culture from many societies without a very rigorous understanding of the social matrix within which these traits acquire their true social significance. In England the work of the diffusionist ethnologists (who argued that all culture of significance originated in a single source—in this case, ancient Egypt) culminated in that of Elliott Smith, Perry, and W. H. R. Rivers, only the last named being remembered to-day for his pioneering work on kinship and primitive psychology. Outside England the work of Fr. W. Schmidt (q.v.) into the origins of religion have been of considerable influence.

The turn of the cent. marks the beginning of modern social A. with the beginning of organised field research by the Cambridge Expedition to the Torres Straits, led by A. C. Haddon, and the Jesup Expedition to Baffinland, which included Boas. Later work by Radcliffe-Brown and Malinowski led to refinement of research techniques and laid the ground for modern social A. Haddon, his disciples Selkman, Rivers, Radcliffe-Brown, and Malinowski in England, and Boas and his followers Kroeber and Lowie in U.S.A., have trained almost every senior Eng.-speaking anthropologist alive to-day. There has now become available a great body of empirical data which can be used as a basis for the formulation of hypotheses about human societies, rather than the mere illustrative material for historical hypotheses already determined upon other grounds, as was used by the 19th-cent. ethnologists and Tylor and Frazier.

An important influence on modern social A. has been that of the Fr. sociologist Durkheim and the German Weber. Durkheim stressed the notion of a social activity or institution being significant by the function it has in the social life of the community as a whole, and he realised that a society can be studied as a social system, the psychological system of an individual being relegated to the psychologists and so outside the sphere of the anthropologist. Although this extreme view is not accepted by all anthropologists, the concept of the functional interrelationship of all aspects of a society's culture has been valuable, and has shown that the piecemeal comparison of individual cultural traits drawn from many different societies, as was done by most of the ethnologists previously mentioned, was based on a misconception.

With the concept of social function has been developed that of social structure, defined as the complex network of actually existing social relations between the members of a society or community. Modern analysis has been devoted largely to showing the social structure of societies

as being the subject of research that is most rewarding, as providing an understanding of the ways in which societies actually function, and as providing the social matrix in which traits of culture can best be understood and compared. Examples are the work done by modern Brit. social anthropologists, e.g. that of Evans-Pritchard on Nuer political organization and religion and on Azande witchcraft and magic, Fortes on Tallensi politics and kinship, R. Firth on social organisation of the Polynesian Tikopia.

At the same time, especially in America, the development of psychology has affected social A. considerably, and much work has been done on the ways in which individuals are socialized in their societies, on the place of the individual within his society's culture, on the relation between personality and culture, and so on. Perhaps the best-known workers in this field are R. Linton and Margaret Mead.

From its beginnings social A. has dealt largely with 'primitive,' non-W. peoples. From the anthropological viewpoint all societies and their cultures are of equal value as providing evidence of variations in culture and social organization—anthropologists try to avoid making value judgments as to whether one society is 'better' or 'worse' in a moral sense than another. An important point is that to make a total functional study of a small-scale society is easier than to make that of a large W. society, and it is easier for the worker to see the former objectively, whereas he is bound up in the values and opinions held in the latter. In addition, an interest in the application of A. to the problems of colonial administration has led to a concentration of interest on colonial peoples. All these factors have led to a decrease in interest in traditional ethnological problems of evolution and diffusion of cultures, and to an increase in functional problems of the ways in which actual societies function as single entities. A great deal of work has also been done on problems of social change, especially in colonial situations, as the change is actually visible at the moment without any conjectures of how it may have occurred in the distant past. Recently a good deal of interest has been taken also in the workings of our own W. society, and of other large-scale societies such as China and India. The work of Lloyd Warner and his associates, mainly American, on the Amer. class system and Amer. Negro-White society has been among the most important of this type of work.

Other branches of A. dealing with man in his social aspect include *Ethnography*, the describing of peoples and their cultures. *Technology* is the study of the origins and growth of the utilitarian and aesthetic arts, i.e., with material culture of human societies. It is closely allied to *Archaeology* (q.v.), the ethnology and ethnography of societies that no longer exist. *Linguistics* is concerned with the growth, structure, and distribution of the languages of mankind and is a valuable

adjunct to ethnology as well as being a discipline in its own right. See MAN; BLOOD; ARCHAEOLOGY.

Sayce, *Primitive Arts and Crafts*, 1933. LINGUISTICS: J. R. Firth, *The Tongues of Men*, 1937.

Anthropomorphism (Gk *anthrōpos*, man; *morphē*, shape), word of modern adaptation, signifying the attribution of human physical and moral qualities generally to God or the gods. The most recent extension of the word is by psychologists to denote the principle according to which man is said to interpret all things through himself.

Anthropophagi, tribe of cannibals mentioned by Pliny as inhabiting a region near the Caspian Sea, and perhaps identical with the Androphagi (q.v.). They pursued the custom of eating the flesh of their aged parents in order to preserve the ancestral soul from decay.

Anthropophagy, see CANNIBALISM.

Anthus, generic name of the pipits, birds related to the wagtails and placed in the family Motacillidae. The meadow pipit or 'titlark' (*A. pratensis*), found in Great Britain is an inhab. of Europe and W. Asia. The tree pipit (*A. trivialis*) is a summer visitor to the British Isles.

Anti-Aircraft Defence. A.-A. D. existed in the First World War, and by 1918 consisted of under 300 guns, about 375 searchlights, and a dozen fighter squadrons. After the war, in 1922, 4 heavy A.-A. brigades and 2 searchlight battalions were formed, all for London. But it was not until 1936, when the political horizon began to darken, that there was a complete A.-A. div.; and by 1938 there was a

corps of 5 divs. In the year in which the Second World War broke out there were 7 divs. forming a command. A year later a formidable artillery manned by skilled gun crews was available against the attack by the Ger. Luftwaffe. In 1943 the A.-A. Command, under Gen. Sir Frederick Pile, had 2 main research stations, employing large numbers of scientists, and progress in research was very marked. An integral part of the A.-A. Command was the Royal Observer Corps, the duties of which included listening with headphones and the use of a plotting instrument (a circular dial, marked with numbers and squares), on top of which was an altitude finder. These observations were reported into the telephone to a centre, the mouthpiece of the phone being fixed over the listening observer's chest. At the centre 'tellers' charted the progress of the reported aircraft, and as raiders passed out of the area of the centre the neighbouring centres were warned of their approach. The whole A.-A. Command was a network of communication working in conjunction with the Royal Corps of Signals. Every gun and searchlight site was connected with its gun-operations room and the neighbouring site. Gun and light sites, observer posts, operations room, fighter sectors, and air fields were all interconnected in a labyrinth of phone cables, supplemented by radio and dispatch riders. The Royal Army Ordnance Corps supplied and maintained all the guns and instruments, lights, and generating sets of the A.-A. Command.

Experience in the Second World War showed that though A.-A. guns destroyed numerous raiding aircraft, the value and effect of A.-A. gunfire was, generally speaking, to keep hostile aircraft at a great height, and to prevent them from following a straight and even course necessary for accurate bombing. An important function of A.-A. guns is also to indicate the position of hostile aircraft to fighters, which is done by firing rounds to burst as near as possible. Sev. times Brit. A.-A. gunners shot down more than 50 Ger. planes over Britain in a week. On 15 Aug. 1940 they destroyed 23. In the first 2 years of the war some 600 were shot down by A.-A. fire over Britain (as against 4000 shot down by fighter planes). In the closing stages of the war A.-A. guns were most successful in winging or destroying in mid air flying bombs projected from sites in France and the Low Countries. A.-A. Command's value as part of U.K. defence structure came under review with the development of the guided missile, and it was finally disbanded in 1955. See FLYING BOMB and RADAR; see also Sir F. A. Pile, *Ack Ack*, 1949.

Antiarchs, Devonian placoderms (q.v.), fishes with the front of the body and head covered by armoured plates. The flattened ventral surface and dorsal eyes indicate a bottom-dwelling mode of life. They had articulated pectoral appendages, a heterocercal tail, and either a scaled or a naked body. *Bothriolepis* is a typical member.

Antiarin ($C_{14}H_{20}O_4 + 2H_2O$), active principle of *Antiaris toxicaria*, the poisonous upas-tree of Java. It is intensely poisonous and is used as an arrow-poison.

Antiaris, botanical name of a genus of trees of the family Moraceae found in the E. Indies. *A. toxicaria* is the upas-tree of Java, which contains a deadly poison but an unwarranted reputation for killing people who fall asleep beneath it.

Antibes (auct. Antipolis), Fr. fishing tn and resort on the Riviera (q.v.), in the dept of Alpes-Maritimes. Juan-les-Pins (q.v.) is part of the tn. There are many luxurious hotels and villas, an auct church (12th-17th cents.), and a 17th-cent. castle, now a museum, which contains a notable collection of works by Picasso (q.v.). There is a trade in olives, oranges, flowers, and perfume. Pop. 24,000.

Antibiotics, substances produced by bacteria, fungi, and actinomycetes which inhibit the growth of other micro-organisms. Since the discovery of penicillin (q.v.) research has produced many other A. At the time of writing (1957) A. in general use are penicillin, streptomycin (q.v.), aureomycin, terramycin, chloramphenicol (chloromycetin—a derivative of nitrobenzene with chlorine atoms in the side chain), bacitracin, the polymyxins, and erythromycin. There are sev. others which are still in the experimental stage. The mode of action of the A. may be broadly divided into those which are bactericidal—i.e. kill bacteria—as well as bacteriostatic—i.e. inhibit the growth of bacteria—and those which are almost wholly bacteriostatic. Penicillin, erythromycin, and streptomycin are powerfully bacteriostatic and in some degree bactericidal, while aureomycin, terramycin, and chloramphenicol are almost wholly bacteriostatic. Clearly the bactericidal A. are the more powerful. Some bacteria are more sensitive to certain A. than to others, and in treating a case it is usual to find out first the sensitivity of the infecting organism to the various A. so that the most effective may be selected in treatment. Strains of bacteria which are resistant to A. are becoming increasingly common, but whether this is due to the survival and multiplication of naturally resistant strains or to an acquired resistance is not certain. There is a danger, if A. are used indiscriminately, that in time the pop. may be exposed to the risk of infection with bacteria which are uncontrollable. There is no fixed dosage for A. An overdose, generally speaking, is harmless and the main aim is to give sufficiently large initial and subsequent doses to overcome the infection. The size of the dose necessary to accomplish this varies with the nature of the infection, the part of the body infected, and the sensitivity of the infecting organism. In general infections the A. are usually administered by hypodermic injection but recently a form of penicillin which can be taken by the mouth has been produced. For local infections they may be given in the form of ointments, drops, or

by inhalation in a spray as well as hypodermically. Penicillin is the most effective all-round antibiotic, and is particularly lethal against what are known as the gram-positive organisms (see BACTERIA), namely staphylococcus, pneumococcus, streptococcus, gonococcus, and the spirochaetes of syphilis (q.v.). Streptomycin is mainly effective against gram-negative organisms, particularly the *Mycobacterium tuberculosis* (see TUBERCULOSIS). It may produce toxic effects such as giddiness, tinnitus, and deafness. Strains of *M. tuberculosis* resistant to streptomycin appear fairly readily and present a problem in treatment. Aureomycin, terramycin, and chloramphenicol are effective against gram-positive and gram-negative organisms (except those of tuberculosis and diphtheria) and also certain virus diseases. These A. are apt to produce toxic effects more often than the others and chloramphenicol in particular is used with caution as it may cause a blood disease known as agranulocytosis. Bacitracin has toxic effects on the kidneys and for this reason is little used. The polymyxins have a limited use and are given only when other A. have failed. See also PENICILLIN.

Antibiotics in agriculture and horticulture. The study of A. for the practical control of certain plant diseases has already yielded promising results. The first effective control of a plant disease was recorded in 1944, when a penicillin-containing filtrate of *Penicillium notatum* was used to control crown-gall disease (*Agrobacterium tumefaciens*). In 1946, streptomycin was shown to be effective against plum bud-wood (*Phytophthora pruni*). Thereafter, scarcity of materials and economic considerations slowed progress, but since 1952 trials of A. under field conditions have become increasingly possible. A. have shown most promise in the control of the bacterial diseases of plants. Since most of these diseases are caused by gram-negative organisms, penicillin (active against gram-positive organisms) is only of limited value and has been little used; but the 'broad-spectrum' A., particularly streptomycin, sometimes in combination with terramycin, have been found effective against many of the bacterial diseases of fruits, tomatoes, commercial vegetable crops, and flowers. Commercial formulations of streptomycin are on the market in U.S.A. and New Zealand for spray application, but not, in 1957, in Britain. As seed-dressings, A. have shown less promise since they become inactivated in the soil. Many A.—cycloheximide, helixin, endomycin, antimycin, toximycin, griseofulvin—have proved to have systemic antifungal properties that promise the control of fungal diseases in plants. The most promising appears to be griseofulvin, derived from *Penicillium griseofulvum*, and can be produced in quantity by deep fermentation. Field trials in 1954-6 have shown that griseofulvin can be used to control a wide range of pathogenic fungi in plants, including those

responsible for such common diseases as apple scab, verticillium tomato wilt, plum silver leaf, celery leafspot, tulip fire, lettuce grey mould, and early tomato blight. A more recent research finding also indicates that pre-treatment of plants with A. such as streptomycin may confer a degree of protection against pathogenic fungi; the fungus, *Phytophthora infestans*, that causes blight in potatoes and tomatoes, has been checked in this way.

Although it is possible that resistant strains of pathogenic organisms may arise with the increasing use of A. for the control of diseases of plants, no evidence of this has yet been noted, and their advent may be looked upon as potentially valuable additional weapons against bacterial and fungal diseases of plants.

Antibody, specific constituent of the body fluids which may be present naturally or which may be formed as a result of the inoculation of antigens (q.v.). See BACTERIA, Immunity.

Antiburghers, name given to those members of the Secession Church of Scotland who in 1747 condemned the burghs oath, and formed the General Associate, or Anti-burgher, Synod.

Antichrist. Though the idea of A. is common enough in Jewish and early Christian sacred writings, the anti-Messianic power is very shadowy and indeterminate, partly perhaps because of the dual meaning of the Gk preposition *anti*, implying both substitution and opposition. Thus the A. may be either a false claimant to Messiahship or an opponent of the true Messiah. The conception of A. first appears in the O.T. in Dan. vii as the little horn, Antiochus IV, a type of St Paul's Man of Sin (cf. Mark xiii. 14). In the N.T. the word A. occurs only in the Epistles of John (Bk. 1, ii. 18 and 22; iv. 3; Bk. 2, verse 7), where it denotes an antagonist to Christ; but in the synoptic gospels is found the old Jewish conception of A. as a false Messiah. St Paul (2 Thess. ii) teaches that before the second coming of Christ the Man of Sin will appear. Most modern commentators regard him as a mere personification of the evil forces that resist Christ, and will come to a head at the end of the world. This agrees with Christ's reference to many false Christs already at work. The Apocalypse similarly portrays the persecuting political forces of the world, and false prophets by the two beasts, who are Satan's emissaries. Nevertheless, St Paul's teaching, and that of the Sacred Books generally from Daniel to Revelation, does suggest the probability that the coming of an individual A. at the end, greater than all earlier leaders of evil and irreligious forces is truly prophesied in scripture. The identification of such leaders in the past is not necessarily erroneous (for the whole Christian era is in the scriptural sense 'the last times' and the Lord is at hand in every Christian generation), but it does not exclude that ultimately there will appear the supreme and specific A. proper. Certainly in the mind of the

writer of the Apocalypse the evil forces of his own day (as 1 John ii. 18 says) were types of the ultimate Beast. The number of the Beast '666' (Rev. xiii. 18) was identified with Nero by the Christians. The Gk title NERON CAESAR written in Heb. characters, if those characters are taken as Heb. numbers (as they could be), adds up to 666. See A Catholic Commentary on the Holy Scripture, 1953; see also ESCHATOLOGY.

Anticlimax or **bathos** is the opposite of climax (q.v.) and consists of a ludicrous descent from the sublime to the commonplace or ridiculous. It may be either unintentional, as in Grainger's line: 'Now, Muse, let's sing of rats,' or deliberate, as in the anonymous:

And thou, Dalhousie, the great god of war
Lieutenant-General to the Earl of Mar.

See also FIGURE OF SPEECH.

Anti-Comintern Pact. This pact was signed by Germany and Japan in Berlin on 25 Nov. 1936, being, ostensibly, an agreement for mutual defence against Communist subversive activities. In its preamble the agreement refers to the 'aim of the Communist International, known as the Comintern, to disintegrate and subdue existing states by all the means at its command,' and records the conviction of the signatories that the interference by the Communist International in the internal affairs of the nations 'not only endangers their internal peace and social well-being but is a menace to world peace.' By the first of the 3 articles of the agreement, the 2 countries agreed to inform each other of Communist activities and to collaborate in preventive measures; by the second article they agreed jointly to invite other states whose internal peace was threatened by the International to come into the agreement; and by the third article the agreement was to remain in force for 5 years, 'but before expiration the parties will come to an understanding for the further method of their co-operation.' On 6 Nov. 1937 Italy announced that she had joined the pact. A year later (Jan. 1939) Hungary joined the pact. Later in the same year Franco's Sp. Gov. also joined, and in 1941 the Nazi satellites—Slovakia, Rumania, Bulgaria, etc.—also signified adherence to the pact; though between Sept. 1939 and June 1941 the Russo-Ger. pact seemed to put the A.-C. P. into abeyance. Public opinion in the W. democracies condemned the pact as a thinly disguised alliance, designed, not principally to combat international Communism, but to pursue a policy of aggression against any states which might not be able to resist absorption—in short, a pact to overawe and dominate the world.

Anti-Corn Law League was formed in 1838-9 at Manchester. Its object was to effect the repeal of the corn laws in Britain. The cause was promoted by oratory and by a paper called *The League*; and among its leading supporters were Cobden, Bright, and Villiers. It dissolved itself when its object was achieved in 1846-9.

Anti-corrosive, material employed to prevent the rusting of iron when exposed to moisture or other harmful influences. A.s are of 2 classes: protective, such as an application of hot tar or some magnetic oxide of iron; and galvanic, such as a coating of zinc or some other electropositive metal to which the corrosion is transferred.

Anticosti, is in the Gulf of St Lawrence, which it divides into 2 channels. It is lowlying and sterile, though there are considerable salmon, trout, and herring fisheries, and seal and bear hunting. It is 140 m. long and 30 m. broad. In 1896 it was purchased and stocked as a game preserve by M. Menier.

Anticyclone, atmospheric system marked by an area of high barometric pressure, caused by descending air, and surrounded by closed isobars. The descending air becomes warmed and dried, and transmits radiation freely. Anticyclonic weather is quiet and settled, with low winds blowing clockwise around the centre in the N. hemisphere and anticlockwise in the S. hemisphere. In summer the A. brings fine sunny weather to the Brit. Is., but in winter there are two types of A., one with overcast skies and the other with clear skies, frosty nights, and early morning fog. The term 'anticyclonic gloom' is sometimes applied to the overcast winter type.

Anticyra, name of 3 anct Gk tns, the most celebrated of which was in Phocis. It was noted for hellebore, a traditional remedy for madness.

Antidotes, medicines that relieve or remove the symptoms caused by poison. An antidote may be *chemical*, i.e. one that changes the nature of the poison so as to make it insoluble or harmless; *mechanical*, i.e. one that prevents absorption by holding the poison in mechanical suspension, or by coating the stomach; or *physiological*, i.e. one that counteracts the physiological effects of a poison. A *universal* antidote is provided by mixing 1 part of dissolved iron sulphate with 2 parts of *magnesia* water.

To mineral acid poisons, alkalis are A. The most suitable are lime, soap, chalk, potash, soda, or *magnesia*; they should be moderately diluted with water. Freshly precipitated oxide of iron, followed by a solution of potassium carbonate, is to some extent a chemical antidote to prussic acid. Atropine is an antidote to aconite, hellebore, veratrine, and morphine. Weak acids such as vinegar are A. to alkalis. Tannin or tea, charcoal, and morphine are A. to atropine and belladonna. Epsom salts and Glauber's salt are A. to carbolic acid. Potash and injected atropine or strychnine are A. to chloral. Egg albumin and milk form an antidote to copper salts. Ammonia is antidotal to formalin. Zinc sulphate is an antidote to lead salts. Potassium permanganate is an antidote to opium or morphine and to strychnine if immediately administered.

Antietam, narrow, deep riv. in Maryland, U.S.A., flowing into the Potomac. A prolonged battle was fought on its banks

between the Federals and the Confederates in Sept. 1862. The former were victorious, but with the loss of nearly 13,000 men.

Antifebrin, *acetanilide* (chemical symbol $C_6H_5.NH.COCH_3$), crystalline substance obtained by acting on aniline with glacial acetic acid. It is an analgesic and antipyretic, though it is undesirable to use it when the fever is prolonged, as its effects pass off so quickly, and relieves the pain of migraine and neuralgia. It is liable to produce alarming symptoms, such as gasping respiration, cyanosis (darkening of the skin through deficient oxidation of the blood), and collapse. In susceptible persons these symptoms may be brought on by even small doses.

Antigen, any substance which after inoculation into the body is capable of giving rise to antibodies (q.v.) in the animal body. See BACTERIA, *Immunity*.

Antigone, daughter of Oedipus and Jocasta, accompanied her father into exile at Colonus. After his death she went to Thebes, where Haemon, son of Creon, the king, fell in love with her. Her brothers, Eteocles and Polynices, slew each other in single combat, and A., disregarding Creon's edict, buried Polynices. As a punishment she was shut up in an underground cave, where she afterwards hanged herself. Haemon in despair put an end to his life. Sophocles immortalised her in *Antigone* and *Oedipus at Colonus*. Euripides also used a version of the theme in his *Phoenician Women*. A modern treatment of the story is given in Anouilh's (q.v.) *Antigone*.

Antigonish, cap. tn of co. of same name, Nova Scotia. It is the seat of the Catholic Bishop of Arichat, and contains St Ninian's Cathedral and the univ. of St Francis Xavier. It is a banking tn, a port of entry into Nova Scotia, and a distributing centre for a large agric. dist.; it has a weekly newspaper, the *Casket*. Pop. 3200.

Antigonus (382-301 BC), known as Cyclops (the one-eyed), one of the generals of Alexander the Great. In the div. of the kingdom after Alexander's death he received Greater Phrygia, Pamphylia, and Lycia. He was forced to flee into Greece, and found favour with Antipater, regent of Macedonia. On the death of Antipater, he determined to win the lordship of Asia, and subdued Asia Minor and Syria. He assumed the title of king in 306 BC. He failed in an attempt to invade Egypt, and fell in a decisive battle at Ipsus (301) in his eighty-first year.

Antigonus Doson, King of Macedonia (229-221 BC), was grandson of Demetrius Poliorcetes. He assumed gov. on the death of Demetrius II and married Chryseis, the queen-mother. His reign was a critical period in the hist. of the interaction of the Gk states. He co-operated with Aratus and the Achaean league against Cleomenes, King of Sparta, invaded Laconia in 221 BC, and by the victory of Sellasia made himself master of Sparta. He repelled an invasion of the Illyrians in Macedonia, and d. a few months later in 220 BC. The appellation, 'Doson' ('about to give') satirically

marked his readiness to promise and slowness to perform.

Antigonus Gonatas (318-239 BC), Macedonian king, grandson of A. Cyclops and son of Demetrius Poliorcetes. He assumed the royal title on his father's death in 283, but did not obtain possession of the throne until 277. Pyrrhus drove him from his kingdom in 272; but he recovered it in the following year, and retained it until his death.

Antigonus of Carystus in Euboea, Gk writer who fl. during the 3rd cent. BC at the court of Attalus I of Pergamum. Fragments of his *Lives of Philosophers* have been preserved by Athenaeus and Diogenes Laertius. His *Collection of Wonderful Tales* was ed. by Keller in the first vol. of *Rezum Naturalium Scriptores Graeci Minores*, 1877.

Antigua, one of the W. Indian Is., is a Brit. possession, forming with Barbuda and Redonda one of the 5 presidencies of the Leeward Is. It was discovered by Columbus in 1493, settled by the English in 1632, made a bishopric in 1842. It is the seat of gov. of the Leeward Is. It became a crown colony in 1898. Chief tns, St John, Falmouth, and Parham. The is.'s natural harbours are St John's, English, Falmouth, Willoughby, and Parham. Sugar is cultivated, and molasses, tamarinds, and pineapples are exported, also Sea Island cotton, which is relieving the is.'s over-dependence on sugar and molasses. Area 108 sq. m. Pop. with dependencies 41,760. The is. was named by Columbus after the church of St Mary of A., Seville. It is an is. of rocky caves and dense thickets of thorny underwood, with picturesque ravines, intricate int paths, and dangerous shores lined with coral reefs. The settlement of A. is associated with the name of Sir Thomas Warner, whose son Edward led a party of Eng. colonists from St Kitts (q.v.) to A. in 1632, and was made the is.'s first governor by his father. Later the is., together with the other Leeward Is., was included in the patent granted to Lord Carlisle, the lessee of which grant was Francis, Lord Willoughby. Willoughby governed the Leeward Is. from Barbados, relinquished control in 1652, but returned after the Restoration and governed till 1666, when he was lost at sea. In 1666 the French took possession of A.; but in 1667 it was ceded to England by the Treaty of Breda. There were soon after the cession only 500 black people on the is., while a cent. later the pop. included nearly 39,000 slaves, 1230 free coloured people, and 2600 whites. The notorious Daniel Parke became governor in 1706. Violent differences occurred between him and the inhab., but he refused to resign and was at length killed by an infuriated mob on 10 Dec. 1710.

Nelson served (1784-7) at the dockyard of Eng. Harbour, where he hauled down the broad pennant of Commissioner Moutray, on the ground that he, Nelson, as captain of the *Boreas*, was senior officer of the station.

See Wm Dampier, *Voyages and Descriptions*, 1699; Capt. Thomas Southey,

Chronological History of the West Indies, 1827; *Antigua and the Antiguans*, 1844; V. L. Oliver, *History of the Island of Antigua*, 1895-9; C. Manington, *The West Indies*, 1925.

'**Anti-Jacobin**,' or '**Weekly Examiner**,' Eng. newspaper founded by George Canning and his friends to express their opposition to the principles and policy of the Fr. revolutionaries. The chief contributors were Canning, George Ellis, and John Hookham Frere, the paper being ed. by Wm Gifford (q.v.). It lasted from 20 Nov. 1797 to 9 July 1798.

Antilegomena (Gk, 'contradicted'), term applied to certain books of the N.T. whose inspiration was not at first universally acknowledged by the Church, viz. James, Jude, 2 Peter, 3 John, and the Apocalypse. The name was given in contrast to the other books, which were called Homologoumena (agreed to). See also BIBLE.

Antilibanus, or **Anti-Lebanon**, mt range in rep. of Lebanon, inferior in height to Lebanon, with which it runs parallel, and from which it is separated by the valley of Coele-Syria. Its highest peak is Mt Hermon, which is 9050 ft high.

Antilles, name often applied to the whole of the W. Indies is. between Florida and Venezuela, sometimes to the 2 large groups, the Greater A. and the Lesser A., or Caribbean Is. The Greater A. comprise the largest is., namely Cuba, Jamaica, Haiti-Dominican rep., and Puerto Rico, as well as the small is. near their coasts. The Lesser A. comprise the Windward and Leeward Is., with the Virgin Is., Barbados, Trinidad, and Tobago. For further information on the A., discovered by Columbus, see under the various names above mentioned.

Antilocapra, or **Prongbuck**, N. Amer. ruminant, somewhat resembling the antelope, but differing from it in having deciduous branched horns. The genus is also characterised by the absence of lateral hoofs. The animal stands about 3 ft high.

Antiochus, son of Nestor, King of Pylos, whom he accompanied to the Trojan war. Famous for beauty, swiftness, and skill, he was the friend of Achilles, who avenged him when he died saving Nestor from Memnon. He was buried with Achilles and Patroclus, on the headland of Sigeum.

Antilogarithm, see LOGARITHM.

Antimachus, Gk epic poet, b. c. 545 BC at Colophon. His works, which show little talent, are full of erudition and were valued by Plato. They include a *Thebais* and the long elegiac poem *Lyde*. A. also ed. the *Iliad* and *Odyssey*. See B. Wyss, *Antimachi Colophonii reliquiae*, 1936.

Antimelos, small, uninhabited is. to the NW. of Melos (q.v.) in the Cyclades, Greece.

Antimony, chemical metallic element (symbol Sb, atomic number 51, atomic weight 121.2) occurring in nature chiefly in combination with sulphur as stibnite, antimonite, or A. sulphide, Sb₂S₃. Other A. compounds found in nature are arseniferous A., As₂Sb, antimonial silver, Ag₃Sb, antimonial nickel, NiSb, A. oxide, Sb₂O₃, etc.

The metal is prepared by melting the sulphide in a reverberatory furnace so as to separate it from impurities of quartz, etc. The pure sulphide is then roasted in order to convert it into the oxide, which is afterwards reduced with carbon. Another method is the fusion of the sulphide with scrap iron, when iron sulphide and A. are formed. The A. is further purified by remelting with potassium carbonate and on solidifying it shows fern-like markings due to crystallisation, and is known as 'star-metal.'

A. is a lustrous silver-white metal. It has a sp. gr. of about 6.7, melts at about 630° C., is hard and so brittle that it can be easily powdered. It volatilises at a white heat in air, and may be distilled in a current of hydrogen. It does not undergo alteration on exposure to the air at ordinary temps., but burns on heating to form the oxide; if burned in contact with charcoal at a high temp. the oxide is evolved in dense white fumes. The metal combines directly with chlorine with evolution of much heat.

A. forms numerous useful alloys with other metals. Eng. type-metal is an alloy of lead, A., and tin; the A. imparts hardness to the alloy and that quality of expanding at the moment of solidification which gives a clear outline to the cast. Britannia metal consists of tin, A., and zinc; pewter contains tin, A., copper, and bismuth; and anti-friction metal is usually composed of copper, A., tin, and lead.

The chief compounds of A. are A. hydride, SbH_3 , a disagreeably smelling gas; A. trioxide, found in the mineral valentinite; pyroantimonie acid, formed by heating the white powder produced by the action of nitric acid on the metal; A. trichloride, a crystalline solid, but if prepared by boiling the sulphide in strong hydrochloric acid, a viscous mass, called butter of A.; and A. pentachloride, a heavy, colourless, fuming liquid.

In medicine, potassium antimonyl tartrate, known as tartar emetic, is administered in small doses as a diaphoretic and expectorant, and in doses of from 1 to 2 grains as an emetic. More frequently it is injected intravenously in the treatment of kala-azar (blackwater fever) and trypanosomiasis (sleeping-sickness). A. trisulphide is given in doses from 1 to 5 grains for the same purposes. In larger doses, A. is an irritant poison, causing vomiting and purging. Chronic antimonial poisoning is characterised by nausea, progressive weakness, and may end in death by exhaustion. In dyeing tartar emetic is used as a mordant.

Antinomianism (Gk *anti*, against; *nomos*, law), doctrine that faith in Jesus Christ dispenses with, and renders unnecessary, so far as a future state is concerned, the observance of morality and the performance of good works. The term 'antinomian' is not older than the Reformation. It was applied by Luther to the followers of John Agricola, his fellow townsman, who was b. at Eisleben in Saxony. At Wittenberg in 1537 Agricola maintained in a disputation the Antinomian point of view, which was controverted by Luther,

Melanchthon, and others. The Antinomian controversy was terminated in 1540 by a retraction by Agricola. A. found foothold in this country during the Commonwealth, but the assembly of divines in 1643 condemned sev. writings which appeared to them antinomian. Parliament in 1648 enacted that any one convicted, on the oaths of 2 witnesses, of maintaining that the moral law of the Ten Commandments is no rule for Christians, or that a believer need not repent or pray for pardon of sin, should publicly retract, or, on his refusal, be imprisoned till he found sureties that he would no more maintain these doctrines.

Antinoüs, see AQUILA.

Antinoüs, beautiful youth, b. Claudopolis in Bithynia, favourite of the Emperor Hadrian, whom he accompanied in his travels. In AD 130 A. committed suicide by drowning himself in the Nile. Hadrian not only enrolled him among the gods, but built temples, instituted festivals, and founded the city of Antinoöpolis in his honour. Numerous coins, statues, and other works of art survive to preserve his memory.

Antioch, now Antakya in Turkey. Founded by Seleucus 300 BC after the battle of Ipsus, 301. Acquired the name of 'Queen of the E.' Here the disciples were first called Christians, AD 42. A. was taken by the Arabs, 637; recovered by the E. emperor, 966; lost again, 1086; retaken by the crusaders in June 1098, and made cap. of a principality, 1099, and held by them till June 1268, when it was captured by the Sultan of Egypt. It was made part of Syria in 1920, but restored to Turkey in 1939. Pop. 30,000.

Antioch College, co-educational institution at Yellow Springs, Ohio, founded by Horace Mann (q.v.) in 1853. Academic training is not regarded as sufficient of itself to equip a student for a career and therefore the college is so organised that the student may divide his time between school and practical work in the economic community. The student-roll of 1956 contained about 1000 men and women. The college has a faculty of over 100 teachers. The Olive Kettering Library has over 100,000 vols.

Antiochus, name of 13 kings of Syria: Antiochus I, Soter (280-261 BC), son and successor of Seleucus I (see SELEUCIDAE; SELEUCUS).

Antiochus II, Theos (261-247 BC), son of the last.

Antiochus III, the Great (223-187 BC), son of Seleucus II. Having strengthened his kingdom, which had begun to disintegrate under his predecessors, he concluded a treaty with Parthia. Later he became involved in hostilities with Rome, and was decisively beaten, first at Thermopylae in 191, and then at Mt Sipylus in 190. (See HANNIBAL.) The terms of peace granted by the Senate (188) obliged him to pay a fine of 15,000 Euboic talents (more than half a million kilograms of silver). In order to raise part of this huge sum, A. attempted to plunder a temple in Elymais; but he was assassinated by the inhab. (187 BC).

Antiochus IV, Epiphanes (175-163 BC), son of the last and successor of his brother, Seleucus IV. He is known for his attempt to eradicate the Jewish religion, which gave rise to the heroic resistance of the Maccabees. A. d. in a state of raving madness.

Antiochus V, Eupator (163-162 BC), son of the last. Only 9 years old at the time of his accession, he was put to death by order of his cousin Demetrius I, Soter (q.v.).

Antiochus VI, Theos (144-142 BC), son of Alexander Balas; put forward as a claimant to the throne against Demetrius II Nicator (q.v.), but murdered by his own sponsor, Tryphon.

Antiochus VII, Sidetes (137-129 BC), younger son of Demetrius I. He succeeded Tryphon, who had temporarily dethroned Demetrius II, and fell in battle against the Parthians.

Antiochus VIII, Grypus (125-96 BC), son of Demetrius II, successor of his brother Seleucus V. The first part of his reign was occupied in war with his half-brother (later Antiochus IX), with whom he agreed to share the kingdom in 112.

Antiochus IX, Cyzicenus (112-95 BC), half-brother of Antiochus VIII (q.v.). He was killed in battle against Seleucus VI.

Antiochus X, Eusebes (95-93 BC), son of the last.

Antiochus XI, Epiphanes, second son of Antiochus VIII. He disputed the throne with Eusebes, by whom he was routed.

Antiochus XII, Dionysus, brother of the last. He held the throne for a short time against Eusebes, but fell in battle against the Arabian king, Aretas. On the death of Eusebes, his subjects, tired of the civil broils of the Seleucidae, offered the kingdom to Tigranes of Armenia, who united it to his own dominions and held it until his defeat by the Romans in 69 BC.

Antiochus XIII, Asiaticus (69-65 BC), son of Antiochus X. He succeeded to the kingdom on the defeat of Tigranes by the Romans; but was dethroned in 65 by Pompey, who made Syria a Rom. province. See E. R. Bevan, *The House of Seleucus* (2 vols.), 1902.

Antipaedobaptists, name given to those who deny the validity of infant baptism. They are generally known by the shorter title of Baptists.

Antiparallel. Two straight lines AB ,

CD , are A . with respect to a transverse line EF cutting them at X and Y respectively when $\angle EXB = \angle FYD$ and $\angle AXE = \angle FYC$.

Antiparos, anct. Olios, is. of the Cyclades group in the Aegean Sea, separated from Paros by a dangerous channel. Vines and grain are grown and there are deposits of zinc, lead, and iron. A. is famous for a superb grotto, very difficult of access, about 300 ft. by 100 ft. and some 80 ft. high, with stalactites and stalagmites.

Antipasch, Low Sunday (q.v.), Sunday after Easter Day.

Antipater, general of Alexander the Great, and regent of Macedonia in the absence of his sovereign (334-323 BC). On Alexander's death, in 323 BC, A. was appointed joint regent with Craterus (q.v.), and together they terminated the so-called Lamian war by defeating the Gk. forces at Crannon (322 BC). In the following year A. once more became sole regent, and d. in 319 BC.

Antipater, Lucius Caelius (fl. 125 BC), Rom. historian, was also an orator and lawyer. He was a contemporary of the Gracchi, and wrote a famous hist. of the Second Punic War. See O. Meltzer, *De L. Caelio Antipatro*, 1867.

Antipatharia, sub-family of coral. The growths, usually found at great depths, are slender and branched in appearance. The polyps resemble small anemones and have from 6 to 24 simple tentacles.

Antipathy (Gk *anti*, contrary; *pathos*, feeling) signifies an involuntary dislike or aversion, such as the aversion to the tastes and smells of many drugs, and the dislike of certain foods. Some A.s arise from fear and past unpleasant associations. Some people have A.s to certain animals, e.g. to cats or snakes, and some faint at the sight or sound of certain things. When such an aversion gives rise to considerable fear it is commonly called a *phobia*.

Antipatris, city of Palestine, at the edge of the plain of Sharon, on the main road from Jerusalem to Caesarea, built by Herod the Great (c. 10 BC), and named after his father Antipater. A. is frequently mentioned by Josephus. See also Acts xxiii. 31-2. It fell into decay in the 4th cent.

Antipaxo, very small Gk is. 1 m. to the SE. of Paxo, one of the Ionian group.

Antiphanes, Athenian comic poet of 4th cent. BC. The chief representative of the Middle Attic comedy. He is supposed to have written between two and three hundred plays, the extant fragments of which were collected in *Comicorum Atticorum Fragmenta* (T. Koch, 1884). See T. B. L. Webster, *Studies in Later Greek Comedy*, 1953.

Antiphilus, Gk painter of the Alexandrian age. He worked for Philip II of Macedonia and Ptolemy I of Egypt. He is said to have been a rival of his contemporary Apelles, and is described by Quintilian as 'excelling in light and shade and caricature' and Pliny mentions sev. of his works in various styles. He was also the inventor of a kind of caricature called *Grylli*. They were a species

of grotesque monsters, part man, part animal or bird.

Antiphlogistics, medicines which have the power of counteracting or allaying fever.

Antiphon (480-411 bc), earliest of the Attic orators, a member of the oligarchical party and largely responsible for the estab. of the Four Hundred in 410. On the restoration of the democracy he was condemned to death. He is often regarded as the founder of political oratory. His chief work was as a professional speech-writer. Only 15 of his speeches have come down to us. They are to be found in Reiske's collection and I. Bekker's *Attic Orators*, 1822-3.

Antiphon (Gk *anti*, against; *phōnē*, the voice), species of psalmody sung alternately. It probably originated in the ancient Jewish service and was introduced into Christian worship by Ignatius (d. AD 115), and into the Lat. Church by Ambrose, Bishop of Milan, in the 4th cent.

Antiphonary, **Antiphonarium**, **Antiphonal**, in music, book wherein the antiphons were written, a copy of which was kept in each church and monastic estab. Such books were often very ornate and costly.

Antipodes (Gk *anti*, against; *pous*, foot), term applied to places diametrically opposed on the earth, so that if a line were drawn connecting them it would pass through the centre of the globe. Noon at one place is midnight at the other, and the one's longest day corresponds with the other's shortest. The A. of England are A. Is., near New Zealand.

Antipolis, see ANTIBES.

Antipope, see POPES, LIST OF THE.

Antipyretics, remedies which tend to reduce the temp. in fevers. They may act (1) by the abstraction of heat, as in the use of the cold bath and ice, and by administering copious doses of diaphoretics and sudorifics; or (2) by lessening heat production by their action on the nervous system, as in the use of antipyrine, antifebrin, and quinine; or (3) by destroying the poison which causes fever; or (4) by increasing the dissipation of heat through their action on the skin or circulation, as alcohol, aconite, antimony, etc.

Antipyrine ($C_{11}H_{12}ON_2$), or *dimethylphenylpyrazolone*, organic substance used in medicine as a febrifuge.

It crystallises in white leaflets which melt at $113^{\circ}C.$, and is soluble in water and alcohol. The aqueous solutions gives a red colour with ferric chloride and bluish-green with nitrous acid.

A. has a slight effect on the temp. in health, but a marked one in fever. It has been used in almost every feverish condition, but its routine use is not now recommended as it may produce severe toxic effects. It relieves migraine, headache, and neuralgia, and predisposes to sleep after the pain has disappeared.

Antiquaries, **Society of**, formed in the 18th cent. to promote the study of antiquities. Earlier societies had been founded in the 16th and 17th cents., but it was not until 1707 that the society was formally reconstituted. A royal charter

was granted by George II in 1751; in 1780 George III granted the society apartments in Somerset House. It is governed by a council of 21 and a president who is also an *ex officio* trustee of the Brit. Museum. The H.Q. are at Burlington House, where its library is situated. See Joan Evans, *A History of the Society of Antiquaries*, 1956.

Antique, paper quality, see PAPER.

Antiquities, see ARCHAEOLOGY; MONUMENTS, ANCIENT; and PREHISTORY.

Antirrhinum, genus of plants belonging to the Scrophulariaceae found in temperate climates. *A. majus* is the snapdragon, which is common in Great Britain; *A. orontium*, the lesser snapdragon, or calves' snout, is a native throughout Europe. Intermediate and dwarf varieties can be grown and of almost any colour except blue.

Anti-Saloon League of America was founded in 1893 in Ohio for the total suppression of the liquor traffic. By means of agitations, legislative measures, and educational and publicity movements the organisation was instrumental in amending the Amer. constitution and bringing about prohibition. With the disappearance of prohibition again from the constitution, the influence of the league declined. In 1948 it was succeeded by the Temperance League of America, which in 1950 merged with the National Temperance Movement to form the National Temperance League.

Antisana, volcanic mt in the Andes Mts in Ecuador, S. America. It is about 18,714 ft high. The vil. of A. is at an altitude of over 13,000 ft on its W. slope.

Antiscii, old astronomical term (derived from the Gk *anti*, against, and *skia*, shadow) signifying those who live on the same meridian, but on opposite sides of the equator, so that their shadows at noon fall in opposite directions. See ANTOECI.

Antiscorbutics, remedies effective against scurvy. Under the Merchant Shipping Act, 1894, A. must be carried on Brit. ships. Lime-juice is often used, hence the nickname 'limey' applied by foreigners to Eng. sailors. See SCURVY.

Anti-Semites, name which was first applied to those who were opposed to the Jews in the second half of the 19th cent. (Anti-Semitism had, however, been prevalent all over medieval Europe, varying in intensity in different countries and at different times.) The modern movement originated in Russia and in the Balkan peninsula and then spread into Austria, Hungary, Rumania, Germany, France, and Algeria, in which countries the Jews were to be found in large numbers. This hatred of the Jews was not the outcome of antipathy to their religion, but arose on account of the wealth and power which they were accumulating. In Russia and Hungary the movement assumed a terrible aspect, and riots and murders took place in 1882. In Germany and Austria anti-Semitic parties arose, and a league was formed to restrict the liberties and political rights of the Jews. Thousands of Jews fled to Britain and to the

U.S.A. as a result. In 1894 the Dreyfus affair occurred in France, in which anti-Semitism played a vital part.

Although Jews are now to be found in most countries, the intensity of anti-Semitic feeling still varies greatly. Russia, Hungary, Austria, and E. Europe generally were, until the late 19th cent., the centres where the strongest animosity was shown. In France and, before the Nazi regime, in Germany, anti-Semitic actions conformed to the usages of the law, and, though exceedingly violent propaganda was common, the legal rights of Jews were upheld. In America and throughout the Brit. Empire anti-Semitism is almost unknown except as one of the many illogical sentiments that occasionally sway individuals, and the Jew is accepted as a fellow-citizen who merely belongs to a minority religion.

A terrible revival of anti-Semitic feeling swept through Germany with the rise to power, in 1933, of the Nazi party under Hitler. Ger. Jews, irrespective of class or attainments, were maltreated and deprived of their livelihood, and many of worldwide celebrity sought refuge in other countries—especially England and the U.S.A. Persecution applied equally severely to persons of Jewish or part-Jewish origin who were themselves baptised Christians. In this revival in Germany, anti-Semitism took the form of a political movement owing its impulse to Hitler, who founded his 'Aryan paragraph' (see ARYAN) on the teaching of Gobineau, Houston Stewart Chamberlain, and others, and made it, in effect, the cardinal feature of his policy of founding a Third Reich embracing only the pure Germanic or 'Nordic' peoples in W., Central, and E. Europe. In conformity with this idea, the Jews were declared to be the enemy of the Ger. people and their persecution became a settled policy which was pursued again in 1938, when Germany annexed Austria, and in 1939 on the annexation of Czechoslovakia. In Russia the Communists would not allow Jews to continue as capitalists or 'unproductive elements,' but, for the rest, they gave them equal rights. Jews have risen to very high office in the Soviet Union; but it would seem that anti-Semitism has not been eliminated from modern Russia, for in the last months of Stalin's life there were distinct signs of it in Soviet propaganda and in certain policy statements; though this official attitude was only temporary. It was in Poland and Rumania, with respectively 3,000,000 and 1,000,000 Jews, that the Jewish issue was most acute before the Second World War; much more than in other countries, even in Germany. Anti-Semitism was a semi-popular movement. This movement implied many motives and mental attitudes: the jealousy felt by the Polish lower middle classes of their Jewish rivals and competitors; the Socialism of the ignorant, in which the Jews were blamed as a sinister capitalist power; the deeply ingrained clerical hatred of the Jew as 'Christ's enemy'; and, finally, the fear of all govts. of the spread of Communism

among the great mass of impoverished Jewish artisans and outright paupers. In Poland and Rumania Jew and non-Jew had tended for cents. to remain in quite separate communities, and both were ignorant of the other's ideals and ways of life. This gulf of separatism was, at least in part, responsible for the passivity and apparent indifference with which the mass of Gentiles watched the slaughter of at least 4,000,000 Jews in the concentration camps of Belsen, Buchenwald, Auschwitz, Dachau, and Maidanek between 1935-45. Since the Second World War the estab. of the state of Israel (q.v.) and the considerable fall in the Jewish pop. in Central Europe, due to Nazi persecution, have helped to make anti-Semitism a force of little importance in Europe generally. In the Middle E., however, anti-Semitism has increased in the Arab states since Israel became a Jewish state and has received official encouragement in Egypt and Saudi Arabia.

See also AUSCHWITZ; BELSEN; 'MEIN KAMPF,' etc.

See A. Dushaw, *Anti-Semitism: the Voice of Folly and Fanaticism*, New York, 1943; James Parkes, *Anti-Semitism: an Enemy of the People*, 1945, and *The Emergence of the Jewish Problem*, 1946.

Antiseptics, agents which prevent putrefaction by destroying or arresting the growth or development of the germs upon which putrefaction depends. The process must be distinguished from disinfection, which destroys the germs causing disease, though the 2 terms are often confused. The theory that putrefaction and fermentation are due to the presence of minute organisms owes much to the researches of Pasteur, and Lord Lister was the originator of the method of treating surgical wounds by substances known to destroy or arrest the growth of these organisms.

The bacteria of putrefaction are always present in ordinary air, but they require certain conditions of temp. and moisture to develop. Thus it is found that extreme heat or cold kills bacteria and prevents infection. If therefore substances like milk or meat are boiled and then kept in hermetically sealed vessels they may be kept fit for consumption for an indefinite period. On the other hand, putrescible substances kept at a low temp. in refrigerators will remain unaffected, and advantage is taken of this fact in the transportation of meat from America, Australia, and New Zealand to this country. Absence of moisture is unfavourable to the growth of bacteria, so that the practice of drying fish, fruit, and meat is a method of preserving them. It should be observed, however, that food materials preserved in such a manner should be kept in a perfectly dry place, as they are liable to absorb moisture from the air, when putrefaction becomes possible. Jam owes its keeping qualities to the high sugar content, in which the osmotic pressure is too great to allow the activity of bacteria, though

here also the entry of atmospheric water vapour should be guarded against.

Besides these methods of preventing infection, there are certain chemical substances which have the power of destroying the germs of putrefaction. Their uses include the preservation of food and the prevention of septic poisoning in wounds. It is necessary, of course, that an antiseptic employed for preserving food should not be injurious or unpalatable to man, and that A. used for dressing wounds should not have an undue irritating effect upon the tissues. Salicylic acid is used for the preservation of food, but the use of boracic acid for this purpose is now illegal. It was, until recent years, much used to preserve milk, butter, meat, and fish. Salicylic acid is used to preserve beer, butter, fruit, and meat, but its employment is not completely innocuous, and therefore should be discouraged. The same criticism applies also to formalin, sometimes used for the preservation of cream.

Carbolic acid was for some time the chief antiseptic used in surgery, but its place has to a great extent been taken by mercuric chloride (corrosive sublimate) and mercury bichloride. Thymol, salicylic acid, phenyl salicylate, and boracic acid are also used as A., as well as alcohol, hydrogen peroxide, iodine, and proprietary derivatives of coal tar (e.g. Dettol). For the dressing of wounds not made by the surgeon iodoform is often employed. It does not kill the bacteria directly, the action on the micro-organisms being subsequent to a decomposition resulting, under the influence of the heat of the body, from fermentation induced by matter exuded from the wound.

The influence of the antibiotics (q.v.), the most modern and most used A. in surgery, on the results of surgical practice has been enormous. Pyæmia, septicæmia, and gangrene are now much more uncommon than formerly, and it has been found possible to treat wounds without resorting to amputations where that course would be impossible without A. Compound fractures and extensive wounds of the limbs do not, therefore, commonly mean the loss of the limb affected. Operations, too, are performed which were formerly considered too dangerous, particularly in connection with abscesses and diseases of bones and joints. Owing to the damage caused by A. to the tissues, and consequent delay in healing, the antiseptic method of nursing has now largely given way to the aseptic technique, which aims at preventing, by strict cleanliness, the entry of germs into wounds.

Anti-slavery. A movement for the abolition of the slave trade was started in England by Thomas Clarkson about 1782, after Lord Mansfield's decision in the Somerset case that slaves could not exist in England. He was assisted by Wm Wilberforce, and in 1792 a motion in favour of gradual abolition passed the Commons. In 1805 the trade was forbidden with new colonies, and in 1807 the General Abolition Bill extended the prohibition to all Brit. possessions. The

Emancipation Act of 1833 provided for the gradual abolition of the state of slavery in the colonies.

In the U.S.A. emancipation was practically accomplished in the N. states by 1799, and there was a gradual growth everywhere of public feeling in favour of total abolition. A. societies were founded in 1832 and 1833, and most Amer. writers, including Emerson, Bryant, Whittier, Lowell, Longfellow, and Mrs Stowe, lent their influence in the same direction. The famous emancipatory edicts of Lincoln in 1862, 1863, and 1865 secured the success of the abolitionists. *See also* SLAVERY AND THE SLAVE TRADE.

Antispasmodics, drugs which have the action of relieving spasms.

Antispast, tetrasyllabic metrical foot, composed of an iambus and a trochee, the first and last syllables being short and the middle ones long, as in 'Clytēmnēstrā'.

Antisthenes (c. 455–c. 360 BC), Gk philosopher, a pupil of Socrates, but not a member of the Platonic Academy. He opened a school in the Cynosarges (q.v.), whence his followers were often supposed to have derived their name, Cynics (q.v.). A.'s philosophy was a development of Socrates' dictum 'Virtue is Knowledge'; its simplicity, and the austerity of his own life, attracted the poorer classes and later exercised some influence on the Stoics. *See* H. Dudley, *A History of Cynicism*, 1937.

Antistrophe (Gk *anti*, against; *strophē*, a turning), part of an ode sung by the chorus on returning from left to right, having previously sung the strophe when moving from right to left. It is a feature of Gk drama.

Anti-Taurus, *see* TAURUS.

Antithesis (Gk *anti*, against; *tithenai*, to place), is a figure of speech in which the contrast of ideas is expressed by balancing one word or phrase against another, as in 'God made the country and man made the town,' or 'To err is human, to forgive, divine.' *See also* FIGURE OF SPEECH.

Antitoxin, term applied to substances elaborated by the body to counteract the toxins of bacteria. Their chemical composition is a matter of doubt, but they are known to be proteins. It is found that when the body is inoculated with small quantities of a toxin, increasing quantities of A. are generated to counteract the poison, so that the individual eventually acquires 'active' immunity; by chemical treatment the toxins can sometimes be converted into less harmful 'toxoids'; these are used for immunisation against diphtheria and tetanus. The serum treatment consists in inoculating an animal, such as a horse, with small quantities of toxin until it becomes immune, when the blood is withdrawn and freed from blood corpuscles; this constitutes the serum (containing A.), which may be regulated to any degree of potency and injected into the human blood system, providing 'passive' immunity. Active immunity protects an individual from a disease, whilst passive immunity is useful as a means of treatment, i.e. when the disease has already

been acquired; both methods are employed in diphtheria and tetanus. See BACTERIA, *Immunity*.

Anti-trades. At times steady winds blow in the upper air in a contrary direction to the trade winds blowing at the earth's surface. Thus in the N. hemisphere they blow from the SW. and in the S. hemisphere from the NW. They are not regularly developed.

Anti-Trinitarians. See ARIUS and UNITARIANISM.

Antitype (Gk *antitupos*, of corresponding form), the actuality of that which was prophesied. Thus, in Scripture, the paschal lamb is the prophetic type, of which Christ is the A.

Antium, now Porto d'Anzio, anct tn of Latium 33 m. S. of Rome, bp. of Caelgula and Nero. Its origins are obscure. From very early times until the 4th cent. bc it belonged to the Volsci, from whom it was taken by the Romans in 338 bc. On this occasion 6 ships of A. were captured, and their beaks (*rostra*) used to decorate the orator's tribunal in the Rom. Forum (hence our word *rostrum*). Under the empire A. was a favourite residence of sev. emperors and noble families, remains of whose villas may be seen along the shore. Excavations at A. have yielded the only known example of a pre-Julian calendar, found painted on a wall.

Antivari, see BAR.

Anti-vivisection, term used to indicate opposition to experimentation on animals based on medical and scientific rejection of claims made by vivisectionists as well as on sentiment and the moral repudiation of the infliction of pain and prolonged suffering. For instance, the failure of cancer research based on experiments on animals to prevent the increase of the disease or to yield adequate curative treatment is claimed by anti-vivisectionists as a strong argument in their favour. The early A. movement of the middle 19th cent. drew public attention to the cruelty of certain experiments carried out on animals by physiologists like Majendie Schiff, Claude Bernard, and others; and members of the medical profession, such as Dr Anna Kingsford, Dr Elizabeth Blackwell, and the distinguished surgeons Lawson Tait and Bigelow, were prominent in condemning the laboratory practices complained of and received the support of outstanding figures in literature, art, and religion.

A. societies were organised in Britain and other countries, and Brit. societies—still active—included, the National A. Society, the Brit. Union for the Abolition of Vivisection, the Animal Defence and A. Society, the Scottish Society for the Prevention of Vivisection, and the Manchester Society for the Protection of Animals from Vivisection. There has been an enormous increase in experimentation in recent times owing to the widespread use of animals for the testing and standardising of drugs, sera, and vaccines. The first royal commission on vivisection was appointed in 1875 and issued its report in the following year. This resulted

in the passing of the Cruelty to Animals Act of 1876, which made it obligatory for experimenters to hold licences and certificates, and legislated for a certain amount of inspection and for the issue of ann. returns by the Home Office. The second royal commission, which was appointed in 1906 and pub. its report in 1912, strongly held that limits should be placed to animal suffering in the search for physiological or pathological knowledge.

The Animal Defence and A. Society has co-ordinated medical opposition to vivisection by the foundation of associated medical bodies, by pub. of numerous articles by members of the profession and by stressing the constructive side of the movement. It has drawn public attention to methods of prevention and cure of disease not associated with experiments on animals, i.e. homoeopathy, nature cure, herbalism, physiotherapy, hydrotherapy, and psychotherapy. For a comprehensive survey of the Brit. movement see E. Westacott, *A Century of Vivisection and Anti-vivisection*, 1949. See also VIVISECTION.

Antlers, outgrowths of the frontal bone found in male deer. The antler is attached by a bony ring, the 'burr,' to a pedicle, which in turn is joined to the skull. During growth the antler is covered by a sensitive, hairy skin, known as 'velvet,' which dries up and is rubbed off when maturity is attained. The A. are shed annually, and the number and complexity of the branches increase year by year. They occur, in various forms, in practically all kinds of deer, and are used for offensive purposes. The female reindeer is antlered as well as the male. A. with more than 12 points are seldom found in Great Britain, but heads of 60 points are in existence on the Continent. Shed A. are used commercially for handles of knives, umbrellas, etc.

Antlia Pneumatica, 'Air-Pump,' constellation in the S. hemisphere, named by Caccille in 1752. Sigma Antliae is a variable star with a period of 7 hrs 47 min.

Antoecol, from the Greek, signifies 'those who live over against each other,' and is the name given to the inhab. of 2 places which have the same lat. and long., except that one place is N. of the equator and the other S. Those who live N. of the equator are A. to those who live S., and vice versa. Two antoecial places have the same hour of day or night, but opposite seasons of the year.

Antofagasta: 1. N. Chilean prov. between Tarapaca and Atacama provs. It is rich in saline deposits. The silver mines of Caracoles are about 90 m. NE. of the port of A. It produces for export silver, copper, lead, and salt. Chief tns are Taltal, Cobija (the old cap.), Tocopilla, Chugucamata, and A. (cap.). The prov. belonged to Bolivia, and was ceded definitely to Chile in 1882. Area 47,515 sq. m.; pop. (1952), 184,779.

2. Port, largest city in N. Chile, cap. of above prov. It is an important commercial centre, exporting nitrates and copper and other metals. The smelting

works for silver mines are located here. Pop. 62,272.

Antoine de Bourbon, Duke of Vendôme (d. 1562), Fr. prince, married, in 1548, Jeanne d'Albret, only child of Henry II, King of Navarre. Henry, Prince of Béarn, afterwards Henry IV of France, was the child of this marriage. A. assumed the title of King of Navarre in the right of his wife. He d. as the result of a wound received at the siege of Rouen.

Antokolski, Marc (1842-1902), Russian sculptor, b. Vilna. In 1864 he was admitted as a special student to the Academy of Fine Arts, St Petersburg, where he gained numerous medals. In 1871 the Emperor Alexander II bought his statue of 'Ivan the Terrible.' A. finally settled in Paris. Among his best works are 'Peter the Great,' 1872; 'Christ Bound before the People,' 1874; 'The Death of Socrates,' 1876; 'The Last Sigh,' 1878; 'Mephistopheles,' 1881; 'Spinoza,' 1882; 'Yermak,' 1900; 'The Sleeping Beauty,' 1900.

Antommarchi, Francesco (c. 1780-1838), Napoleon I's physician at St Helena, a native of Corsica, and a surgeon and anatomist of considerable repute. Napoleon left him a considerable sum of money. After serving as director of hospitals in the Polish revolution, he went to the W. Indies, and d. in Cuba. He wrote *Les Derniers Moments de Napoléon*, 1823.

Antonelli, Giacomo (1806-76), It. papal statesman, son of a wood-cutter from the vil. of Sonnino. After a brilliant career in the Grand Seminary at Rome, Pope Gregory XVI preferred him to various eccles. appointments. Pius IX made him a cardinal in 1847, and in 1848 president of the Liberal Cabinet which drew up the *Statuto* or Constitution.

Antonello da Messina (c. 1414-c. 1479), It. painter, b. Messina. He was a close follower of Flemish methods of painting, which he learnt from the Van Eycks and introduced into Italy. He acquired great renown in Venice as a portrait painter and a pioneer of the oil technique. His chief extant works are 'Salvator Mundi' and 'The Crucifixion,' both in the National Gallery, London, the portrait of an unknown man (Berlin Museum), and portraits at Dresden, Rome, Venice, and in the Louvre.

Antonescu, Marshal Ion, see RUMANIA. History.

Antonia Major, elder daughter of M. Antonius and Octavia, according to Suetonius and Plutarch, but Tacitus (*Ann.* iv. 44; xii. 64) speaks of her as the younger daughter. She married L. Domitius Ahenobarbus. Her son, Cn. Domitius, married Agrippina, and was the father of the Emperor Nero; her daughter, Domitia Lepida, was the mother of Messalina, afterwards married to the Emperor Claudius.
